1259	47	Hentges	Harlan	Center for Energy Matters, Inc.	The DEIS extols the benefits of dealing with Canada, without even mentioning the involvement of the Chinese government in Tar Sands production. This omission is alarming. We would urge the State Department to determine that investment by the Chinese government in the Canadian Tar Sands is an essential factor that must be part of full and fair discussion of this project.	Consolidated Response P&N-4 provides information on investments by Chinese companies in Canadian oil sands projects. The investments of Chinese firms in oil sands projects would have no effect on the ability of the proposed Project to provide the heavy crude oil needed in the Gulf Coast area.
1259	48	Hentges	Harlan	Center for Energy Matters, Inc.	The DEIS at 3.9-016 and 3.9-21 purports to describe the manner in which TransCanada will purchase right of way and pay compensation. The DEIS presents an ideal way to acquire right-of-way, but it does not address what TransCanada is actually doing. For months TransCanada has been coercing private landowners to sell easements by threatening to use the power of eminent domain.	As noted in Consolidated Response EAS-2, state laws dictate under what circumstances eminent domain may be used and define the eminent domain process within the state. DOS has no legal authority in the easement negotiations or in eminent domain proceedings.
1259	49	Hentges	Harlan	Center for Energy Matters, Inc.	The actual experience of landowners is a far more accurate and useful than TransCanada idealized description of its process. The right-of-way acquisition process is actually confusing and coercive. The DEIS should present a full and fair discussion of this issue based on the actual experiences of land owners.	As noted in Consolidated Response EAS-2, state laws dictate under what circumstances eminent domain may be used and define the eminent domain process within the state. DOS has no legal authority in the easement negotiations or in eminent domain proceedings.
1259	50	Hentges	Harlan	Center for Energy Matters, Inc.	We submit that the draft EIS presents a flawed analysis of environmental injustice. Environmental injustice is not a matter of race or poverty; it is a matter of an abuse of political power. Some communities cannot protect themselves from abuse of political power because they are poor. Some cannot protect themselves from political power because they are of ethnic or racial minorities. Some communities, however, cannot protect themselves from abuse of political power and environmental injustice because they are small.	Consolidated Response JUS-1 and Section 3.10.1.2 of the EIS describe the counties in the project area with higher populations of minority and low-income groups that may be impacted by the project. This analysis is in accordance with Council on Environmental Quality guidance for analysis of potential environmental justice effects. As noted in Section 3.10 of the EIS, implementation of the proposed Project is not expected to result in adverse impacts that would fall disproportionately on minority or low-income populations located along the pipeline route. Moreover, project-related spending and tax revenues would result in substantial socioeconomic benefits in the region of influence, which may positively affect low-income and minority populations and Native American tribes through increased employment opportunities, income benefits, and improved public service levels.
1259	51	Hentges	Harlan	Center for Energy Matters, Inc.	Environmental injustice along the route this pipeline is not a matter of poverty or race. It is a matter of numbers. The number of citizens whose property is taken for the pipeline is small from a political perspective. It is located on a strip of rural land about 10 miles wide and 1,400 miles long. Thus, it is not like a community. These few people scattered through the plains do not have political power, organization or other resources needed to participate effectively in the draft EIS process. They do not have means by which to present their interests. Unless the State Department addresses this	Consolidated Response JUS-1 and Section 3.10.1.2 of the EIS describe the counties in the project area with higher populations of minority and low-income groups that may be impacted by the project. This analysis is in accordance with Council on Environmental Quality guidance for analysis of potential environmental justice effects. As noted in Section 3.10 of the EIS, implementation of the proposed Project is not expected to result in adverse impacts that would fall disproportionately on minority or low-income populations located along the pipeline route. Moreover, project-related

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					environmental injustice, these people - this community - will bear environmental risks and suffer environmental damages that would not be possible if this pipeline were built where the affected citizens had political influence equal to that of any ordinary community.	spending and tax revenues would result in substantial socioeconomic benefits in the region of influence, which may positively affect low-income and minority populations and Native American tribes through increased employment opportunities, income benefits, and improved public service levels.
1259	52	Hentges	Harlan	Center for Energy Matters, Inc.	The abuse of political power occurring during this project is made possible by the pipeline route. Indeed, the pipeline route does not appear to have any other purpose other than to reduce public participation.	DOS held 20 public scoping meetings, 19 public comment meetings on the draft EIS, and accepted comments on the draft EIS from April 16 through July 2, 2010. As noted in Section 1.7 of the EIS, DOS received substantial public input during scoping and the public comment period on the draft EIS.
1259	54	Hentges	Harlan	Center for Energy Matters, Inc.	The route does insure the least amount of public scrutiny. It insures the smallest number of people will be inclined to examine the potential for environmental impacts and the safety of the pipeline.	DOS received substantial public input during scoping and the public comment period on the draft EIS.
1259	55	Hentges	Harlan	Center for Energy Matters, Inc.	The route insures the fewest large businesses or governmental entities will devote resources to examining the project.	As noted in Consolidated Response ENR-1, the environmental review, including preparation of this EIS, has been conducted consistent with the DOS regulations pertaining to NEPA (22 CFR Part 161) as well as the Council on Environmental Quality (CEQ) regulations for implementing NEPA (40 CFR Part 1500). As a result, DOS considers the EIS to be consistent with the requirements of a NEPA environmental review.
1259	56	Hentges	Harlan	Center for Energy Matters, Inc.	The route insures that a minimum amount of resources will be devoted to effectively presenting the interest of the people who are most effected by the project.	As noted in Consolidated Response ENR-1, the environmental review, including preparation of this EIS, has been conducted consistent with the DOS regulations pertaining to NEPA (22 CFR Part 161) as well as the Council on Environmental Quality (CEQ) regulations for implementing NEPA (40 CFR Part 1500). As a result, DOS considers the EIS to be consistent with the requirements of a NEPA environmental review.
1259	58	Hentges	Harlan	Center for Energy Matters, Inc.	The draft EIS does not meaningfully discuss this environmental justice. Incredibly it concludes there is no environmental justice concern.	Consolidated Response JUS-1 and Section 3.10.1.2 of the EIS describe the counties in the project area with higher populations of minority and low-income groups that may be impacted by the project. This analysis is in accordance with Council on Environmental Quality guidance for analysis of potential environmental justice effects. As noted in Section 3.10 of the EIS, implementation of the proposed Project is not expected to result in adverse impacts that would fall disproportionately on minority or low-income populations located along the pipeline route. Moreover, project-related spending and tax revenues would result in substantial socioeconomic benefits in the region of influence, which may positively affect low-income and minority populations and Native American tribes through increased employment opportunities, income benefits, and improved public service levels.
1259	59	Hentges	Harlan	Center for Energy Matters, Inc.	The Center for Energy Matters and the Association of Rural Land Owners believe the Draft Environmental Impact Statement for the Keystone XL Pipeline is seriously flawed. Due to lack of specificity and analysis, the discussion presented by the DEIS is, at best, uselessly general, and at	As noted in Consolidated Response REG-2, DOS takes seriously its responsibilities to thoroughly evaluate the environmental effects of its Presidential Permit decisions consistent with NEPA and other relevant laws and regulations. In conducting the environmental review of the proposed

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					worst, biased and misleading.	Project, DOS followed NEPA, Council on Environmental Quality regulations and guidance, and all other applicable laws and regulations. In addition, DOS was assisted by a third-party environmental contractor in the environmental review of the proposed Project. That contractor, Cardno ENTRIX, has conducted environmental impact assessments of nearly 30 proposed pipeline projects and has experience in such work throughout the U.S., including in the states along the proposed corridor. DOS also consulted extensively with other relevant federal agencies that have particular technical expertise and authority relevant to the proposed Project. As a result, DOS considers the EIS to be in full compliance with the requirements of a NEPA environmental review.
1259	60	Hentges	Harlan	Center for Energy Matters, Inc.	We believe flaws in the DEIS are the result of a process that discouraged and hindered public participation, particularly by the people who live on, work on and own the pipeline route. The process excluded input from the citizens who have the most direct information concerning the environmental impacts of this pipeline. As a result, the DEIS fails to present a full and fair discussion of many issues.	As noted in Consolidated Response ENR-1, the environmental review, including preparation of this EIS, has been conducted consistent with the DOS regulations pertaining to NEPA (22 CFR Part 161) as well as the Council on Environmental Quality (regulations for implementing NEPA (40 CFR Part 1500) and includes the preparation of this EIS. As a result, DOS considers the EIS to be in full compliance with the requirements of a NEPA environmental review. DOS held 20 public scoping meetings and 19 public comment meetings on the draft EIS. Scoping meetings and the comment meetings on the draft EIS were held in the vicinity of the proposed route to provide affected landowners with the opportunity to participate in the meetings. Also see Consolidated Response CMT-2 for issues related to public comment meetings.
1551	1	Herbert	Craig	Norvell	We are in favor of this project.	Comment acknowledged.
1551	2	Herbert	Craig	Norvell	The Keystone XL project will hold our rates flatter.	Comment acknowledged.
1551	3	Herbert	Craig	Norvell	It will give a boost to this county and the schools here through taxes and other benefits.	Comment acknowledged.
1545	15	Herbert.	Craig	Norvell	we are in favor of this project for what it can do for your co-op members, what it can do for your schools and what it can do for your counties. On the basis of the co-op members, we all know energy prices are going up. This project, of this size, will help level it off so we can keep the rates at a constant rate for as long as we can.	Comment acknowledged.
442	1	Hergenrader	Allan		It would be a disaster that would be caused by Keystone. This is a horrendous idea. You do not have right on your side. The people of the state of Nebraska are against you.	Comment acknowledged.
442	2	Hergenrader	Allan		I am totally against Keystone being allowed to run an underground pipeline over the Ogallala Aquifer. A leak in that pipeline over the aquifer can do harmful damage to huge amounts of fresh water that can be found nowhere else in the world. Take this pipeline and move it far around the aquifer.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. Consolidated Response ALT-1 addresses potential alternative routes, including routes that would avoid much of the Northern High Plains Aquifer system.
525	1	Hermanson	Heidi		This is a very bad idea indeed. Did we learn nothing from the Gulf Spill? Please reconsider this action and do not put the pipeline in.	Consolidated Response ENR-1 provides information on the Department of State's environmental review process, the National Interest Determination process, and the need to complete those reviews before approving or denying the Presidential permit for the proposed Project.
502	1	Hernandez	Mika	Sierra Student Coalition	The proposed extension of the Keystone XL Pipeline Project is, simply put, a horrible idea. First of all, the fact that it will	As described in Consolidated Response GLF-1, the risks associated with the proposed Project are substantially different

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					stretch the length of the Ogallala Aquifer is so dangerous!	from those associated with the BP Deepwater Horizon Project. , Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
502	2	Hernandez	Mika	Sierra Student Coalition	We have seen the disgusting and devastating impacts of the oil "leak" in the Gulf of Mexico; imagine a spill like that happening over one of the largest fresh water sources in the world, and most essential water table for our country. The impacts would be immediate, and most likely irreparable.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. As described in Consolidated Response GLF-1, the risks associated with the proposed Project are substantially different from those associated with the BP Deepwater Horizon Project.
502	3	Hernandez	Mika	Sierra Student Coalition	Also, the project would infringe on and disrupt the natural migratory path of the Sand Hill Cranes. This is simply inexcusable. What right do we have to disrupt a pattern that has existed for generations and generations before us? Often when shifts in natural patterns like this take place, other habitats and environments (often those where people are) are changed too.	Construction and operation of the proposed Project would not infringe on or disrupt the migration of sandhill cranes. Most wetland habitats altered by construction would be restored. River roosting habitats would be crossed using the horizontal directional drilling (HDD) method and there would be no surface damage to these habitats. HDD is described in Section 2.3.3.5 of the EIS.
502	4	Hernandez	Mika	Sierra Student Coalition	Thirdly, the fact that this extension will cross through the lands of many active Native American tribes is an example of racism and racial inequality. To take over land that has already been so degraded is unethical and definitely bad for America's image worldwide. We would be viewed as oppressive, something that America has fought against.	Consolidated Response CUL-1 and Section 3.11 of the EIS address protection of historic properties and the consultations conducted in compliance with Section 106 of the National Historic Preservation Act, including consultation with Indian tribes. Consolidated Response JUS-1 addresses environmental justice issues.
502	5	Hernandez	Mika	Sierra Student Coalition	Lastly, it is my firm belief as a member of the youth of America, that we as a society are happily moving further and further away from dirty energy practices that involve fossil fuels and consequently fossil fuel transport. I am optimistic that the people of my generation are innovating and developing the sector of energy production in a way that promotes and uses clean, renewable energy. There is no realistic future for energy coming from fossil fuels like oil (as is involved in the Keystone Project), and to invest in and promote an expansion is just an economic bad play. It will lose money in the long run, while it degrades the environment and the social justice of our nation. I do not believe that we should gamble with our beautiful landscape and the well being of this country's citizens, and neither should the US State Department.	Consolidated Response ALT-2 addresses the use of alternative technologies and alternative energy sources. Consolidated Response P&N-5 addresses issues related to investments in other technologies.
879	1	Hernandez	Luis		Great project for US. it will help to improve our economic by providing jobs and opportunities to all Americans across the pipeline ROW. In addition, this project will be subcontracted 100% to American companies from management, procurement, and construction.	Comment acknowledged.
887	1	Hernandez	Maria		I strongly believe that this will help our economy by saving our families jobs, we should not be making decisions to take away American projects because we are against some of the oil issues that have happened in the past if were to do this for everything that went wrong what would be of this wonderful country? I love this country and strongly believe that we should support our companies so that they can continue to offer opportunities to our families!	Comment acknowledged.
522	1	Herndon	Crystal		Many of us in Nebraska are extremely concerned about the impact this pipeline, with its proposed thinner material, will have on our Ogallala Aquifer. I hope that we can learn from the environmental devastation of the Exxon Valdez and BP oil	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. Keystone has withdrawn its application for a Special Permit as described in Consolidated Response REG-1. As described in

