GLOSSARY AND ACRONYMS

Terms are defined within the context of this Environmental Impact Statement.

algal bloom: A sudden eruption of algae or cyanobacteria growth in water, which usually results from an excess of certain nutrients (e.g., nitrogen, phosphorous).

background: Refers to views beyond 1,500 feet and to the horizon

chert: A fine-grained sedimentary rock that was often used as a raw material for prehistoric stone tools

deciview: the unit of visibility deterioration is the deciview (dV), with one dV being equivalent to a 10-fold change in atmospheric clarity

foreground: Refers to views from zero to approximately 500 feet

gossan: Intensely oxidized, weathered, or decomposed rock, usually the upper and exposed part of an ore deposit or mineral vein

Isopleth: Model simulations using the AERMOD system produce diagrams that show the distribution of dispersed pollutants at ground level. These diagrams, termed “isopleth maps,” depict the distributions as a series of overlaid irregular contours onto a regional map. Isopleth maps somewhat resemble the effect of a topographic contour map, with outlines of the specific concentration levels serving the similar purpose as outlines of specific ground elevation on a topographic map.

mesic shrubs: Require a moderate amount of water to grow.

midden: A collection of branches, twigs, grasses, or leaves surrounding a nest.

middle-ground: Refers to views from approximately 500 to 1,500 feet.

mucking: Removing broken material from blast rounds.

Net Precipitation Transfer: This is made up of the net precipitation and runoff water, which together would be routed from the Process Water Pond to the mill. The net precipitation transfer would be treated at the Water Treatment Plan.

plugs: Massive concrete blocks confined by bulkheads at both ends used to completely fill a short segment of an open mine working. Grouting may accompany plug installation to minimize fracture flow around the plug and at the plug/bedrock interface.

Species of Concern: Species that are either known to be rare or declining, or declining due to the lack of basic biological information.

sub-wave base: Refers to below the wave base (i.e., the maximum depth at which a water wave’s passage causes significant water motion. For water depths deeper than the wave base, bottom sediments and the seafloor are no longer stirred by the wave motion above).

tailings: A fine-grained waste product from the mill.

void: The space from which the ore was removed.
