1.0 SURFACE WATER

1.1 INTRODUCTION

Performance goals were established in the Clark Fork River Operable Unit (CFROU) Record of Decision (ROD) for surface water [EPA, 2004]. The goal for surface water quality is for concentrations of all metal contaminants of concern (COCs; arsenic, cadmium, copper, lead, and zinc) to be below the concentrations identified in the CFROU ROD (Table 2-1). When the remediation activities are completed, surface water quality in the Clark Fork River is expected to fully support the growth and propagation of coldwater fishes (e.g., salmonids) and associated aquatic life. Surface waters will be monitored at specific locations along the Clark Fork River. Performance goals must be met at each location for the remedial actions to be considered successful.

This report evaluates progress toward attainment of surface water performance goals as defined in the CFROU ROD (Table 2-1). Water chemistry data were collected in 2024 to monitor COC concentrations and make direct comparisons to relevant performance standards. In addition to COC concentrations, data were collected to describe other water quality constituents which influence the toxicity of metal contaminants or otherwise influence the ecology of the Clark Fork River. Other water quality constituents described include total suspended sediment, common ion, and nutrient concentrations, and other physical properties of water (e.g., pH).

Table 1-1. Remediation performance goals for surface water in the Clark Fork River Operable Unit [EPA, 2004].

Contaminant of Concern	Performance Goal		
	Aquatic Life Standard[1]		Human Health or Drinking Water Standard (µg/L)
	Chronic (µg/L)	Acute (µg/L)	
Arsenic	150	340	10/18[2]
Cadmium	0.25	2	5
Copper[3]	9	13	1,300
Lead	3.2	81	15
Zinc	119	119	2,100

1.2 METHODS

The purpose of the surface water monitoring program is to collect data describing the temporal and spatial variation of metal and nutrient concentrations, and other physical properties of surface water in the CFROU. These data provide a long-term record of environmental conditions in the CFROU. As of 2024, 15 years of CFROU surface water data (2010-2024) have been collected under this monitoring

[1] The aquatic life standards for cadmium, copper, lead, and zinc vary in relation to water hardness. The values displayed in this table correspond to a water hardness of 100 mg/L.

[2] The performance standard includes both the federal maximum contaminant level (MCL; 10 µg/L; dissolved concentration) and the state of Montana standard (18 µg/L; total recoverable concentration).

[3] Based on the federal ambient water quality criteria (EPA [1986]; dissolved concentration).

program. This long-term record provides a data set to evaluate the effect of remediation on environmental conditions in the CFROU over time.

Some changes to the surface water monitoring program's methods have occurred over time. Generally, the changes to the program have consisted of expanding or contracting the temporal or spatial extent of the sampling program (i.e., certain sample sites were added or removed and additional sample periods were added or removed). Fundamental sample collection, processing, and analysis methods have remained consistent throughout the duration of the monitoring program.[4]

1.2.1 MONITORING LOCATIONS

Surface water was monitored at eight CFROU sites in 2024 (Figure 1-1; Table 1-2). The monitoring network included six sites in the Clark Fork mainstem and two sites on tributary streams.

1.2.1.1 CLARK FORK RIVER MAINSTEM

Each of the mainstem sample site locations were selected for a specific monitoring objective. The six mainstem Clark Fork River monitoring sites in Reach A (Sites CFR-03A, CFR-07D, CFR-11F, CFR-18, CFR-27H, and CFR-34) were included to provide a detailed spatial representation of conditions in Reach A where the remedial work is occurring. Site CFR-18 was added to the monitoring network in 2024 to monitor remedial work in Phases 7 and 8.

1.2.1.2 TRIBUTARIES

Tributary site locations were selected to assess the significance of COC or nutrient loading from the two primary sources upstream from the CFROU. Each tributary has one sample site located immediately above the CFROU.

1.2.1.2.1 Silver Bow Creek

Silver Bow Creek is the upstream-most tributary of the Clark Fork River. Silver Bow Creek historically was the primary source of COCs to the Clark Fork River [DEQ and EPA, 1995] but it has undergone extensive remediation since 1998 and COC concentrations are reduced compared to historic levels [Sando et al., 2014; RESPEC, 2024a]. All streamflow from Silver Bow Creek is captured by the Warm Springs Ponds and treated to reduce metal loading before discharging to the Clark Fork River. One sample site (Silver Bow Creek at Warm Springs; Site SS-25) is located on Silver Bow Creek, below the confluence of the Warm Springs Ponds Outfall and the Mill-Willow Bypass.

1.2.1.2.2 Warm Springs Creek

The Clark Fork River mainstem begins at the confluence of Silver Bow Creek and Warm Springs Creek. Warm Springs Creek is a major tributary to the Clark Fork River in Reach A. Warm Springs Creek typically has relatively low nutrient concentrations and relatively cool streamflows. Water chemistry in Warm Springs Creek is monitored at Site WSC-SBC.

[4] One significant change occurred to sediment laboratory analysis methods in 2014. Prior to 2014, metal concentrations were measured on a wet weight basis. Since 2014, all sediment metals concentrations have been analyzed on a dry weight basis.

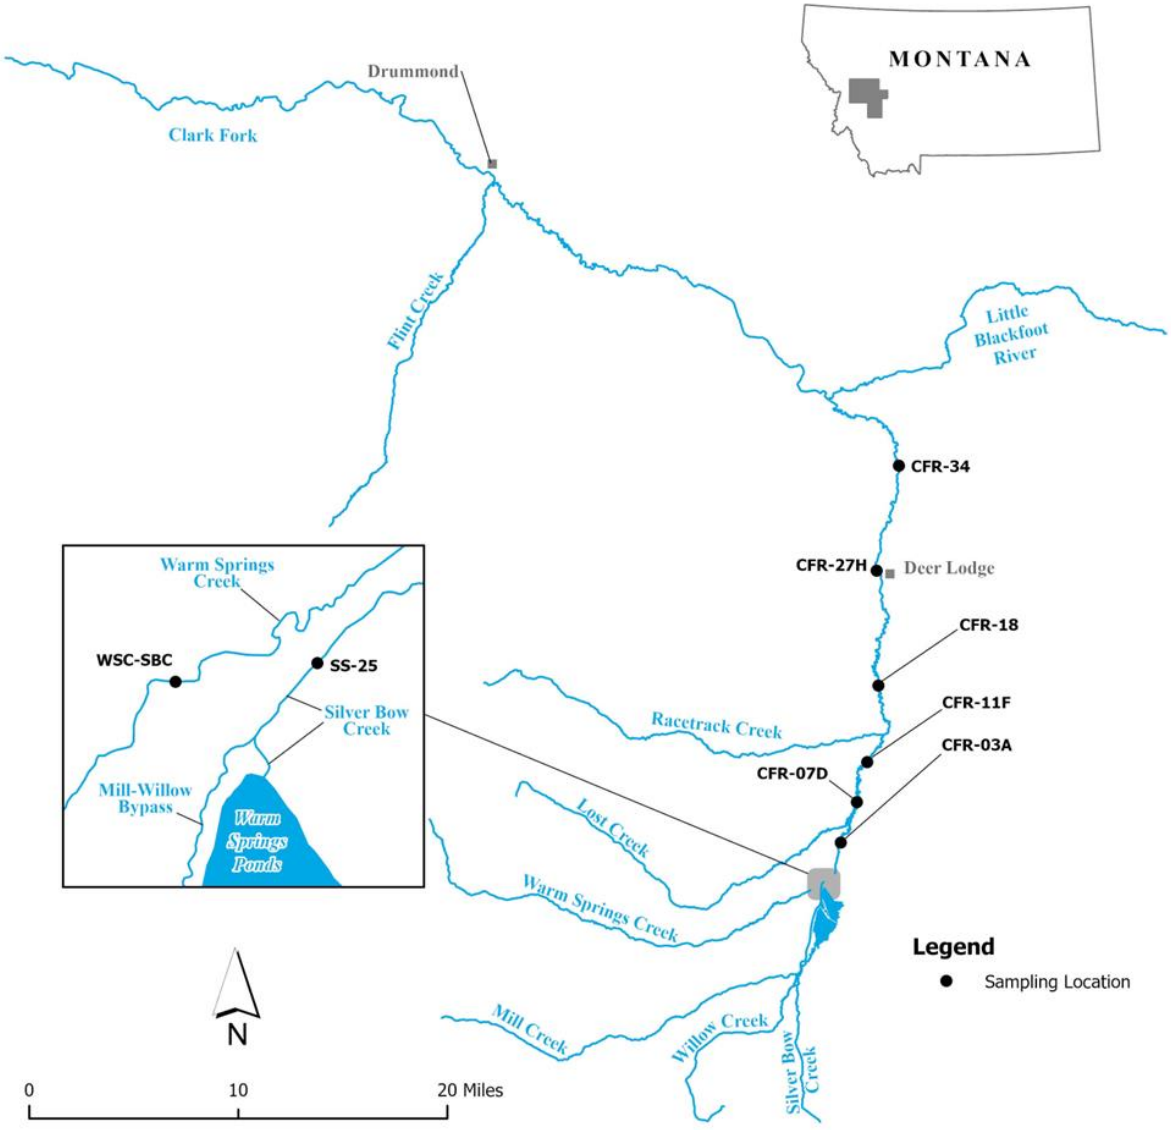

Figure 1-1. Surface water sampling locations in the Clark Fork River Operable Unit.

Table 1-2. Surface water sampling locations in the Clark Fork River Operable Unit. Streamflows were measured at all sites which did not a have co-located U.S. Geological Survey (USGS) streamflow gage.

Site ID	Site Location	Co-located USGS Streamflow Gage	Location (GPS coordinates, NAD 83)	
			Latitude	Longitude
Mainstem Sites				
CFR-03A	Clark Fork River near Galen	12323800	46.20877	-112.76740
CFR-07D	Clark Fork River at Galen Road	none	46.23725	-112.75302
CFR-11F	Clark Fork River at Gemback Road	none	46.26520	-112.74430
CFR-27H	Clark Fork River at Deer Lodge	12324200	46.39796	-112.74283
CFR-18	Clark Fork River at Perkins Lane	none	46.31737	-112.73609
CFR-34	Clark Fork River at Williams-Tavenner Bridge	none	46.47119	-112.72492
Tributary sites				
SS-25	Silver Bow Creek at Warm Springs	12323750	46.18123	-112.77917
WSC-SBC	Warm Springs Creek near mouth	12323770	46.18041	-112.78592

1.2.2 MONITORING SCHEDULE

At least one monitoring event was scheduled for each calendar quarter of 2024. Each quarterly monitoring event occurred near the end of each corresponding quarter. Monitoring events occurred on March 19, 2024 (Q1), May 29, 2024 (Q2), September 12, 2024 (Q3), and November 25, 2024 (Q4).

1.2.3 MONITORING PARAMETERS

Surface water samples were analyzed for the parameters and analytes listed in Table 1-3. Parameters and analytes were the same at all sites.

Four monitoring stations in the DEQ Clark Fork River monitoring network were co-located with active U.S. Geological Survey (USGS) streamflow gaging stations (Table 1-2). For sample sites with co-located gage stations, USGS streamflow records were accessed and streamflows were obtained from those gages for inclusion in this report. Streamflows at monitoring stations without co-located USGS gages were measured manually.

Table 1-3. Sampling parameters and analytes for surface water monitoring of the Clark Fork River Operable Unit.

Parameter	Analytes
Metal concentrations (total recoverable and dissolved)	Arsenic, cadmium, copper, lead, and zinc
Nutrient concentrations	Nitrogen (total nitrogen, nitrate plus nitrite, ammonia[5]), and phosphorus (total)
Common ion concentrations (total)	Sulfate, chloride, alkalinity, bicarbonate, magnesium, potassium, sodium
Field parameters	Total suspended sediment concentration, hardness, water temperature, pH, specific conductivity, dissolved oxygen (DO) concentrations, turbidity

[5] Ammonia concentrations were only measured in the Silver Bow Creek site.

1.2.4 SAMPLE COLLECTION AND ANALYSIS

Sample collection, analysis, and quality assurance procedures were described in the quality assurance project plan (QAPP) [RESPEC, 2024b]. Methods generally followed standard operating procedures (SOPs) developed for the Clark Fork River [AR, 1992]. Field sampling procedures were in accordance with DEQ [2019a] and followed "clean hands/dirty hands" procedures to minimize sample contamination as described in USGS [2006][6]. Composited surface water samples were collected using width-depth integration according to methods described in USGS [2006]. When streamflows were high, and samples could not be safely collected by wading, samples were collected with a crane mounted D-95 sampler operated from road bridges.

Field parameters (water temperature, pH, dissolved oxygen concentration, and conductivity) were measured during each monitoring event with a field multimeter (YSI Professional Plus or YSI 556). Turbidity was measured with a field turbidity meter (Hach Model 2100P Portable Turbidimeter). Streamflows were measured using either a portable electromagnetic streamflow meter (Marsh-McBirney Flo-Mate 2000) or an acoustic doppler current profiler (Teledyne StreamPro). Calibration methods for field meters, data recording and handling methods, and quality assurance and quality control procedures are described in the quality assurance project plan (QAPP) [RESPEC, 2024b].

Samples were analyzed by Energy Laboratories (Helena, Montana). Requested laboratory analysis procedures for each analyte are presented in Table 2-4.

Table 1-4. Analytes, methods, and reporting limits for surface water samples in the Clark Fork River Operable Unit. All samples were analyzed by Energy Laboratories in Helena, Montana.

Analyte	Requested Method	Requested Reporting Limit (mg/L)[7]	Holding Time (days)	Bottle	Preservative
Physical Properties and Inorganics					
Solids, Total Suspended (at 105C)	A 2540 D	1	7	1 L HDPE	4 ± 2 C
Alkalinity, Total (as CaCO3)	A 2320 B	4	14	500 mL HDPE	
Alkalinity, Bicarbonate (as HCO3)					
Chloride	EPA 300.0	1	28		
Sulfate					
Hardness (as CaCO3)	A 2340 B		180		
Nutrients					
Nitrogen, Ammonia (as N)	EPA 350.1	0.05	28	250 mL HDPE	4 ± 2 C
Nitrogen, Nitrate-Nitrite (as N)	EPA 353.2	0.02			H2SO4 to pH<2, 4 ± 2 C

[6] We deviated from the USGS [2006] protocols to minimize sample contamination (Section 4.0.2) in two regards. First, we did not collect samples sequentially in the order of least to greatest potential for contamination. Second, samples were processed outside the sampling vehicles, rather than within an enclosed space.

[7] Requested reporting limits are either the required reporting limit of DEQ [2019b], or the lowest reporting limit previously provided by the analytical laboratory, whichever is lower.

Analyte	Requested Method	Requested Reporting Limit (mg/L)[7]	Holding Time (days)	Bottle	Preservative
Nitrogen, Total	A 4500 N-C	0.05	30		4 ± 2 C
Phosphorus, Total	EPA 365.1	0.003	28		H2SO4 to pH<2, 4 ± 2 C
Dissolved Metals (0.45 µm filtered)

1.2.5 DATA ANALYSIS

Data analysis approaches included evaluation of remedial performance goal exceedances (for COCs) or relevant regulatory standards (for non-COC constituents) and evaluation of spatial and temporal trends.

Exceedances were assessed by comparing constituent concentrations to the relevant performance goal or regulatory standard. For some COCs and for ammonia concentrations, the relevant goal or standard is based on site- and time-specific conditions (e.g., hardness-based standards; DEQ [2019b]) which were measured concomitantly with each sample collected. Some performance goals and regulatory standards assume that the measured constituent concentration will be consistent over a specific period. For example, the chronic aquatic life standard is typically based on 96-hour mean concentrations [DEQ, 2019b]. However, in this monitoring program analyte concentrations were measured at a specific point in time and mean concentrations over time are unknown. Therefore, assessments of performance goal or regulatory standard exceedances assume that the measured concentration was representative of the required period as it relates to each specific goal or standard.

To informally identify temporal trends, COC and total nitrogen and phosphorus concentrations through the periods of record at each monitoring site are displayed in scatterplots and LOESS (locally estimated scatterplot smooth) curves are fitted to the data.

Some samples had constituent concentrations which were below the method detection limits and therefore the precise concentration was unknown. These results are known as "censored data". To represent those censored data in graphical representations (i.e., scatterplots), values were substituted at half the method detection limit for each result below the detection limit concentration.

1.2.6 QUALITY CONTROL, QUALITY ASSURANCE, AND DATA VALIDATION

Data quality objectives (DQOs) were established in the CFROU monitoring project quality assurance project plan (QAPP) for data "representativeness", "comparability", "completeness", "sensitivity", "precision", "bias", and "accuracy" [RESPEC, 2024b]. Assessment of each DQO for surface water data collected in 2024 is provided in Appendix A.

1.3 RESULTS

1.3.1 STREAMFLOW

Streamflows, measured at each site at the time each sample was collected, are presented in Table 1-5.

Several sample sites were co-located with USGS streamflow gages, including Silver Bow Creek at Warm Springs (USGS 12323750), Warm Springs Creek at Warm Springs (USGS 12323770), Clark Fork River near Galen (USGS 12323800), and Clark Fork River at Deer Lodge (USGS 12324200), Hydrographs for 2024 for each of those sites are presented in Figure 1-2 through Figure 1-5.

Based on the annual hydrographs, streamflows in 2024 were generally well below average particularly during the spring, summer, and fall. Streamflows were particularly low in Silver Bow Creek and in the Clark Fork River mainstem. Warm Springs Creek had flows which were closer to the long-term median, although still generally below the median in the spring and summer.

Table 1-5. Streamflow (ft^3/s) at Clark Fork River Operable Unit monitoring stations, 2024.[8]u

1.3.2 FIELD PARAMETERS

The following tables present measured field parameters at each CFROU site at the time samples were collected in 2024. Measured field parameters included: water temperature (Table 1-6), pH (Table 1-7), conductivity (Table 1-8), dissolved oxygen concentration (Table 1-9), and turbidity (Table 1-10).

Table 1-6. Water temperature (ºC) at Clark Fork River Operable Unit monitoring stations, 2024.

1.3.5 NUTRIENTS

1.3.5.1 TOTAL NITROGEN

Total nitrogen concentration ranged from 0.17-0.49 mg/L in the Clark Fork River, from 0.23-0.65 mg/L in Silver Bow Creek, and from 0.08-0.13 mg/L in Warm Springs Creek (Table 1-17). The Clark Fork River sites at Deer Lodge (Site CFR-27H) and at Williams-Tavenner Bridge (Site CFR-34) and Silver Bow Creek (Site SS-25) exceeded the Clark Fork River total nitrogen standard (ARM 17.30.631) in Q3 2024 (Table 1-17). Those sites also exceeded the Clark Fork River total nitrogen standard concentration in other quarters but the standard was only technically applicable during the Q3 monitoring period.

Concentrations measured in 2024 were generally at the lower end of the range of prior sample concentrations at each site, with the exception of the Q3 2024 sample from Silver Bow Creek, which was the highest total nitrogen concentration observed at the site since 2018 (Figure 1-6).

Table 1-17. Total nitrogen concentrations (mg/L) at Clark Fork River Operable Unit monitoring stations, 2024.

Site ID	Site Location	Sample Period

WSC-SBC	Warm Springs Creek near mouth	0.09	0.10	0.08	0.13
	Exceeds Clark Fork River total nitrogen standard (0.30 mg/L; applies to mainstem sites from June 21 to September 21; ARM 17.30.631). Numeric exceedances of the standard are highlighted even during periods when the standard would not technically apply.				

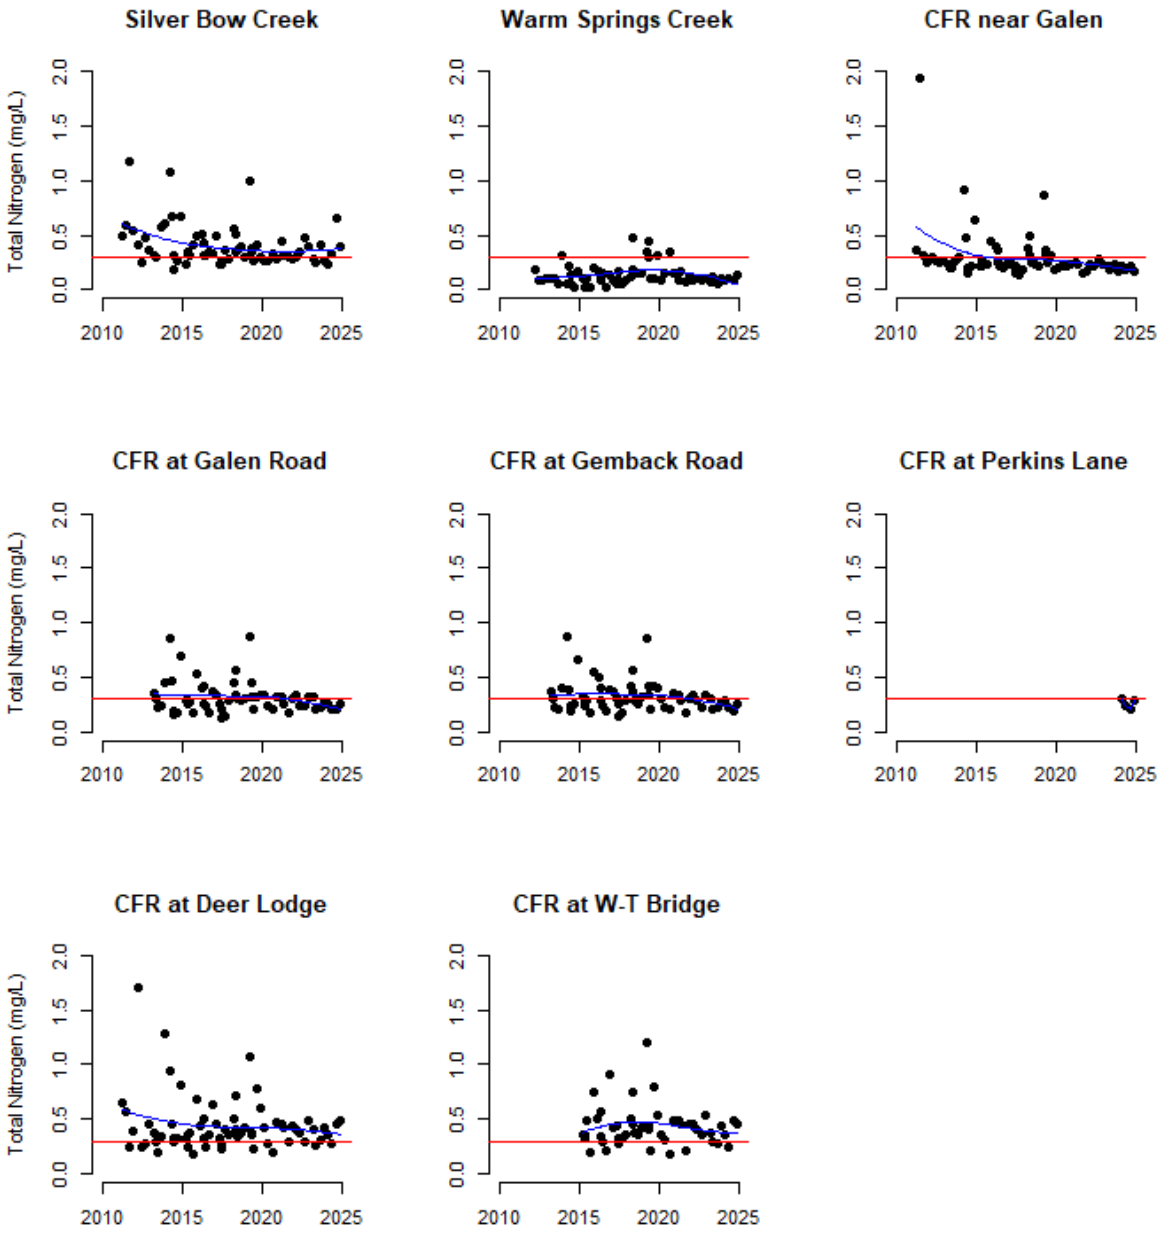

Figure 1-6. Total nitrogen concentration (mg/L) at sampling sites in the Clark Fork River Operable Unit, 2010-2024. Red line represents Clark Fork River total nitrogen standard (ARM 17.30.631). Blue lines represent locally estimated scatterplot smooth.

1.3.5.2 NITRATE PLUS NITRITE NITROGEN

Nitrate plus nitrite nitrogen concentrations in the CFROU in 2024 are presented in Table 1-18.