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					spills that are partly the result of our consumer lifestyle. Syncrude's extraction of oil from tar sands is already having a tragic impact on wildlife. Please stop this potential disaster and instead focus on safer alternative forms of energy.	Consolidated Response GLF-1, the risks associated with the proposed Project are substantially different from those associated with the BP Deepwater Horizon Project.
949	1	Herres	Mary	Nebraska Democratic Women's Caucus	Please stop the Keystone Pipeline XL Project from crossing the Ogallala Aquifer and creating the danger of polluting our fresh water source in the plain states of America. The project can be run outside the parameters of the Aquifer and should be run above ground so that future leakage can be detected in a timely manner.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. Consolidated Response ALT-1 addresses potential alternative routes, including routes that would avoid much of the Northern High Plains Aquifer system. Issues related to an aboveground pipeline are addressed in Consolidated Response CST-1.
1542	79	Herrin	Kevin		I left this area for good reasons. I lost my aunt, grandmother, grandfather, and another aunt to cancer. We have one of the largest cancer facilities in the state because of the number of cases in the area.	As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries. Also see Consolidated Response JUS-1 which addresses potential impacts to minority and low-income populations.
1542	81	Herrin	Kevin		Why should we trust your generation with this? You won't be around to deal with the consequences.	The commenter's opinion is noted.
1542	84	Herrin	Kevin		The jobs will eventually leave. The pipeline isn't really creating jobs, it's shifting jobs. We're not doing anything for this economy.	Consolidated Response ECO-1 and Section 3.10.2.2 of the EIS address potential socioeconomic impacts.
1542	85	Herrin	Kevin		Let's crush this, get our minds out of this line of thinking and actually do something good for this area and the people in the US.	Consolidated Response ENR-1 provides information on the Department of State's environmental review process, the National Interest Determination process, and the need to complete those reviews before approving or denying the Presidential permit for the proposed Project.
1317	3	Hervey	Susie	Pipeline Machinery International	There are important environmental benefits from Keystone XL as well. The current tragedy in the Gulf reinforces the value of diverse, land based, products moving by pipeline at much lower risk. Pipelines are the safest, most reliable, economical and environmentally favorable way to transport oil and petroleum products, as well as other energy liquids, throughout the U.S.A. America depends on the more than 168,000 miles of liquid pipelines to move energy and raw materials our country relies on.	Comment acknowledged.
1317	4	Hervey	Susie	Pipeline Machinery International	Secuding stable and affordable energy from our North American allies through projects such as the. Keystone pipeline is in the national interest. We should continue to expand America's access to safe,affordable energy to help ensure improved domestic and global energy security and stable prices for consumers. Any disruptiOn orredudion of oil/rom the Gulf is much better replaced from within North America than from imported and less reliable foreign sources.	Comment acknowledged.
1317	5	Hervey	Susie	Pipeline Machinery International	During construction, Keystone XL will create more than 13,000 jobs funded with private investment.	Consolidated Response ECO-1 and Section 3.10.2.2 of the EIS address the potential socioeconomic impacts of the proposed Project.
1317	6	Hervey	Susie	Pipeline Machinery International	In addition, local governments will have a steady source of income from economic activity associated with construction and from property taxes the pipeline company will pay. Thank you for the opportunity to comment, and we urge you to issue a permit for this pipeline.	Comment acknowledged.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
1558	2	Hess	Tim		They've underestimated the damage that digging a big trench through the middle of my farm is going to do. They assume that the cropland will heal in a year. Ask any farmer, that's not true.	The EIS has been revised in response to this comment. Section 3.9.1.3 and Consolidated Response FRM-1 address compensation for lost crops.
1558	3	Hess	Tim		I'm concerned with the roads. There is going to be thousands of trucks on these gravel roads and they will not stand up.	Consolidated Response RDS-1 addresses concerns about the condition of roadways and roadway structures associated with construction and operation of the proposed Project. As noted in that response, Keystone would be responsible for roadway improvements and restoration if damage occurs due to Project-related activities.
1558	4	Hess	Tim		I'm concerned with the pressure waiver.	Keystone has withdrawn its application for a Special Permit as described in Consolidated Response REG-1. As described in Consolidated Response SAF-1, the Pipeline and Hazardous Materials Safety Administration (PHMSA) has regulatory requirements that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project in a manner that protects the health and safety of the public and the environment. In addition, PHMSA developed 57 Project-specific Special Conditions that Keystone has agreed to implement. Incorporation of those conditions would result in a Project that would have a degree of safety over any other typically constructed domestic oil pipeline system under current code and a degree of safety along the entire length of the pipeline system similar to that which is required in HCAs as defined in 49 CFR 195.450.
1558	6	Hess	Tim		About the oversight issue: the two year oversight period is not sufficient, coming back and checking every two years.	It is not clear what oversight period the commenter is referring to. Consolidated Response SAF-1 describes the regulatory requirements of the Pipeline and Hazardous Materials Safety Administration that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project. The response includes information on the required inspection and monitoring periods.
1558	7	Hess	Tim		Who's going to oversee the construction period?	As noted in Consolidated Response SAF-1, Keystone must comply with the Pipeline and Hazardous Materials Safety Administration (PHMSA) regulatory requirements for design and construction, and PHMSA would conduct on-site inspections during construction. There would also be on-site Environmental Inspector during construction as described in Section 2.3.5.2 of the EIS.
1558	8	Hess	Tim		About the reclamation: Keystone is committed to monitoring, repair and reclamation for several years, but what defines 'several'? Shouldn't they be required to stay with this until it's completed? As long as anybody has a problem with the reclamation, Keystone needs to be there.	Reclamation and revegetation would be enforced through the easement agreement as described in EAS-2. The U.S. Department of State has no legal authority over negotiations of easement agreements and has no legal status to enforce the conditions of an easement agreement. A landowner who considers Keystone to be out of compliance with an easement agreement would need to contact local law enforcement officials, or initiate legal proceedings.
756	1	Hey	Susan		I do not believe our country should support the development of energy from tar sands. It is my understanding that large quantities of water and methane are needed to process this product...	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project.
756	2	Hey	Susan		...There is an opportunity for leaks and spills over many miles of the continent disrupting wildlife ecosystems and human	Section 3.13 of the EIS addresses reliability and safety issues, including calculations of the probability of a spill from the

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					life...	Project and the potential environmental impacts associated with spills.
756	4	Hey	Susan		The waste of water alone should mean, "No permit".	The proposed Project would not require the use of water except for hydrostatic testing of the pipeline. Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1.
836	1	Hiatt	Melanie	Doane College	Please stop the Keystone XL Pipeline Project.	Consolidated Response ENR-1 provides information on the Department of State's environmental review process, the National Interest Determination process, and the need to complete those reviews before approving or denying the Presidential permit for the proposed Project.
277	1	Higgins	Pattyjo		I am very much against this pipeline running close to the Ogallala Aquifer. I would think we need to look at the disaster that a pipeline leak has caused the Ocean and the fisherman in that area. The aquifer is vital in our area, without it we would look like a desert. I believe that water is society biggest need, with that in mind, why would we want to endanger it!	As described in Consolidated Response GLF-1, the risks associated with the proposed Project are substantially different from those associated with the BP Deepwater Horizon Project.
1492	1	Hildestad	Terry	MDU Resources Group, Inc	I am writing in support of TransCanada's pipeline project and urge the department the pipeline. Keystone XL crude oil to grant a permit for Our company has a unique perspective of the importance of this project and the value it will provide to both our region and the country, due to our position as the only Fortune 500 company headquartered in the four-state region of North and South Dakota, Montana and Wyoming. MDU Resources is a substantial developer of energy resources in the region, including oil and natural gas production (we are the largest natural gas producer in Montana), pipeline operation, and a natural gas and electric utility business with nearly 1 million customers. The Keystone XL project will provide significant benefits to our country's energy supply, including:• It will provide a reliable and economic supply of oil from a proven ally and neighbor that already is the largest exporter of oil to the U.S. This can help lessen our dependence on supplies from unfriendly or unstable countries.• The pipeline's transportation capacity can help increase much-needed domestic oil production from the Bakken and Three Forks formation, which is projected to be the largest continuous oil reserve in the lower 48 states.• The pipeline offers substantial environmental benefits by enabling proven, land-based production - a supply source that has become even more important in the wake of the Gulf Coast drilling tragedy. In addition, pipelines are the safest, most reliable, economical and environmentally favorable way to transport oil and petroleum products. For these reasons, I urge the approval of this important project.	Comment acknowledged.
1492	2	Hildestad	Terry	MDU Resources Group, Inc	Finally, the Keystone XL project is estimated to result in approximately \$1 billion of investment in Montana, creating needed in the state and the communities in the pipeline's proximity.	Consolidated Response ECO-1 addresses potential socioeconomic impacts, and Consolidated Response TAX-1 addresses concerns regarding taxes.
35	1	Hilding	Nancy		If the bills for cost of the DEIS are sent to Keystone, you should ask for additional dollars to send a CD for all persons who submitted substantial comments in scoping. The decision about not sending CDs is a cost saving choice - you save	The sign-in sheets at the public scoping meetings included an option to request for a CD of the draft EIS. CDs of the DEIS were sent to everyone who requested it.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					Keystone money. It reduces public access to document in rural areas with dial up internet connections to depend on downloading documents from internet.	
971	1	Hilding	Nancy	Prairie Hills Audubon Society	Grasslands are the most imperiled and least protected of all major habitat types: less than 2% of temperate grasslands worldwide have been conserved. The primary goal in conducting the 2004 assessment of the Northern Great Plains ecoregion was to identify large-scale core conservation areas that contain high biodiversity value and have high restoration potential. The assessment identified 11 high-priority areas for large-scale conservation. Among these are Grasslands National Park/Bitter Creek occurring in Saskatchewan and Montana, respectively, and Slim Buttes occurring in north western South Dakota. Both Bitter Creek and Slim Buttes will be crossed by one of the three alternative routes evaluated for the proposed Keystone XL pipeline project.	Grasslands National Park in Saskatchewan, Bitter Creek in Montana, and Slim Buttes in North Dakota are not crossed by the proposed route.
971	2	Hilding	Nancy	Prairie Hills Audubon Society	Although an assessment of wildlife and natural resources potentially affected by the proposed pipeline was completed by the proponents, route B will cross Slim Buttes, SD, which we consider to be a high-priority conservation area. Therefore, we ask that the proponents evaluate and report where discrepancies occur between criteria used to assess the wildlife and natural resource values of the Slim Buttes area within the EIS and the NPCN and The Nature Conservancy assessments of the area.	Identification of sensitive environments crossed by the proposed Project is discussed in Consolidated Response ENV-1. Grasslands National Park in Saskatchewan, Bitter Creek in Montana, and Slim Buttes in North Dakota are not crossed by the proposed Project.
971	3	Hilding	Nancy	Prairie Hills Audubon Society	We hope you will discuss the economic impact of stopping the pipeline for repairs; if there is a leak does the whole pipeline shut down while a new pipe is laid to replace leaking pipe? Will this provide a disincentive to quickly fix leaking pipes or will the pipeline want to collect a certain number of leaking sections before it shuts down the pipeline?	As soon as a leak is identified, Keystone would be required to repair the pipe. Keystone would not wait for additional leaks before making the appropriate repairs. Consolidated Response OIL-2 addresses maximum-sized releases from the Project. To repair a breached pipeline section, typically a section of pipe would be removed and a replacement section would be welded into place. In most cases, the process would require only a few days for the repair and restarting the pipeline. During that time, the crude oil storage capacity at the refineries that would receive crude oil would likely be sufficient to prevent crude oil supply interruption at the refineries. As a result, the economic impacts of a pipeline breach and the resulting oil spill from the proposed Project pipeline would likely be minimal.
971	5	Hilding	Nancy	Prairie Hills Audubon Society	We think the actions to produce the oil in Canada and the actions to refine the oil in the southern states are connected actions. The environmental impacts of these connected actions must be disclosed in the DEIS.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information on current and future production. As noted in that response, without the proposed Project, oil sands development would continue at or above the current level until at least 2020, with or without the proposed Project. As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries.
971	6	Hilding	Nancy	Prairie Hills Audubon Society	We are very concerned about how disturbed soils will be reseeded. In the DEIS it indicates you will you a seed mix of the land owners choice. We believe you need to inventory the pipeline to see if you are crossing pristine native grasslands	Reseeding procedures are addressed in Section 3.5.5 of the EIS and in Section 4.15.5.3 f the Keystone Construction, Mitigation, and Reclamation Plan in Appendix B of the EIS.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					that are still comprised of native species.	
971	7	Hilding	Nancy	Prairie Hills Audubon Society	If you plant alfalfa or any other “desired” but non-native seed you will disturb pristine native prairie. You should inventory the path of the pipeline for the amount of native prairie that is currently free from non-native species. You should disclose the loss of such as an impact of building the pipeline.	Native seed mixes would be used in restoration, as recommended by local NRCS offices, although landowners would determine what seed mixes are used as discussed in the Construction, Mitigation, and Reclamation Plan, which is Appendix B of the EIS. Native grasslands were identified along the proposed Project route and impacts to high-quality native grasslands are identified in Table 3.5.5-3.
971	8	Hilding	Nancy	Prairie Hills Audubon Society	You should disclose the plans to control weeds, and invasive not desired plant species that grow along the line of disturbance.	Keystone would implement measures to prevent the spread of noxious weeds and invasive aquatic animals as described in Sections 3.5.5.4 and 3.7.3.1 of the EIS. Section 3.7.3.1 of the EIS was revised to include additional measures Keystone would implement to prevent the spread of aquatic invasive species. The measures described were recommended by federal and state management agencies.
971	9	Hilding	Nancy	Prairie Hills Audubon Society	Please discuss any possibility the pipeline construction will help spread Emerald Ash Borer.	The current distribution of the Emeralds Ash Borer (<i>Argrilus planipennis</i>) is east of the Keystone XL proposed Project (See http://www.emeraldashborer.info/index.cfm). Keystone does not plan to plant or transport ash trees. Canadian provinces and U.S. states with infestations have quarantines to prevent infested ash firewood, logs or nursery trees from being transported. Construction of the Keystone XL proposed Project would not contribute to the spread of the Emerald Ash Borer.
971	10	Hilding	Nancy	Prairie Hills Audubon Society	Please discuss the closeness of pump stations or other places that make noise, to cemeteries, and any other places of outdoor worship; especially consider sacred places of Native Americans.	Section 3.11 describes the impacts of the project to cultural resources including places of religious and cultural significance. Extensive consultation with Native American groups has been performed to take these impacts into account.
975	1	Hilding	Nancy		The “purpose and need” should not be written to be so narrow as to only allow the Secretary of State to choose the pipeline. The “purpose and need” should be broad -- such as being an need to increase energy supplies in the USA. It should not be written to guarantee the Keystone XL pipeline is the only way to accomplish the “purpose and need”. To do so is to violate NEPA and the CEQ regulations that implement it.	Consolidated Response P&N-7 addresses commentor concerns that the stated purpose of the proposed Project in the EIS is “too narrow.” Consolidated Response P&N-1 addresses the need that the Project has been proposed to meet.
975	2	Hilding	Nancy		The Range of alternatives is not large enough as the only place there is an alternate route is in Montana. For “action alternatives”, other routes should be available along the entire pipeline, especially in places where conflicts or problems exist.	Consolidated Response ALT-1 addresses potential alternative routes, and Section 4.3 of the EIS identifies reasonable alternatives to the proposed route, including potential alternative routes outside of Montana. However, most alternatives on the northern end of the route initiate near Morgan, Montana, the point where the Canadian portion of the Keystone XL pipeline would meet the U.S./Canada border. The route of the Canadian portion of the Project has been approved and terminates near Morgan.
975	3	Hilding	Nancy		There should be alternative places for pumping stations and support communities.	As noted in Section 4.5 of the EIS, the locations of pump stations are in part determined by the engineered hydraulics of the pipeline system. Once Keystone determined the range of distances along the proposed route where each pump station could be placed, it attempted to site the stations at locations along that distance that would avoid or minimize impacts.
975	4	Hilding	Nancy		The pipeline should clearly disclose the chemicals that will be	Consolidated Response OIL-4 addresses the composition of

