CERTIFICATION OF DATA INTEGRITY

Bison Engineering, Inc., certifies the data in this report is an accurate summary of the air quality conditions measured at the Black Butte Copper Project air monitoring site. Every effort was made to obtain accurate and representative data and to comply with the procedures set forth in the project-specific *Quality Assurance Project Plan*, the *State of Montana Ambient Air Monitoring Program Quality Assurance Project Plan (April 2013)*, and the Environmental Protection Agency's *Quality Assurance Handbook for Air Pollution Measurement Systems: Volume I, A Field Guide to Environmental Quality Assurance (April 1994)*, *Volume II, Ambient Air Quality Program (May 2013)*, and *Volume IV, Meteorological Measurements (March 2008)*.

APPENDICES

- Appendix A: Meteorological Data
- Appendix B: Performance Audit Reports

1.0 INTRODUCTION

Tintina Resources, Inc. established an ambient air monitoring site to measure wind speed, wind direction, standard deviation of wind direction, temperature at 9 meters and 2 meters, delta temperature, solar radiation, barometric pressure, and precipitation. The station was established to accurately characterize the local meteorology and collect baseline data in support of an operating permit application and various environmental studies.

The meteorological monitoring system was installed in April 2012. The site is operated by Bison Engineering, Inc., of Helena and Billings. Figure 1 shows the location of the monitoring site.

This report presents the data collected during the first quarter (January through March) of 2015. In addition, a description of the monitoring system operations is presented, together with summaries of quality assurance activities, including calibrations and performance audits. Tabular summaries of the data completeness achieved and the periods of missing data also are presented. Appendix A presents hourly meteorological data collected.

2.0 MONITORING SYSTEM OPERATIONS

The installation of the monitoring meteorological system equipment took place in April 2012, soon after the equipment was received from the manufacturers. The installation and calibration of the equipment required about two weeks to complete. All meteorological parameters were in full operation and producing valid data by April 30, 2012.

Steve Heck of Bison conducted performance audits of the meteorological system on March 11, 2015. All results were satisfactory. The Bison report of the audits is presented in Appendix B. The wind speed and wind direction sensors were replaced and calibrated after the audits were completed.

3.0 CALIBRATION DATA

As discussed in Section 4.0, the system's as-found condition was audited on March 11, 2015. Refurbished wind speed and wind direction sensors were installed and calibrated after the audits were completed, so that the existing units could be serviced (they were working properly when removed). No calibration adjustments were needed for any of the other meteorological instruments, based on the audit results.

4.0 PERFORMANCE AUDIT DATA

Steve Heck of Bison conducted performance audits of the meteorological system on March 11, 2015. All results were satisfactory. The Bison report of the audits is presented in Appendix B.

5.0 DATA COMPLETENESS

The meteorological percentages of data recovery achieved during the first quarter of 2015 are given in Tables 1 and 2. In these tables, the number of possible data values during each month of the quarter is given, together with the number of valid readings and the number of hours spent on quality assurance activities (such as calibrations, performance audits, and maintenance on the sensors). The quality assurance hours are added to the number of hours of valid data to compute the net percentage data recovery.

During the first quarter the net percentage data recovery was 94.4 percent for precipitation (discussed below), 99.5 percent for wind speed and 100.0 percent for all other parameters at the site. The loss of wind speed data was due to the sensor's cups being frozen in place because of weather. Those periods of missing data are summarized in Table 3a.

The precipitation gauge opening at the Tintina site is located approximately 18 inches above ground level, and the early part of the winter of 2014 – 2015 experienced heavy snowfall. The Tintina site representative was diligent about keeping the precipitation gauge and the area within its wind screen clear of snow, but the general snow depth at the Tintina site was sufficient to cause drifting at times during the latter half of January. This resulted in drifting of snow into the gauge, and false positive precipitation readings as the accumulated snow melted. The snowpack melted rapidly during February and March due to unusually mild weather, so drifting did not affect the precipitation readings in those months.

Table 3b lists the periods when drifting effects were suspected based on Bison's review of the meteorological data file. Those periods were assigned hourly values of 0.000 inches in Appendix A, since it is **probable** that the actual precipitation amount during those hours was zero. Because that cannot be known with certainty, those periods have been counted as missing data in Tables 1 and 2. This resulted in a net data recovery for precipitation of 83.6 percent for January and 94.4 percent for the quarter.

In general, false positive precipitation periods were suspected when:

- 1) Non-zero precipitation readings were accompanied by low-to-moderate relative humidity readings (versus readings of 75-80% or higher that would typically occur during a precipitation event), **and**
- 2) Significant wind (indicating potential drifting) was present, generally 4-5 meters per second or higher.

6.0 MONITORING DATA

The hourly data values collected at the monitoring sites are given in the data tables in Appendix A. Each of these tables presents one month's data for all parameters in the monitoring system. In addition, the average, maximum, and minimum values for each parameter for each day are listed (for wind direction, the prevailing wind direction for the day is given). For those hours with missing data, a code is given that explains the reason the data were missing. These codes are given in Table 4.

Monthly and quarterly wind rose distributions from the monitoring site are presented in Tables 5 through 8. These tables give the percentage frequency of occurrence of winds from 16 cardinal directions and from 22 wind speed ranges. These same data are presented graphically in Figures 2 through 5. In the wind rose figures, the length of each "petal" of the rose is proportional to the percentage of time the wind blew from that direction. On the bottom of each figure is a histogram showing the average wind speed from each of the cardinal wind directions.

Table 4. Missing Data Codes

Mnemonic Code	Description	Equivalent EPA Null Value Reason Code
Sc	Scheduled but not collected	9972
Ti	Sample time out of limits	9973
Fi	Filter damage	9976