Table 1-18. Nitrate plus nitrite nitrogen concentrations (mg/L) at Clark Fork River Operable Unit monitoring stations, 2024.

J	Estimated because: (1) result is between method detection limit and analytical reporting limit, or (2) relative percent difference of associated field sample and duplicate pair was above project-specific data quality objective (25 percent).				

1.3.5.3 TOTAL AMMONIA

Ammonia concentrations were measured in Silver Bow Creek at Site SS-25. Concentrations were below the analytical reporting limit in all quarters except Q3. In Q3 ammonia concentration was 0.08 mg/L.

1.3.5.4 TOTAL PHOSPHORUS

Total phosphorus concentration ranged from 0.008-0.049 mg/L in the Clark Fork River, from 0.013-0.082 mg/L in Silver Bow Creek, and from 0.003-0.020 mg/L in Warm Springs Creek (Table 1-19). Exceedances of the total phosphorus standard (ARM 17.30.631) occurred in Q3 2024 in the Clark Fork River mainstem at Site CFR-34 and in Silver Bow Creek (Site SS-25). Concentrations also exceeded the Clark Fork River total phosphorus standard concentration in other quarters at multiple sites but the standard was only technically applicable during the Q3 monitoring period.

Concentrations measured in 2024 were generally at the lower end of the range of prior sample concentrations at each site (Figure 1-7).

Table 1-19. Total phosphorus concentrations (mg/L) at Clark Fork River Operable Unit monitoring stations, 2024.

J	Estimated because: (1) result is between method detection limit and analytical reporting limit, or (2) relative percent difference of associated field sample and duplicate pair was above project-specific data quality objective (25 percent).				
	Exceeds Clark Fork River total phosphorus standard (0.020 mg/L; applies to mainstem sites from June 21 to September 21; ARM 17.30.631). Numeric exceedances of the standard are highlighted even during periods when the standard would not technically apply.				

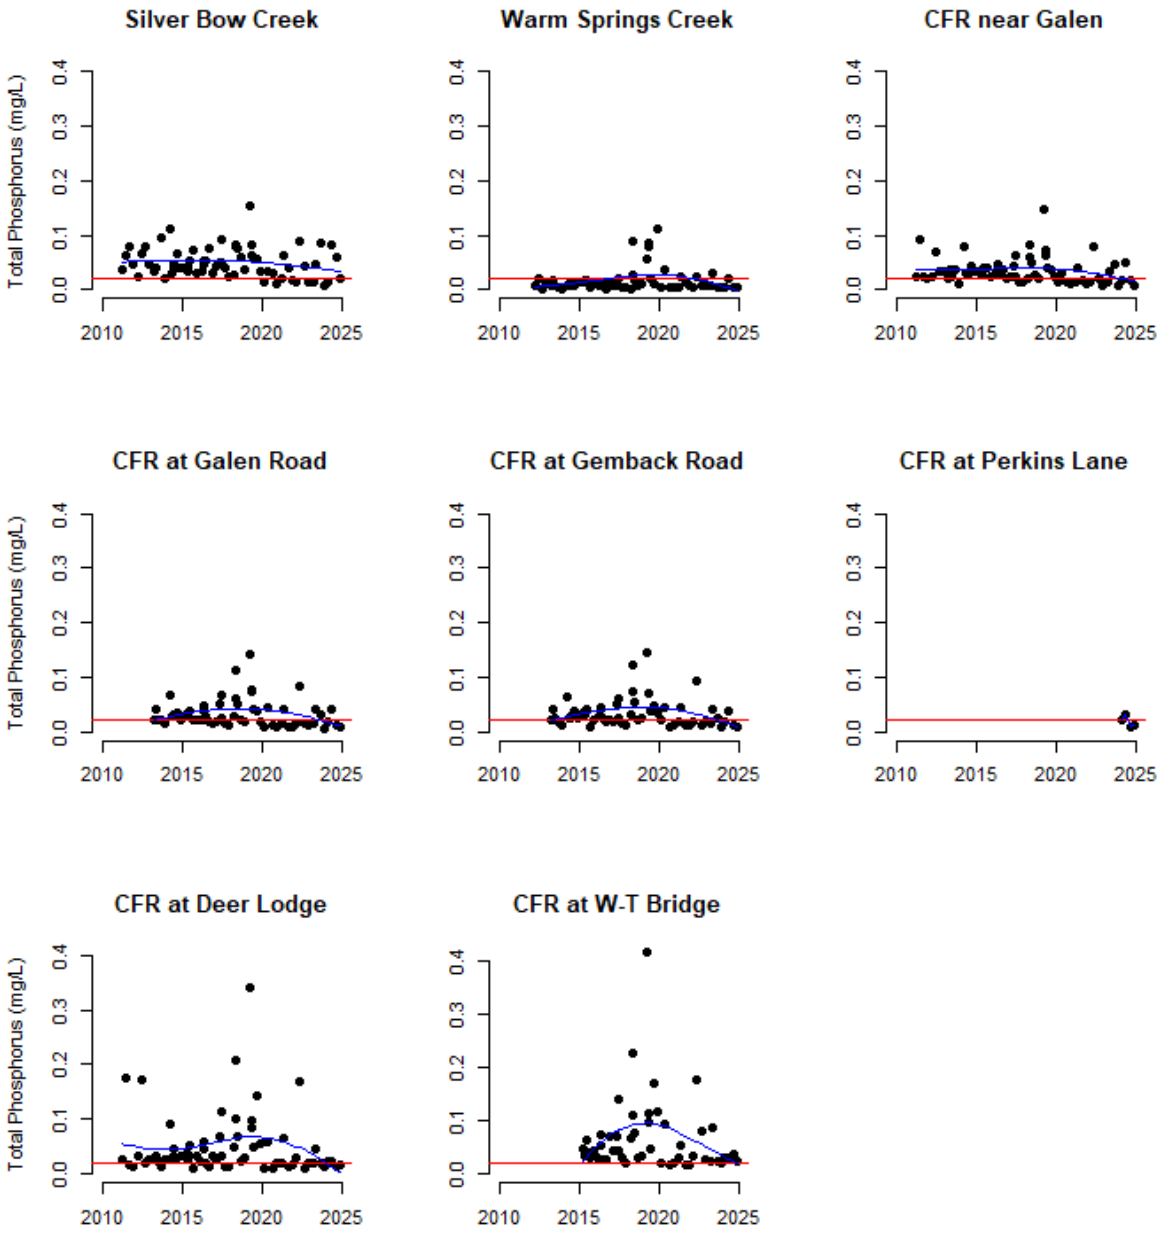

Figure 1-7. Total phosphorus concentration (mg/L) at sampling sites in the Clark Fork River Operable Unit, 2010-2024. Red lines represent the Clark Fork River total phosphorus standard (applies to mainstem sites from June 21 to September 21; ARM 17.30.631). Blue lines represent locally estimated scatterplot smooth.

1.3.6 CONTAMINANTS OF CONCERN

1.3.6.1 ARSENIC

1.3.6.1.1 Dissolved

Dissolved arsenic concentration ranged from 0.005-0.012 mg/L in the Clark Fork River, from 0.008-0.017 mg/L in Silver Bow Creek, and from 0.003-0.003 mg/L in Warm Springs Creek (Table 1-20). Exceedances of the dissolved arsenic performance goal occurred in Q2 at Clark Fork River mainstem Sites CFR-11F, CFR-18, CFR-27H and CFR-34 and in Silver Bow Creek (Site SS-25) in Q2 and Q3.

Dissolved arsenic concentrations measured in 2024 were generally at the lower end of the range of prior sample concentrations at each site (Figure 1-7). Concentrations appear to be trending downward in Silver Bow Creek and at all Clark Fork River mainstem sites since 2017.

Table 1-20. Dissolved arsenic concentrations (mg/L) at Clark Fork River Operable Unit monitoring stations, 2024.

	Exceeds specified arsenic surface water performance goal for dissolved concentration (0.010 mg/L) [EPA, 2004].				

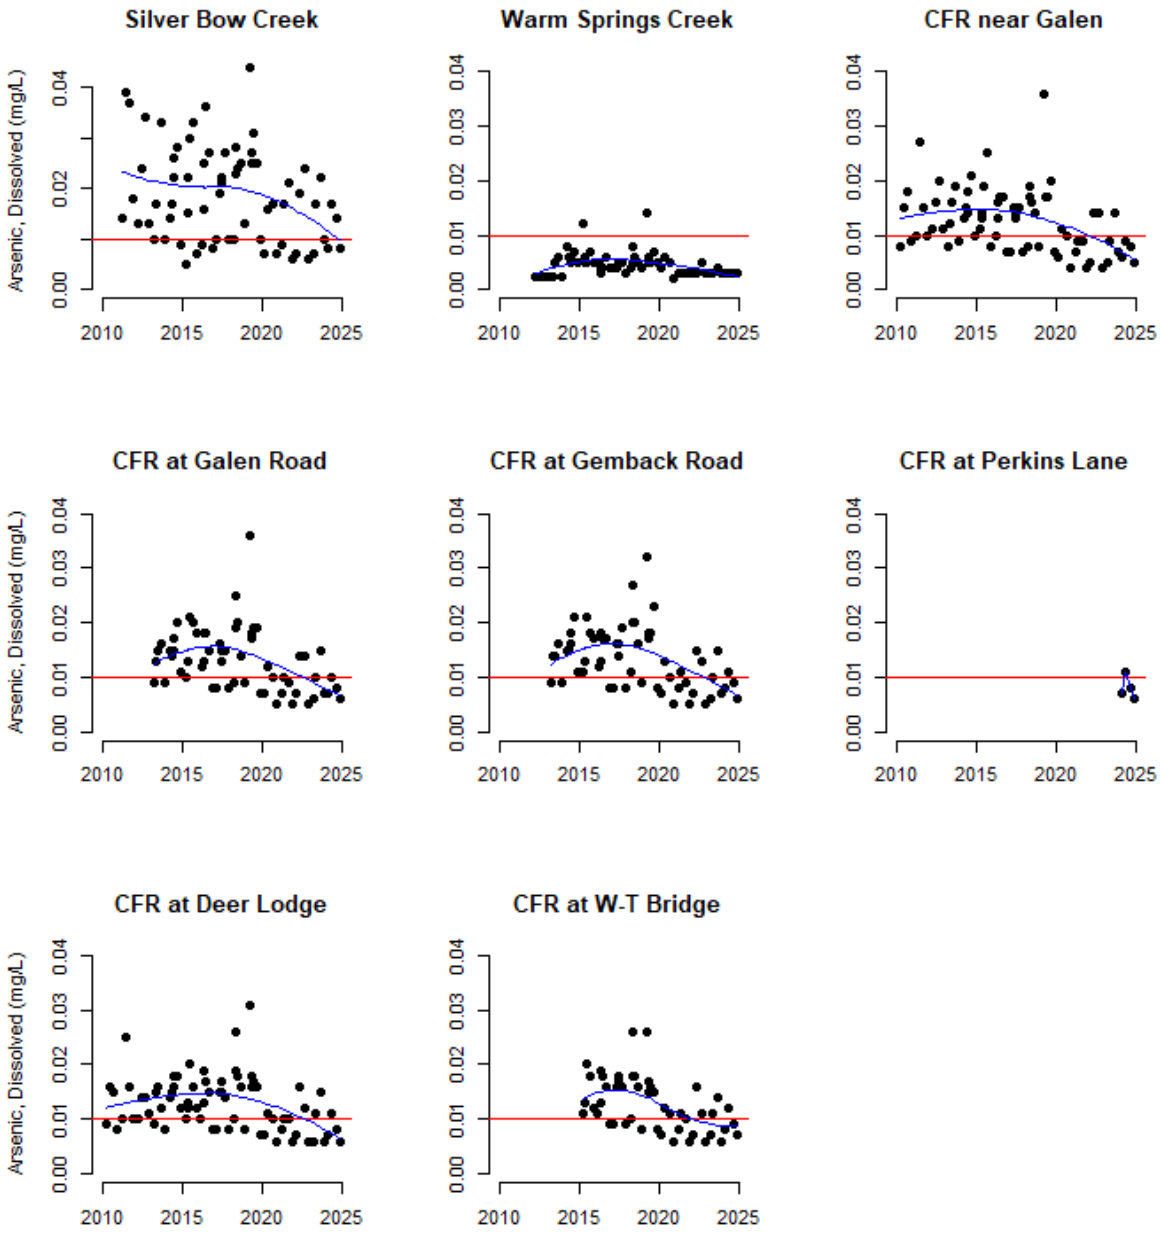

Figure 1-8. Dissolved arsenic concentration sampling sites in the Clark Fork River Operable Unit, 2010-2024. Red lines represent the arsenic performance goal for dissolved concentration [EPA, 2004]. Blue lines represent locally estimated scatterplot smooth.

1.3.6.1.2 Total Recoverable

Total recoverable arsenic concentration ranged from 0.006-0.013 mg/L in the Clark Fork River, from 0.009-0.019 mg/L in Silver Bow Creek, and from 0.003-0.005 mg/L in Warm Springs Creek (Table 1-21). Exceedances of the total recoverable arsenic performance goal occurred in Q2 in Silver Bow Creek (Site SS-25).

Total recoverable arsenic concentrations measured in 2024 were generally at the lower end of the range of prior sample concentrations at each site (Figure 1-7). Concentrations appear to be trending downward in Silver Bow Creek and at all Clark Fork River mainstem sites since 2017.

Table 1-21. Total recoverable arsenic concentrations (mg/L) at Clark Fork River Operable Unit monitoring stations, 2024.

[9] Two samples collected on April 8, 2019, are not depicted: 0.081 mg/L at Site CFR-27H ("CFR at Deer Lodge") and 0.092 mg/L at Site CFR-27H ("CFR at W-T Bridge").

1.3.6.2 CADMIUM

Total recoverable cadmium concentration ranged from 0.00002-0.00014 mg/L in the Clark Fork River, from 0.00002-0.00012 mg/L in Silver Bow Creek, and from <0.00002-0.00005 mg/L in Warm Springs Creek in 2024 (Table 1-22). There were no exceedances of the chronic aquatic life standard at any sites in 2024.

Concentrations measured in 2024 were generally at the lower end of the range of prior sample concentrations at each site (Figure 1-7). Concentrations appear to be trending downward at some Clark Fork River mainstem sites since 2017.

1.3.6.3 COPPER

Dissolved copper concentration ranged from 0.001-0.007 mg/L in the Clark Fork River, from 0.0008-0.003 mg/L in Silver Bow Creek, and from 0.0009-0.002 mg/L in Warm Springs Creek in 2024 (Table 1-23). There were no exceedances of the chronic aquatic life standard [EPA, 1986] based on dissolved copper concentrations in 2024.

Concentrations measured in 2024 were generally at the lower end of the range of prior sample concentrations at each site (Figure 1-7).

1.3.6.5 ZINC

Total recoverable zinc concentration ranged from 0.003-0.030 mg/L in the Clark Fork River, from 0.004-0.016 mg/L in Silver Bow Creek, and from 0.002-0.010 mg/L in Warm Springs Creek in 2024 (Table 1-24). There were no exceedances of the chronic aquatic life standard at any sites in 2024.

Concentrations measured in 2024 were generally at the lower end of the range of prior sample concentrations at each site (Figure 1-7).

1.4 DISCUSSION

1.4.1 STREAMFLOWS

The snowpack in 2024 was poor in the upper Clark Fork basin which resulted in streamflows which were well below the long-term median in the spring and throughout the remainder of the year. Low streamflows corresponded to low overall metal concentrations in the CFROU in 2024.

1.4.2 FIELD PARAMETERS

1.4.2.1 PH

DEQ's beneficial use stream classifications for the upper Clark Fork River watershed vary by stream section. The designation for the Clark Fork River from the Warm Springs Creek confluence to the Cottonwood Creek confluence in Deer Lodge "C-2" and the river designation from the Cottonwood Creek confluence to the Little Blackfoot River confluence at Garrison is "C-1" (ARM 17.30.607). Each of those reaches has specific pH range standards: 6.5-8.5 for river reaches with C-1 designations and 6.5-9.0 for C-2 designations. There were no violations of these pH range standards at any sites in 2024.

1.4.2.2 DISSOLVED OXYGEN

Dissolved oxygen concentrations measured at all Clark Fork River sites and during all sample periods of 2024 were above the dissolved oxygen 1-day minimum standard (8.0 mg/L; DEQ [2019b]) for river reaches classified as C-1 or C-2 where early life stages of fish are present.

1.4.2.3 TURBIDITY

DEQ has established maximum allowable increases above naturally occurring turbidity for specific river reaches in the Clark Fork River based on beneficial use designations. The allowable increase is 10 nephelometric turbidity units (NTU) in C-2 classified reaches and five units for C-1 classified reaches. The difference in turbidity between all adjacent sites were within these limits in 2024.

1.4.3 NUTRIENTS

Numeric water quality standards have been adopted for nutrients in the Clark Fork River from the Warm Springs Creek confluence to the Blackfoot River confluence (ARM 17.30.631). All of the CFROU mainstem sites sampled in 2024 fall within this regulated nutrients zone. Nutrient standards for this segment of the Clark Fork River are 0.300 mg/L for total nitrogen and 0.020 mg/L for total phosphorus, but these standards apply only to the summer season (June 21 through September 21). In Q3 2024, two mainstem sites (Sites CFR-27H and CFR-34) had a total nitrogen concentration above the standard and one mainstem site (Site CFR-34) had total phosphorus concentrations above the standard.

1.4.4 CONTAMINANTS OF CONCERN

Exceedances of COC performance goals occurred for arsenic in 17 percent of the 24 mainstem samples but not for any other COCs. In Silver Bow Creek, arsenic exceeded the COC goal in 50 percent of the four samples. In Warm Springs Creek, there were no COC goal exceedances.

Long-term trends at CFROU sites suggest the remedial actions may be contributing to declines in COC concentrations. All COC concentrations have declined rapidly since approximately 2017 at the mainstem site located furthest downstream (Site CFR-34). At Deer Lodge (Site CFR-27H), arsenic,

cadmium, and copper concentrations have declined rapidly since 2017 and lead appears to also be declining, but at a more modest rate. Cadmium and copper appear to be declining at a modest rate since 2017 at all mainstem sites. Arsenic has declined rapidly at all mainstem sites since around 2017.

2.0 SEDIMENT

2.1 INTRODUCTION

The selected remedy for the CFROU does not include excavation of streambed sediments, however, remedial actions to remove floodplain tailings deposits and reduce streambank erosion within the CFROU are expected to result in reduced COC concentrations for instream sediments within the Clark Fork River. Therefore, instream sediment COC concentrations will be monitored in the CFROU prior to, during, and following remediation. This report reviews temporal trends for instream sediment metals concentrations in the CFROU during 2024 and prior monitoring years.

No specific remediation performance standards were established within the CFROU ROD for concentrations of COC metals in instream sediments [EPA, 2004]. In lieu of performance standards, the "threshold effect concentration" (TEC) and "probable effect concentration" (PEC) provide useful reference values for instream sediment quality (Table 2-1). These reference values are consensus-based sediment quality guidelines for benthic organisms from MacDonald et al. [2000]. At metal COC concentrations above the TEC, benthic organisms may be affected by that COC. At metal COC concentrations above the PEC, benthic organisms are likely to be affected by that COC.

Table 2-1. Reference values for contaminant of concern (COC) concentrations (expressed as dry weight concentrations [DW]) in instream sediments within the Clark Fork River Operable Unit. The threshold effect concentration (TEC) and probable effect concentration (PEC) were described in MacDonald et al. [2000].

Contaminant of Concern	Threshold Effect Concentration (mg/kg-DW)	Probable Effect Concentration (mg/kg-DW)
Arsenic	9.79	33.0
Cadmium	0.99	4.98
Copper	31.6	149
Lead	35.8	128
Zinc	121	459

2.2 METHODS

2.2.1 MONITORING LOCATIONS

Instream sediment was monitored at each surface water monitoring site (Figure 1-1; Table 1-1).

2.2.2 MONITORING SCHEDULE

Sediment samples were collected at the same time surface water samples were collected at each site. Monitoring events occurred on March 19, 2024 (Q1), May 29, 2024 (Q2), September 12, 2024 (Q3), and November 25, 2024 (Q4).

2.2.3 MONITORING PARAMETERS

Sediment samples were analyzed for dry weight (DW) total metal (arsenic, cadmium, copper, lead, and zinc) concentrations. Each sample was sieved in the laboratory and only the <0.063 mm size fraction was retained for analysis.

2.2.4 SAMPLE COLLECTION AND LABORATORY ANALYSIS

Sediment samples were collected by compositing subsamples from at least five depositional zones in wadeable locations at each monitoring site. Shallow (less than 5 cm below bed surface) bed sediment was collected manually with a high-density polyethylene spoon following the DEQ standard operating procedure [DEQ, 2019a]. The fine fraction (particle diameter <0.063 mm) portion of each sample was isolated from each by wet sieve in the laboratory shortly after collection and retained for analysis. Each sample was analyzed for total extractable dry weight concentrations (mg/kg-DW) of arsenic, cadmium, copper, lead, and zinc following methods identified in Table 2-2. The relative proportion (by weight) of the fine fraction sediment in each sample was also determined. Sediment samples were analyzed by Energy Laboratories (Helena, Montana).

Table 2-2. Analytes, methods, and reporting limits for instream sediment sampling in the Clark Fork River Operable Unit.

Analyte	Requested Method	Requested Reporting Limit (mg/kg-DW)	Holding Time (days)	Bottle	Preservative
Total Metals Digestion	EPA 3050	-	-	-	-
Arsenic	SW 6010B	5	180	1000 mL clear glass wide mouth jars	4 ± 2 C during shipment; -15 C in laboratory
Cadmium	SW 6010B	0.2			
Copper	SW 6010B	5			
Lead	SW 6010B	5			
Zinc	SW 6010B	5			

2.2.5 DATA ANALYSIS

Sample concentrations for each COC were compared to the TEC and PEC reference values for each COC to evaluate rates of exceedances. Temporal trends were evaluated informally through visual inspection of scatterplots for each COC, at each site, over the duration of monitoring in the CFROU.

Additionally, locally estimated scatterplot smooth (LOESS) curves were fitted to the data for each scatterplot.

2.2.6 QUALITY CONTROL, QUALITY ASSURANCE, AND DATA VALIDATION

Data quality objectives (DQOs) were established in the CFROU monitoring project quality assurance project plan (QAPP) for data "representativeness", "comparability", "completeness", "sensitivity", "precision", "bias", and "accuracy" [RESPEC, 2024b]. Assessment of each DQO for sediment data collected in 2024 is provided in Appendix A.

2.3 RESULTS

2.3.1 CONTAMINANTS OF CONCERN

2.3.1.1 ARSENIC

Arsenic concentrations ranged from 92-242 mg/kg in the Clark Fork River sediment samples, from 144-168 mg/kg in Silver Bow Creek samples, and from 66-69 mg/kg in Warm Springs Creek samples in 2024 (Table 2-3). Exceedances of the probable effect concentration occurred in all 2024 samples.

Concentrations measured in 2024 were generally similar to, or lower than, past results at most sites (Figure 2-1). There does not yet appear to be evidence of temporal trends at any of these sites.

Table 2-3. Total arsenic concentrations (mg/kg dry weight) in fine fraction (<0.063 mm) instream sediment samples from the Clark Fork River Operable Unit, 2024.

	Exceeds threshold effect concentration (9.79 mg/kg; MacDonald et al. [2000]).		
	Exceeds probable effect concentration (33.0 mg/kg; MacDonald et al. [2000]).		