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					added to the oil so it will flow. It should clearly disclose the impacts of such chemicals on the environment if they spill.	the crude oil that would be transported by the proposed proposed Project. As noted in that response, the Canadian crude oil is similar to heavy crude oils currently being transported by pipeline and refined in the U.S. The composition of the oil that would be transported is addressed in Section 3.13.5.1. Sections 3.13.5 and 3.13.6 address the potential impacts if there is a spill of oil from the proposed proposed Project based on the composition of the oil transported.
975	5	Hilding	Nancy		The DEIS should not just look at state and federal listed T & E species, it should look at any species the Federal agencies have identified as species of regional concern. Federal agencies such as the Forest Service can have lists that are different from States or the USFWS.	The EIS addresses species noted during scoping and consultations with state and federal agencies.
975	6	Hilding	Nancy		Fragmentation impacts should be clearly disclosed.	Fragmentation impacts are discussed in Section 3.6.2. of the EIS.
975	7	Hilding	Nancy		The DEIS should clearly disclose the impacts to local roads from the traffic of building the pipeline.	Section 3.10.3 of the EIS addresses traffic impacts due to construction of the proposed Project. Consolidated Response RDS-1 addresses concerns about the condition of roadways and roadway structures associated with construction and operation of the proposed Project.
975	8	Hilding	Nancy		The DEIS should clearly indicate how adequate the bonding is to insure pipeline owners clean up of leaks and messes. It should provide discussion of how the owner's of the pipeline will be policed by the government to be sure the owners are doing their job correctly. We have the oil leak mess in the Caribbean as an example of something to worry about	Consolidated Response LIA-1 addresses Keystone's liability if there is a spill of hazardous materials or fuel during construction or a spill of crude oil from the proposed Project. Consolidated Response LIA-2 addresses the issue of bonding for the proposed Project. Consolidated Response SAF-1 describes the regulatory requirements that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project. It also describes the inspections and reviews of the proposed Project that the Pipeline and Hazardous Materials Safety Administration would conduct to ensure compliance with those regulatory requirements.
1550	16	Hilding	Nancy	Prairie Hills Audubon Society of western South Dakota	Being sent a letter telling me that I can go to the Internet to download this huge document does not work for people with dial-up.	Consolidated Response CMT-6 addresses issues related to the availability of paper copies of the draft EIS.
1550	18	Hilding	Nancy	Prairie Hills Audubon Society of western South Dakota	I'm glad you sent a CD, DEIS copy to the people along the pipeline, but you didn't send it to us, an environmental group that sent in substantive comments. So I think there's a problem with distribution and access to the CDs. I personally find that going to the library to look at these huge documents doesn't really work because the documents are so huge.	Consolidated Response CMT-6 addresses issues related to the availability of paper copies of the draft EIS.
1550	20	Hilding	Nancy	Prairie Hills Audubon Society of western South Dakota	[is there] going to be another agency besides the Secretary of State who has to sign the ROD or is it only the Secretary of State who's signing the ROD. ...not sure how frequently you do NEPA documents and what your level of skill is with NEPA, so I think it would be very good if you have one of these agencies who does NEPA on a regular basis also signing this document....I would very much like for Natural Resources, and environmental protection sort of entity to also	Consolidated Response REG-2 addresses issues related to concerns about the Department of State being the lead federal agency for the NEPA environmental review and the permits and regulatory approvals that Keystone would have to obtain to construct, operate, maintain, monitor, and inspect the Project.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					sign the ROD.	
1550	21	Hilding	Nancy	Prairie Hills Audubon Society of western South Dakota	Would like clarification on whether or not it's a third party EIS.	Comment acknowledged. DOS was assisted in preparation of the EIS by a third-party contractor.
1550	22	Hilding	Nancy	Prairie Hills Audubon Society of western South Dakota	We're concerned about leaks from the pipeline, needless to say, how monitoring of leaks should be done. And also, how are you going to stop to fix a pipeline all the way from Canada down to New Orleans, you know as soon as it stops leaking, do you just stop the whole pipeline to insert a piece of pipe you know in multiple places from Canada to New Orleans. I think it's going to Louisiana. So how do you stop it to insert a new piece of pipe and what happens then.	The pipeline would extend from the U.S. Canada border in Montana to the Port Arthur area with a lateral to east of Houston. Consolidated Response OIL-3 and Section 3.13.5 of the EIS describe the methods for detecting leaks and stopping the flow of oil when they are detected. If a section of pipe requires replacement, the flow of oil in the pipeline would be stopped, the pipeline would be purged to the extent possible, and the damaged section excavated and replaced. The pipeline would remain shut down until the Pipeline and Hazardous Materials Safety Administration or the delegated state agency has reviewed the repair and testing to determine that it is safe to re-start the flow of oil.
1550	23	Hilding	Nancy	Prairie Hills Audubon Society of western South Dakota	concerned about siting near the special places that are of cultural significance. [church or cemetery]	Consolidated Response CUL-1 and Section 3.11 of the EIS address protection of historic properties and the consultations conducted in compliance with Section 106 of the National Historic Preservation Act, including consultation with Indian tribes.
1550	24	Hilding	Nancy	Prairie Hills Audubon Society of western South Dakota	We're concerned about the thing crossing wild areas that might qualify for wilderness.	The proposed Project would not cross any federal or state Wilderness or areas identified for consideration as Wilderness. Areas in the National Wilderness Preservation System are currently not designated in the vicinity of the proposed route. The closest area identified was Big Slough Wilderness Area in Houston County, Texas which is approximately 11 miles from nearest point along the proposed route (see U.S. Geologic Survey 2009. National wilderness Preservation system of the United States. Available online at: http://nationalatlas.gov/mld/wildrnp.html). Further, no foreseeable wilderness areas have been identified near the proposed Project. The most recent legislation designating two million additional acres, the Omnibus Public Lands Act in March 2009, does not include any areas in any state the proposed Project would cross and no states the proposed Project would cross have wilderness area programs (C.P. Dawson and P. Thorndike. 2002. State-Designated Wilderness Programs in the United States. International Journal of Wilderness 8(3):21-26).
1550	25	Hilding	Nancy	Prairie Hills Audubon Society of western South Dakota	We're concerned about fragmentation because we think roads go along the pipeline, and Chas raised a fragmentation issue. We're concerned about the waters that it crosses, both ground and surface water.	There would not be an access road along the length of the proposed Project. Areas used for temporary access roads during construction would be restored and few permanent access roads to aboveground facilities (pump stations and valve station) would be constructed. Potential impacts associated with habitat fragmentation are addressed in Section 3.6 of the EIS.
1550	26	Hilding	Nancy	Prairie Hills Audubon Society of western South	And somebody else raised the concern about adequate monitoring and baseline data on the streams in the state, loss of streams if they have too small a flow or if they're intermittent. The DNR has no baseline data on those streams.	Consolidated Response WAT-1 and Section 3.3.2 addresses stream crossing methods and the associated potential water quality impacts.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
				Dakota	They do not get monitored, so to what degree are the streams that you're crossing even recognized and monitored and watched over from DNR. So if you don't have your baseline data, then you'll never know what your impacts are because you don't know what the status quo is before you start doing it. And so, of course, we're concerned about crossing the high water table areas and streams and water bodies and wetlands.	
1550	27	Hilding	Nancy	Prairie Hills Audubon Society of western South Dakota	We're also concerned about noxious weed invasion and evasive plant invasions. You're going to have this nice long corridor that's going to bring plants in that may not be wanted, and you may be crossing areas that are kind of virgin with respect to the native plant communities.	Keystone would implement measures to prevent the spread of noxious weeds and invasive aquatic animals as described in Sections 3.5.5.4 and 3.7.3.1 of the EIS. Section 3.7.3.1 of the EIS was revised to include additional measures Keystone would implement to prevent the spread of aquatic invasive species. The measures described were recommended by federal and state management agencies. Keystone will develop and implement weed control plans which includes identification of weed sources identified along the ROW that includes additional specific descriptions of methods for containment and control as part of its Construction, Mitigation, and Reclamation Plan, which is in Appendix B of the EIS.
1550	28	Hilding	Nancy	Prairie Hills Audubon Society of western South Dakota	We're concerned about noise. You should be discussing that, particularly at your pumping stations. What's the impact from sounds?	Consolidated Response NOI-1 and Section 3.12.2 of the EIS address issues related to noise from pump stations.
1550	31	Hilding	Nancy	Prairie Hills Audubon Society of western South Dakota	we're concerned about social impacts. We think that you're going to be creating temporary cities along the line to house workers. So we're concerned about how those would be done and we're concerned about the temporary cities impact on the local economy, boom and bust. We're also concerned about whether that creates a nice development opportunity for these rural areas. Could some of that facility be kept to be turned into housing, a campground?	Consolidated Response ECO-1 and Section 3.10.2.2 of the EIS address potential socioeconomic impacts, including impacts associated with the presence of construction workers. Section 2.2.7.4 of the EIS describes the work camps proposed by Keystone, including plans for decommissioning the camps.
35	1	Hilding	Nancy		If the bills for cost of the DEIS are sent to Keystone, you should ask for additional dollars to send a CD for all persons who submitted substantial comments in scoping. The decision about not sending CDs is a cost saving choice - you save Keystone money. It reduces public access to document in rural areas with dial up internet connections to depend on downloading documents from internet.	The sign-in sheets at the public scoping meetings included an option to request for a CD of the draft EIS. CDs of the DEIS were sent to everyone who requested it.
1550	16	Hilding	Nancy	Prairie Hills Audubon Society of western South Dakota	Being sent a letter telling me that I can go to the Internet to download this huge document does not work for people with dial-up.	The sign-in sheets at the public scoping meetings included an option to request for a CD of the draft EIS. CDs of the DEIS were sent to everyone who requested it.
1550	18	Hilding	Nancy	Prairie Hills Audubon Society of western South Dakota	I'm glad you sent a CD, DEIS copy to the people along the pipeline, but you didn't send it to us, an environmental group that sent in substantive comments. So I think there's a problem with distribution and access to the CDs. I personally find that going to the library to look at these huge documents doesn't really work because the documents are so huge.	CDs of the DEIS were sent to everyone who requested it. The CD mailing list included two different addresses for Nancy Hilding.
869	1	Hildreth	Eleanor	Houston Climate	Because of new EPA regulations, the EIS for Keystone XL should report on greenhouse gas (GHG) emissions of tar	As noted in Section 3.12. 1.1, EPA did not include the crude oil transportation segment of the petroleum and natural gas

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
				Protection Alliance	sands.... Greenhouse gas emissions enabled by the Keystone XL pipeline should be included in the EIS because EPA rule 40 CFR Part 98, effective December 29, 2009, requires reporting of GHG emissions from suppliers of fossil fuels and from facilities that emit more than 25,000 tons of GHGs per year. www.epa.gov/climatechange/emissions/ghgrulemaking.html Because the proposed Keystone XL pipeline would supply fuel to refineries and because the amount is huge, it falls under this rule....The reported impact on our climate should include: - - GHGs from pipeline operations. --GHGs that will result from burning the fuel carried by the pipeline. --GHGs emitted in Canada from extraction of the tar sands oil carried by the pipeline. Without economic transport to market, that fossil fuel would not be extracted....Like coal, tar sands are new investments in dirty energy infrastructure. But the GHG emissions from tar sands are much higher than coal per unit of energy produced...	industry in its rulemaking for GHG reporting due in part to its small contribution to total petroleum and natural gas fugitive emissions (accounting for much less than 1 percent). The responsibility for reporting was placed on the processing plants and refineries. Consequently, the proposed Project would not trigger GHG reporting requirements.
1544	111	Hildreth	Eleanor		Concern about the increase in hurricanes due to climate change and Houston's vulnerability to hurricane damage.	Consolidated Response ENV-6 addresses concerns regarding the influence of climate change on the potential impacts of the proposed Project.
1544	112	Hildreth	Eleanor		Concern about severe weather such as torrential rains and drought associated with climate change increasing in Texas.	Consolidated Response ENV-6 addresses concerns regarding the influence of climate change on the potential impacts of the proposed Project.
1544	113	Hildreth	Eleanor		Concern about rising sea level due to climate change.	Consolidated Response ENV-6 addresses concerns regarding the influence of climate change on the potential impacts of the proposed Project.
1544	114	Hildreth	Eleanor		Concern about rising insurance rates due to climate change.	Consolidated Response ENV-6 addresses concerns regarding the influence of climate change on the potential impacts of the proposed Project.
1544	116	Hildreth	Eleanor		I would like the DEIS to address the impacts of global warming and greenhouse gases that will be enabled by this pipeline.	Consolidated Response GHG-1 addresses the greenhouse gas life-cycle analyses presented in the revised EIS. Climate change is addressed in Section 3.14.3.14. As noted in that Section, implementation of the proposed Project is unlikely to result in a measureable climate change.
606	1	Hill	Jeffrey		I have been following the reports in the Omaha World Herald about the Keystone XL pipeline and have become very concerned about the wisdom of this project. Please do the right thing and route this pipeline away from the Nebraska Sand Hills.	Identification of sensitive environments crossed by the proposed Project is discussed in Consolidated Response ENV-1 and ENV-3. Issues related to the Sand Hills area are addressed in Consolidated Response ERO-1. Consolidated Response ALT-1 addresses potential alternative routes, including routes that would avoid much of the Northern High Plains Aquifer system and the Sand Hills area.
167	1	Hillestad	Robert		I oppose the pipeline in Nebraska.	Comment acknowledged.
45	1	Hiney	Anne		I would like to respectfully express my opposition to the Keystone XL Pipeline Project. I believe our nation should be focusing on clean energy development rather than facilitating the production of tar sands oil.	Consolidated Response ALT-2 addresses the use of alternative technologies, alternative energy sources, and conservation of energy.
173	1	Hite	William	United Association	On behalf of the 350,000 members of the United Association, I am writing to request your strong support for the Keystone KXL Pipeline project being developed by TransCanada, Inc. As discussed below, there are specific regulatory actions pending before your Administration which we request	Comment acknowledged.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					expeditious review and approval.	
173	2	Hite	William	United Association	Keystone KXL is a major \$12 billion economic stimulus and investment project that will substantially expand U.S. underground pipeline infrastructure and capacity by constructing a safe and reliable transmission facility for transporting crude oil from Canada through the U.S. Midwest and to our Gulf Coast refineries. This initiative not only fulfills sound U.S. energy policy goals, but will spur robust employment opportunities for American workers in the construction industry, as well as related industries.	Comment acknowledged.
173	4	Hite	William	United Association	Of equal importance, the Keystone KXL project will serve as a major engine for future job growth and help put Americans back to work. Mr. President, as you know, the alarming fact is that unemployment in the U.S. construction industry is now over 20 percent. Our industry has literally millions of people looking for work and far too many losing their homes and facing other severe hardships.	Comment acknowledged.
173	5	Hite	William	United Association	Keystone KXL alone will create some 10,000 critically-needed jobs for building trades workers. It is also estimated this project will generate over 340,000 additional U. S. jobs between 2011 and 2015 in other affected industries, including manufacturing and service industries. A substantial number of these jobs will be created because the pipe and pumps for this project will be made in the United States. Significantly, all of this job-creation will occur without a single dollar of federal stimulus funds.	Consolidated Response ECO-1 and Section 3.10.2.2 of the EIS address the potential socioeconomic impacts of the proposed Project.
173	6	Hite	William	United Association	Moreover, many state and local governments stand to benefit since they will collect substantial tax revenues generated by this initiative {over \$100 million in property tax alone, plus sales, fuel and other taxes}. Local communities will benefit as well from new business and employment opportunities that emerge as this nearly 2,000-mile pipeline unfolds across the country.	Consolidated Responses TAX-1 and ECO-1 address the estimated increases in the tax base and the jobs generated by the proposed Project. Also see the revisions to Sections 3.10.2.3 and 3.10.2.4 of the EIS.
173	7	Hite	William	United Association	Keystone KXL is also a well-planned project. TransCanada currently manages more than 35,000 miles of oil and natural gas pipeline in the U.S. and it has done an exemplary job of planning and organizing this project. Long-term transportation contracts are already in place, as are numerous supply contracts with U.S. equipment manufacturers. A great deal of the regulatory work has already been completed as key approvals have been issued from the Canadian government; other approvals have been secured or are expected shortly from state governments in South Dakota and Montana. Additional points regarding the status and positive impact of the Keystone KXL Project are set forth in the attached briefing document.	Comment acknowledged.
173	8	Hite	William	United Association	We understand that substantial progress has been made with respect to each of these actions already and respectfully request the continued support and assistance of your administration to finalize these matters and, if at all possible, expedite them for the reasons set forth above. In sum, please know that the United Association stands firmly behind TransCanada and the Keystone KXL project. We believe this	Comment acknowledged.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					project exemplifies the commitments we share with your Administration of promoting energy independence, putting people back to work, and helping our country get on the road to economic recovery.	
173	10	Hite	William	United Association	The Keystone KXL pipeline is an enormous \$12 billion economic stimulus project that will create approximately 6,000 high-wage construction jobs in 2011-2012 and over the course of several years will generate over 340,00 additional jobs in manufacturing and service sectors.	Consolidated Response ECO-1 and Section 3.10.2.2 of the EIS address the potential socioeconomic impacts of the proposed Project.
173	13	Hite	William	United Association	This project offers billions of privately-funded economic stimulus dollars and will produce substantial future tax revenues for states and communities along the pipeline route.	Consolidated Response ECO-1 addresses potential socioeconomic impacts, and Consolidated Response TAX-1 addresses concerns regarding taxes.
173	15	Hite	William	United Association	Oil sands account for more than 170 billion barrels of oil and represent 97 percent of that vast reserve. Canada's oil sands have a crude oil supply potential of more than 100 years.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information on current and future production. As noted in that Consolidated Response, without the proposed Project, oil sands development would continue at or above the current level until at least 2020, with or without the proposed Project.
173	16	Hite	William	United Association	Long term supply is critical in a world where supply risks are growing, whether due to declining production from a once reliable source, an unstable geo-political climate, or uncertainties in key oil-producing regions.	Comment acknowledged.
173	19	Hite	William	United Association	The Keystone Pipeline is an enormous economic stimulus project that represents billions of dollars in capital investment, pays millions in tax revenue for state and local government, and creates thousands of jobs. The construction of Keystone KXL will create nearly 10,000 construction jobs in 2011-2012. The Canadian Energy Research Institute also found that the economic impact of oil sands development is expected to lead to the creation of more than 342,000 new U.S. jobs between 2011 and 2015. During construction, Keystone KXL will generate \$20.9 billion in total expenditures, \$9.6 billion in output (gross product), and 118,935 person years of employment.	Consolidated Response ECO-1 addresses potential socioeconomic impacts, and Consolidated Response TAX-1 addresses concerns regarding taxes.
173	20	Hite	William	United Association	During construction, Keystone KXL will generate \$486.36 million tax revenue for state governments and \$99.1 million for local taxing entities where the pipeline is located.	Consolidated Response TAX-1 and revisions to Section 3.10.2.4 of the EIS address concerns regarding taxes associated with implementation of the proposed Project.
1558	64	Hjorth	Doug		It's a really big concern to me, because as far as aerial spraying on our dry land, they hardly irrigate the land because of all the power lines. This really devalues the land.	Consolidated Response VAL-1 addresses concerns regarding property values.
339	1	Hlava	Teri		I am deeply concerned about the Ogallala High Plains Aquifer as it relates to the TransCanada Keystone XL pipeline. I understand the last date to comment to you about this before the "hearing" is June 14, 2010. Here is basically why I am troubled, having studied water in Nebraska for many years. Few Americans are aware that under the soil of the high plains of the central United States-- Nebraska, Kansas, Oklahoma, Arkansas and Texas -- lies one of our greatest treasures. the Ogallala, or High Plains Aquifer, ten million years old, is the largest aquifer in the United States and one of the largest in the world, encompassing an area of 174,050 square miles, with about the same amount of water as Lake Erie. This is	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. Consolidated Response ALT-1 addresses potential alternative routes, including routes that would avoid much of the Northern High Plains Aquifer system. Consolidated Response OIL-4 addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils. Keystone has withdrawn its application for a Special Permit as described in Consolidated Response REG-1.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					<p>pure, potable water. TransCanada Keystone XL plans a pipeline route carrying tar sands oil, and expected to go 1,980 miles from Alberta through Nebraska and other Great Plains states to the U.S. Gulf Coast. This route brings the potential for contamination to aquifers on which we all will depend. In Nebraska, the route runs directly through the grass-stabilized dunes of the Nebraska Sand Hills that sit atop the Ogallala Aquifer. The topsoil so shallow that most of the area has never been plowed. In the spring, the meadows between the hills are dotted with shallow lakes formed by the groundwater that is never far from the surface. Those making comparisons between the Gulf oil spill and tar sands oil imply that pipelines overland are safe – and that leaks are easily remedied. But the aquifer would quickly absorb any leaks like a sponge, contaminating the drinking water and agricultural irrigation waters in America's heartland from South Dakota to Texas. The newer tar sands pipelines are all high-pressure pipelines meant to transport corrosive and dirty bitumen. Yet the companies have all asked for waivers of safety standards that allow them to use less steel to save costs. To save their costs – but increase the cost to this fragile and critically important environment. The pipeline is planned to be 3 feet in diameter, buries 4 feet deep. A farmer said, "In the fall and spring of the year we've got groundwater that comes up and fills the ditches along roadways with water. Those ditches," he said, "aren't 4 feet deep." It is estimated that by the end of this century the world will not have enough freshwater to meet our needs, The largest water need is for food production – more than 75 percent of all freshwater use is for agriculture. The highly productive agricultural lands of the plains, irrigated with water from the High Plains Aquifer, are a critical piece in feeding the world. Protecting the aquifer from potential contamination is of concern not to the Great Plains alone, but to all of us, everywhere. TransCanada Keystone XL obviously has chosen the shortest and most direct route from Alberta to the Gulf – above the High Plains Aquifer. If there must be a pipeline, why can't a route be found that does not endanger this critically important resource?</p>	
598	1	Hockman	Marilyn		<p>The first Keystone Pipeline project went through my farm by Dochester, Nebraska and I was not happy to have it go through my land. We are also on the Ogallala Aquifer but our soil is different than the Sandhills. I think that is very dangerous to the water in our state to have it go through the Sandhills. If that would leak it could ruin the water for our state and that is a precious asset.</p>	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
285	1	Hodges	Janice		<p>I do not want the pipeline to go through the Ogallala Aquifer. We have great water and do not need anything to jeopardize that.</p>	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
369	2	Hodges	Christine		<p>However, the Sandhills is the worst place this could occur. The porous nature of the soil and its proximity to Ogallala Aquifer would make it hard to contain any spill quickly enough to prevent pollution to the water supply. Why not locate the pipeline on a different route? Clay soils are abundant in other areas of Nebraska and would provide a safer, much less</p>	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. Consolidated Response ALT-1 addresses potential alternative routes, including routes that would avoid much of the Northern High Plains Aquifer system.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					permeable base.	
1421	1	Hoeven	John	Governor of North Dakota	I am writing to express my support for TransCanada's Keystone XL (KXL) crude oil pipeline, and to urge that the Department of State continue its permitting process for this energy infrastructure project	Comment acknowledged.
1421	3	Hoeven	John	Governor of North Dakota	KXL is important for America's domestic energy security. It will also facilitate the ongoing development of the Bakken and Three Forks formations within the Williston Basin here in North Dakota.	Consolidated Response ALT-3 addresses issues related to a potential pipeline connection to the proposed Project in Montana.
1552	36	Hoff	Dena		I would like to know why the on-ramp is not addressed in the EIS and whether plans for the on-ramp have been canceled. If it is going to happen, it needs to be analyzed. If not, the Governor should have notified the communities that are going to be impacted economically by the pipeline going through or not.	Consolidated Response ALT-3 addresses issues related to transportation of crude oil from the Williston Basin.
1552	37	Hoff	Dena		The EIS should use language that's very specific; avoiding words like 'several' or 'may'. We don't need speculative language, we need specifics so that we know what's going to happen.	Many of the potential impacts identified in the EIS are just that -- impacts that may, or may not, occur depending on specific situations at the time of construction, operation, maintenance, and inspection of the proposed Project. In those cases a qualifier is used with the description of the potential impact. Where impacts would clearly occur, such as short-term impacts to crops or rangeland due to construction through those areas, the EIS states what the impact would be.
1552	38	Hoff	Dena		Taxpayers and landowners alike need to know if they are going to be burdened with any kind of cleanup or impacts caused by cost-cutting measures in the building of this pipeline.	If the comment regarding "cost-cutting measures" is in reference to Keystone's application for a Special Permit, Keystone has withdrawn its application for the permit as described in Consolidated Response REG-1. Consolidated Response LIA-1 addresses Keystone's liability if there is a spill of hazardous materials or fuel during construction or a spill of crude oil from the proposed Project.
1552	39	Hoff	Dena		As an irrigated farmer, I was really disappointed in the section addressing the impacts. It was woefully inadequate and should be redone.	Consolidated Response FRM-1 addresses potential ranch of farmland impacts, and Consolidated Response FRM-2 addresses potential impacts to irrigated cropland.
1552	40	Hoff	Dena		You need to be looking at all the very different soil types and they need to be studied for impacts.	See Section 3.2 of the EIS for a discussion of the potential impacts to due to construction and normal operation of the proposed Project.
1552	41	Hoff	Dena		The idea that the damage done to irrigated land will fix itself in a year is absolutely ridiculous, and it's an insult to anybody who has irrigated land.	Consolidated Response FRM-2 describes potential impacts to irrigated crops and Keystone's responsibilities to compensate for damage to these crops. The EIS has been revised in response to this comment.
1552	42	Hoff	Dena		Why does a foreign country get the right to eminent domains, and why should that trump property rights of residents?	As described in Section 1.0 of the EIS and in Consolidated Response RES-2, TransCanada-Keystone Pipeline LP (Keystone) is not a foreign corporation. It is a limited partnership organized under the laws of the state of Delaware. Keystone has the same rights as other pipeline companies in the U.S. to propose projects. If easement negotiations with landowners are not successful, Keystone would initiate eminent domain proceedings. Consolidated Response EAS-2 also addresses issues related to easement negotiations and eminent domain.
1552	44	Hoff	Dena		Who bears responsibility for rusting, leaking pipes?	Consolidated Response LIA-1 addresses Keystone's liability if there is a spill of hazardous materials or fuel during