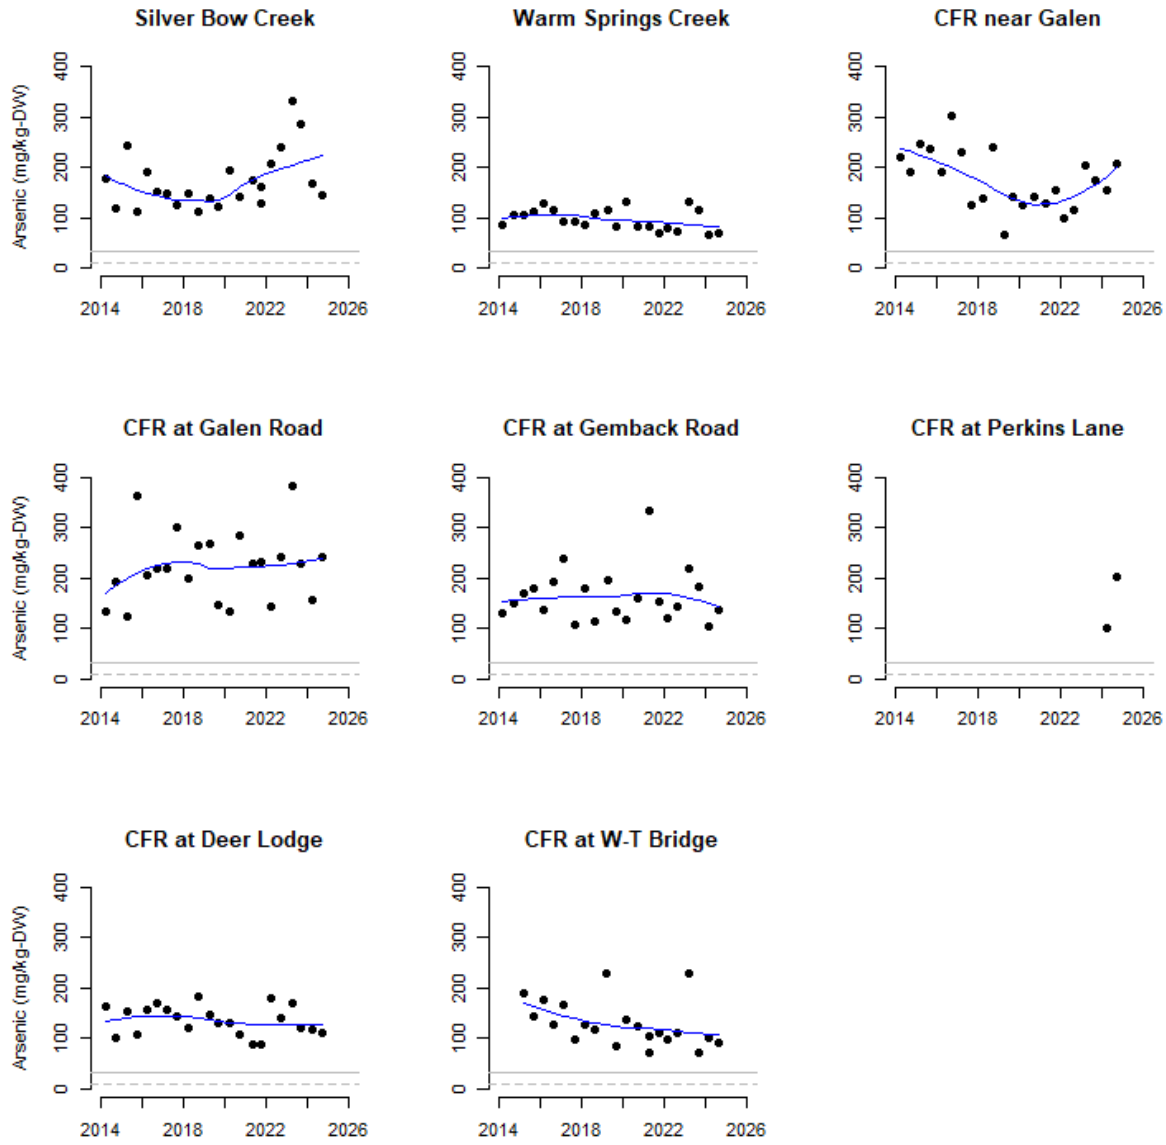

Figure 2-1. Total arsenic concentrations (dry weight) at each site in the Clark Fork River Operable Unit, 2014-2024. Gray lines represent the "threshold effect concentration" (TEC; dashed line; 9.79 mg/kg) and the "probable effect concentration" (PEC; solid line; 33.0 mg/kg) [MacDonald et al., 2000]. Blue lines are the locally estimated scatterplot smooth (LOESS) curves fitted to the data for each plot.

2.3.1.2 CADMIUM

Cadmium concentrations ranged from 4.4-12.5 mg/kg in the Clark Fork River sediment samples, from 8.9-10.2 mg/kg in Silver Bow Creek samples, and from 2.1-3.3 mg/kg in Warm Springs Creek samples in 2024 (Table 2-4).

All samples exceeded the threshold effect concentration in 2024. Exceedances of the probable effect concentration occurred at mainstem Site CFR-07D in Q2, at all mainstem sites in Q3, and in Silver Bow Creek during both sample periods of 2024.

Concentrations measured in 2024 were generally similar to, or lower than, past results at most sites (Figure 2-2). There does not yet appear to be evidence of temporal trends at any of these sites.

Table 2-4. Total cadmium concentrations (mg/kg dry weight) in fine fraction (<0.063 mm) instream sediment samples from the Clark Fork River Operable Unit, 2024.

[10] One sample with a concentration of 106 mg/kg-DW, collected near Galen on September 10, 2019, is not depicted. This sample is not fitted in the LOESS curve for the site.

2.3.1.3 COPPER

Copper concentrations ranged from 815-2,270 mg/kg in the Clark Fork River sediment samples, from 298-338 mg/kg in Silver Bow Creek samples, and from 661-864 mg/kg in Warm Springs Creek samples in 2024 (Table 2-5). Exceedances of the probable effect concentration occurred in all 2024 samples.

Concentrations measured in 2024 were generally similar to, or lower than, past results at most sites (Figure 2-3). There does not yet appear to be evidence of temporal trends at any of these sites.

	Exceeds probable effect concentration, 149 mg/kg [MacDonald et al., 2000].		

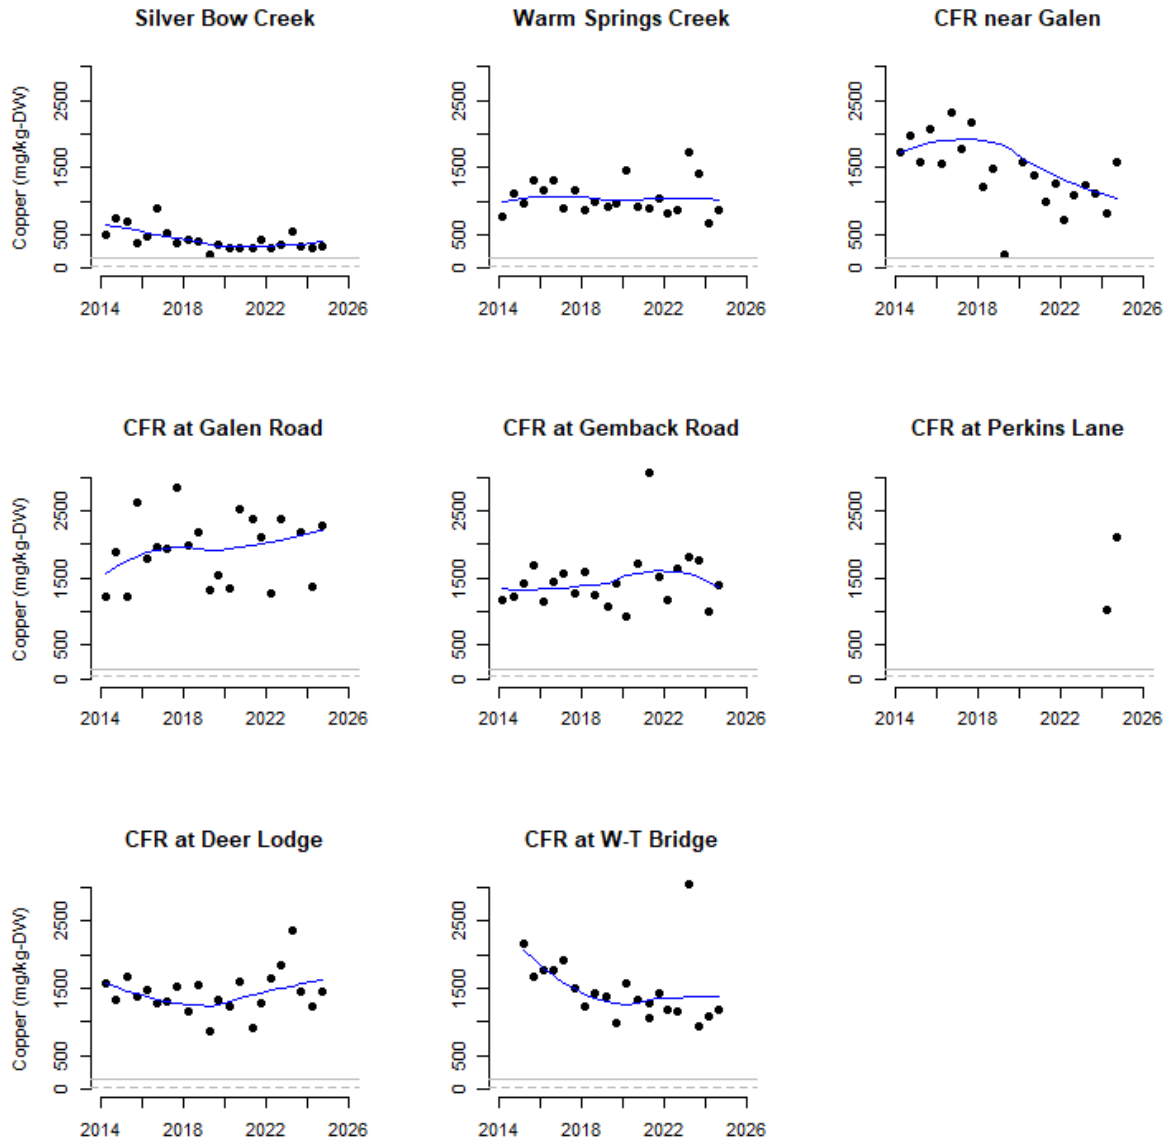

Figure 2-3. Total copper concentrations (dry weight) at each site in the Clark Fork River Operable Unit, 2014-2024. Gray lines represent the "threshold effect concentration" (TEC; dashed line) at 31.6 mg/kg and the "probable effect concentration" (PEC; solid line) at 149 mg/kg [MacDonald et al., 2000].[11] Blue lines are the locally estimated scatterplot smooth (LOESS) curves fitted to the data for each plot.

[11] One sample with a concentration of 4,880 mg/kg, collected near Galen on September 10, 2019, is not depicted.

2.3.1.4 LEAD

Lead concentrations ranged from 120-405 mg/kg in the Clark Fork River sediment samples, from 155-173 mg/kg in Silver Bow Creek samples, and from 82-102 mg/kg in Warm Springs Creek samples in 2024 (Table 2-6).

Concentrations measured in 2024 were generally similar to, or lower than, past results at most sites (Figure 2-4). There does not yet appear to be evidence of temporal trends at any of these sites.

Table 2-6. Total lead concentrations (mg/kg dry weight) in fine fraction (<0.063 mm) instream sediment samples from the Clark Fork River Operable Unit, 2024.

	Exceeds threshold effect concentration, 35.8 mg/kg [MacDonald et al., 2000].		
	Exceeds probable effect concentration, 128 mg/kg [MacDonald et al., 2000].		

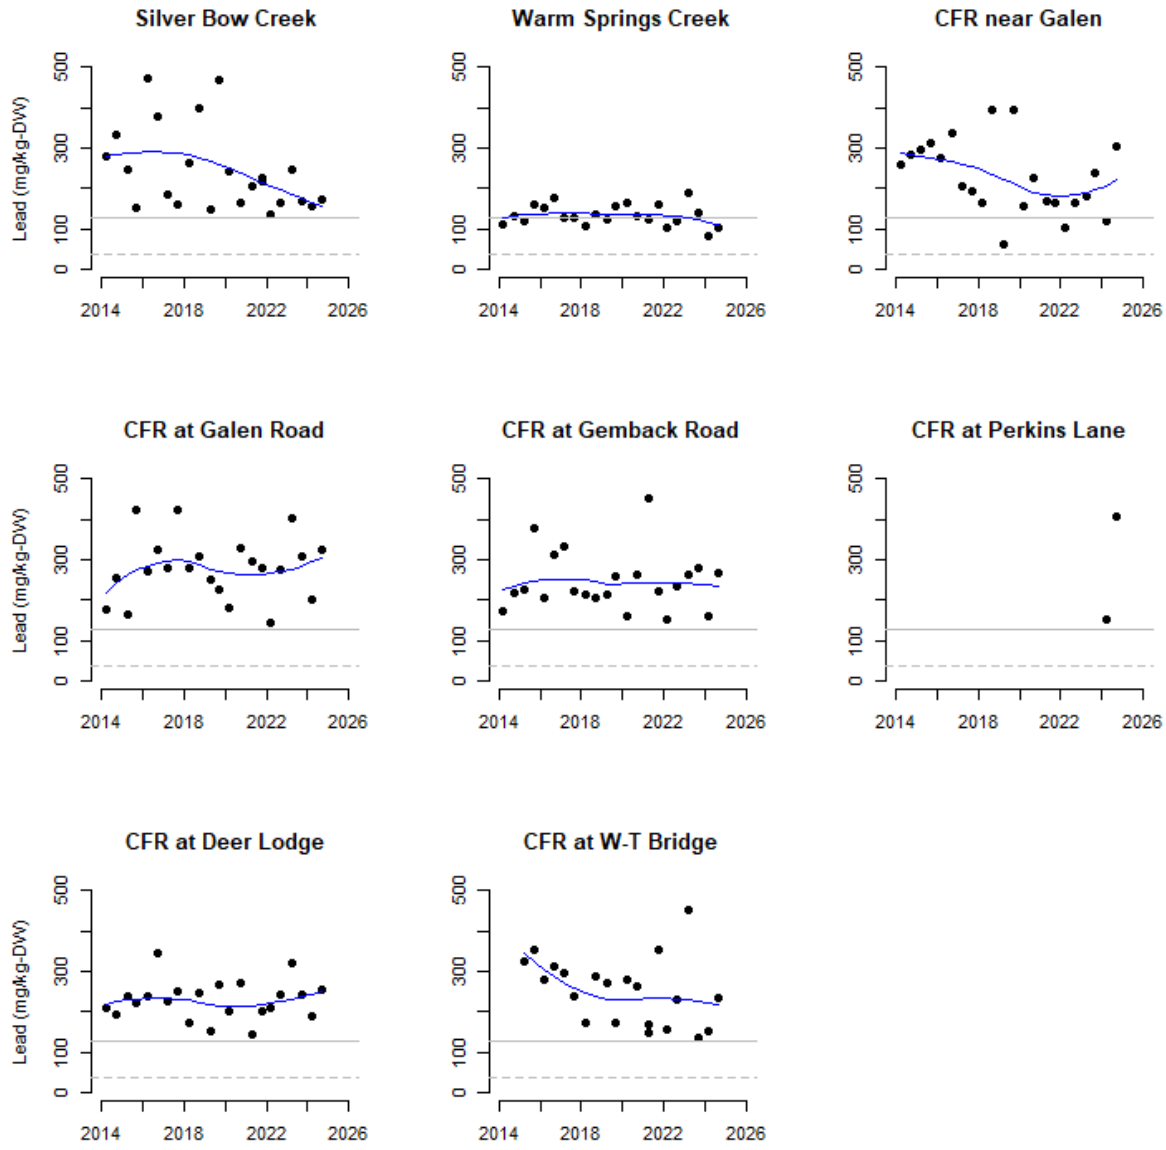

Figure 2-4. Total lead concentrations (dry weight) at each site in the Clark Fork River Operable Unit, 2014-2024. Gray lines represent the "threshold effect concentration" (TEC; dashed line) at 35.8 mg/kg and the "probable effect concentration" (PEC; solid line) at 128 mg/kg [MacDonald et al., 2000]. Blue lines are the locally estimated scatterplot smooth (LOESS) curves fitted to the data for each plot.

2.3.1.5 ZINC

Zinc concentrations ranged from 815-2,080 mg/kg in the Clark Fork River sediment samples, from 1,740-2,100 mg/kg in Silver Bow Creek samples, and from 356-464 mg/kg in Warm Springs Creek samples in 2024 (Table 3-9). All samples exceeded the threshold effect concentration and all samples except that from Warm Springs Creek in Q2 also exceeded the probable effect concentration in 2024.

Concentrations measured in 2024 were generally similar to, or lower than, past results at most sites (Figure 2-5). There does not yet appear to be evidence of temporal trends at any of these sites.

Table 2-7. Total zinc concentrations (mg/kg dry weight) in fine fraction (<0.063 mm) instream sediment samples from the Clark Fork River Operable Unit, 2024.

Gray lines represent the "threshold effect concentration" (TEC; dashed line) at 121 mg/kg and the "probable effect concentration" (PEC; solid line) at 459 mg/kg [MacDonald et al., 2000].[12] Blue lines are the locally estimated scatterplot smooth (LOESS) curves fitted to the data for each plot.

[12] One sample with a concentration of 16,400 mg/kg, collected near Galen on September 10, 2019, is not depicted. This sample was not fitted in the LOESS curve for the site.

2.4 DISCUSSION

Results of 2024 sampling were generally consistent with prior results although generally COC concentrations were relatively low compared to prior results at each site. As in prior monitoring periods, rates of probable effect concentration (PEC) exceedances were high for all COCs in the mainstem sites in 2024. In 2024, PEC exceedances occurred in all mainstem samples for arsenic, copper, and zinc; in 58 percent of the samples for cadmium; and in 92 percent of the samples for lead. Prior rates of exceedances in the mainstem (from 2014-2023) were also 100 percent for arsenic and copper; 82 percent for cadmium; 97 percent for lead; and 99 percent for zinc.

3.0 VEGETATION

3.1 INTRODUCTION

Major remediation and revegetation has been completed in Phases 1, 2, 3, 5, 6, 15, and 16 of the Clark Fork River Operable Unit (CFROU). Work was completed in Phase 1 in 2014; in Phases 2, 5, and 6 in 2016; in Phases 15 and 16 in 2021; and in Phase 3 in 2024. Monitoring has occurred in each of these phases to assess vegetation conditions as measured by specific metrics and to evaluate progress toward attainment of vegetation performance targets.

Monitoring in 2024 was conducted to satisfy Year-10 vegetation monitoring requirements for Phase 1, and Year-1 vegetation monitoring requirements for Phase 3. This report provides detailed methods and results for vegetation monitoring activities in those phases in 2024.

Year-10 monitoring in Phase1 also required a final wetland delineation to assess wetland area. This wetland delineation report is available in Appendix G.

3.2 METHODS

3.2.1 MONITORING LOCATIONS

Performance standards for vegetation are identified in the CFROU Record of Decision (ROD) and are grouped according to "post-remedial land use and landscape position" [EPA, 2004]. We identified three specific vegetation zones corresponding to these "post-remedial land use and landscape position" groupings as identified in the ROD and have defined these vegetation zones to correspond to the specific vegetation performance standards (Table 3-1). The vegetation zone closest to the river is the "Riparian Zone", which is defined in the ROD as the "streambank riparian buffer zone" [EPA, 2004] and includes the area from the streambank and extending laterally 50 feet from the streambank on either side of the river. All areas outside the Riparian Zone are either identified as "Transition Zone" or "Upland Zone". Transition Zone areas are those outside the Riparian Zone but within the 100-year floodplain. The Upland Zone are any areas that are outside the 100-year floodplain.

Final monitoring plot and transect locations for Phases 1 and 3 are presented in Figure 3-1 and Figure 3-2.

Table 3-1. Vegetation minimum performance standards and guidelines for monitoring metrics in the Clark Fork River Operable Unit [EPA, 2004].

Vegetation Zone	Monitoring Metric	Year (post-remediation)						
		1	2	3	4	5	7	10
Riparian[13]	Planted woody species survival (%)[14]	90	90					
	Preferred woody species canopy cover (%)					50	60	80
	Total canopy cover of non-weed perennial vegetation (%)	90	95		98	98	98	98
	Noxious weed cover (%)							<5
Transition[15]	Total canopy cover of non-weed perennial vegetation (%)	90	95	98		98		
	Noxious weed cover (%)							<5
Upland[16]	Total canopy cover of non-weed perennial vegetation (%)							45
	Species richness (per 100 square meters)[17]							5
	Noxious weed cover (%)							<5

[13] The Riparian Zone performance standards correspond to Exhibit 2-26 in the ROD [EPA, 2004]. The Riparian Zone is defined as a polygon extending 50 feet laterally from the streambank on each side of the river in each remedial area. The Riparian Zone corresponds to the Streambank Riparian Buffer Zone, which is described in the ROD.

[14] The ROD specifies replanting criteria for the fourth, fifth, and seventh years instead of monitoring for this metric [EPA, 2004].

[15] The Transition Zone performance standards are identified in the ROD in Exhibit 2-27 [EPA, 2004]. This zone will be defined in the field as any portion of the floodplain between the riparian zone and the 100-year floodplain.

[16] This vegetation zone corresponds to performance standards identified in the ROD in Exhibit 2-28 [EPA, 2004]. Specific timelines for attaining performance standards in Exhibit 2-28 were not identified [EPA, 2004].

[17] Each species must account for more than 1 percent cover to be counted toward this metric; noxious weeds are not counted toward this metric. This metric does not apply in areas intended for agricultural crop production.

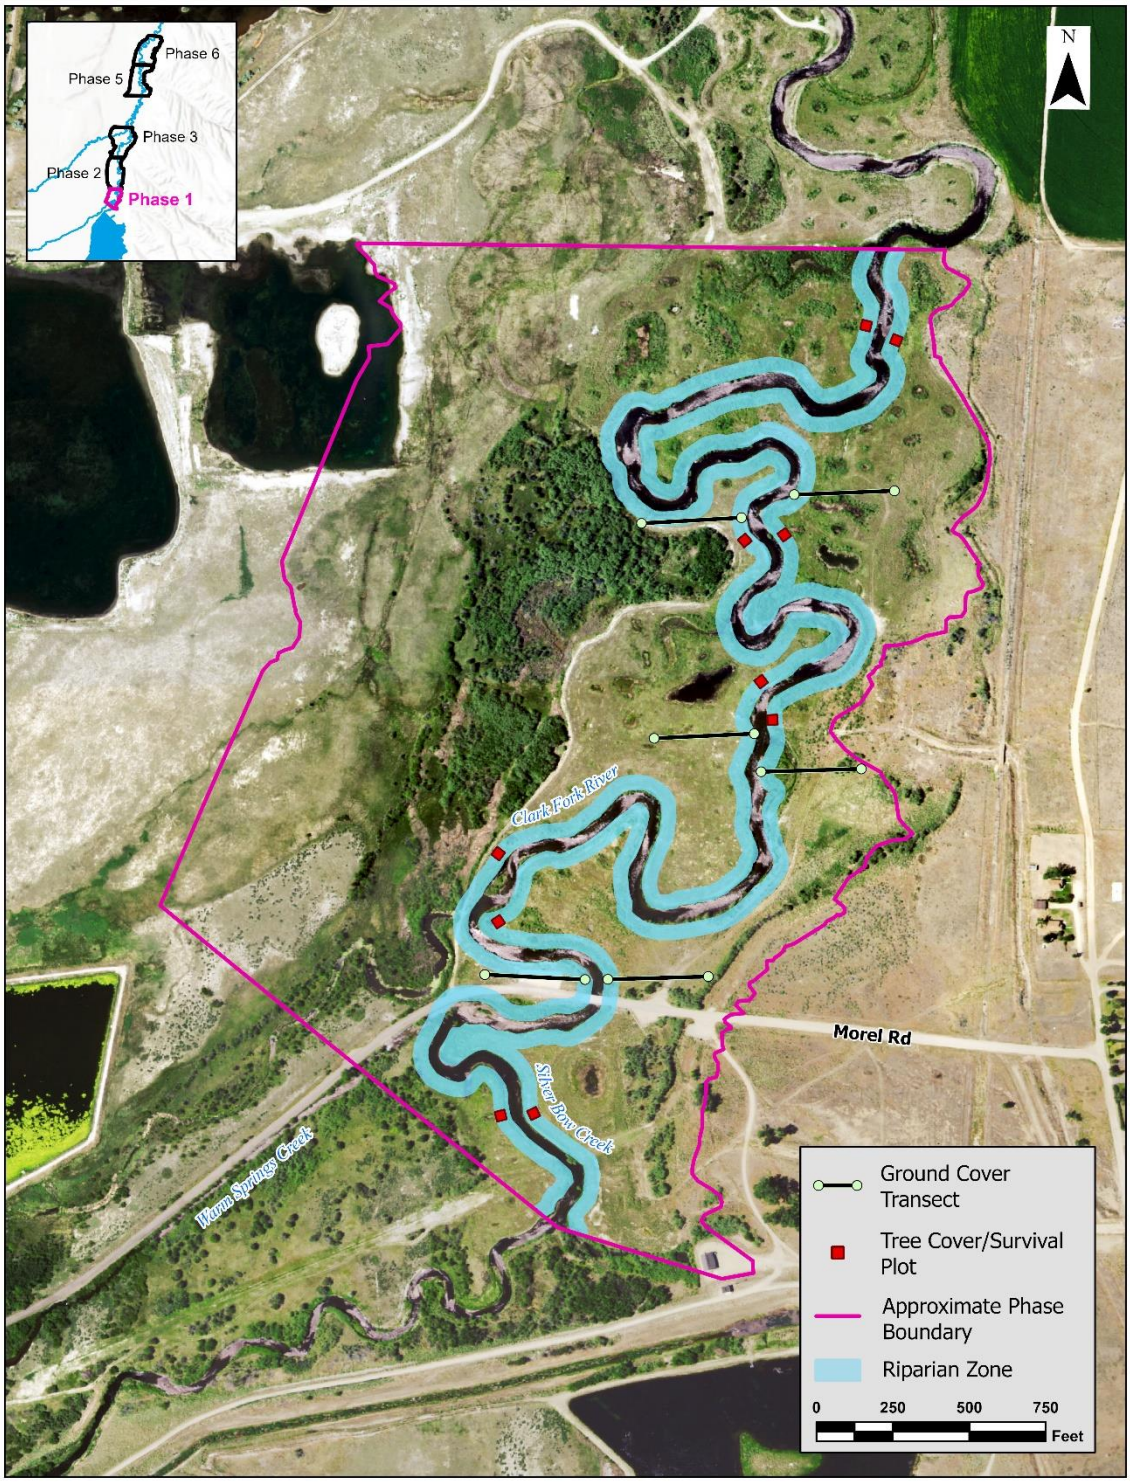

Figure 3-1. Vegetation monitoring plots and transects in Phase 1 of the Clark Fork River Operable Unit, 2024.