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
						construction or a spill of crude oil from the proposed Project.
1305	1	HOFFA	JAMES	INTERNATIONAL BROTHERHOOD OF TEAMSTERS	I am writing on behalf of 1.4 million Teamster members in support of the Keystone XL Pipeline project being developed by TransCanada, Inc. There can be no doubt that this project is in the national interest and should go forward as quickly as possible. The Keystone project will construct a 1,980-mile, 36-inch crude oil pipeline beginning at Hardisty, Alberta and extending southeast through Saskatchewan, Montana, South Dakota and Nebraska. This \$12 billion economic stimulus and investment will substantially expand the underground pipeline infrastructure in the United States, allowing for the transportation of crude oil from Canada to Gulf Coast refineries in the U.S.	Consolidated Response ECO-1 addresses potential socioeconomic impacts, and Consolidated Response TAX-1 addresses concerns regarding taxes.
1305	2	HOFFA	JAMES	INTERNATIONAL BROTHERHOOD OF TEAMSTERS	It has been estimated that construction of the pipeline, which is scheduled to take place from 2011 to 2012, will create 10,000 construction jobs alone. With the unemployment rate in construction hovering near 20%, these jobs are critically needed by the millions of workers facing eviction and other hardships due to lack of work. In addition, over 340,000 additional U.S. jobs will be generated between 2011 and 2015 in related manufacturing and service industries as a result of the pipeline. The funds generating this job creation will come entirely from the private sector.	Consolidated Response ECO-1 and Section 3.10.2.2 address potential socioeconomic impacts.
1305	3	HOFFA	JAMES	INTERNATIONAL BROTHERHOOD OF TEAMSTERS	However, state and local governments will collect substantial tax revenues as a result of the project. It has been estimated that property tax collection alone will exceed \$100 million and this does not include revenue generated by increased sales, fuel and other taxes.	Consolidated Response TAX-1 and revisions to Section 3.10.2.4 of the EIS address concerns regarding taxes associated with implementation of the proposed Project.
1305	5	HOFFA	JAMES	INTERNATIONAL BROTHERHOOD OF TEAMSTERS	While this energy is badly needed to help our nation's economic recovery, the draft environmental impact statement recently issued in connection with the project states that the pipeline will have limited adverse environmental impact during construction. For this reason, I urge that a finding be made that the pipeline is in the national interest and that the necessary environmental review be completed as quickly as practical so that the Presidential Permit can be issued as soon as possible.	Comment acknowledged.
693	1	Hoffman	Kristin		Upon learning about the proposed TransCanada XL Pipeline that is to cross Nebraska OVER the Ogallala Aquifer I have many concerns. 1) Tar sand oil is very dirty and pollutes, exponentially, through every step of it's production.	As noted in Consolidated Response OIL-4, the composition of crude oil that would be transported by the proposed Project would be essentially the same as that of other heavy crude oils refined in the U.S. Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project.
693	2	Hoffman	Kristin		Burying the pipeline through the Nebraska Sandhills and over our largest aquifer is a threat to the entire population and ecosystems in our state. Our water is our lifeblood! It is more important than oil! It's not a matter of if the pipe will leak, but when, where and how much!	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. Consolidated Response OIL-1 addresses the likelihood of spills from the Project.
693	3	Hoffman	Kristin		I would hope my government, that I elected, would protect Nebraska and all other proposed sacrificed states from this pipeline. At the very least, rigorous environmental research	The impacts associated with implementation of the proposed Project are addressed in Section 3.0 of the EIS. As noted in that section, construction and normal operation the proposed

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					needs to be done.	Project would not result in significant environmental impacts. Section 3.13 of the EIS addresses reliability and safety issues, including calculations of the probability of a spill from the Project and the potential environmental impacts associated with spills.
738	1	Hoffman	Scott		The proposed new pipeline path crosses some of the most unique and fragile ecosystems in the world. These must be protected at all cost.	Identification of sensitive environments crossed by the proposed Project is discussed in Consolidated Response ENV-1 and ENV-3. Issues related to the Sand Hills area are addressed in Consolidated Response ERO-1.
738	2	Hoffman	Scott		The proposed new pipeline path crosses the largest underground aquifer in the country. These must be protected at all cost.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
1179	3	Hollenbeck	John		Now we want to bring a pipeline from Canada to Texas, over the most precious natural water supply this nation has.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
1179	5	Hollenbeck	John		Cost [of re-routing pipeline further west] should not be an issue.	Consolidated Response ALT-1 addresses potential alternative routes, including routes that would avoid much of the Northern High Plains Aquifer system and the Sand Hills area. .
1287	1	Holley	Pat	Cameron International	I write in support of Trans Canada's Keystone XL crude oil pipeline project and urge the department to grant a permit for the pipeline.	Comment acknowledged.
1287	5	Holley	Pat	Cameron International	Securing stable and affordable energy from our North American allies through projects such as the Keystone pipeline is in the national interest.	Comment acknowledged.
1287	6	Holley	Pat	Cameron International	Considering the economic and energy security benefits of these vital resources, we should continue to expand America's access to safe, affordable energy to help ensure improved domestic and global energy security and stable prices for consumers.	Comment acknowledged.
1287	8	Holley	Pat	Cameron International	Additional pipeline capacity will help consumers and businesses throughout the United States.	Comment acknowledged.
1287	9	Holley	Pat	Cameron International	This project also stands to provide a powerful private sector economic stimulus. During construction, Keystone XL will create more than 13,000 jobs funded with private investment.	Consolidated Response ECO-1 and Section 3.10.2.2 of the EIS address the potential socioeconomic impacts of the proposed Project.
1287	10	Holley	Pat	Cameron International	Local governments will have a steady source of income from economic activity associated with construction and from property taxes the pipeline company will pay.	Comment acknowledged.
1287	11	Holley	Pat	Cameron International	Rejection of the permit or suspension of the review would sacrifice the significant economic benefits this project stands to deliver and force U.S. consumers to rely on other sources of crude oil not economically and politically allied with U.S. interests. This would be a mistake.	Comment acknowledged.
1287	12	Holley	Pat	Cameron International	I urge the granting of the permit.	Comment acknowledged.
1288	1	Holley	Pat	Cameron International	Recently a number of advocacy groups sent a letter seeking suspension of the permitting of the Keystone XL pipeline. I encourage you to reject the request and to continue to review the proposed project.	Comment acknowledged.
1288	3	Holley	Pat	Cameron International	Construction of this project stands to bring significant economic benefits to the areas where it will be built.	Comment acknowledged.
1288	5	Holley	Pat	Cameron	The permitting processes in place are appropriate and should	Comment acknowledged.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
				International	proceed so that a final determination can be made about the impacts of the project and whether it is in the national interest.	
183	1	hollowwood@jun-o.com			I do not understand how anyone could even consider running an oil pipeline through the nation's largest clean water aquifer, and several rivers in the Nebraska Sandhills.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
183	3	hollowwood@jun-o.com			In todays paper was a write up about "a leaked pipeline caused oil to spill into Salt Lake City creek, coating geese and ducks". The fact that it happened there, shows that there are no guarantees that it would not happen in Nebraska. Every summer during the dry spell we are all asked to conserve water, to value out clean water supply by not dumping chemicals down the gutters etc.....you need to make the wise decision to do the same to protect our clean water supply and not allow that pipeline anywhere near the Nebraska rivers and aquifer. Do not let the oil companies control our water source! Keep our water clean! No pipeline in these areas!	Consolidated Response ALT-1 addresses potential alternative routes, including routes that would avoid much of the Northern High Plains Aquifer System. Issues related to the Northern High Plains Aquifer System are addressed in Consolidated Responses AQF-1 through AQF-4.
64	1	Holman	Dale		We do not need the Keystone XL pipeline. The impact on the environment would be awful. There are enough problems with the enviroment right now without adding more to it. We DO NOT need the pipeline.	Consolidated Response P&N-1 addresses the need that the Project has been proposed to meet. The impacts associated with implementation of the proposed Project are addressed in Section 3.0 of the EIS. As noted in that response, the proposed Project would not result in any significant environmental impacts.
410	1	Holmes	Zoe		I grew up in Southeastern Nebraska. Nebraska is a prairie, which means it is grassy, vast, and flat. It is also shockingly beautiful and most of that beauty comes from the fact that our native grasses, plants, and wildlife have water. Their water comes from the Ogallala Aquifer, which is one of the world's largest aquifers. It feeds eight states, but the majority rests in Nebraska. The proposed pipeline would cut right next to the aquifer--right next to Nebraska, eight states, and one of America's greatest resources. Underground, a leak could go undetected for days, meaning the leak could kill our pure water--and we'd have no way of knowing. It would poison our state. The disaster happening right now on the Gulf shows how precarious and how dangerous pipelines can be. It also shows us the value of water. Water, clean pure water, is already a precious resource. It will, with pollution, only become more precious. The proposed pipeline doesn't just potentially damage my state now--it potentially destroys a resource that America will need 10, 20, 50 years from now for a resource (crude oil) that IS replaceable. Water is finite. Ways to power machines are not. When I voted for this administration, I voted for people that I thought would make good, long-term decisions, whether or not they were popular. For the sake of my home state, for the sake of America's water, I hope I didn't choose poorly.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
1422	1	Holmes	Carl	Kansas House of Representatives	I write to express my support for the proposed Keystone XL Pipeline ...	Comment acknowledged.
1422	2	Holmes	Carl	Kansas House of Representatives	I agree with the Draft Environmental Impact Statement (DEIS) that the delivery of secure and affordable supplies of Canadian energy to American consumers would have minimal impacts on the environment. I encourage the Department of	Comment acknowledged.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					State to reach a final, logical conclusion reached in the DEIS that the proposed Keystone XL Pipeline would have "limited adverse environmental impact during construction and operation".	
1422	5	Holmes	Carl	Kansas House of Representatives	Oil sands account for more than 97 percent of that vast reserve: 170 billion barrels of oil with the potential for more than 100 years of production.	Comment acknowledged.
262	1	Holt	David	Consumer Energy Alliance	Please find enclosed approximately 6 comment letters generated by Consumer Energy Alliance and other interested stakeholders. Each of these letters highlights support for the Keystone XL Draft Environmental Impact Statement.	Comment acknowledged.
262	2	Holt	David	Consumer Energy Alliance	On behalf of Consumer Energy Alliance (CEA), I appreciate the opportunity to submit the following comments to the State Department regarding the Draft Environmental Impact Statement (DEIS) on the Keystone XL pipeline project, which concluded that the delivery of secure and affordable supplies of Canadian energy to American consumers would have minimal impacts on the environment.	Comment acknowledged.
262	4	Holt	David	Consumer Energy Alliance	As discussed in the DEIS, the evaluation studied the project's potential impact on a number of environmental matters. CEA appreciates the efforts by the State Department to evaluate the potential environmental consequences of the Keystone project and agrees with the Agency's findings that the proposed project "would result in limited adverse environmental impacts during both the construction and operation."	Comment acknowledged.
262	5	Holt	David	Consumer Energy Alliance	Upon completion, the proposed project will consist of three new pipelines that will span approximately 1,380 miles across the United States from Canada, which will carry about 700,000 barrels of crude per day initially, eventually increasing to 900,000 barrels. These secure energy supplies from the proposed pipeline will strengthen America's energy and economic security, as well as creating hundreds of high-paying, family-supporting jobs along the way.	Comment acknowledged.
250	1	Holzer	Jane	Montana Salinity Control Association	Montana Salinity Control Association (MSCA) is a technical service program that is a satellite on Montana's conservation districts with the express purpose to remediate saline soil and water resources. MSCA has conducted a shallow ground water investigation in portions of Section 23, 24, 25 Township 35 North Range 33 East, which coincides with the proposed Keystone XL pipeline. MSCA has made recommendations to the landowner (Rodney Reitan), but the reclamation project is only in the beginning stages of long-term (ten years) land-use change to resolve the salinity problems. Plowing a pipeline through the saline site would disturb the ground water reclamation.	Consolidated Response PVT-2 addresses concerns related to the proximity of the proposed Project to existing structures and facilities.
250	2	Holzer	Jane	Montana Salinity Control Association	There are numerous saline areas covering well over 30 acres within the investigated area with an elevated saline ground water table that you should be aware of that would complicate the installation and maintenance of the Keystone pipeline. The saline areas are adjacent to the county road and out in the fields. See the accompanying map for saline area locations. The upper 2-6 feet of soil profile is sandy clay loam over clay	As described in Consolidated Response SAF-1, the Pipeline and Hazardous Materials Safety Administration (PHMSA) has regulatory requirements that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project in a manner that protects the health and safety of the public and the environment. In additions to its regulations in 49 CFR Parts 194 and 195, PHMSA developed

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					and clay loam. The chemistry of the saline water is sodium and magnesium sulfate that is corrosive to some materials. The areas with a white salt crust have an elevated water table within 3-5 feet from the soil surface. If it is possible to route the pipeline away from these saline areas, it would be beneficial to the local soil and water resource and the pipeline installation. For further information on salinity issues for this site or in general, please contact the MSCA office at (406) 278-3071. MSCA has projects through the proposed pipeline route.	57 Project-specific Special Conditions that Keystone has agreed to implement and to incorporate into its manual for operations, maintenance, and emergencies that is required by 49 CFR 195.402. These regulations and Special Conditions specify pipeline material and qualification standards, design requirements, measures to protect the pipeline from internal and external corrosion, measures to monitor and inspect for corrosion, and requirements to replace sections of pipe if specified levels of corrosion are detected. The pipe would be coated to withstand corrosion and a cathodic protection system would be installed to minimize external corrosion.
185	1	Honey	Maureen		Here in Nebraska we are outraged that Keystone intends to build a pipeline RIGHT THROUGH the largest freshwater aquifer in the United States. Pipelines inevitably break down and there is no outlet from an aquifer. The oil and sand tar will stay there forever and will forever pollute one of our greatest resources, used for irrigation and human water supplies as well. I don't understand how the EPA can approve this project. We'll be watching to see what you do.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
641	1	Honnen	Elizabeth		We must protect the Ogallala Aquifer. Please keep this pipeline away from the Nebraska Sand Hills.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
1085	1	Honnen	Dean&Beth		Please do not allow the Keystone pipeline to run through the Nebraska Sandhills. We must protect the Ogallala Aquifer.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
1145	1	Hood	David		I fear the pipeline because of the possible damage it could cause. It's bad enough on ocean water where it can be skimmed off the top. But in the massive water supply in Nebraska which is underground it can't be skimmed off.	Issues related to the Northern High Plains Aquifer System are addressed in Consolidated Responses AQF-1 through AQF-4. Consolidated Response AQF-3 provides information on hypothetical spills from the Project over two areas of the Northern High Plains Aquifer System. Consolidated Response RES-1 addresses issues related to preparation and review of the Emergency Response Plan for the proposed Project.
692	1	Hopp	Gerald		Despite all precautions presented in arguments about public and environmental safety protocols, this pipeline should not be allowed any type of construction access. This is of particular reference to the groundwater pool in the Ogallala Aquifer. It is too great a resource to shoulder this risk. Please resist the powers of any Canadian or United States interest groups to allow this pipeline.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
1284	2	Hopstad	Floyd		I signed up with the Northern Plains Resource Council in hopes that by joining forces, we might together, draw attention to numerous issues and concerns that would probably be ignored otherwise. But, from my standpoint, this is all crazy.	Comment acknowledged.
1284	3	Hopstad	Floyd		On doing a little research this morning. I punched in "Enbridge" and found out that at least that 50 year old pipeline was 'above ground', making it possible to monitor spills and leaks. Putting a pipeline 7 feet deep in the ground with a "permanent easement" attached to a EIS is no solution!	Issues related to an aboveground pipeline are addressed in Consolidated Response CST-1. Consolidated Response SAF-1 describes the regulatory requirements that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project in a manner that protects the health and safety of the public and the environment.
1284	4	Hopstad	Floyd		What is one of the first things they requested? They want to use inferior pipe in places they refer to as "low consequence areas".	Keystone has withdrawn its application for a Special Permit as described in Consolidated Response REG-1. As described in Consolidated Response SAF-1, the Pipeline and Hazardous Materials Safety Administration (PHMSA) has regulatory requirements that Keystone must comply with to construct,

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
						operate, maintain, inspect, and monitor the proposed Project in a manner that protects the health and safety of the public and the environment. In addition, PHMSA developed 57 Project-specific Special Conditions that Keystone has agreed to implement. Incorporation of those conditions would result in a Project that would have a degree of safety over any other typically constructed domestic oil pipeline system under current code and a degree of safety along the entire length of the pipeline system similar to that which is required in HCAs as defined in 49 CFR 195.450.
561	1	Horner	Mo		Routing an oil pipeline over the Nebraska Sandhills above the Ogallala Aquifer is a very poor idea. Where is the wisdom to understand this needs to be rerouted over safer land? This is the water supply for millions of citizens of the Great Plains. Someone, please stop this. Now.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. Consolidated Response ALT-1 addresses potential alternative routes, including routes that would avoid much of the Northern High Plains Aquifer system.
768	1	Horner	Jennnifer		No Keystone pipeline across Nebraska's Sandhills. This is a delicate ecosystem that should be protected.	Identification of sensitive environments crossed by the proposed Project is discussed in Consolidated Response ENV-1 and ENV-3. Issues related to the Sand Hills area are addressed in Consolidated Response ERO-1.
768	3	Horner	Jennnifer		This sounds like a terrible idea.	The commenter's opinion is noted.
376	1	Hosch	Jacqueline		My husband is a St. Paul Local #455 Pipefitter. He has worked most of his 25 year career at the two oil refineries in the Twin Cities. Flint Hills Resources is ranked as one of the Nation's least polluting oil refineries, in spite of the fact that they refine Canadian crude.	Comment acknowledged.
376	2	Hosch	Jacqueline		Please support the continued and expanded use of Canadian crude; it will create much needed jobs right here in America.	Comment acknowledged.
376	3	Hosch	Jacqueline		If we focus our efforts on updating oil refineries to handle the Canadian crude in an environmentally friendly way, as Flint Hills has done, we will boost our own economy, while at the same time clean-up the environment. Banning the importing of it, as legislatures in Minnesota have proposed, will not create less pollution filtering down from Canada, as China will be more than happy to oblige in our lack of interest.	Comment acknowledged.
376	4	Hosch	Jacqueline		I would like to express my support for the U.S. Department of State's Draft Environmental Impact Statement (DEIS) on the Keystone XL pipeline project, which concluded that the delivery of secure and affordable supplies of Canadian energy to American consumers would have minimal impacts on the environment.	Comment acknowledged.
376	5	Hosch	Jacqueline		As discussed in the DEIS, the evaluation studied the project's potential impact on a number of environmental matters. I appreciate the efforts by the State Department to evaluate the potential environmental consequences of the Keystone project and agree with the Agency's findings that the proposed project would result in limited adverse environmental impacts during both the construction and operation.	Comment acknowledged.
376	6	Hosch	Jacqueline		Upon completion, the proposed project will consist of three new pipelines that will span approximately 1,380 miles across the United States from Canada, which will carry about 700,000 barrels of crude per day initially...These secure energy supplies from the proposed pipeline will strengthen America's	Comment acknowledged.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					energy and economic security, as well as creating hundreds of high-paying, family-supporting jobs along the way.	
376	7	Hosch	Jacqueline		Since the U.S. imported 1.5 million barrels of oil daily from the Canadian oil sands last year and that number is expected to climb to 4.3 million barrels a day over the next two decades, I ask the federal government to consider the benefits of projects like the Keystone XL.	Comment acknowledged.
376	8	Hosch	Jacqueline		Clearly they can improve America's future by securing additional energy supplies so we will no longer be forced to import resources from people and places around the world whose strategic interests don't always align with our own. Securing stable and affordable energy from our North American allies through future projects, such as the Keystone pipeline, is clearly a national priority that can be completed with minimal environmental impacts. Considering the economic and energy security benefits of these vital resources, we should continue to expand America's access to safe, affordable energy to help ensure improved domestic and global energy security and stable prices for consumers.	Comment acknowledged.
706	2	Hotovy	Emily	Sierra Club	There isn't a way to save the aquifer if a leak should happen.	Issues related to the Northern High Plains Aquifer System are addressed in Consolidated Responses AQF-1 through AQF-4. Consolidated Response AQF-3 provides information on hypothetical spills from the Project over two areas of the Northern High Plains Aquifer System.
706	3	Hotovy	Emily	Sierra Club	This can NOT be allowed to happen...Step up, say no to Big Oil and say yes to saving our environment and our economy....it's a horrible idea overall.	The commenter's opinion is noted.
706	4	Hotovy	Emily	Sierra Club	Not only does it hurt our economy, ...	Consolidated Response ECO-1 addresses potential socioeconomic impacts, and Consolidated Response TAX-1 addresses concerns regarding taxes.
706	5	Hotovy	Emily	Sierra Club	Not only does it hurt our delicate ecosystem in the Sand Hills.	Identification of sensitive environments crossed by the proposed Project is discussed in Consolidated Response ENV-1 and ENV-3. Issues related to the Sand Hills area are addressed in Consolidated Response ERO-1.
706	6	Hotovy	Emily	Sierra Club	Not only does it...creates all kinds of safety concerns surrounding it, ...	As described in Consolidated Response SAF-1, the Pipeline and Hazardous Materials Safety Administration (PHMSA) has regulatory requirements that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project in a manner that protects the health and safety of the public and the environment. In addition, PHMSA developed 57 Project-specific Special Conditions that Keystone has agreed to implement. Incorporation of those conditions would result in a Project that would have a degree of safety over any other typically constructed domestic oil pipeline system under current code and a degree of safety along the entire length of the pipeline system similar to that which is required in HCAs as defined in 49 CFR 195.450.
706	7	Hotovy	Emily	Sierra Club	With whats going on in the Gulf right now this is NOT the kind of PR nightmare that Nebraskans need.	As described in Consolidated Response GLF-1, the risks associated with the proposed Project are substantially different from those associated with the BP Deepwater Horizon Project.
706	7	Hotovy	Emily	Sierra Club	With whats going on in the Gulf right now this is NOT the kind of PR nightmare that Nebraskans need.	As described in Consolidated Response GLF-1, the risks associated with the proposed Project are substantially different