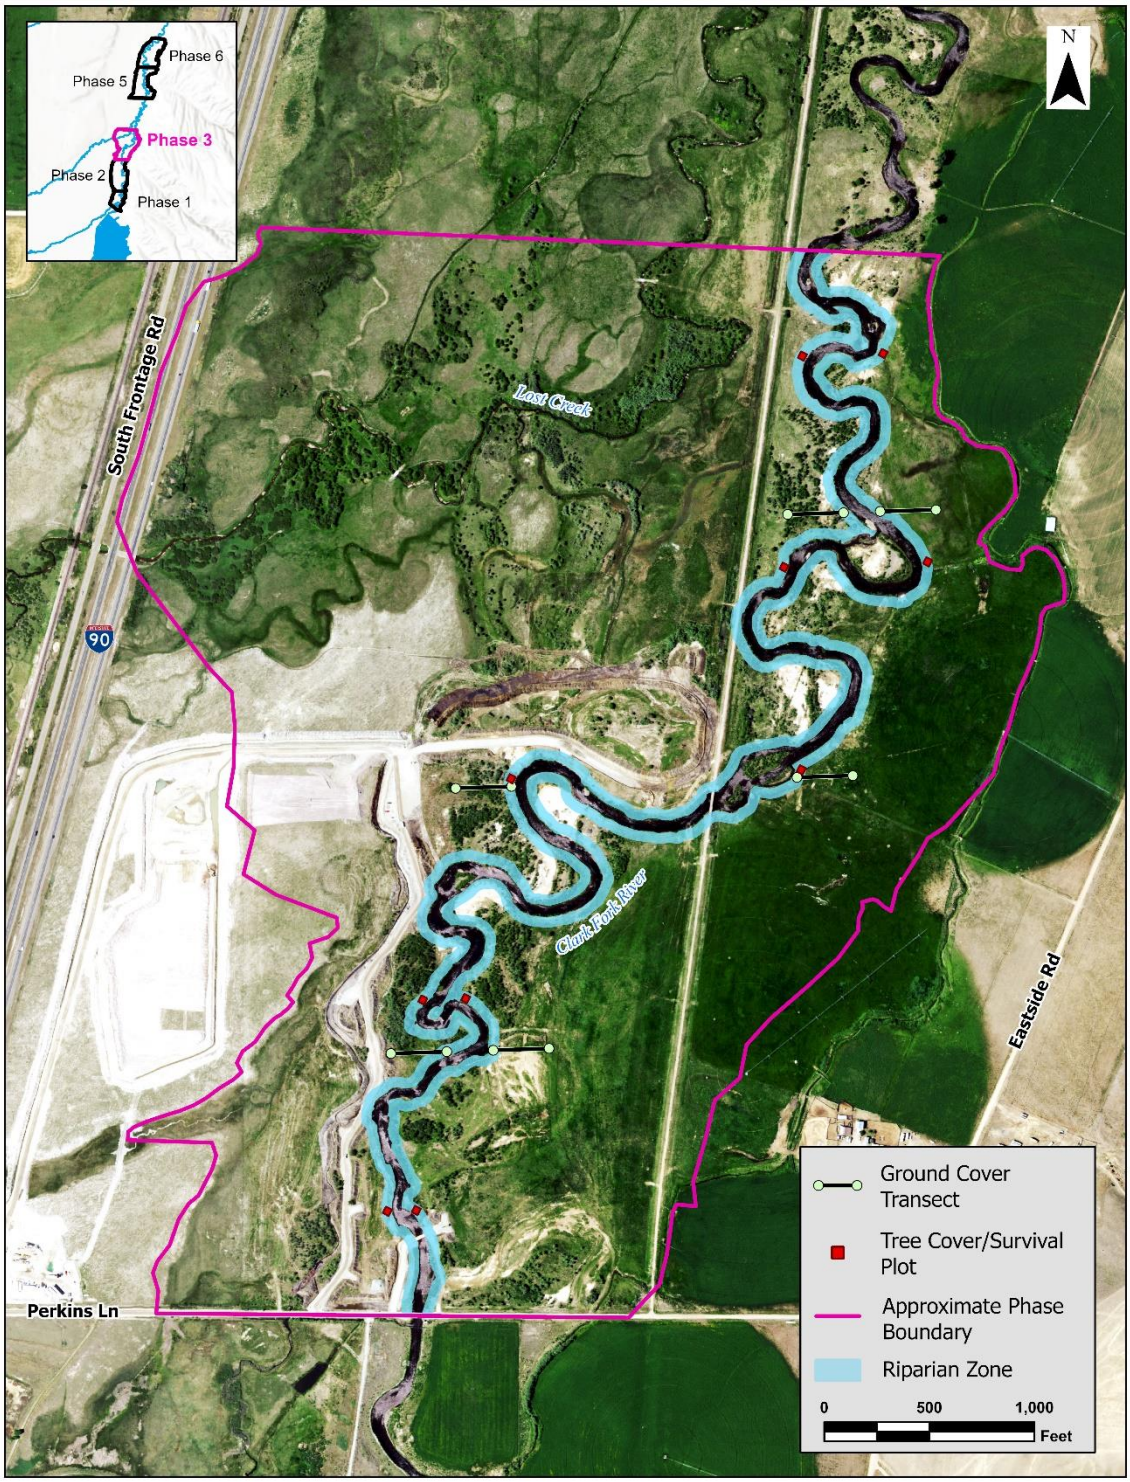

Figure 3-2. Vegetation monitoring plots and transects in Phase 3 of the Clark Fork River Operable Unit, 2024.

3.2.1.1 GROUND COVER

The CFROU ROD identified "total canopy cover of non-weed perennial vegetation" as a monitoring metric which we hereafter refer to as "ground cover". Ground cover was monitored in 60 small (1-m^2) plots (hereafter referred to as "transect subplots") located along six transects within each phase. Transects were 100 m and extended away from the riverbank along an east-west orientation. A pair of transect subplots were placed every 20 m, beginning at 10 m from the riverbank, as depicted in Figure 3-3. Transects were paired on each side of the river at three locations within each phase at 25 percent, 50 percent, and 75 percent of the linear distance from the phase start (upstream boundary) to the phase end (downstream boundary).

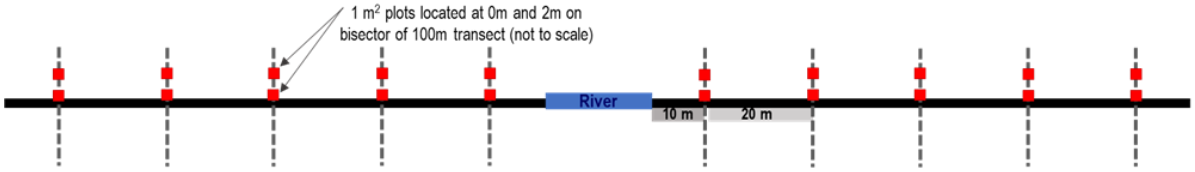

Figure 3-3. Example diagram of two transects and associated subplots for monitoring of total canopy cover of non-weed perennial vegetation.

3.2.1.2 TREE CANOPY COVER AND SURVIVAL

Five woody species (i.e., tree) canopy cover or survival plots were located on each side of the river within each phase for a total of ten plots per phase. All plots were located within the Riparian Zone of each phase (i.e., a 50-foot buffer extending out from the bank on each side of the river). Monitoring plots were 100-m^2. Plots were located at approximately 10, 30, 50, 70, and 90 percent of the linear distance from the phase origin and terminus (i.e., the upstream and downstream ends of each phase where the river passes through the phase boundary), in the nearest planting unit from those locations.[18]

3.2.2 MONITORING PARAMETERS

3.2.2.1 PHASE 1

Phase 1 monitoring in 2024 focused on Year-10 performance targets. In the Riparian Zone, monitoring included assessment of ground cover and tree cover. In the Upland Zone, monitoring focused on total ground cover, noxious weed cover, and species richness.

3.2.2.2 PHASE 3

Phase 3 monitoring in 2024 focused on Year-1 performance targets. In the Riparian Zone, monitoring included assessment of ground cover and tree survival. In the Transition Zone, monitoring focused on assessment of ground cover.

3.2.3 MONITORING SCHEDULE

Vegetation monitoring occurred from June 27-28, 2024.

[18] These points were determined prior to visiting the site using standard GIS tools and layers. Field biologists will navigate to these points using field GPS units.

3.2.4 SAMPLE COLLECTION AND ANALYSIS

3.2.4.1 TREE COVER

Each 100-m^2 canopy cover monitoring plot was sampled using a 121-point grid to provide a total cover estimate for the entire plot (Figure 3-4). Sampling grid lines were evenly spaced (11 per side including the plot boundaries) along each plot side. Samples were collected at each gridline intersection (red dots) for a total of 121 cover measurements per floodplain plot. At each grid point, a vegetation surveyor determined if an imaginary survey rod extended vertically from the ground to the forest canopy would contact (i.e., be covered by) any portion of a shrub or tree species and the proportion of points covered was calculated as the total cover estimate for each plot. Photos of each canopy cover monitoring plot are available to view in Appendix G.

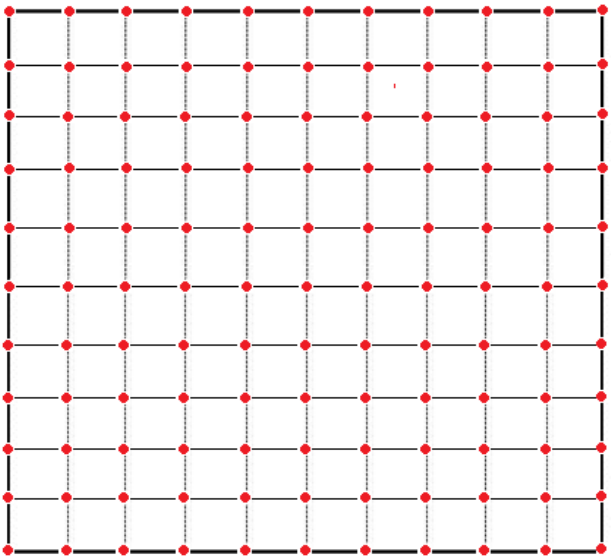

Figure 3-4. Schematic sampling grid for estimating shrub cover within each 100-m^2 Riparian Zone plot.

3.2.4.2 TREE SURVIVAL

In each survival plot (located in planting units within the Riparian Zone), each containerized woody plant was evaluated to determine plant species and survival. Plants which were rooted partially on the plot boundaries were considered within the plot if at least 50 percent of the plant's roots were assumed to be inside the plot. A photo was taken of each survival plot following sampling. Photos of each survival plot are available to view in Appendix G.

3.2.4.3 GROUND COVER

Within each transect subplot, the vegetation zone was determined (i.e., Riparian, Transition, or Upland) and visual estimates of cover percentage were made for each perennial plant species present. A photograph was taken of each transect subplot after each cover estimate was made. Vegetation monitoring photographs are available to view in Appendix E.

Ground cover was monitored in 60 one-square meter plots within each phase in 2024. As in prior monitoring years, plots were distributed systematically across the floodplain of each phase along six

transects. Plots were located in Riparian Zones, Transition Zones, and Upland Zones of each phase. Plot locations were determined independently from vegetation zones and thus sample sizes within each zone varied by phase (Table 3-2).

Table 3-2. Ground cover plot counts for each vegetation zone, in each phase monitored within the Clark Fork River Operable Unit in 2024.

Phase	Riparian Zone	Transition Zone	Upland Zone	Total
1	17	35	8	60
3	16	44	0	60

3.2.5 DATA ANALYSIS

3.2.5.1 PRECIPITATION

Climate and precipitation data were gathered from available sources and summarized to provide context for the 2024 vegetation monitoring results.

3.2.5.2 GROUND COVER

All perennial plant species in each transect subplot were identified and cover of each species, within each subplot, was estimated. Noxious species were noted and the cover of each was estimated as well. Noxious species were defined as any species identified as a noxious plant by MDA [2019]. Based on these classifications, average cover percentages for total vegetation and for noxious weeds were determined for each vegetation zone and compared to the performance target for each zone.

3.2.5.3 TREE COVER

Average (mean) canopy cover from each plot monitored within each phase was calculated and compared to the Year-10 performance target.

3.2.5.4 TREE SURVIVAL

Average (mean) survival was determined for all species collectively within each phase as the metric for evaluation of the "planted woody species survival" performance target. In addition, survival was averaged for each species within each phase to assist project managers in determining suitable species for Riparian Zone planting.

3.2.5.5 SPECIES RICHNESS

The total number of non-weed species observed in the Upland Zone was compared to the total number of transect subplots that occurred within the Upland Zone to estimate species richness per 100 square meters.

3.3 RESULTS

3.3.1 PRECIPITATION

The Deer Lodge valley is classified as having a "continental, warm-summer" or "Dfb" climate [Weatherbase, 2020] according to the Koppenen climate classification scale [Kottek et al., 2006]. This climate type is common in western plains and mountain states of the U.S. and is similar to "cold semi-arid steppe" or "BSk" climates. The Deer Lodge valley tends to have low annual precipitation averaging 11.6 inches from 2000-2024. Most precipitation tends to accumulate during the months of May and June (Figure 3-5).

Annual precipitation in Deer Lodge was 10.9 inches in 2024, or 94 percent of the average. Precipitation during the months of May and June, which are critical for establishment of vegetation in the region [Prodgers, 2021], was near average for May, but approximately 35 percent below average for June (Figure 3-5).

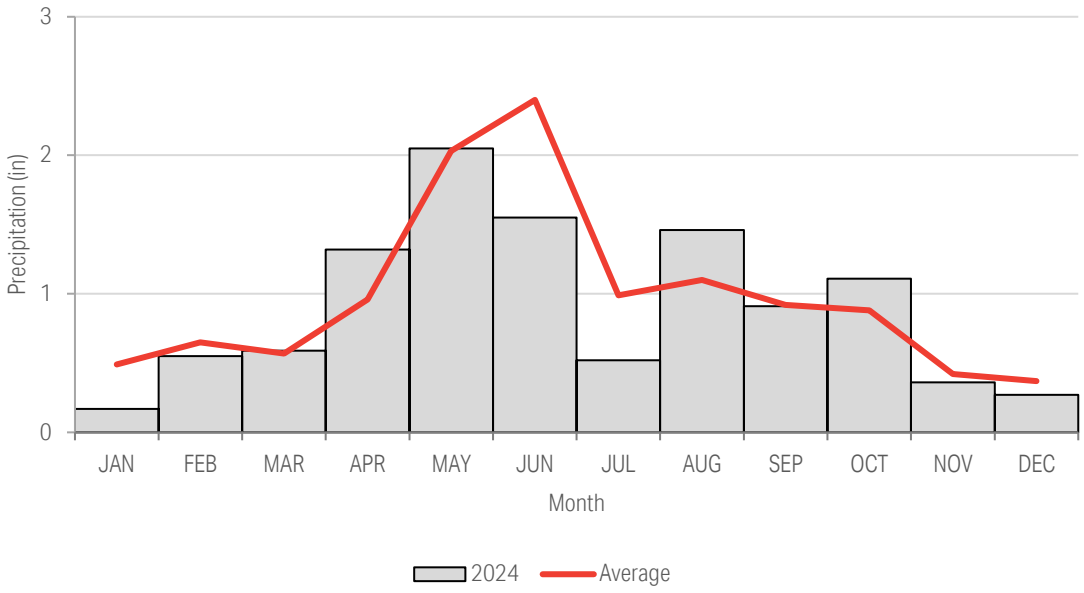

Figure 3-5. Monthly precipitation at Deer Lodge, Montana in 2024 [Weather Underground, 2025] compared to the long-term average [NWS, 2025].

3.3.2 PHASE 1

3.3.2.1 TREE COVER

The CFROU ROD specified a Year-10 performance target for tree cover of 80 percent in the Riparian Zone. Tree cover was estimated as 73.5 percent in 2024 falling below the performance target. Although below the final tree cover target, cover has increased during each monitoring period since Year-5 (Table 3-3).

Table 3-3. Post-remediation mean canopy cover in Phase 1 of the Clark Fork River Operable Unit.

Phase	Tree Canopy Cover (%)		
	Year-5	Year-7	Year-10
1	33.2	72.0	73.5
Performance Standard	50	60	80

3.3.2.2 GROUND COVER

The CFROU ROD specified a Year-10 performance target for ground cover of 98 percent in the Riparian Zone and 45 percent in the Upland Zone. In the Riparian Zone, ground cover in 2024 was 76.4 percent and therefore did not meet the Year-10 performance target but ground cover was 68.8 percent in the Upland Zone which exceeded the target (Figure 3-6). Ground cover has increased during each recent monitoring period in the Riparian Zone, and each other zone, indicating a positive trend throughout the phase.

As of Year-10, 23 separate plant species were observed in the Phase 1 floodplain (Table 3-4). Plant diversity was highest in the Transition Zone (18 species), lowest in the Upland Zone (5 species), and moderate in the Riparian Zone (12 species). Great Basin wildrye was the most abundant species in the Riparian and Transition Zones and rubber rabbitbrush was the most abundant species in the Upland Zone. One observed plant species in the Upland Zone could not be identified.

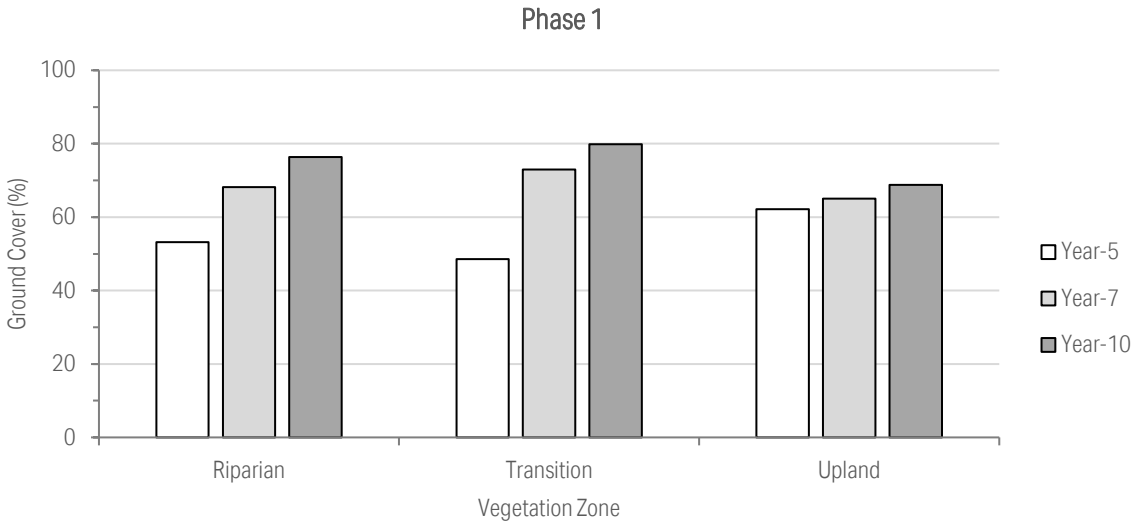

Figure 3-6. Post-remedy ground cover by vegetation zone and monitoring year in Phase 1 of the Clark Fork River Operable Unit.

Table 3-4. Mean ground cover (%) by species in vegetation zones of Phase 1 of the Clark Fork Operable Unit ten-years post-remedy (2024).

Species	Riparian Zone	Transition Zone	Upland Zone
Baltic rush		10.1	
Canada wildrye	9.4	5.9	
Cattail		0.1	
Cheatgrass			0.6
Common yarrow	2.4	0.3	
Creeping foxtail		1.4	
Creeping spikerush		0.9	
Fringed sagebrush		0.1	
Great Basin wildrye	21.4	26.4	
Meadow Timothy	0.6	1.1	
Mustard			1.9
Narrowleaf willow	7.4	7.0	
Orchard grass	1.8		
Prickly lettuce	1.2	4.0	
Red fescue		2.6	
Redtop	14.4	4.4	
Rubber rabbitbrush		2.9	40.0
Silver buffaloberry		0.3	
Slender wheatgrass	7.6	6.4	25.6
Speckled alder	2.4		
Unknown species			0.6
Wild oats		5.9	
Yellow sweetclover	7.9		
Canada thistle[19]		0.1	
Total	**76.4**	**79.8**	**68.8**

[19] Noxious weed species; not included in total cover summation.

3.3.2.3 SPECIES RICHNESS

The CFROU ROD specified a Year-10 performance target for the Upland Zone of least five species. This performance target was met in the Upland Zone of Phase 1 in 2024 (Table 3-4). Species observed included: slender wheatgrass, wild licorice, mustard, rubber rabbitbrush, cheatgrass, and one unknown forb species.

3.3.2.4 NOXIOUS WEEDS

The CFROU ROD specified a Year-10 performance target of no more than 5 percent cover from noxious weeds. This performance target was met in all vegetation zones of Phase 1 in 2024. Noxious weeds were entirely absent from the Riparian and Upland Zones of Phase 1 and noxious weed cover in the Transition Zone was 0.1 percent (Canada thistle).

3.3.3 PHASE 3

3.3.3.1 TREE SURVIVAL

The CFROU ROD specified a Year-1 performance target for tree survival of 90 percent in the Riparian Zone. Tree survival was 95 percent for plantings in 2024 exceeding the target. A total of 375 trees were observed and 357 trees were alive among the ten plots monitored. All planted trees observed were either sandbar willow or Bebb's willow.

3.3.3.2 GROUND COVER

The CFROU ROD specified a Year-1 performance target for ground cover in the Riparian and Transition Zones of 90 percent. Ground cover in Phase 3 was 42.2 percent in the Riparian Zone and 69.3 percent in the Transition Zone in 2024 falling short of the target in both zones (Figure 3-7). No monitoring plots were established in the Upland Zone of Phase 3 in Year-1.

As of Year-1, 17 separate plant species were observed in the Phase 3 floodplain (Table 3-5). Plant diversity was highest in the Transition Zone (16 species). Nine species were observed in the Riparian Zone. Alfalfa was the most abundant species in both vegetation zones monitored in Year-1. No noxious weed species were observed in Phase 3 in Year-1. One observed plant species could not be identified in the Transition Zone.