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
						from those associated with the BP Deepwater Horizon Project.
959	1	Hovorka	Duane	Nebraska Wildlife Federation	The proposed pipeline raises some very important issues for the future direction of America's energy and climate policy, the impact of the project on migratory birds that would be harmed by the associated tar sands oil development in Canada, and the risk to natural resources in Nebraska. The Nebraska Wildlife Federation does not believe the Draft Environmental Impact Statement (DEIS) adequately addresses these issues.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project. Consolidated Response GHG-2 also addresses the potential causal connection of implementation of the proposed Project and expanded oil sands production in Canada. Consolidated Response ENV-4 addresses issues related to oil sands production and migratory birds.
959	2	Hovorka	Duane	Nebraska Wildlife Federation	The Nebraska Wildlife Federation does not believe the project as currently conceived is one that meets proper environmental tests of law, and does not believe building of the pipeline as conceived would be in the national interest of the United States of America.	Consolidated Response P&N-6 addresses the need for a supplemental DEIS. Consolidated Responses ENR-1 and P&N-9 provide information on the DOS environmental review process, the National Interest Determination process, and the need to complete those reviews before approving or denying the Presidential permit for the proposed Project.
959	3	Hovorka	Duane	Nebraska Wildlife Federation	In the DEIS, Table 3.3.1-2 shows over 100 miles of pipeline route in Nebraska where groundwater is less than 50 feet from surface. In addition, floodplains and flowing rivers would be expected to have groundwater less than 50 feet from surface. Sandhills ranchers often tell of hitting groundwater when digging holes for fence posts. The Ogallala Aquifer underlies the Sandhills, and is fed by rainfall that moves through its porous soils. The Ogallala Aquifer stretches south through the Great Plains to Texas, and serves as a key underground water source for irrigation, industry and drinking water throughout that area. Should the pipeline leak or break in the segments where aquifers are close to the surface, the result would be contamination of a portion of the aquifer. Given the difficulty of cleaning up groundwater, the best-case response could be simply containing the spill and monitoring the resulting plume.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
959	4	Hovorka	Duane	Nebraska Wildlife Federation	We were unable to find in the DEIS information on the specific gravity of the fluids moving through the pipeline, including the chemicals to be used to improve the flow of the oil. Experts we have consulted with caution that the oil is not akin to light oil that would float to the surface when exposed to water. In the event of a pipeline break or leak, the oil and its constituent chemicals could mix in with and contaminate groundwater, and would almost certainly contaminate rivers, wetlands or other surface water should the spill occur in proximity to those resources.	Consolidated Response OIL-4 and Section 3.13.5 address the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is a homogeneous mixture that is similar in composition to other heavy crude oils. The specific gravity of the crude is less than that of fresh water and would float on water. If a spill were to occur and reach groundwater or surface water, the oil would behave similar to other heavy crude oil and the constituents of the crude oil would not instantly separate.
959	5	Hovorka	Duane	Nebraska Wildlife Federation	The questions raised by TransCanada's application to use thinner than standard steel and higher pressures in the Keystone XL pipeline, and allegations only now coming to light about the use of weaker or potentially defective materials in the first Keystone pipeline, heighten our concern about the risks to the Ogallala aquifer and other groundwater in Nebraska.	Keystone has withdrawn its application for a Special Permit as described in Consolidated Response REG-1. Issues related to the Northern High Plains Aquifer System are addressed in Consolidated Responses AQF-1 through AQF-4.
959	6	Hovorka	Duane	Nebraska Wildlife Federation	The pipeline would cut across the Nebraska Sandhills, one of the most fragile ecosystems in North America. The Sandhills is the largest sand sea in the western hemisphere. The sand dunes, now stabilized by prairie except where they have been	The EIS was revised to include additional information on Keystone's construction and restoration techniques within the Sand Hills in Section 3.5. Additional information on Keystone's process for development of construction and

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					disturbed, were formed by wind-blown sand. Some of the dune formations are several hundred feet deep. The fragile nature of the Sandhills can be seen from the scars on the land from the 1970's, when native range was plowed and center pivot systems installed. Decades after the irrigation systems were abandoned and the land 'restored', the impacts are still visible. The areas 'restored' are still subject to substantial wind erosion.	restoration methods within the Sand Hills and other issues are discussed in Consolidated Response ENV-1. Issues related to the Sand Hills area are addressed in Consolidated Response ERO-1.
959	7	Hovorka	Duane	Nebraska Wildlife Federation	The DEIS indicates that "During Project operations, there could be risks associated with pipeline exposure due to lateral or vertical scour at water crossings during floods. " However, the DEIS does not appear to recognize that the potential for blowouts to occur in fragile, disturbed Sandhills soils also provides a significant risk of pipeline exposure. Should that happen, the pipeline would be exposed to the potential for the ground to actually blow out from under the pipeline.	Issues related to the Sand Hills area are addressed in Consolidated Response ERO-1.
959	8	Hovorka	Duane	Nebraska Wildlife Federation	We appreciate that the DEIS recognizes the need for special considerations and measures to be taken in the Sandhills during construction due to the highly erodible nature of the soils. However, the risk to the Sandhills is not limited to the construction phase of the project. Once in place, the pipeline would be subject to wind erosion from blowouts, a risk that would be increased because of the disturbance of the native prairie that now stabilizes the sand dunes, and that would be disturbed during construction.	Issues related to the Sand Hills area are addressed in Consolidated Response ERO-1.
959	9	Hovorka	Duane	Nebraska Wildlife Federation	As the DEIS notes, "Due to the relatively high temperature of the oil in the pipeline, increased pipeline operation temperatures may cause a very localized increase in soil temperatures and a decrease in soil moisture content. "Operation of the Project would cause slight increases in soil temperatures at the soil surface of 4 to 8° F primarily during January to May and November to December along the pipeline route in Montana, South Dakota, and Nebraska.... Operation of the Project would cause increases in soil temperature 6 inches below the surface of 10 to 15 °F with the largest increases during March and April in the Steele City Segment of the Project ." While many plants, especially herbaceous annuals, would not produce root systems that would penetrate much below 6 inches, some plants, notably native prairie grasses, trees, and shrubs, have root systems penetrating well below 6 inches. Soil temperatures closer to the pipeline burial depth of 6 feet may be as much as 40° F warmer than the ambient surrounding soil temperatures.	Heat dissipation and potential impacts on native vegetation and crops are discussed in Section 3.5.5 of the EIS. The EIS was revised to add discussions of temperature effects on native prairie grasses and crops in Section 3.5.5, and additional discussions of this issue are included in Consolidated Response ENV-2. Appendix L of the EIS illustrates modeled temperature effects of the pipeline from Montana to Texas and reviews effects of increased soil temperature on native prairie grasses and crops.
959	10	Hovorka	Duane	Nebraska Wildlife Federation	The risk to the Sandhills could be made worse by two important factors. The pipeline itself is designed to move tar sands oil at elevated temperatures designed to improve the flow of the oil. The temperature increase and loss of soil moisture could have significant impacts in the already-fragile soils of the Sandhills. The native prairie species that stabilize the Sandhills include deeply rooted prairie grasses and forbs that are adapted to the relatively arid climate of the region. The "localized increase in soil temperature" and loss of soil moisture would impact the vegetation that grows right over the pipeline. That could impair the ability of the vegetation to	Special Condition Identification of sensitive environments crossed by the proposed Project including the Sand Hills and potential alterations of soil Issues related to the effect of the temperature of the oil that would be transported by the proposed Project is discussed in Consolidated Response ENV-2 and in Sections 3.2, 3.5, and 3.6 of the EIS. Appendix L of the EIS provides a model for heat dissipation and soil temperature profiles. As noted in Special Condition 15 (Appendix U of the EIS) the temperature of the oil would be the same as in most other crude oil pipelines: "Normal pump discharge temperatures should remain at or below 120°

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					continue to stabilize the soil that is intended to protect the pipeline from exposure.	Fahrenheit (°F).” Issues related to the Sand Hills area are addressed in Consolidated Response ERO-1.
959	11	Hovorka	Duane	Nebraska Wildlife Federation	A second factor that could impact the Sandhills is climate change. According to the mid-range projections for Nebraska, the average Dec-Feb temperatures in Nebraska are expected to increase by 3° to 5° F by about 2050, while the average summer (Jun-Aug) temperatures are expected to increase by 5° to 6° F by that time. Those expected summer temperatures imply a summer climate in Nebraska similar to current summers in Oklahoma and West Texas. The result of higher temperatures, especially in the summer, would logically be reduced soil moisture, especially in the top layers of soil. In the case of the Nebraska Sandhills, that has implications for vegetative cover – and continued stabilization of the sand dunes – that have yet to be well studied. However, the potential for more substantial mobilization and movement of the sand dunes in the Sandhills in the coming decades is an important risk factor. This issue needs much further study before conclusions of “no impact” like those drawn in the DEIS can be justified.	Section 3.14.3.14 discusses the potential impacts of climate change on the proposed Project, and the proposed Project’s potential to impact climate change. Section 3.2.2.1 (Soils and Sediments) provides special provisions and measures to reduce impacts to the Sand Hills area. In addition, Issues related to the Sand Hills area are addressed in Consolidated Response ERO-1.
959	12	Hovorka	Duane	Nebraska Wildlife Federation	The DEIS cites at least 89.4 miles of pipeline impacting the Rainwater Basin, and at least 10 Rainwater Basin “wetlands of special concern or value” crossed by the project (Table 3.4.2-1). This is in addition to 37 “wetlands of special concern or value” in the Sandhills that are impacted by the project. The DEIS relies on the proposed project’s restoration activities as a basis to conclude that there will be no major impacts to wildlife. In fact, as we note below, the commitments to restoration of disturbed wetlands or other habitat to pre-construction conditions includes little detail and is very conditional. Given that lack of clear commitment, the DEIS is wrong in concluding that the pipeline’s impacts on wildlife will be minor.	Keystone has committed to follow the Construction, Mitigation, and Reclamation Plan presented in Appendix B of the EIS for all wetland crossings. Emergent wetlands would be restored, resulting in little permanent impacts to wetlands and wildlife habitat. Section 3.4 of the EIS was revised to state the following: “. . . restoration of wetlands in arid regions is not always successful (FERC 2004).” Federal Energy Regulatory Commission. 2004. Research of Wetland Construction and Mitigation Activities for Certificated Section 7(c) Pipeline Projects. Office of Energy Projects, Washington, D.C. Available online at: < http://www.ferc.gov/legal/maj-ord-reg/land-docs/2004-wet-lands.pdf > .
959	13	Hovorka	Duane	Nebraska Wildlife Federation	The DEIS relies for wetland mitigation largely on the U.S. Army Corps of Engineers Section 404 permits, and equivalent state wetland permit programs, under the theory that those permits will accord an appropriate level of protection for wetlands. Unfortunately, the State of Nebraska does not have a wetland permitting program, and the Nebraska Game & Parks Commission has estimated that some two-thirds of Nebraska’s wetlands now fall outside the jurisdiction of the Corps of Engineers.	Keystone has committed to follow the same construction, mitigation, and reclamation plan for all wetland crossings regardless of whether the wetland qualifies as jurisdictional under the U.S. Army Corps of Engineer Section 404 permits. The only difference would be the requirement for compensatory mitigation for permanent wetland losses. Keystone is currently consulting with the State of Nebraska concerning permanent wetland impacts at Pump Station 22. Most wetlands would be restored after pipeline construction. See Section 3.4 of the EIS for further information on wetland impacts and mitigation.
959	14	Hovorka	Duane	Nebraska Wildlife Federation	The Nebraska Department of Environmental Quality (NDEQ) protects many wetlands from degradation as “waters of the state.” It does not issue permits, but operates a consultation process whereby landowners or project sponsors can ask for a consultation on suggested mitigation for wetland impacts. The consultation typically results in a letter from the Department outlining any mitigation recommendations that, if followed, should protect the landowner from subsequent fines or penalties. The consultation is voluntary, and following the mitigation recommendations is voluntary, although the	Keystone has committed to follow the same construction, mitigation, and reclamation plan for all wetland crossings regardless of whether the wetland qualifies as jurisdictional under the U.S. Army Corps of Engineer Section 404 permits. The only difference would be the requirement for compensatory mitigation for permanent wetland losses. Keystone is currently consulting with the State of Nebraska concerning permanent wetland impacts at Pump Station 22. Most wetlands would be restored after pipeline construction. Section 2.3.3.6 of the EIS for further information on wetland

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					landowner risks a fine or penalty if they fill or degrade a wetland without going through the consultation process and following the recommendations. The Department has few resources committed to the program, and few field personnel who seek out violations.	crossings. See Section 3.4 of the EIS for further information on wetland impacts and mitigation.
959	15	Hovorka	Duane	Nebraska Wildlife Federation	We were unable to find in the DEIS any commitment (or indication) that TransCanada will consult with the NDEQ on Nebraska wetland impacts for wetlands not under the Corps of Engineers' jurisdiction, and no commitments that it would comply with any resulting mitigation recommendations. In fact, according to the DEIS, "Wetland impacts that affect non-jurisdictional wetlands under the CWA Section 404 would not require mitigation. Given the situation and lack of effective enforcement mechanisms at the state level, we believe the State Department does not have adequate justification to believe that wildlife, water quality, and other environmental impacts from draining or damage of wetlands in Nebraska will be fully mitigated.	Keystone has committed to follow the same construction, mitigation, and reclamation plan for all wetland crossings regardless of whether the wetland qualifies as jurisdictional under the U.S. Army Corps of Engineer Section 404 permits. The only difference would be the requirement for compensatory mitigation for permanent wetland losses. Keystone is currently consulting with the State of Nebraska concerning permanent wetland impacts at Pump Station 22. See Section 3.4 of the EIS for further information on wetland impacts and mitigation.
959	16	Hovorka	Duane	Nebraska Wildlife Federation	The DEIS also does not adequately account for the changes to wetlands that likely will occur in future years, during the useful life of the pipeline, that would make the project's impacts on wetlands even more severe. According to research by Dr. W. Carter Johnson at South Dakota State University, wetlands in the Prairie Potholes region (in Montana, North Dakota, South Dakota, Minnesota, and northern Iowa and Nebraska) "would be particularly vulnerable to climate change, even if precipitation were to continue at historic levels. Only a substantial increase in precipitation would counterbalance the effects of a warmer climate." The US State Department's own analysis from 2002 echoes this concern: "Prairie potholes, which provide important habitat for ducks and other waterfowl, are likely to become much drier in a warmer climate." The DEIS does not adequately address the implications of these additional pressures on wetlands, which will make the loss, drainage or degradation of wetlands that result from the project even more important.	Potential long-term climate change related impacts to wetland are discussed in general Consolidated Response ENV-6. Keystone implemented avoidance, minimization, and mitigation for limiting impacts to wetlands from proposed Project construction. Most wetlands would be restored after construction. See Section 3.4 of the EIS for further information on wetland impacts and mitigation.
959	17	Hovorka	Duane	Nebraska Wildlife Federation	In Nebraska's Rainwater Basin, a critically important migratory stopover for waterfowl in the Central Flyway, impacts similar to those anticipated in the Prairie Pothole region would be expected. In fact, conservation organizations in the area are already building these anticipated impacts into their planning. Studies estimate that less than 10% of the historic Rainwater Basin wetlands have survived the draining and filling of the last century. That makes each remaining wetland extremely important. The Rainwater Basin wetlands are considered "endangered" by the Nebraska Game & Parks Commission, and the U.S. Fish and Wildlife Service identified them as one of nine areas in the U.S. of critical concern for wetland loss.	Potential long-term climate change related impacts to wetland are discussed in general Consolidated Response ENV-6. Keystone implemented avoidance, minimization, and mitigation for limiting impacts to wetlands from proposed Project construction. Most wetlands would be restored after construction. See Section 3.4 of the EIS for further information on wetland impacts and mitigation.
959	18	Hovorka	Duane	Nebraska Wildlife Federation	In addition to the risks to migratory birds from potential impacts to wetlands in Nebraska (and other states) resulting from pipeline construction and operation, the project would impact migratory birds that rely on boreal forests in Canada.	Section 3.14.4 of the EIS was revised to add information concerning the assessment of impacts from oil sands development on wildlife and the boreal forest in Alberta. Consolidated Responses ENV-4 and WIL-2 address migratory birds. Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1,