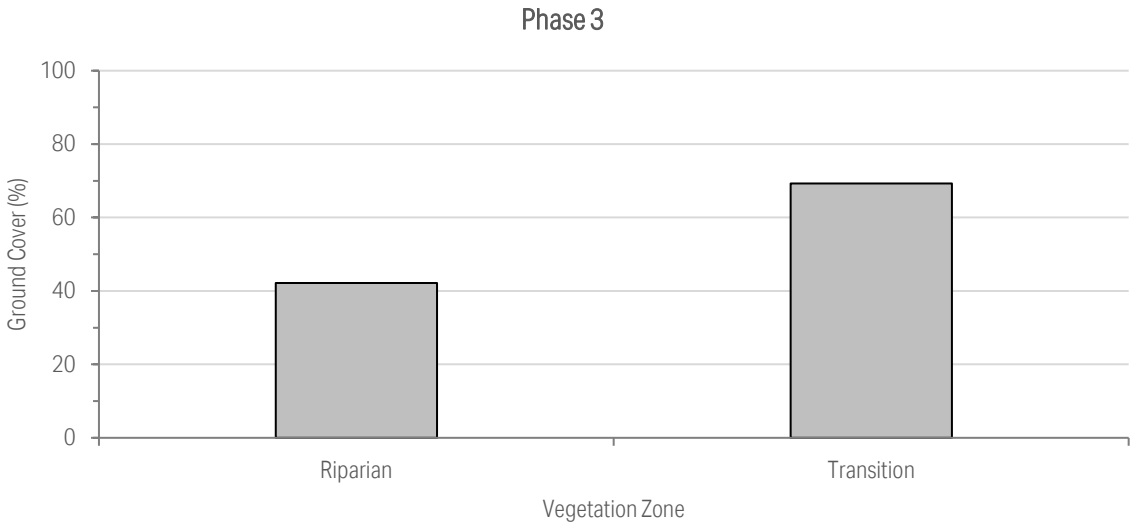

Figure 3-7. Year-1 post-remedy ground cover by vegetation zone in Phase 3 of the Clark Fork River Operable Unit.

Table 3-5. Mean ground cover (%) by species in vegetation zones of Phase 3 of the Clark Fork Operable Unit one-year post-remedy (2024).

Species	Riparian Zone	Transition Zone
Alfalfa	27.5	30.9
Baltic rush		1.4
Bebb willow	1.9	0.6
Common yarrow	1.6	4.8
Creeping foxtail		10.6
Fringed sagebrush		0.1
Mexican kochia	0.3	
Mustard		2.6
Narrowleaf willow	1.4	1.0
Red fescue	2.2	0.6
Redtop	0.6	3.3
Showy milkweed		0.7
Slender wheatgrass	0.8	4.3
Unknown species		0.1
White clover		1.1
Wild licorice		0.2
Wild oats		0.3
Yellow sweetclover	5.9	6.7
Total	**42.2**	**69.3**

3.4 DISCUSSION

Vegetation monitoring occurred in Phases 1 and 3 in 2024. Phase 1 was remediated in 2014 and Phase 3 was remediated in 2023. Therefore, monitoring in 2024 represented Year-10 and Year-1 conditions in each of those phases, respectively. Precipitation levels in 2024 were below average in the months of May and June which are critical to the establishment of vegetation, particularly in recently remediated phases. This low precipitation may have contributed to the low ground cover consistently observed in the monitoring plots in 2024.

Monitoring in Phase 1 focused on Year-10 performance targets, including: tree cover, ground cover, and noxious weed cover in the Riparian Zone; noxious weed cover in the Transition Zone; and ground cover, species richness , and noxious weed cover in the Upland Zone. Performance targets were met for noxious weed cover throughout the phase and for ground cover and species richness in the Upland Zone (Table 3-6). Performance targets were not met for tree cover or ground cover in the Riparian Zone.

Monitoring in Phase 3 focused on Year-1 performance targets, including: tree survival and ground cover in the Riparian Zone; and ground cover in the Transition Zone. The tree survival performance target was met but the ground cover performance target was not met in either zone.

Table 3-6. Attainment of revegetation performance targets for Clark Fork River Operable Unit phases monitored in 2024.

Phase	Vegetation Zone	Monitoring Metric	Year (post-remediation)	
			1	10
1	Riparian	Preferred woody species canopy cover (%)	-	Fail
		Total canopy cover of non-weed perennial vegetation (%)	-	Fail
		Noxious weed cover (%)	-	Pass
	Transition	Noxious weed cover (%)	-	Pass
	Upland	Total canopy cover of non-weed perennial vegetation (%)	-	Pass
		Species richness (per 100 square meters)	-	Pass
		Noxious weed cover (%)	-	Pass
3	Riparian	Planted woody species survival (%)	Pass	-
		Total canopy cover of non-weed perennial vegetation (%)	Fail	-
	Transition	Total canopy cover of non-weed perennial vegetation (%)	Fail	-

4.0 BIRDS

4.1 INTRODUCTION

Bird assemblages were monitored in the Clark Fork River Operable Unit (CFROU) during the spring of 2024. This report provides an assessment of the bird monitoring data collected in 2024. Special attention is paid to species richness by project phase and to special status species (e.g., Montana Species of Concern [MNHP, 2024]). Results provide information relevant to remedial design and construction teams to assess if remedial actions influence bird use in the CFROU and to minimize disturbance to bird habitat during construction and revegetation activities.

4.2 METHODS

4.2.1 MONITORING LOCATIONS

Birds were monitored at 15 sites distributed among eight CFROU phases (Phases 1, 2, 3, 4, 5, 6, 7, and 15) in 2024 (Table 4-1; Figure 4-1). Results are generally summarized by phase. Observations from sites within Phases 3 and 4 were combined, as were observations from sites within Phases 5 and 6. All monitoring sites were located within the floodplain riparian zone adjacent to the river or nearby water features such as constructed ponds. Monitoring sites were located in habitats that were representative of a large proportion of the prevailing bird habitat within each phase. Monitoring site locations have been consistent each year since 2016.

Construction-related remedial actions were completed in the fall of 2014 in Phase 1 (60 acres). Phase 1 was the first phase remediated in the CFROU. Revegetation actions continued in Phase 1 through the winter of 2015. Phase 1 consists of 1.6 river miles. Several features adjacent to this phase likely influence bird use within its boundaries. The Warm Springs Wildlife Management Area is located on the southern boundary of Phase 1. In addition, the confluence of Warm Springs Creek and Silver Bow Creek is located within the phase near the upstream (southern) boundary. Two sites were monitored in Phase 1: Sites 1-A and 1-B.

Phase 2 (88 acres) was under construction from the summer of 2015 through the fall of 2016. Phase 2 consists of 1.9 river miles immediately downstream from Phase 1. Two sites were monitored in Phase 2: Sites 2-A and 2-B.

Remediation was completed in Phase 3 in the 2023 monitoring period but Phase 4 had not been remediated as of 2024. Combined, these phases consist of 261 acres and 4.5 river miles and are located downstream from Phase 2. Three sites have been monitored in Phases 3 and 4: Sites 3/4-A, 3/4-B, and 3/4-C.

Remediation began in Phases 5 and 6 (125 acres combined) in the summer of 2014 and construction and revegetation actions were completed in 2016. Combined, these phases consist of 4.3 river miles and are located immediately downstream from Phase 4. The Racetrack Pond, located immediately downstream, is a feature adjacent to Phase 6 which may influence bird use. Three sites were monitored in Phases 5 and 6: Sites 5/6-A, 5/6-B, and 5/6-C.

Phase 7 (84 acres) had not been remediated as of 2024. This phase consists of a 1.9-mile river reach located immediately downstream from Phase 6. Phase 7 is adjacent to the Racetrack Pond, which likely provides a strong influence on the bird assemblage and bird use within the phase. Two sites were monitored in Phase 7: Sites 7-A and 7-B. Site 7-A is located along the shoreline of the Racetrack Pond.

Phase 15 construction and revegetation has been completed. Phase 15 is located within the Grant-Kohrs National Historic Site just north of Deer Lodge. The Grant-Kohrs National Historic Site is a 1,600-acre working cattle ranch maintained by the National Park Service. Three sites were monitored in Phase 15 in 2024: Sites 15-A, 15-B, and 15-C.

Table 4-1. Bird monitoring sites in the Clark Fork River Operable Unit, 2024.

Phase	Site	Latitude	Longitude
1	1-A	46.18778	112.76891
	1-B	46.19385	112.76527
2	2-A	46.19414	112.77627
	2-B	46.19612	112.76863

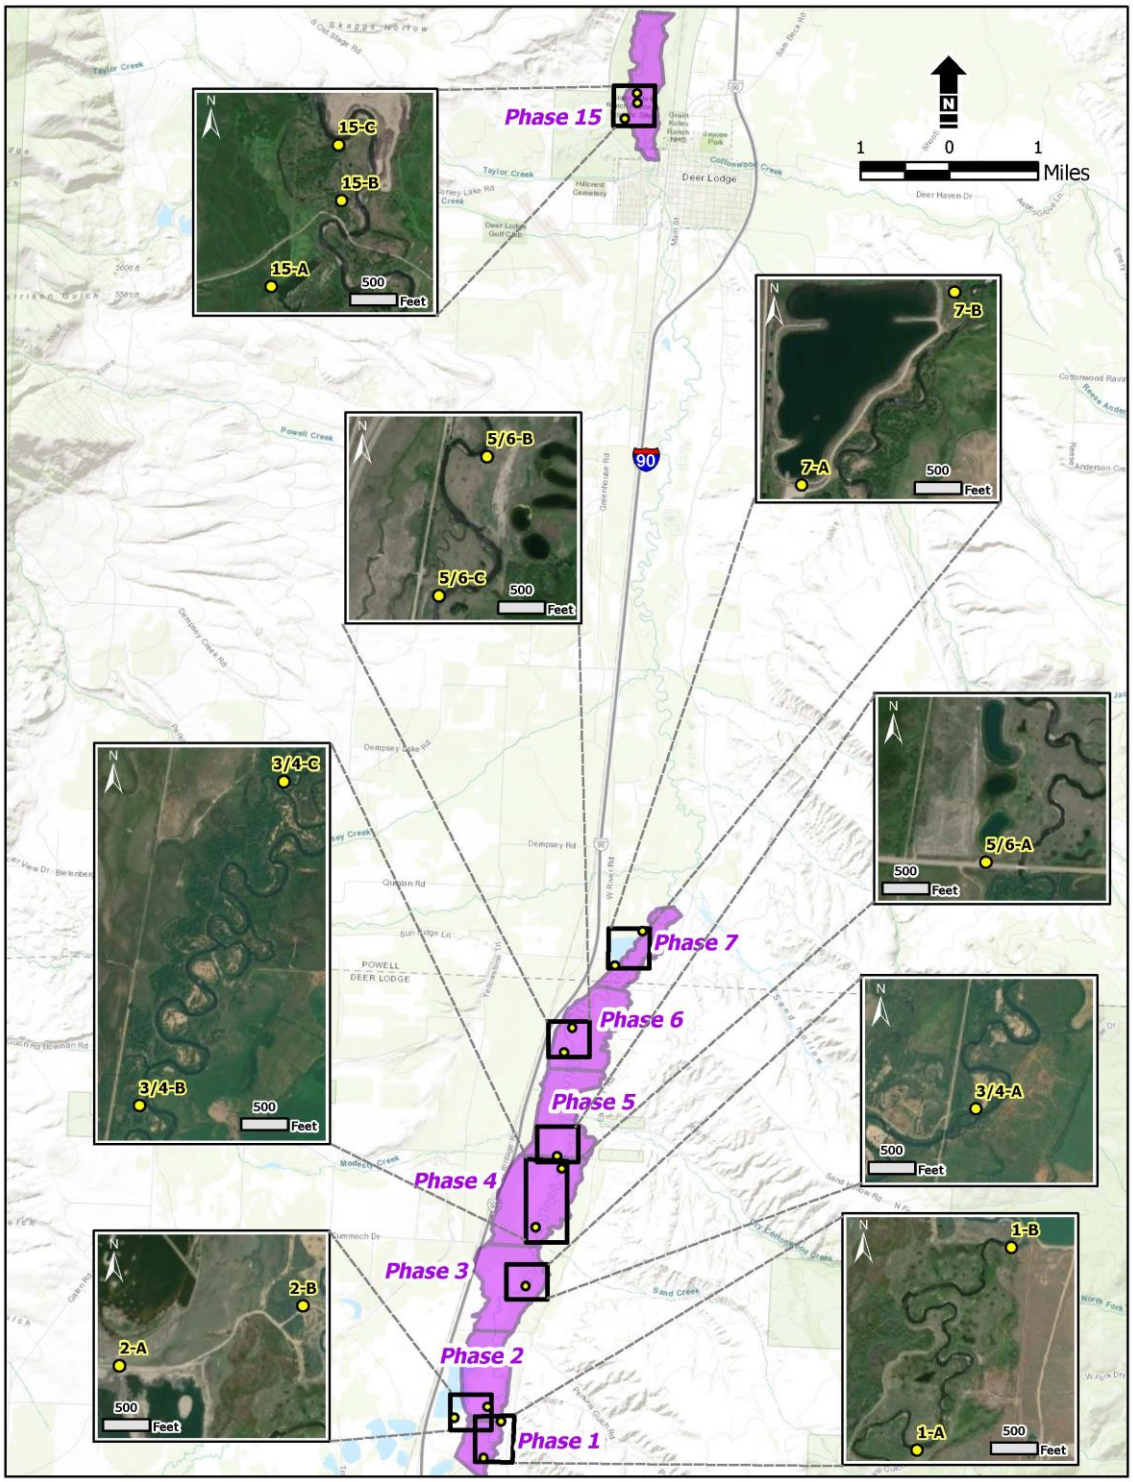

Figure 4-1. Bird monitoring locations in the Clark Fork River Operable Unit, 2024.

4.2.2 MONITORING SCHEDULE

The 2024 monitoring year constituted the tenth year of bird monitoring in the CFROU; monitoring has occurred annually since 2015. Monitoring each year has occurred during the spring and early summer months of April, May, and June. In 2024, monitoring occurred weekly at each site from April through June. Each site was visited 13 times during the monitoring period. Each monitoring site visit (i.e., "point-count") lasted ten minutes.

4.2.3 MONITORING PARAMETERS

Birds were observed following standard point-count methods similar to Hutto et al. [1986] and Buckland et al. [2001]. Birds were counted by species during each point-count. Types of individual bird observations were distinguished and classified separately as: (1) observed by sight within a 40-m radius, (2) identified by call or song, (3) identified by sight flying within a 40-m radius, or (4) identified by sight flying outside 40 m.

4.2.4 MONITORING METHODS

At each monitoring site, counts were conducted after a two-minute settling period following the surveyor's arrival, to allow birds to become accustomed to the surveyor's presence. Each bird observed was recorded using a four-letter abbreviation commonly referred to as an "ALPHA" code [IBP, 2018].

4.2.5 DATA ANALYSIS

This report compares bird species richness (i.e., species counts) among phases and among years in the CFROU.

4.3 RESULTS

4.3.1 EFFORT AND OBSERVATIONS

Point-counts were conducted at 15 sites in 2024. Each site was visited on 13 occasions (weekly) during a three-month monitoring period from April through June. In total, 195 point-counts were conducted in 2024 (Table 4-2). Among all point-counts conducted in 2024, 13,998 individual birds were observed from 134 different species, or about 30 percent of the species inhabiting Montana [MNHP, 2024] (Table 4-3). Most of the bird observations were within 40 m from the point-count site. The greatest number of individual birds (3,946), and species (94), were observed in Phase 7. The lowest number of individuals (1,492) were observed in Phase 1 and the fewest number of species (61) were observed in Phase 2.

Over the entire period of bird monitoring in the CFROU (2015-2024), 1,620 point-counts have occurred (Table 4-2) and 180 bird species have been observed, representing 40 percent of the 442 bird species believed to occur in Montana [MBRC, 2021]. Over the entire period of record in this monitoring program, a total of 116,610 individual birds have been observed and identified (Table 4-3).

Although bird assemblages have been abundant and diverse in all phases, Phase 7 has uniquely high diversity (147 species observed) and abundance (36,370 individuals observed) and accounts for nearly a third of all bird observations in the CFROU since 2015.

Table 4-2. Monitoring effort (point-counts) in each phase of the Clark Fork River Operable Unit by year.

Year	Phase							Total
	1	2	3/4	5/6	7	8	15	
2015	34	0	0	0	34	0	32	100
2016	23	0	31	0	24	35	31	144
2017	17	17	25	24	18	0	29	131
2018	20	20	28	29	16	0	29	142
2019	24	25	35	36	24	0	36	180
2020	26	26	39	39	26	0	39	195
2021	26	26	37	39	26	0	39	193
2022	26	26	13	39	26	0	39	169
2023	26	26	15	39	26	0	39	171
2024	26	26	39	39	26	0	39	195

Table 4-3. Bird richness and frequency of individual bird observations by phase in the Clark Fork River Operable Unit, 2015-2024. The monitoring period of record and level of effort has varied among phases and is summarized in Table 4-2.

Phase	2024		Period of Record	
	Species	Individuals	Species	Individuals
1	67	1,492	115	11,586
2	61	1,719	111	16,861
3/4	76	2,413	123	16,831
5/6	89	2,696	139	20,708
7	94	3,946	147	36,370
8	-	-	52	974
15	81	1,732	133	13,280
Total[20]	**134**	**13,998**	**180**	**116,610**

4.3.2 SPECIES RICHNESS

4.3.2.1 PHASE 1

Phase 1 has been monitored continuously for ten years from 2015-2024. During that period, 115 bird species have been observed and 67 of those species were observed in 2024 (Table 4-4). A Caspian Tern was observed in Phase 1 in 2024 and had never previously been observed in the Clark Fork River Operable Unit in this monitoring program. Species observed in Phase 1 for the first time in 2024 included Caspian Tern, Lincoln's Sparrow, and House Wren (Table 4-4).

Table 4-4. Bird species observed in Phase 1 of the Clark Fork River Operable Unit, 2015-2024.

Species	Year									
	2015	2016	2017	2018	2019	2020	2021	2022	2023	2024
Hawks, kites, and eagles										
Bald Eagle	X	X	X			X	X	X		X
Ferruginous Hawk								X		
Golden Eagle										
Northern Harrier	X	X	X	X		X	X	X	X	X

4.3.2.2 PHASE 2

Phase 2 has been monitored continuously for eight years from 2017-2024. During that period, 111 bird species have been observed and 61 of those species were observed in 2024 (Table 4-5). No new species were observed in Phase 2 in the 2024 monitoring period (Table 4-5).

Table 4-5. Bird species observed in Phase 2 of the Clark Fork River Operable Unit, 2017-2024.

4.3.2.3 PHASES 3 AND 4

Phases 3 and 4 have been monitored continuously for nine years from 2016-2024. During that period, 123 bird species have been observed and 76 of those species were observed in 2024 (Table 4-6). A Cackling Goose was observed in Phase 7 in 2024 and had never previously been observed in the Clark Fork River Operable Unit in this monitoring program. Species observed in Phases 3 and 4 for the first time in 2024 included Cackling Goose, Trumpeter Swan, and Pine Siskin (Table 4-6).

4.3.2.4 PHASES 5 AND 6

Phases 5 and 6 have been monitored continuously for eight years from 2017-2024. During that period, 139 bird species have been observed and 89 of those species were observed in 2024 (Table 4-7). Species observed in Phases 5 and 6 for the first time in 2024 included Eurasian Wigeon, Rock Pigeon, Prairie Falcon, Pine Siskin, Hermit Thrush, Veery, Mountain Bluebird, and Dusky Flycatcher (Table 4-7).

Table 4-7. Bird species observed in Phases 5 and 6 of the Clark Fork River Operable Unit, 2017-2024.

4.3.2.5 PHASE 7

Phase 7 has been monitored continuously for ten years from 2015-2024. During that period, 147 bird species have been observed and 94 of those species were observed in 2024 (Table 4-8). Species observed in Phase 7 for the first time in 2024 included Peregrine Falcon, Prairie Falcon, Black-headed Grosbeak, Pine Siskin, Lincoln's Sparrow, and Red-naped Sapsucker (Table 4-8).

4.4 DISCUSSION

The CFROU provides habitat for a diverse array of bird species. Over the last ten years, 180 distinct bird species, representing 18 taxonomic orders and 48 families, have been observed in the CFROU. This level of diversity is remarkable given that this sizable proportion of Montana species (40 percent) have been observed in a monitoring area of only about 40 square miles (or 0.03 percent of Montana's geographic area). The most diverse taxonomic orders include Passeriformes (perching birds; 79 species), Anseriformes (waterfowl; 28 species), Charadriiformes (shorebirds and waders; 26 species), and Accipitriformes (birds of prey; 10 species).

APPENDIX A

QUALITY ASSURANCE AND QUALITY CONTROL REVIEW AND SUMMARY

INTRODUCTION

Specific quality assurance and quality control (QA/QC) requirements for field measurements, sample collection, laboratory analysis, and the reporting of resulting data were established by protocols contained in the quality assurance project plan (QAPP), a component of the approved sampling and analysis plan (SAP) for the Clark Fork River Operable Unit (CFROU). The following quality control checklist is a component of the Montana Department of Environmental Quality QA/QC protocols and provides review and validation of water chemistry and related data generated under the CFROU environmental monitoring program in 2024. This checklist provides an outline for reviewing and assessing some factors potentially affecting data quality and assists in identifying data that may be invalid or require additional documentation.

QUALITY CONTROL/CORRECTIVE ACTIONS

Work order receipt checklists were completed by Energy Labs for each batch of quarterly samples delivered. These checklists are provided in Appendix B. Specific quality control issues identified during each monitoring period included the following:

- First Quarter (Q1): No quality control issues were identified.
- Second Quarter (Q2): No quality control issues were identified.
- Third Quarter (Q3): Sample collection times were not provided on the chain of custody for samples WSC-SBC and SS-25. Sample collection times were recorded on the sample bottles for those samples.
- Fourth Quarter (Q4): No quality control issues were identified.

SUMMARY OF QUALITY CONTROL AND ANALYSIS RESULTS

Summarized in this appendix are quality control measures performed on field and laboratory data generated from surface water and instream sediment samples collected from the CFROU monitoring events. Assessed under the DEQ standard quality assurance and quality control protocols are data quality objectives (DQOs), including categories for: “representativeness”, “comparability”, and “completeness”. Also assessed under the DEQ standard quality assurance and quality control protocols are data quality indicators (DQIs) including categories for: ”sensitivity”, “lab precision”, “overall precision”, and “bias and accuracy”.

Overall, DQOs and DQIs were generally met at all monitoring sites in the CFROU. Surface water samples were collected and analyzed for total suspended sediment, nutrients, metals (dissolved and total recoverable), and common ions at sample sites on four occasions. Instream sediment samples were collected and analyzed for metals (total) during the first (Q1) and third (Q3) quarters.

REPRESENTATIVENESS

All surface water and instream sediment monitoring sites in the CFROU sampled met stated objectives for “spatial representativeness”. That is, all monitoring sites were sampled at the established locations specified in the project SAP.

Surface water sediment monitoring was conducted quarterly. Q1 monitoring occurred during base streamflow conditions prior to the onset of spring runoff. Q2 monitoring occurred during spring runoff. Biological monitoring was conducted in conjunction with Q3 surface water and instream sediment sampling, during low streamflows near the seasonal minimum, within the specified index period for sampling biota. Q4 monitoring occurred during base streamflow conditions as late in the season as possible, prior to winter ice up. Sampling activities occurred during the last month of each respective quarter, and all data met specified CFROU criteria for temporal representativeness.

COMPARABILITY

Comparability is the applicability of project data to the remedial performance goals specified in the SAP for the various environmental media monitored under the project. The performance goal for surface water quality is for all contaminants of concern (COC) to meet water quality performance goals as described in the Record of Decision. Data acquired by the monitoring are applicable to assessing attainment of project performance goals.

COMPLETENESS

An overall data completeness goal of 85 percent was specified for the CFROU project and an evaluation table for data completeness is not required if the goal is met or exceeded. Data completeness for surface water and instream sediment samples from the CFROU monitoring sites was near 100 percent, with all chemical and physical parameters collected and analyzed during each of the four quarterly monitoring events.

SENSITIVITY

The method detection limit (MDL) established by Energy Laboratories through laboratory blank analyses is an expression of sensitivity. The MDL documented in QA/QC summary reports that accompany each set of laboratory analytical reports was less than the project-required reporting limit (RL), and was often below detection, for all analytical methods pertaining to CFROU monitoring (Appendix B).

Sensitivity of field methods for surface water samples was determined through deionized water field blank analyses. Results for all metals, common ions and suspended sediment parameters in field blanks were below the analytical reporting limits for 100 percent (96 of 96) of the surface water field blank analytes.

PRECISION

LABORATORY

Laboratory precision was assessed by the relative percent difference (RPD) metric comparing laboratory samples with duplicates. RPD comparisons were made for all analytes measured in this program. Established criteria allow a maximum of 20 percent RPD for water sample results which are at least five times greater than the RL, and 35 percent RPD for sediment samples which are at least five times greater than the RL. Results of laboratory quality control procedures are available in Appendix B.

OVERALL

The overall precision of surface water and instream sediment sample analyses from the CFROU was assessed with RPD comparisons between samples and paired field duplicates. Established criteria allow a maximum of 25 percent RPD for water sample results at least five times the RL, and 40 percent RPD for sediment samples at least five times the RL. All associated data which exceeds these criteria have been J-flagged in the project database.

One surface water sample and duplicate pair was collected in each quarterly sampling event, and these were analyzed for dissolved and total recoverable metals, nutrients, and common ions. Results of RPD comparisons for all metal, common ion and suspended sediment parameters in the field duplicate and field sample pairs were within the established criteria in 99 percent (95 of 96) of the sample and duplicate pairs. The one exception was for total phosphorus in the sample pair from Site CFR-03A on September 12, 2024, which had an RPD of 127 percent.

One instream sediment sample and duplicate pair was collected during each sampling event, and these were analyzed for total metals. All analytes in the sediment field duplicate and field sample pairs in Q1 had RPDs below 40 percent. In Q3, the RPD for the field sample and duplicate pair exceeded 40 percent for cadmium, copper, lead, and zinc. RPDs were 69 percent for cadmium, 53 percent for copper, 58 percent for lead, and 51 percent for zinc. All results for those metals in Q3 have been qualified with "J-flags" in the project database.

BIAS AND ACCURACY

Bias is defined as directional error from the true value of individual measurements. For field measurements (water temperature, pH, specific conductance, dissolved oxygen [DO] concentration, DO percent saturation, and turbidity), potential bias was addressed through frequent calibration of field instruments documented in calibration logs, and consistent field procedures. For water chemistry and sediment results, potential bias was minimized by adherence to approved field procedures for sample collection and handling, and decontamination of sampling equipment.

Accuracy is the combination of high precision and low bias. Accuracy of laboratory results was assessed by reviewing the analytical method controls (i.e., lab control sample, continuing calibration verification, lab fortified blank, standard reference material) and analytical batch controls (i.e., matrix spike and matrix spike duplicate). Limits established by the laboratory through control charting of each method's performance served as assessment criteria. Any analytical method controls or analytical batch controls that had values outside of the acceptable recovery range were re-analyzed, as detailed in the analytical QC summary provided by Energy Laboratories and included with each analytical summary report (Appendix B).

The analyses presented in this report were performed by Energy Laboratories, Inc., 3161 E. Lyndale Ave., Helena, MT 59604, unless otherwise noted. Any exceptions or problems with the analyses are noted in the report package. Any issues encountered during sample receipt are documented in the Work Order Receipt Checklist.

The results as reported relate only to the item(s) submitted for testing. This report shall be used or copied only in its entirety. Energy Laboratories, Inc. is not responsible for the consequences arising from the use of a partial report.

If you have any questions regarding these test results, please contact your Project Manager.

Containers requiring zero headspace have no headspace or bubble that is <6mm (1/4").	Yes ☐	No ☐	No VOA vials submitted ☑
Water - pH acceptable upon receipt?	Yes ☑	No ☐	Not Applicable ☐

Standard Reporting Procedures:

Lab measurement of analytes considered field parameters that require analysis within 15 minutes of sampling such as pH, Dissolved Oxygen and Residual Chlorine, are qualified as being analyzed outside of recommended holding time.

Solid/soil samples are reported on a wet weight basis (as received) unless specifically indicated. If moisture corrected, data units are typically noted as –dry. For agricultural and mining soil parameters/characteristics, all samples are dried and ground prior to sample analysis.

The reference date for Radon analysis is the sample collection date. The reference date for all other Radiochemical analyses is the analysis date. Radiochemical precision results represent a 2-sigma Total Measurement Uncertainty.

For methods that require zero headspace or require preservation check at the time of analysis due to potential interference, the pH is verified at analysis. Nonconforming sample pH is documented as part of the analysis and included in the sample analysis comments.

Contact and Corrective Action Comments:

The temperature of the sample(s) for shipping container 1 was 0.6°C, shipping container 2 was 1.0°C, and shipping container 3 was 1.2°C.
Per T. Traxler the Sediment analysis should be on one fraction only. wjj 3/21/2024

The analyses presented in this report were performed by Energy Laboratories, Inc., 3161 E. Lyndale Ave., Helena, MT 59604, unless otherwise noted. Any exceptions or problems with the analyses are noted in the report package. Any issues encountered during sample receipt are documented in the Work Order Receipt Checklist.

The results as reported relate only to the item(s) submitted for testing. This report shall be used or copied only in its entirety. Energy Laboratories, Inc. is not responsible for the consequences arising from the use of a partial report.

Energy Laboratories, Inc. verifies the reported results for the analysis has been technically reviewed and approved for release.

ANALYTICAL SUMMARY REPORT

If you have any questions regarding these test results, please contact your Project Manager.

CLIENT: MT DEQ-Federal Superfund
Project: CFROU Monitoring
Work Order: H24050895

Report Date: 06/27/24

CASE NARRATIVE

Prep Comments for Sample H24050895-004E, Test PRP-P-W: The prep hold time was exceeded by 2 days.
Prep Comments for Sample H24050895-004E, Test PRP-P-W: The prep hold time was exceeded by 2 days.
Prep Comments for Sample H24050895-004E, Test PRP-P-W: The prep hold time was exceeded by 2 days.

All "J" qualified analyte concentrations are below the laboratory minimum recommended Reporting Limit (RL) and above the calculated method detection limit (MDL). Inorganic analytes reported with "J" qualifiers should be verified against the corresponding method blank and continuing calibration blanks. Inorganic "J" quantitations near the MDL may be suspect due to possible method background levels, sample matrix effects, and/or daily variability in instrument signal-to-noise levels.

Container/Temp Blank temperature:	3.6°C On Ice		
Containers requiring zero headspace have no headspace or bubble that is <6mm (1/4").	Yes ☐	No ☐	No VOA vials submitted ☑
Water - pH acceptable upon receipt?	Yes ☑	No ☐	Not Applicable ☐

Standard Reporting Procedures:

Lab measurement of analytes considered field parameters that require analysis within 15 minutes of sampling such as pH, Dissolved Oxygen and Residual Chlorine, are qualified as being analyzed outside of recommended holding time.

Solid/soil samples are reported on a wet weight basis (as received) unless specifically indicated. If moisture corrected, data units are typically noted as –dry. For agricultural and mining soil parameters/characteristics, all samples are dried and ground prior to sample analysis.

The reference date for Radon analysis is the sample collection date. The reference date for all other Radiochemical analyses is the analysis date. Radiochemical precision results represent a 2-sigma Total Measurement Uncertainty.

For methods that require zero headspace or require preservation check at the time of analysis due to potential interference, the pH is verified at analysis. Nonconforming sample pH is documented as part of the analysis and included in the sample analysis comments.

Trip Blanks and/or Blind Duplicate samples are assigned the earliest collection time for the associated requested analysis in order to evaluate the holding time unless specifically indicated.

Contact and Corrective Action Comments:

The Temperature Blank temperature for shipping container 1 was 2.0°C and shipping container 2 was 3.6°C. tj 5/31/24

In certain circumstances, samples submitted to Energy Laboratories, Inc. may be subcontracted to other certified laboratories in order to complete the analysis requested. This serves as notice of this possibility. All subcontracted data will be clearly notated on your analytical report.

ANALYTICAL SUMMARY REPORT

October 08, 2024

MT DEQ-Federal Superfund
PO Box 200901
Helena, MT 59620-0901

Work Order: H24090532 Quote ID: H1525

Project Name: CFROU - SURFACE WATER

Energy Laboratories Inc Helena MT received the following 10 samples for MT DEQ-Federal Superfund on 9/14/2024 for analysis.

Lab ID	Client Sample ID	Collect Date	Receive Date	Matrix	Test
H24090532-001	CFR-34	09/12/24 10:00	09/14/24	Surface Water	Metals by ICP/ICPMS, Dissolved Metals by ICP/ICPMS, Tot. Rec. Alkalinity to pH 4.5 Hardness Anions by Ion Chromatography Nitrogen, Nitrate + Nitrite Nitrogen, Total Persulfate Metals Digestion by E200.2 E365.1 Digestion, Total P Nitrogen, Total Persulfate A4500 N-C Phosphorus, Total Solids, Total Suspended

The analyses presented in this report were performed by Energy Laboratories, Inc., 3161 E. Lyndale Ave., Helena, MT 59604, unless otherwise noted. Any exceptions or problems with the analyses are noted in the report package. Any issues encountered during sample receipt are documented in the Work Order Receipt Checklist.

The results as reported relate only to the item(s) submitted for testing. This report shall be used or copied only in its entirety. Energy Laboratories, Inc. is not responsible for the consequences arising from the use of a partial report.

Energy Laboratories, Inc. verifies the reported results for the analysis has been technically reviewed and approved for release.

If you have any questions regarding these test results, please contact your Project Manager.

MCL - Maximum Contaminant Level
ND - Not detected at the Reporting Limit (RL)
J - Estimated value - analyte was present but less than the Reporting Limit (RL)
L -Lowest available reporting limit for the analytical method used and/or volume submitted

ANALYTICAL QC SUMMARY REPORT

Client: MT DEQ-Federal Superfund
Prepared by Helena, MT Branch

Work Order: H24090532
BatchID: 42595
Date: *08-Oct-24*

Run ID :Run Order: **SEAL AA500_240927A: 241** SampType: **Initial Calibration Verification Standard** Lab ID: **ICV** Method: **E365.1**

Analysis Date: **09/29/24 11:22** Units: **mg/L** **Prep Info:** Prep Date: **8/7/2018** Prep Method: **E365.1**

Analytes 1	Result	PQL	SPK value	SPK Ref Val	%REC	LowLimit	HighLimit	RPD Ref Val	%RPD	RPDLimit	Qual
Phosphorus, Total as P	0.239	0.010	0.25	0	**96**	90	110				

Associated samples: **H24090532-001E, H24090532-002E, H24090532-003E, H24090532-004E, H24090532-005E, H24090532-006E, H24090532-007E, H24090532-008E, H24090532-009E, H24090532-010E**

Qualifiers:
ND - Not Detected at the Reporting Limit
J - Analyte detected below quantitation limits
S - Spike Recovery outside accepted recovery limit
R - RPD outside accepted recovery limits
N - Analyte concentration was not sufficiently high to calculate RPD
A - Analyte concentration greater than four times the spike amount

Containers requiring zero headspace have no headspace or bubble that is <6mm (1/4").	Yes ☐	No ☐	No VOA vials submitted ☑
Water - pH acceptable upon receipt?	Yes ☑	No ☐	Not Applicable ☐

Standard Reporting Procedures:

Lab measurement of analytes considered field parameters that require analysis within 15 minutes of sampling such as pH, Dissolved Oxygen and Residual Chlorine, are qualified as being analyzed outside of recommended holding time.

Solid/soil samples are reported on a wet weight basis (as received) unless specifically indicated. If moisture corrected, data units are typically noted as –dry. For agricultural and mining soil parameters/characteristics, all samples are dried and ground prior to sample analysis.

The reference date for Radon analysis is the sample collection date. The reference date for all other Radiochemical analyses is the analysis date. Radiochemical precision results represent a 2-sigma Total Measurement Uncertainty.

For methods that require zero headspace or require preservation check at the time of analysis due to potential interference, the pH is verified at analysis. Nonconforming sample pH is documented as part of the analysis and included in the sample analysis comments.

Trip Blanks and/or Blind Duplicate samples are assigned the earliest collection time for the associated requested analysis in order to evaluate the holding time unless specifically indicated.

Contact and Corrective Action Comments:

The temperature blank temperature in shipping container 1 was 2.3°C, shipping container 2 was 2.4°C, shipping container 5 was 2.3°C, shipping container 6 was 1.3°C and shipping container 7 was 2.0°C.

Work Order Receipt Checklist - Continued

MT DEQ-Federal Superfund H24090532

The temperature of the sample(s) in shipping container 3 was 2.3°C, shipping container 4 was 1.9°C.

The analyses presented in this report were performed by Energy Laboratories, Inc., 3161 E. Lyndale Ave., Helena, MT 59604, unless otherwise noted. Any exceptions or problems with the analyses are noted in the report package. Any issues encountered during sample receipt are documented in the Work Order Receipt Checklist.

The results as reported relate only to the item(s) submitted for testing. This report shall be used or copied only in its entirety. Energy Laboratories, Inc. is not responsible for the consequences arising from the use of a partial report.

Energy Laboratories, Inc. verifies the reported results for the analysis has been technically reviewed and approved for release.

If you have any questions regarding these test results, please contact your Project Manager.

CLIENT: MT DEQ-Federal Superfund
Project: CFROU-SEDIMENT
Work Order: H24090536

Report Date: 10/31/24

CASE NARRATIVE

The difference in results between samples CFR-18 and CFR-18 QC-FD is mostly likely attributed to the differences in moisture content between the two samples. JCS 103124

All "J" qualified analyte concentrations are below the laboratory minimum recommended Reporting Limit (RL) and above the calculated method detection limit (MDL). Inorganic analytes reported with "J" qualifiers should be verified against the corresponding method blank and continuing calibration blanks. Inorganic "J" quantitations near the MDL may be suspect due to possible method background levels, sample matrix effects, and/or daily variability in instrument signal-to-noise levels.

Containers requiring zero headspace have no headspace or bubble that is <6mm (1/4").	Yes ☐	No ☐	No VOA vials submitted ☑
Water - pH acceptable upon receipt?	Yes ☐	No ☐	Not Applicable ☑

Standard Reporting Procedures:

Lab measurement of analytes considered field parameters that require analysis within 15 minutes of sampling such as pH, Dissolved Oxygen and Residual Chlorine, are qualified as being analyzed outside of recommended holding time.

Solid/soil samples are reported on a wet weight basis (as received) unless specifically indicated. If moisture corrected, data units are typically noted as –dry. For agricultural and mining soil parameters/characteristics, all samples are dried and ground prior to sample analysis.

The reference date for Radon analysis is the sample collection date. The reference date for all other Radiochemical analyses is the analysis date. Radiochemical precision results represent a 2-sigma Total Measurement Uncertainty.

For methods that require zero headspace or require preservation check at the time of analysis due to potential interference, the pH is verified at analysis. Nonconforming sample pH is documented as part of the analysis and included in the sample analysis comments.

Trip Blanks and/or Blind Duplicate samples are assigned the earliest collection time for the associated requested analysis in order to evaluate the holding time unless specifically indicated.

Contact and Corrective Action Comments:

The temperature blank temperature in shipping container 1 was 2.3°C, shipping container 2 was 2.4°C, shipping container 5 was 2.3°C, shipping container 6 was 1.3°C and shipping container 7 was 2.0°C.

Work Order Receipt Checklist - Continued

MT DEQ-Federal Superfund H24090536

The temperature of the sample(s) in shipping container 3 was 2.3°C, shipping container 4 was 1.9°C.
The collection times were not provided on the chain of custody for samples WSC-SBC and SS-25. WSC-SBC was collected at 16:30 and SS-25 was collected at 17:15 per the sample containers.

The analyses presented in this report were performed by Energy Laboratories, Inc., 3161 E. Lyndale Ave., Helena, MT 59604, unless otherwise noted. Any exceptions or problems with the analyses are noted in the report package. Any issues encountered during sample receipt are documented in the Work Order Receipt Checklist.

The results as reported relate only to the item(s) submitted for testing. This report shall be used or copied only in its entirety. Energy Laboratories, Inc. is not responsible for the consequences arising from the use of a partial report.

Energy Laboratories, Inc. verifies the reported results for the analysis has been technically reviewed and approved for release.

If you have any questions regarding these test results, please contact your Project Manager.

CLIENT: MT DEQ-Federal Superfund
Project: CFROU-SURFACE WATER
Work Order: H24110734

Revised Date: 03/13/25
Report Date: 12/23/24

CASE NARRATIVE

Joe Naughton contacted laboratory regarding results for sample WSC-SBC-007 Cadmium results due to higher than historically. Sample was re-digested and analyzed again for Cadmium. Attached is the revised report with the corrected value for Cadmium. WJJ 03/13/25

All "J" qualified analyte concentrations are below the laboratory minimum recommended Reporting Limit (RL) and above the calculated method detection limit (MDL). Inorganic analytes reported with "J" qualifiers should be verified against the corresponding method blank and continuing calibration blanks. Inorganic "J" quantitations near the MDL may be suspect due to possible method background levels, sample matrix effects, and/or daily variability in instrument signal-to-noise levels.

Container/Temp Blank temperature:	3.0°C On Ice		
Containers requiring zero headspace have no headspace or bubble that is <6mm (1/4").	Yes ☐	No ☐	No VOA vials submitted ☑
Water - pH acceptable upon receipt?	Yes ☑	No ☐	Not Applicable ☐

Standard Reporting Procedures:

Lab measurement of analytes considered field parameters that require analysis within 15 minutes of sampling such as pH, Dissolved Oxygen and Residual Chlorine, are qualified as being analyzed outside of recommended holding time.

Solid/soil samples are reported on a wet weight basis (as received) unless specifically indicated. If moisture corrected, data units are typically noted as –dry. For agricultural and mining soil parameters/characteristics, all samples are dried and ground prior to sample analysis.

The reference date for Radon analysis is the sample collection date. The reference date for all other Radiochemical analyses is the analysis date. Radiochemical precision results represent a 2-sigma Total Measurement Uncertainty.

For methods that require zero headspace or require preservation check at the time of analysis due to potential interference, the pH is verified at analysis. Nonconforming sample pH is documented as part of the analysis and included in the sample analysis comments.

Trip Blanks and/or Blind Duplicate samples are assigned the earliest collection time for the associated requested analysis in order to evaluate the holding time unless specifically indicated.

Contact and Corrective Action Comments:

The temperature blank temperature in shipping container 1 was 0.1°C and shipping container 2 was 3.0°C. TKJ 11/26/24

1.0 INTRODUCTION

This report provides detailed methods and results for the wetland delineation and functional assessment conducted by RESPEC for Phase 1 of the Clark Fork River Operable Unit (CFROU) to satisfy Year-10 post-remediation monitoring requirements as described in the CFROU Record of Decision (ROD) [EPA, 2004]. The ROD states that after 10 years, there should be "no net loss of wetlands" compared to pre-project conditions in any CFROU project phases in order to meet U.S. Army Corps of Engineers (USACE) criteria [EPA, 2004]. For Phase 1, a total of 0.47 acres of wetlands were identified prior to the remedy [Geum Environmental Consulting, Inc., 2012]. Additionally, the ROD stated that the Functionally Effective Wetland Area (FEWA) assessment method should be applied to wetlands within the CFROU [EA Engineering, Science, and Technology, 1992]. According to Geum Environmental Consulting, Inc. [2012], a reference wetland FEWA score of 2.3 was developed for the CFROU. This report considers the pre-remediation wetland area of 0.47 acres and the reference FEWA score of 2.3 as the Year-10 performance targets for Phase 1 of the CFROU.

2.0 METHODS

RESPEC conducted a wetland delineation of Phase 1 from July 1-3, 2024. The study area included the entire 134.42-acre Phase 1 remediation area. The delineation was conducted in accordance with USACE [Environmental Laboratory, 1987; USACE, 2010]. The wetland indicator status for each plant species was derived from national status archives [USACE, 2020], and the plant nomenclature for the delineation followed that established for Montana plants [Lesica, 2012]. Wetlands were classified according to standard protocols for the U.S. [Cowardin et al., 1979] and A hydrogeomorphic classification system [Smith et al., 1995]. Wetlands observed during the field survey were mapped using a resource-grade global navigation satellite system (Trimble R1) accurate to one-meter and companion electronic tablet with ArcGIS Field Maps software.

Soil data for the project area were acquired from the Natural Resource Conservation Service (NRCS) web soil survey [NRCS, 2024]. Hydric soil and wetland hydrology indicators, if observed, were recorded to a maximum depth of 20 inches at each wetland soil pit and matching upland soil pits. Wetland plot information for vegetation, hydrology, and soils was recorded on USACE wetland determination data forms. New data forms were completed at representative locations throughout the phase. Photographs were taken of each wetland and upland data point and at representative locations throughout the phase.

The FEWA assessment method was completed for wetlands identified within Phase 1 using the evaluation form provided by EA Engineering, Science, and Technology [1992]. The assessment area for the FEWA form consisted of the entirety of Phase 1; however, only wetlands delineated within the remediated soil removal area were considered as part of the functional assessment. Additional data used to complete the FEWA form included threatened and endangered Species records from the U.S. Fish and Wildlife Service Information for Planning and Consultation Database [U.S. Fish and Wildlife Service, 2024] as well as Montana Species of Concern occurrence records from the Montana Natural Heritage Program [2024].

3.0 RESULTS

3.1 WETLAND DELINEATION

A total of 53.96 acres of wetlands were delineated across the 134.42-acre Phase 1 remediation area. Additionally, 34.36 acres of wetlands were identified during the delineation outside of the remediated area and were not included in the functional assessment or used to determine if performance targets had been met. Wetlands occurring within the remediated area totaled 19.60 acres which exceeded the 0.47-acre pre-remedy wetland area. A map of all delineated wetlands, as well as the locations of wetland and upland data pits, is provided in Figure 1. Representative wetland photographs are provided in Appendix G. Completed wetland determination data forms are provided in Appendix H.

The dominant wetland class in Phase 1 was depressional [Cowardin et al., 1979]. The dominant hydrogeomorphic class was palustrine emergent with scrub-shrub, Aquatic bed and forested wetlands were also present within the phase [Smith et al., 1995]. The wetlands present within the Phase 1 remediated area included excavated depressions with hydrology primarily tied to groundwater and fringe wetlands that have developed along the river and expanded laterally over time. There was evidence of hydric soil development across the phase, but mottles were observed across soils found in excavated depressions and river margin wetlands. Wetland vegetation was dominated by cattails (*Typha latifolia*) and foxtail (*Alopecurus arundinaceus*) in the herbaceous stratum and sandbar willow (*Salix exigua*) in the shrub stratum. Vegetation in adjacent upland areas consisted of Great Basin wild rye (*Elymus cinerius*) and other grasses in the herbaceous stratum and buffaloberry (*Shepherdia canadensis*) in the shrub stratum.

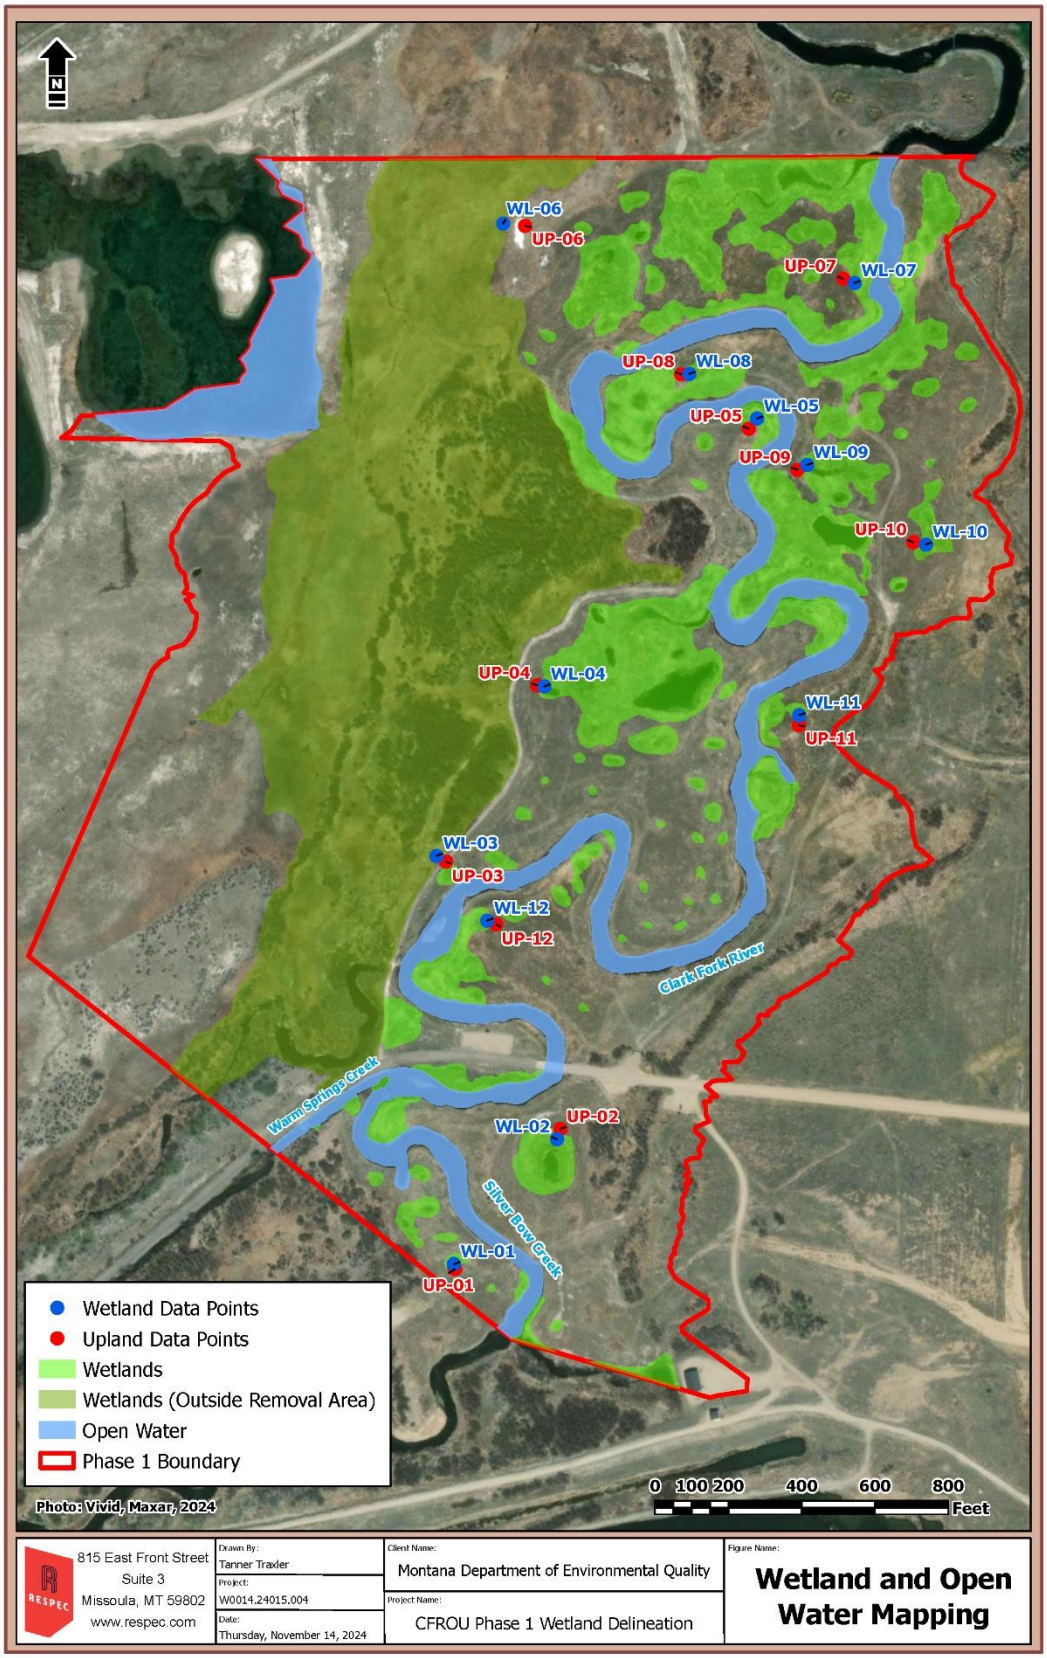

Figure 1. Wetlands and open water in Phase 1 of the Clark Fork River Operable Unit, 2024.

3.2 WETLAND FUNCTIONAL ASSESSMENT

A FEWA functional assessment form was completed for the 19.60 acres of wetlands delineated within the remediated area (Appendix I). One FEWA form was deemed appropriate for all wetlands considered as part of the assessment because the wetlands are all hydrologically connected and generally consist of similar soil types and vegetation species.

The total FEWA score for the wetlands identified within the remediated area of Phase 1 was at 2.55, exceeding the target score of 2.3. The site received functional ratings of "moderate" or "high" for each of the ten functional categories. Table 1 provides a summary of the functional ratings and overall FEWA assessment score for Phase 1.

Table 1. Summary of wetland functional ratings and overall score for Phase 1 of the Clark Fork River Operable Unit, 2024.

Functional Category[1]	Rating	Numeric Rating	Weight	Score
Hydrologic support	High	3	1.0	3.0
Floodflow alteration	Moderate	2	0.5	1.0
Sediment stabilization and erosion control	High	3	1.0	3.0
Water purification	Moderate	2	1.0	2.0
Production export and food-chain support	High	3	1.0	3.0
Aquatic diversity and abundance	High	3	1.5	4.5
Wildlife diversity and abundance: breeding	High	3	1.5	4.5
Wildlife diversity and abundance: migration	Moderate	2	1.5	3.0
Wildlife diversity and abundance: wintering	Moderate	2	1.0	2.0
Threatened, endangered or sensitive species habitat	Moderate	2	1.0	2.0
Total points				**28.0**
Maximum total points				**33.0**
Overall rating				**2.55**

4.0 DISCUSSION

A wetland delineation was conducted for Phase 1 of the CFROU July 2024 as part of the Year-10 post-remediation performance monitoring program. A total of 19.60 acres of wetlands were delineated across the remediated areas in Phase 1 which exceeded the pre-remediation wetland area of 0.47 acres. Additionally, the FEWA functional assessment method for the wetlands delineated was 2.55 which also exceeded the target reference score of 2.3. Wetlands observed throughout Phase 1 appeared to be ecologically functional and wetland area will likely to expand over time presuming the hydrologic system remains relatively stable.

[1] Refer to Appendix I for complete FEWA assessment form and explanation of methods and scores.

Depth (inches)	Matrix Color (moist)	Matrix %	Redox Features Color (moist)	Redox Features %	Type[1]	Loc[2]	Texture	Remarks
0-4	10YR 3/1	100					Loamy/Clayey	Loam
4-20	10YR 4/2	95	10YR 5/8	5	C	M	Loamy/Clayey	Prominent redox concentrations

[1]Type: C=Concentration, D=Depletion, RM=Reduced Matrix, CS=Covered or Coated Sand Grains. [2]Location: PL=Pore Lining, M=Matrix.

Hydric Soil Indicators: (Applicable to all LRRs, unless otherwise noted.)

- ___ Histosol (A1)
- ___ Histic Epipedon (A2)
- ___ Black Histic (A3)
- ___ Hydrogen Sulfide (A4)
- ___ 1 cm Muck (A9) **(LRR D, G)**
- X Depleted Below Dark Surface (A11)
- ___ Thick Dark Surface (A12)
- ___ Sandy Mucky Mineral (S1)
- ___ 2.5 cm Mucky Peat or Peat (S2) **(LRR G)**
- ___ Sandy Gleyed Matrix (S4)
- ___ Sandy Redox (S5)
- ___ Stripped Matrix (S6)
- ___ Loamy Mucky Mineral (F1) **(except MLRA 1)**
- ___ Loamy Gleyed Matrix (F2)
- X Depleted Matrix (F3)
- ___ Redox Dark Surface (F6)
- ___ Depleted Dark Surface (F7)
- ___ Redox Depressions (F8)

Indicators for Problematic Hydric Soils[3]:

- ___ 2 cm Muck (A10) **(LRR A, E)**
- ___ Iron-Manganese Masses (F12) **(LRR D)**
- ___ Red Parent Material (F21)
- ___ Very Shallow Dark Surface (F22)
- ___ Other (Explain in Remarks)

[3]Indicators of hydrophytic vegetation and wetland hydrology must be present, unless disturbed or problematic.

Restrictive Layer (if observed):

Type: _____

Depth (inches): _____

Hydric Soil Present? **Yes** X **No** ___

Remarks:
Clay loam with mottles below 4".

HYDROLOGY

Wetland Hydrology Indicators:

Primary Indicators (minimum of one is required; check all that apply)

- ___ Surface Water (A1)
- ___ High Water Table (A2)
- X Saturation (A3)
- ___ Water Marks (B1)
- ___ Sediment Deposits (B2)
- ___ Drift Deposits (B3)
- ___ Algal Mat or Crust (B4)
- ___ Iron Deposits (B5)
- ___ Surface Soil Cracks (B6)
- ___ Inundation Visible on Aerial Imagery (B7)
- ___ Sparsely Vegetated Concave Surface (B8)
- ___ Water-Stained Leaves (B9) (**except MLRA 1, 2, 4A, and 4B**)
- ___ Salt Crust (B11)
- ___ Aquatic Invertebrates (B13)
- ___ Hydrogen Sulfide Odor (C1)
- ___ Oxidized Rhizospheres on Living Roots (C3)
- ___ Presence of Reduced Iron (C4)
- ___ Recent Iron Reduction in Tilled Soils (C6)
- ___ Stunted or Stressed Plants (D1) (**LRR A**)
- ___ Other (Explain in Remarks)

Secondary Indicators (2 or more required)

- ___ Water-Stained Leaves (B9) (**MLRA 1, 2 4A, and 4B**)
- ___ Drainage Patterns (B10)
- ___ Dry-Season Water Table (C2)
- ___ Saturation Visible on Aerial Imagery (C9)
- ___ Geomorphic Position (D2)
- ___ Shallow Aquitard (D3)
- X FAC-Neutral Test (D5)
- ___ Raised Ant Mounds (D6) (**LRR A**)
- ___ Frost-Heave Hummocks (D7)

Field Observations:

Surface Water Present? Yes ___ No ___ Depth (inches): ___

Water Table Present? Yes ___ No ___ Depth (inches): ___

Saturation Present? (includes capillary fringe) Yes X No ___ Depth (inches): 4

Wetland Hydrology Present? **Yes** X **No** ___

Describe Recorded Data (stream gauge, monitoring well, aerial photos, previous inspections), if available:

Remarks:
Saturation at 4".

U.S. Army Corps of Engineers

Indicators for Problematic Hydric Soils[3]:

- ___ 2 cm Muck (A10) **(LRR A, E)**
- ___ Iron-Manganese Masses (F12) **(LRR D)**
- ___ Red Parent Material (F21)
- ___ Very Shallow Dark Surface (F22)
- ___ Other (Explain in Remarks)

[3]Indicators of hydrophytic vegetation and wetland hydrology must be present, unless disturbed or problematic.

Restrictive Layer (if observed):

Type: _____

Depth (inches): _____

Hydric Soil Present? **Yes** ___ **No** X

Remarks:

No hydric soil indicators observed.

HYDROLOGY

Wetland Hydrology Indicators:

Primary Indicators (minimum of one is required; check all that apply)

- ___ Surface Water (A1)
- ___ High Water Table (A2)
- ___ Saturation (A3)
- ___ Water Marks (B1)
- ___ Sediment Deposits (B2)
- ___ Drift Deposits (B3)
- ___ Algal Mat or Crust (B4)
- ___ Iron Deposits (B5)
- ___ Surface Soil Cracks (B6)
- ___ Inundation Visible on Aerial Imagery (B7)
- ___ Sparsely Vegetated Concave Surface (B8)
- ___ Water-Stained Leaves (B9) (**except MLRA 1, 2, 4A, and 4B**)
- ___ Salt Crust (B11)
- ___ Aquatic Invertebrates (B13)
- ___ Hydrogen Sulfide Odor (C1)
- ___ Oxidized Rhizospheres on Living Roots (C3)
- ___ Presence of Reduced Iron (C4)
- ___ Recent Iron Reduction in Tilled Soils (C6)
- ___ Stunted or Stressed Plants (D1) (**LRR A**)
- ___ Other (Explain in Remarks)

Secondary Indicators (2 or more required)

- ___ Water-Stained Leaves (B9) (**MLRA 1, 2 4A, and 4B**)
- ___ Drainage Patterns (B10)
- ___ Dry-Season Water Table (C2)
- ___ Saturation Visible on Aerial Imagery (C9)
- ___ Geomorphic Position (D2)
- ___ Shallow Aquitard (D3)
- ___ FAC-Neutral Test (D5)
- ___ Raised Ant Mounds (D6) (**LRR A**)
- ___ Frost-Heave Hummocks (D7)

Field Observations:

Surface Water Present?	Yes ___	No X	Depth (inches): ___
Water Table Present?	Yes ___	No X	Depth (inches): ___
Saturation Present? (includes capillary fringe)	Yes ___	No X	Depth (inches): ___

Wetland Hydrology Present? **Yes** ___ **No** X

Describe Recorded Data (stream gauge, monitoring well, aerial photos, previous inspections), if available:

Remarks:

No hydrology indicators observed. Soil dry.

INTRODUCTION

This evaluation form is intended to be used for determining wetland functional value of wetlands located on Superfund Sites in the Upper Clark Fork River Basin (UCFR), Montana. This rating of wetland functional value is to be subsequently used in determining the amount of "functionally effective" wetlands, which is defined as delineated wetland acreage adjusted by an overall rating for wetland functional value. The method for arriving at this rating is detailed in Part D of this form.

The questions and organization of the procedure are adapted from the Wetland Evaluation Technique (WET 2.0) of Adamus et al. 1987. Although this evaluation uses many of the indicators and follows a similar structure as WET 2.0, it is significantly different in several important ways:

- it has been made more regionally specific to the range of conditions found in the Upper Clark Fork River Basin;
- it has been streamlined by having fewer indicators than WET 2.0;
- it has a simplified key to arriving at a particular rating;
- it is based primarily on a combination of the "effectiveness" and "opportunity" evaluations of WET 2.0, with very little use of a "social significance" evaluation; and
- it provides for an overall rating of wetland functional value.

The evaluation is divided into four parts. In Part A, the precise area to be evaluated, termed the Assessment Area (AA) is determined. Part B is a series of questions to generally characterize the AA. Part C is the evaluation, which depends largely on information filled out in Part A and B. It is made up of ten categories of wetland functional value:

- Hydrologic Support (Groundwater Recharge and Discharge)
- Floodflow Alteration
- Sediment Stabilization and Erosion Control
- Water Purification
- Production Export/Food Chain Support
- Aquatic Diversity and Abundance

- Wildlife Diversity and Abundance: Breeding
- Wildlife Diversity and Abundance: Migration
- Wildlife Diversity and Abundance: Wintering
- Habitat for Threatened, Endangered, or Sensitive Species

Part D is an analysis of the evaluation results, which includes a summary of the ratings in Part C over all ten categories, arriving at an overall wetland rating. This summary is followed by a description of how effective wetland area is to be calculated. An option for weighting the various categories is given, which if modified should be accompanied by an explanation for using different weights for any of the functional categories.

For categories dealing with wildlife diversity and abundance, waterfowl are given an emphasis in both this evaluation and WET 2.0, since waterfowl are typically the most abundant and common wetland dependent wildlife species. Although other types of wildlife, such as non-game birds and mammals, may also depend on wetlands, addressing their habitat requirements would make this evaluation considerably more complicated. Consequently, it was judged to be undesirable for the purposes of this form.

Like WET 2.0, the evaluation is based on indicators of wetland functional value. The determination of a rating is based on a key, where yes or no answers to indicator questions lead to ratings from **very low** to **high**. The key works in basically two ways: (1) an answer to one question can result in a particular rating or be necessary for a particular rating due to its major effect on wetland functions; or (2) the effect of several indicators together can result in a particular rating. Not all categories have a rating of **very low**. The **very low** rating was given only to the water purification and aquatic and wildlife habitat related functions, where the presence of a barren tailings surface results in a very low value. Other categories were given the **low**, **moderate**, and **high** ratings, similar to WET 2.0.

Since WET 2.0 is presently considered to be based on the most extensive and up-to-date synthesis of research on wetland functions, indicator questions were generally taken either directly or in modified form from that evaluation method. Although in some cases they may seem arbitrary, they were assumed to be based on the best available information and were used unless more site specific information deemed otherwise.

This evaluation includes use of the U.S. Fish and Wildlife Service " Classification of Wetland and Deep Water Habitat in the United States" (Cowardin et al. 1979) to describe wetland systems and classes. Using this evaluation will require some field data or at least a good on-the-ground familiarity with the assessment area.

PART A: DEFINITION OF ASSESSMENT AREA

For each functional evaluation to be conducted, it is necessary to define the boundaries of the Assessment Area (AA). The geographical unit to be evaluated may be defined by both natural and administrative boundaries. Natural boundaries are likely to be associated with floodplain edges, stream reaches of similar characteristics, lake complexes, or general hydrological connectivity. Administrative boundaries are most likely to include boundaries of operable units or proposed remedial actions. The AA should be mostly composed of wetland area, although there may also be some non-wetland area intermixed or adjacent to the wetland.

For example, the AA could be an entire operable unit or, if the operable unit is large and complex, it could be subdivided according to physical or biological attributes. Subdividing an operable unit is probably most critical when levels of disturbance or negative impacts to the wetlands vary strongly within the operable unit. However the AA is defined, effective wetland area will be quantified at the level of the operable unit for purposes of accounting total wetland areas before and after remedial actions.

1. What name has been given to this AA? CFROU Phase 1

2. What is the total acreage of the AA? 134.42 of wetlands in the AA? 19.60

3. In what operable unit is the AA located? Clark Fork River OU

4. List any other AAs in this operable unit? Phases 2-22
Wetland assessments not yet completed for other Phases.

5. Have the boundaries of the AA wetlands been delineated? Yes
Title of delineation report: CFROU 2024 Annual Report - Phase 1 Wetland Report

6. Describe the boundaries of the AA and the location of the wetlands in the AA, including sketch map on following page. Provide a justification for determining the AA boundaries.

The boundary of the AA is the Phase 1 boundary. Only the wetlands delineated within the soil removal areas of Phase 1 were considered as part of the assessment.

See 2024 CFROU Annual Report

Sketch map of _____ Assessment Area, showing location of AA boundaries and wetlands within and adjacent to AA.

PART B: CHARACTERISTICS OF ASSESSMENT AREA (AA)

Area

1. Is the **surface area** of the wetland within the AA and any connected wetlands within one mile of the AA:

   a. ____ less than 5 acres?
   b. ____ between 5 and 40 acres?
   c. X between 40 and 200 acres?
   d. ____ greater than 200 acres?

2. The **watershed** of the AA is:

   a. ____ less than 1 square mile
   b. ____ 1-100 square miles
   c. X 101-2,500 square miles
   d. ____ greater than 2,500 square miles

Vegetation and Habitat

3. Which **wetland system** is dominant (D) and which are also present (P) in the AA?

   a. P Lacustrine
   b. D Palustrine
   c. P Riverine

4. Which **vegetation class** (as defined by Cowardin et al. 1979) is dominant (D) in the AA wetland and which comprise at least 10% or 1 acre of the AA wetland (P)?

		Percent of Wetland	Major Plant Species Present
a.	Forested		
b. P	Scrub-Shrub	25	Salix spp.
c. D	Emergent	70	Typha latifolia, Alopecurus arundinaceus
d. P	Aquatic Bed	5	Lemna sp.

Vegetative cover of wetland (in percent of total area) 95 %

5. **Vegetation/Water Interspersion**

If surface water is present in the AA, does the horizontal pattern of obligate emergent vegetation consist of:

a. X relatively few, continuous areas of vegetation with little interspersion with channels or pools, as in Example A of Figure 1? **(Low V/W Interspersion)**

b. ____ a condition intermediate between Examples A and B of Figure 1? **(Moderate V/W Interspersion)**

c. ____ a mosaic of relatively small patches of vegetation interspersed with channels or pools, as in Example B of Figure 1? **(High V/W Interspersion)**

6. **Vegetation Class Interspersion**

The horizontal pattern of vegetation classes in the AA consist of:

a. ____ relatively homogenous areas supporting a single vegetation class with little or no interspersion between these areas? **(Low Vegetation Class Interspersion)**

b. X a condition intermediate between (a) and (c)? **(Moderate Vegetation Class Interspersion)**

c. ____ a highly interspersed mosaic of relatively small areas (at least 100 sq. ft.) that support different vegetation classes? **(High Vegetation Class Interspersion)**

7. **Vegetation Form Richness**

Which of the following conditions best applies to the AA's wetland?

a. ____ one vegetation class present and fewer dominance types than in (b). **(Low Vegetation Form Richness)**

b. ____ two vegetation classes present; or at least two dominance types if under 10 acres, four dominance types if 10-100 acres, or six dominance types if greater than 100 acres. **(Moderate Vegetation Form Richness)**

c. X at least three vegetation classes present; or at least two vegetation classes and at least four dominance types if under 10 acres, six dominance types if 10-100 acres, or eight dominance types if greater than 100 acres. **(High Vegetation Form Richness)**

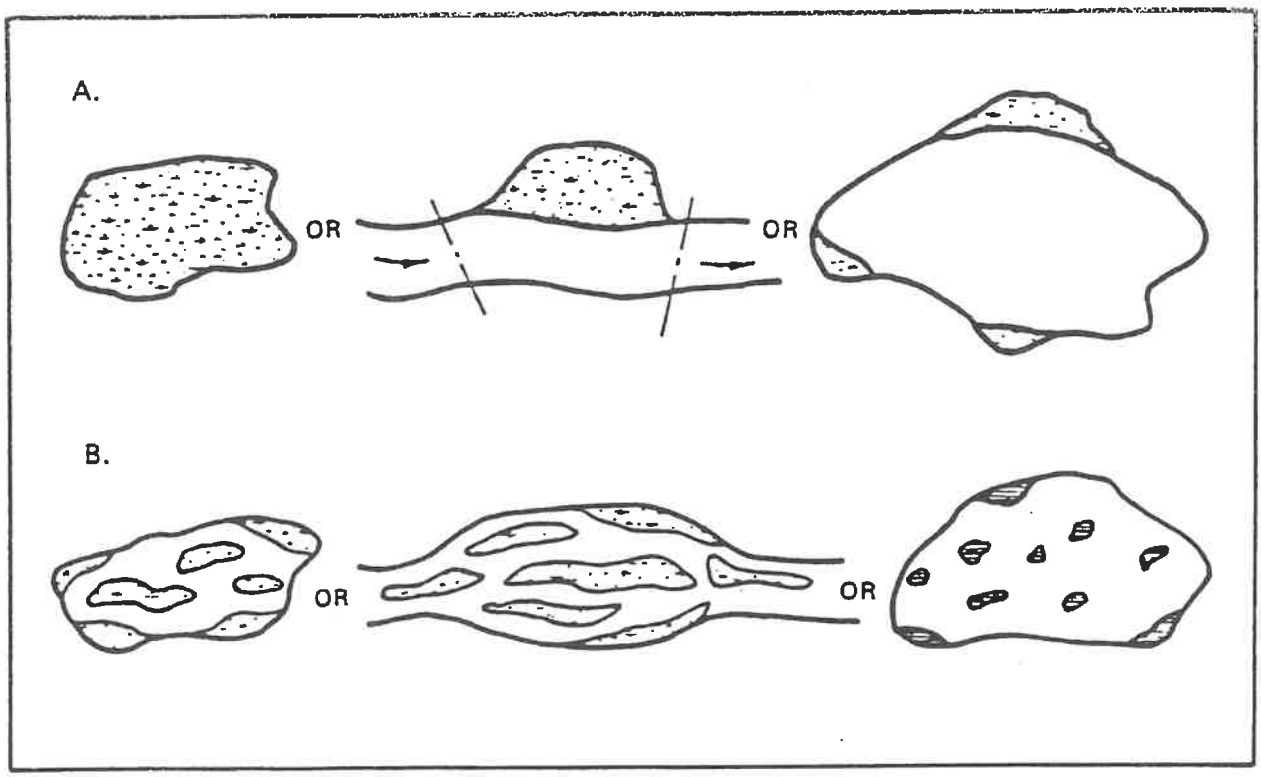

Figure 1. **Examples of low (A) and High (B) vegetation/water interspersion (source: Adamus et al., 1987).**

8. This question pertains to the context of the wetland in relation to any nearby wetlands. A wetland is a "cluster" wetland if together with nearby wetlands it has a certain minimum area of emergent or scrub-shrub vegetation. In contrast, it is an "oasis" wetland, if it is a relatively small and isolated amount of emergent or scrub-shrub vegetation (threshold areas for this question are taken directly from WET 2.0).

(a) Within 1,000 yd of the AA's center, is the acreage of emergent wetland greater than 4.6 acres or that of scrub-shrub wetland greater than 2.3 acres?
__X__ If so, the wetland is part of a **cluster** wetland.

(b) Within 1,000 yd of the AA's center, is the acreage of emergent wetland less than 0.8 acres or that of scrub-shrub wetland less than 0.4 acres?
_____ If so, the wetland is an **oasis** wetland.

9. Is the average **width of vegetation** dominated by obligate emergent, scrub/shrub, or forested vegetation greater than 20 ft (measured perpendicular to flow)? __X__

Hydrology

10. **Inlet/Outlet Conditions**

Does surface water (excluding precipitation or sheet flow) enter and/or exit the AA through an:

a. __X__ inlet with permanent flow
b. ____ inlet with intermittent flow
c. __X__ outlet with permanent flow
d. ____ outlet with intermittent flow

11. Does the AA contain a **channel** with at least seasonally flowing water? __X__

12. If channel flow is present, does **water velocity** average:

a. ____ 0-0.5 ft/sec
b. ____ 0.5-1.5 ft/sec
c. __X__ 1.5-3.3 ft/sec
d. ____ 3.3+ ft/sec

13. **Hydrologic Alteration**

(a) Have **ditches, canals, channels, or levees** been constructed in the AA that result in water flowing out of the AA at a significantly faster rate than would occur without these features? ____

(b) Has an outlet been added to the AA or an inlet been recently (i.e. within the last 10 years) blocked off, significantly **altering the hydroperiod** of the wetland? ____

(c) Is water level in the AA dependent on **artificial control** (other than for purposes of wildlife or fisheries management)? X

14. **Hydroperiod**

What is the dominant (D) and secondary (S) flooding regime in the AA (see Figure 2 and Cowardin et al. (1979) for key to hydroperiod)?

a. ____ permanently flooded
b. ____ intermittently exposed
c. D semipermanently flooded
d. S seasonally flooded
e. ____ saturated (no standing water)
f. ____ temporarily flooded
g. ____ intermittently flooded

Substrate

15. Is the **surface substrate** (upper 3 inches) in the AA predominantly:

a. ____ organic soil (peat or muck)?
b. X fine mineral soil (clay, silt, or loam)?
c. ____ sand?
d. ____ cobble-gravel?
e. ____ bedrock?
f. ____ rubble?

Disturbance

16. Is more than 75% of the AA wetland **barren tailings** surfaces? ____

17. Has the AA been **tilled, filled, bladed, or excavated** within the past three years? ____

18. Are there **sediment sources** upstream from the AA that may contribute substantial amounts of inorganic sediment to the AA? ____

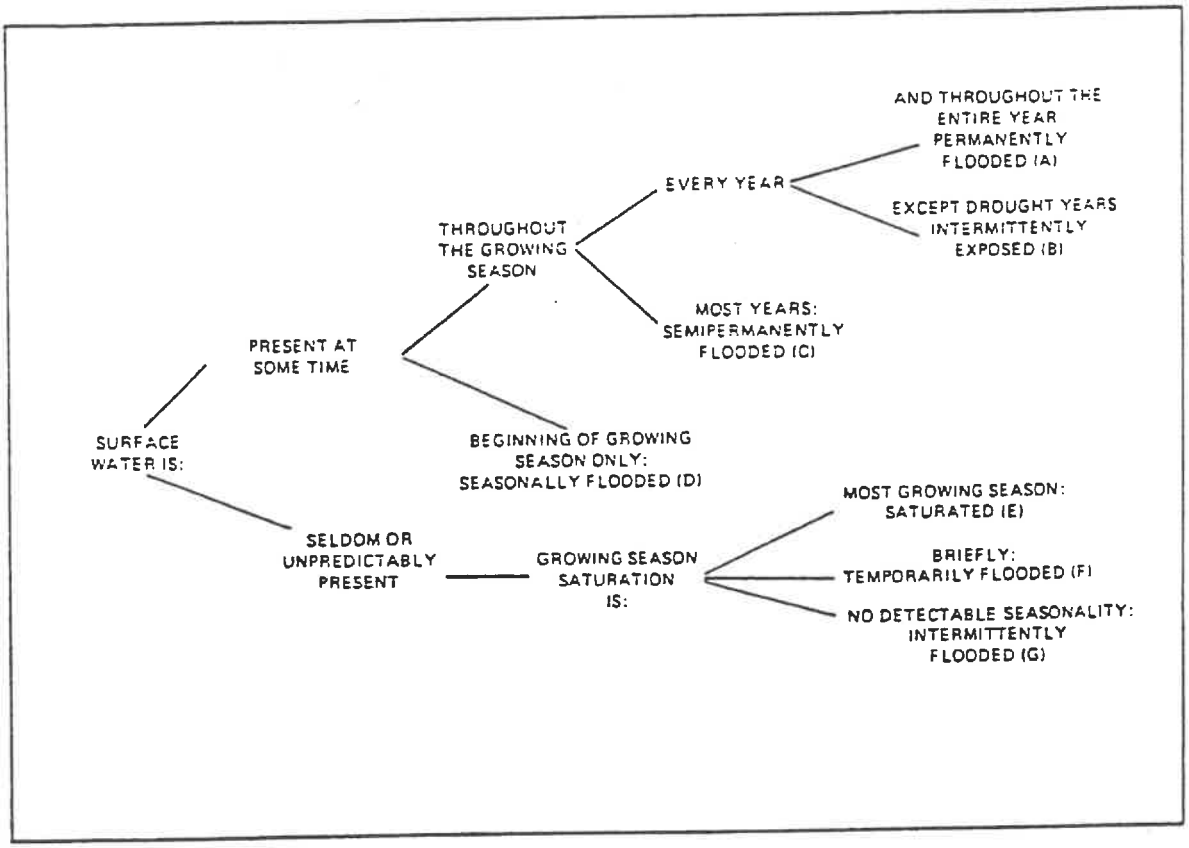

Figure 2. **Key for determination of hydroperiod (source: Adamus et al., 1987).**

19. Is the AA affected by **frequent human activity** due to:

(a) visits by people at least three times daily in the AA or areas adjacent and visible to the AA? X

(b) human activity common within 1,000 feet if surface water mostly less than 3 feet or within 600 feet if surface water greater than 3 feet deep? X

Although the site specific data requested in this question may not be directly known, the nature of land-use or institutional controls (e.g., zoning, land ownership, permitted land use, etc.) should be a good indicator of whether or not #19(a) or #19(b) are met.

PART C: FUNCTIONAL EVALUATION

Many questions in Part C are referred to by a three part notation, such as "B:1,a-b", where B refers to Part B, question #1, answer (a) or (b). Unless otherwise specified, this notation indicates a "yes" answer is needed to the referenced question in Part B. Other questions in Part C occur just once or were considered not pertinent in the general characterization of the AA wetland, and they were therefore not included in Part B.

Hydrologic Support (Groundwater Recharge and Discharge)

1. Is the AA in an area known to be a groundwater recharge area ? ____

2. Is the AA located immediately below a dam? ____

3. Does local topography favor groundwater discharge due to any of following? X

   a. ____ geologic fault oriented perpendicular to surface flow
   b. ____ decrease in soil permeability downslope of AA (e.g., bedrock, clay pan)
   c. ____ AA being at base of relatively steep slope
   d X stream adjacent or within AA known to be a "gaining stream"
   e. ____ other _____

4. AA has no inlet, but does have permanent outlet? ____

Rating for Hydrologic Support

#1 - #4 are all no:	**Low**
#4 is yes; #1, #2 and #3 are all no:	**Moderate**
#1, #2, or #3 are yes:	**High**

Floodflow Alteration

5. How many of the following are true of the AA? (0-2) (3-4) (5-6)

   a. X wetland is within 100 year floodplain of a stream channel
   b. X hydroperiod is not permanently flooded or intermittently exposed (B:14,c-g)
   c. X potential for ponding of high flows is apparent
   d. ____ total area of wetland is greater than 200 acres (B:1,d)
   e. ____ forest or scrub/shrub vegetation covers greater than 30% of AA (B:4)
   f. ____ inlet is wider than outlet

Rating for Floodflow Alteration

0-2 of #5 are yes:
3-4 of #5 are yes:
5-6 of #5 are yes:

Low
(Moderate)
High

Sediment Stabilization and Erosion Control

6. Are potential erosive forces present in AA (e.g., channel flow of high velocity (B:12,d) or open water wider than 100 feet) or are eroding areas adjacent to wetland? X

7. Does AA have wetland vegetation that can effectively buffer effects of erosive forces (e.g., well-vegetated stream banks, bands of erect vegetation greater than 20 ft. wide (B:9) adjacent to wide open water, moderate to high water/vegetation interspersion (B:5,b-c))? X

Rating for Sediment Stabilization and Erosion Control

Both #6 or #7 are no:
Only #7 is yes:
Both #6 and #7 are yes:

Low
Moderate
(High)

Water Purification (Sediment/Toxicant Reduction, Nutrient Removal/Transformation)

8. Is the AA characterized by any of the following? X

   a. ___ no outlet present (B:10,c and d are both no) or impoundment is by artificial or natural dam
   b. X dominated by erect, persistent vegetation that has a hydroperiod of seasonally flooded or wetter (B:14,a-d)
   c. ___ direct evidence of accretion (i.e. accumulation of organic matter or sediment) from historic photos or field sampling and accretion continues to occur
   d. X depositional environments with erect vegetation greater than 20 feet wide (B:9)

9. Is the AA characterized by three or more of the following? X

   a. ___ constricted outlet
   b. ___ slow-velocity flow (B:12,a but less than 0.3 feet/sec)
   c. X riverine system with good pool-riffle ratios or pools and instream debris
   d. X relatively long-duration and extent of seasonal flooding (B:14,a-d)
   e. X having a zone of obligate erect vegetation greater than 20 feet wide (B:9)

10. Is the AA characterized by three or more of the following? ____

a. ____ slow-velocity flow (B:12,a but less than 0.3 feet/sec) and AA wetland has greater than 50% vegetation cover (B:4)
b. X fine mineral soils
c. ____ 50% or greater vegetation cover in the AA wetland (B:4) and nutrient (nitrogen and phosphorus) sources are present upgradient from the AA (B:18,A)
d. X hydroperiod permanently flooded or saturated or nearly so (B:14,a-e)
e. ____ vegetation form richness is high (B:7,c)

11. Is the AA characterized by artificial channelization (B:13,a) or tillage (B:17)? ____

12. (a) Are there potentially significant non-point or point sources of sediment (B:18), toxicants, or high nitrogen/phosphorus levels upstream within 10 miles? ____
(b) Is AA dominated by barren, tailings surface (B:16)? ____

13. Is channel flow present in the AA or contiguous with the AA (B:11)? X

Rating for Water Purification

#12(b) is yes:	**Very Low**
#12(b) is no and #11 is yes:	**Low**
#12(b) and #11 are no and #8, #9, and #10 are all no:	**Low**
#8, #9, or #10 are yes; #12(a) or #13 is no:	**Moderate**
#8, #9, or #10 are yes and #12(a) and #13 are yes:	**High**

Production Export / Food Chain Support

14. For whatever wetland system is dominant in the AA, how many of the characteristics listed below under that system are present in the AA? (all) (more than half) (half or less)

Riverine:

a. ____ aquatic habitat is potentially eutrophic
b. ____ significant areas of erect or submerged vegetation are present
c. ____ watershed greater than 100 square miles (B:2,c-d)

Lacustrine:

a. ____ aquatic habitat is potentially eutrophic
b. ____ significant areas of erect or submerged vegetation are present
c. ____ pH not acidic
d. ____ plant productivity high
e. ____ potential for erosion or substantial flooding

Palustrine:

a. X significant areas of erect or submerged vegetation are present
b. X plant productivity high
c. X potential for erosion or substantial flooding
d. X channel flow (B:11) or open water occurs within or adjacent to AA

15. The AA has permanent or intermittent outlet (B:10,c-d)? X

Rating for Production Export / Food Chain Support

#15 is no	**Low**
#15 is yes and	
#14 is (half or less):	**Low**
#14 is (more than half):	**Moderate**
#14 is (all):	**High**

Aquatic Diversity and Abundance

16. An aquatic bed class is present within the AA (B:4,d) or hydroperiod is permanently flooded or intermittently exposed (B:14,a-b)? X

17. Are toxic substances known to enter the aquatic habitat more than once in a year in concentrations high enough to severely depress fish or aquatic invertebrate populations? ____

18. For whatever wetland system is dominant in the AA, how many of the characteristics listed below under that system are present in the AA? (all) (half or more) (less than half)

Riverine:

List A

a. ____ ditches, channels, canals, levees are not present in the AA (B:13,a = no)
b. ____ water velocity is mostly less than 1.5 feet/sec (B:12,a-b)
c. ____ summer water temperatures are less than 20° C

List B

a. ____ a substantial portion of the stream channel is shaded
b. ____ significant areas of good fish cover occur in the stream (e.g., moderately dense aquatic vegetation, crevices, undercut banks,

submerged logs and stumps, tree roots, boulders, overhanging vegetation, good pool/riffle ratio)

c. ____ suspended solid concentrations are generally not high (as judged by visual observations or documented measurements)

Lacustrine:

a. ____ has permanent inlet and outlet (B:10,a and B:10,c)
b. ____ not dominated by sand bottom (B:15,c = no)
c. ____ high plant form richness (B:7,c) or vegetation/water interspersion (B:5,c)
d. ____ water temperatures greater than 10° C during summer
e. ____ water level not controlled artificially (B:13,c)

Palustrine:

a. X has permanent inlet or outlet (B:10,a or B:10,c) or is fringe or island situation (Note: a fringe wetland is defined as (1) a wetland adjacent to a stream having a width of both channel sides combined less than 1/3 the width of the channel; or (2) a wetland adjacent to a body of open water having a cumulative surface area less than 1/3 the surface area of open water.)
b. X aquatic habitat has some aquatic bed present (B:4,d) or does not have entirely sand substrate (B:15,c = no) or some fish cover present
c. X high plant form richness (B:7,c) or high vegetation/water interspersion (B:5,c)
d. ____ AA wetland is 30-60% open water and emergent vegetation is generally obligate wetland species (B:4,c with obligate wetland species)
e. X inorganic sediment input does not seriously impact water quality

Rating for Aquatic Diversity and Abundance

#16 is no or #17 is yes — **Low**

#16 is yes and #17 is no and

Riverine:

Any from List A in #18 are no — **Low**

All from List A are yes and less than two from List B in #18 are yes — **Moderate**

All from List A are yes and at least two from List B in #18 are yes — **High**

Lacustrine and Palustrine:

Less than two from list in #18 are yes — **Low**

Two to three from list in #18 are yes — **Moderate**

At least four from list in #18 are yes — **High**

Wildlife Diversity and Abundance: Breeding

19. Is AA wetland dominated by barren, tailings surface (B:16)? ____

20. Are any of the following true? ____

    a. ____ AA has been tilled, filled, bladed, excavated (B:17)
    b. ____ AA has been drained or its water supply cut off
    c. ____ AA wetland and any adjacent wetland total less than 5 acres in surface area (B:1,a) and AA wetland has frequent human activity (B:19,a-b)
    d. ____ substrate is bedrock, rubble, or cobble/gravel (B:16,d-f)
    e. ____ low vegetation/water interspersion (B:5,a), low vegetation interspersion (B:6,a), and low plant form richness (B:7,a)

21. For whatever wetland system is dominant in the AA, how many of the characteristics listed below under that system are present in the AA? _____

    Riverine:
    a. ____ AA and any adjacent wetland total greater than 5 acres (B:1,b-d)
    b. ____ vegetation/water interspersion is moderate to high (B:5,b-c) or vegetation interspersion is high (B:6,c) or plant form richness is high (B:7,c)
    c. ____ wooded areas (forest or shrub) occur adjacent or connected to AA
    d. ____ water velocity is less than 1.5 feet/sec (B:12,a-b)
    e. ____ adjacent upland vegetation provides suitable nesting sites for dry nesting waterfowl

    Lacustrine:
    a. ____ AA and any adjacent wetland total greater than 5 acres (B:1,b-d)
    b. ____ AA is cluster or oasis wetland (B:8,a-b)
    c. ____ area of mostly obligate emergent species and shallow water (less than 6.6 feet) comprises at least 10% of AA wetland (B:4)
    d. ____ other wetlands having strongly different hydroperiods are present within 1 mile (B:14,e-g for wetlands within 1 mile)
    e. ____ presence of small island (at least 50 feet from shore) or moderate to high vegetation/water interspersion (B:5,b-c) or moderate to high vegetation interspersion (B:6,b-c) or high plant form richness (B:7,c)
    f. ____ adjacent upland vegetation provides suitable nesting sites for dry nesting waterfowl

    Palustrine:
    a. X AA wetland and any adjacent wetland total greater than 5 acres (B:1,b-d)
    b. X wetlands with a hydroperiod of permanently flooded, intermittently exposed, or seasonally flooded occur within 1 mile of AA (B:14,a-d for wetlands within 1 mile)

c. X high vegetation/water interspersion (B:5,c) or high vegetation interspersion (B:6,c) or high plant form richness (B:7,c)

d. X wooded areas (forest or shrub) occur adjacent or connected to AA or there is a band of mostly obligate emergent vegetation at least 20 feet wide (B:9)

Rating for Wildlife Diversity and Abundance: Breeding

#19 is yes	Very Low
#19 is no and #20 is yes	Low
#19 and #20 are no and	
less than two of #21 are yes	Low
two to three #21 are yes	Moderate
at least four of #21 are yes	High

Wildlife Diversity and Abundance: Migration

22. Is AA wetland dominated by barren, tailings surface (B:16)? ____

23. Is either of the following true? ____

a. ____ AA and any adjacent wetland total less than 5 acres in surface area (B:1,a) and frequent human activity occurs in AA (B:19,a-b)

b. ____ wetland has no outlet (B:10,c and d are no) and has toxic inputs

24. How many of the following are true of the AA? ____

a. ____ 30-60% of the AA wetland is open water and emergent vegetation is generally obligate

b. X high plant form richness (B:7,c)

c. ____ high vegetation/water interspersion (B:5,c) or high vegetation interspersion (B:6,c)

d. X wetland vegetation or hydrology not recently (i.e., within last 10 years) disturbed (B:13,a-c or B:7,c all no)

e. ____ wetland in AA and any connected wetlands within one mile of the AA are greater than 200 acres (B:1,d)

f. ____ wet mud flat or open water area greater than 20 acres is present

Rating for Wildlife Diversity and Abundance: Migration

#22 is yes:	Very Low
#22 is no and #23 is yes:	Low
#22 and #23 are no and	
Less than two #24 are yes:	Low
Two to three of #24 are yes:	Moderate

Four to six of #24 are yes: **High**

Wildlife Diversity and Abundance: Wintering

25. Is AA dominated by barren, tailings surface (B:16)? ____

26. Are any of the following true? ____

    a. ____ all of wetland freezes over for more than one month/year
    b. ____ AA and any adjacent wetland total less than 5 acres in surface area (B:1,a) and no permanent outlet (B:10,c is no) and AA has little or poor shelter for wildlife
    c. ____ AA and any adjacent wetland total less than 5 acres in surface area (B:1,a) and has frequent human activity during winter (B:19, a-b in winter) and no wooded areas (forest or shrub) in or adjacent to AA

27. Wetland in AA and any adjacent wetland total greater than 5 acres (B:1,b-d) and AA wetland is oasis or part of cluster wetland (B:8,a-b)? X

28. How many of the following are true of the AA? ____

    a. ____ 30-60% of AA wetland is open water and emergent vegetation is generally obligate wetland species
    b. X high plant form richness (B:7,c)
    c. ____ high vegetation/water interspersion (B:5,c) or high vegetation interspersion (B:6,c)
    d. ____ wetland vegetation or hydrology not recently disturbed (B:13,a-c and B:17 are all no)
    e. ____ frequent human activity does not occur in AA (B: 19,a-b are no)
    f. X substrate is not bedrock, rubble, or cobble-gravel (B:15,d-f are no)
    g. ____ open water with adjacent grain fields is present in AA

Rating for Wildlife Diversity and Abundance: Wintering

#25 is yes:	**Very Low**
#25 is no and #26 is yes:	**Low**
#25 and #26 are no and	
Less than four of #28 are true:	**Moderate**
#27 is true and at least four of #28 are true:	**High**

Threatened, Endangered, or Sensitive (TES) Species Habitat

29. Are there any Federally listed threatened or endangered plant or animal species that are known to regularly or frequently occur in the AA? _____

30. Are there any Federally listed threatened or endangered plant or animal species that are known to occur occasionally in the AA? X

31. Are there any state listed threatened, endangered, or sensitive plant or animal species (Montana Natural Heritage Program status of S1, S2, or S3) that are known to occur regularly or frequently in the AA? X

32. No federal or state listed threatened, endangered, or sensitive plant or animal species are known to occur in the AA? _____

Rating for Threatened, Endangered, or Sensitive (TES) Species Habitat

#29, #30, and #31 are all no; #32 is yes
#30 or #31 is yes
#29 is yes

Low
Moderate
High

PART D: ANALYSIS OF EVALUATION RESULTS

Summary of Ratings for All Functional Categories

The following procedure should be used to summarize ratings over the ten categories covered in this evaluation, with results entered on the rating sheet on next page:

(1) in column (a) list the ratings (very low, low, moderate, or high) in the evaluation for each category;

(2) in column (b) fill in the numeric rating as **very low = 0.5, low = 1, moderate = 2, and high = 3**;

(3) if considered necessary, modify given weighting values in column (c) for any category (provide justification below);

(4) multiply numeric rating in column (b) by weight in column (c) and record in column (d);

(5) total scores from all ten categories and enter as "Total";

(6) determine maximum possible score by multiplying weight in column (c) by 3 and total scores from all ten categories, and enter as "Maximum Total" (default = 33);

(7) divide "Total" by "Maximum Total" and multiply by 3; enter as "Overall Wetland Rating".

RATING SHEET FOR SUMMARIZING RESULTS OF WETLAND FUNCTIONAL EVALUATION

Functional Category	Column (a) Rating	(b) Numeric Rating	(c) Weight[a]	(d) Score
Hydrologic Support	High	3	1.0	3
Floodflow Alteration	Mod	2	0.5	1
Sediment Stabilization and Erosion Control	High	3	1.0	3
Water Purification	Mod	2	1.0	2
Production Export / Food Chain Support	High	3	1.0	3
Aquatic Diversity/Abundance	High	3	1.5	4.5
Wildlife Diversity/Abundance: Breeding	High	3	1.5	4.5
Wildlife Diversity/Abundance: Migration	Mod	2	1.5	3
Wildlife Diversity/Abundance: Wintering	Mod	2	1.0	2
TES Species Habitat	Mod	2	1.0	2
Total (sum of column (d))				28
Maximum Total				33
OVERALL RATING FOR AA WETLAND				2.55

[a] The category weight of 0.5 for floodflow alteration is based on the rationale that the floodflow function is generally of less importance on most Superfund site wetlands in the Upper Clark Fork basin due to their position lower down in the watershed; and category weights higher than 1.0 are based on the importance given by regional natural resource agencies to Upper Clark Fork Basin wetlands for wildlife migration/breeding and fisheries habitat. If different weights are used, the rationale for these weightings should be included with this evaluation.

Calculation of Effective Wetland Area

As described in the introduction, effective wetland area is the wetland area (in acres) delineated in an operable unit adjusted by its Overall Rating for functional value, as determined on the previous page. This adjustment would be made using the following formula

$$\text{Functionally Effective Wetland Area} = \frac{\text{Actual Wetland Area X Overall Rating}}{3}$$

It should be noted that functionally effective wetland area is a relative area value, i.e. it is some fraction of actual wetland area having an Overall Rating of 3.0. Obviously, an acre value for functionally effective wetland area can only be compared to other such values determined by this method. Functionally effective wetland areas calculated by this formula are intended to be used for comparing pre- and post- remediation wetlands and are not be considered as actual acres of physical area.

It is evident that choice of the Assessment Area is critical to determining the functionally effective wetland area, since the Overall Rating for each evaluation applies to the entire AA evaluated. Consequently, if the area to be evaluated is made up of areas that have experienced very different levels of disturbance or negative impacts, they should be evaluated separately.

For all AAs within an operable unit, the acres of functionally effective wetland are to be summed to arrive at a total functionally effective wetland area for that operable unit. This value can then be used as a baseline value for comparison to post-remediation changes in area of functionally effective wetlands. Post-remediation wetland areas can be determined on a preliminary basis using projected outcomes of remediation designs, but a re-evaluation of effective wetland areas should be conducted after remedial actions have taken place. This re-evaluation ideally should be about 10 years following remediation, after any wetlands created or modified as a result of remedial actions have had the opportunity to develop. Preferably, the method described in this form will also be used in the re-evaluation subsequent to remediation actions.

$$FEWA = \frac{19.60 \times 2.55}{3} = 16.66 \text{ acres}$$