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
						including information regarding development of oil sands projects with and without the proposed Project.
959	20	Hovorka	Duane	Nebraska Wildlife Federation	In considering the reasonably foreseeable impacts of the project, the pipeline itself cannot be separated from the production of tar sands oil that is proposed to be moved through the pipeline.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information on current and future production. As noted in that response, without the proposed Project, oil sands development would continue at or above the current level until at least 2020, with or without the proposed Project.
959	21	Hovorka	Duane	Nebraska Wildlife Federation	Existing capacity in current pipelines (including the original Keystone pipeline) can already handle far more than the oil production capacity in place.	Consolidated Response P&N-1 addresses the need that the Project has been proposed to meet. As noted in that response, the Project has been proposed to meet the heavy crude oil needs of refineries in the Gulf Coast area, not for the U.S. in general. In addition, the Alberta Clipper and existing Keystone pipeline projects serve other markets and do not meet the demands of the Gulf Coast refineries.
959	22	Hovorka	Duane	Nebraska Wildlife Federation	The Keystone XL pipeline would substantially increase the capacity to transport tar sands oil from Alberta. It only makes sense as part of a strategy to substantially increase the capacity to produce oil from the tar sands region.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information on current and future production. As noted in that response, without the proposed Project, oil sands development would continue at or above the current level until at least 2020, with or without the proposed Project.
959	25	Hovorka	Duane	Nebraska Wildlife Federation	Drilling in the tar sands requires a complex network of wells, roads, and pipes in areas where drilling is taking place. Although the companies involved assert that the land is reclaimed after mining, there has not yet been any mine fully reclaimed. Forest, peatlands, and wetlands ecosystems are highly complex, and it is unlikely they will regenerate in areas filled with mine waste.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information on current and future production. As noted in that response, without the proposed Project, oil sands development would continue at or above the current level until at least 2020, with or without the proposed Project.
959	26	Hovorka	Duane	Nebraska Wildlife Federation	Mining and drilling operations in the tar sands have severe impacts on water supply and quality in Alberta. The tar sands region is rich in wetlands in the form of bogs, fens, shallow ponds, shoreline marshes, and river delta systems, such as the Peace-Athabasca Delta just downstream from the tar sands (to the north). Mining operations require dredging wetlands and taking large amounts of water from the rivers.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information on current and future production. As noted in that response, without the proposed Project, oil sands development would continue at or above the current level until at least 2020, with or without the proposed Project.
959	27	Hovorka	Duane	Nebraska Wildlife Federation	Changes to Alberta's rivers and underground reservoirs through mining operations could have profound impacts on the hundreds of thousands of birds that are dependent on the wetland habitats in the tar sands and Peace-Athabasca Delta and other parts of the Mackenzie River watershed, and that includes waterfowl and other birds that migrate across the U.S. Canada border.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project. Consolidated Response ENV-4 addresses issues related to oil sands production and migratory birds.
959	28	Hovorka	Duane	Nebraska Wildlife Federation	Among the birds that are threatened by the loss of the Boreal Forest habitat are Whooping Cranes, which are protected under the Endangered Species Act and one of the rarest birds in North America.	The commenter is referring to boreal forest habitat in Canada since the proposed Project does not cross any boreal forest habitat in the U.S. Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information on current and future production.
959	29	Hovorka	Duane	Nebraska Wildlife Federation	Less than 400 Whooping Cranes survive in the wild, including about 265 in the only naturally remaining migratory population which winters in and near the Aransas National Wildlife Refuge on the Texas Gulf Coast, and nests in and near the Wood Buffalo National Park just north of the tar sands mines.	Potential Project-related impacts and proposed conservation measures for the whooping crane are discussed in Section 3.8.1.2 and the Biological Assessment presented in Appendix T of the EIS.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					The birds' primary migration route takes them through Nebraska, including critical migratory habitat along the Central Platte River in Nebraska. Birds from this population migrate over the Boreal Forest and occasionally use wetland habitat in their migrations.	
959	30	Hovorka	Duane	Nebraska Wildlife Federation	The Whooping Cranes breeding success is jeopardized in dry years and most climate change scenarios predict more dry years within the region where they nest. Further, heavy water withdrawals for the extraction of the tar sands may eventually impact the hydrology of the area enough to reduce the water supply in the wetlands on which the Whooping Cranes depend.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information on current and future production. As noted in that response, without the proposed Project, oil sands development would continue at or above the current level until at least 2020, with or without the proposed Project. Section 3.14.4 of the EIS was revised to add a discussion of the environmental impacts due to oil sands development. Issues related to development of oil sands projects in Canada are also addressed in Consolidated Response CAN-1, including information on current and future production. Consolidated Response ENV-6 addresses concerns regarding the influence of climate change on the potential impacts of the proposed Project, and Section 4.14 of the EIS was revised to add information on the influence of climate-change on potential Project impacts.
959	31	Hovorka	Duane	Nebraska Wildlife Federation	Another associated risk to Whooping Cranes is the construction and operation of new power distribution lines to provide electricity to pumping stations along the pipeline. In Nebraska, this includes the construction of several new 115,000 volt power transmission lines that all appear to be within (or very near) the 100-mile wide corridor that includes most of the confirmed sitings of Whooping Cranes migrating through Nebraska. This corridor also includes the heart of the Central Flyway used by many species of migratory birds.	The potential impacts to whooping cranes from the electrical distribution lines to pump stations are discussed as a connected action in Section 3.8 and in the Biological Assessment presented in Appendix T of the EIS, including recommended conservation measures.
959	34	Hovorka	Duane	Nebraska Wildlife Federation	Nearly every major river system in Nebraska fails to meet federal and state water quality standards. That includes the Niobrara (impaired by bacteria), Loup (bacteria), Middle Platte (bacteria), and West Fork Big Blue (bacteria, Selenium and Dieldrin), all to be crossed by the pipeline. As the DEIS notes, Prairie Creek and the Big Blue River are impaired by low dissolved oxygen. We do not believe the pipeline construction will worsen problems like E coli bacteria, but the increased suspended solids and other construction-related pollutants that could result could provide additional stresses to waterways already impaired during construction, and after construction to the extent restoration efforts are not completely successful.	Consolidated Response WAT-1 addresses concerns regarding potential water quality impacts.
959	35	Hovorka	Duane	Nebraska Wildlife Federation	With respect to Prairie Creek and the Big Blue, additional turbidity from construction on the river or upstream tributaries could contribute to making the low dissolved oxygen problems worse.	Consolidated Response WAT-1 and Section 3.3.2 address potential water quality impacts.
959	36	Hovorka	Duane	Nebraska Wildlife Federation	The methods proposed in the DEIS for water body and wetland crossings are unnecessarily destructive in many instances.	Section 3.3 of the EIS addresses stream crossings, including permitting requirements and potential impacts. As noted in Consolidated Response WAT-1, prior to commencing any stream crossing construction activities, Keystone would be required to obtain a permit under Section 404 of the Clean Water Act (CWA) and, in some cases, under Section 10 of the Rivers and Harbors Act of 1899 administered by the USACE

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
						and a CWA Section 401 water quality certification as per state regulations. These federal and state agencies would require measures to limit unnecessary impacts to aquatic and riparian species and their habitat during construction as a condition of the crossing permits. In Montana each crossing of a perennial stream would be reviewed in the field by personnel from the Montana Department of Environmental Quality and specific requirements for stream crossings would be determined upon completion of that review. The potential impacts to water quality associated with waterbody crossings are addressed in Section 3.3.2 of the EIS.
959	37	Hovorka	Duane	Nebraska Wildlife Federation	In addition to the perennial streams, the pipeline would cross many intermittent water bodies. In the event that these intermittent water bodies are dry or stagnant at the time of crossing, the DEIS says conventional upland cross-country construction techniques would be used. However, the pipeline would be installed with the open-cut wet crossing method if water is flowing at the time of installation. The open-cut wet crossing method is potentially more harmful to wildlife and wildlife habitat than other methods by causing the discharge of suspended solids and other pollutants into waters, many of which are already impaired. The DEIS fails to explain why commitments are not made to ensure crossings at times when a less harmful method can be used, or the likely impacts of the more harmful methods.	Consolidated Response WAT-1 addresses stream crossing methods and the associated potential water quality impacts. Section 3.3 of the EIS addresses permitting requirements and potential impacts. Section 3.3 of the EIS addresses stream crossings, including permitting requirements and potential impacts. As noted in Consolidated Response WAT-1, prior to commencing any stream crossing construction activities, Keystone would be required to obtain a permit under Section 404 of the Clean Water Act (CWA) and, in some cases, under Section 10 of the Rivers and Harbors Act of 1899 administered by the USACE and a CWA Section 401 water quality certification as per state regulations. These federal and state agencies would require measures to limit unnecessary impacts to aquatic and riparian species and their habitat during construction as a condition of the crossing permits. In Montana each crossing of a perennial stream would be reviewed in the field by personnel from the Montana Department of Environmental Quality and specific requirements for stream crossings would be determined upon completion of that review. Keystone would prefer to construct stream crossings during low flow periods, or for intermittent streams, when there is no flow. However, the timing of stream crossing will be determined by the limitations imposed in environmental permits, weather conditions, and other variables. The potential impacts to water quality associated with waterbody crossings are addressed in Section 3.3.2.2 of the EIS.
959	38	Hovorka	Duane	Nebraska Wildlife Federation	Given the size and scope of the project, and the likelihood that contractors and equipment will be moving throughout the states involved in the project, we think it is reasonable to expect problems with respect to invasive aquatic species, both plants and critters. We recognize the DEIS calls for some efforts to reduce the likelihood of transporting invasive species from location to location (Section 3.7). For example, measures to thoroughly clean equipment in areas where zebra mussels are known to occur. However, a lack of intensive surveys means public agencies only have a rough idea of where zebra mussels and other invasive species are actually found, so measures that apply only in areas "where zebra mussels are known to occur" may not stop such transfers from occurring.	Keystone would implement measures to prevent the spread of noxious weeds and invasive aquatic animals as described in Sections 3.5.5.4 and 3.7.3.1 of the EIS. Additional description of measures Keystone would implement to prevent the spread of aquatic invasive species were added to Section 3.7.3.1 of the EIS. The measures described in these sections were recommended by federal and state management agencies. Keystone would develop and implement weed control plans which include identification of weed sources identified along the ROW and additional specific descriptions of methods for containment and control.
959	39	Hovorka	Duane	Nebraska Wildlife	If the project will not take preventive measures to stop invasive species from spreading except where they are known	Keystone would implement measures to prevent the spread of noxious weeds and invasive aquatic animals as described in

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
				Federation	to be present, then there is a real risk that such species will be spread and that risk must be examined. Also, what constitutes a "thorough cleaning" is pretty subjective and apparently up to the operator of the equipment, so there are risks that such procedures may not remove all invasive species that could be contained in equipment and subsequently spread to other waterbodies.	Sections 3.5.5.4 and 3.7.3.1 of the EIS. Section 3.7.3.1 of the EIS was revised to include additional measures Keystone would implement to prevent the spread of aquatic invasive species. The measures described were recommended by federal and state management agencies.
959	40	Hovorka	Duane	Nebraska Wildlife Federation	The utmost precaution should be taken in preventing the spread of invasive species, since they are a pollutant that spreads exponentially over time, and once established, are nearly impossible to eradicate and incredibly costly to manage.	Keystone would implement measures to prevent the spread of invasive aquatic animals as described in Section 3.7.3.1 of the EIS. The measures described in this section were recommended by federal and state management agencies.
959	41	Hovorka	Duane	Nebraska Wildlife Federation	Nebraska has a state-wide volunteer stream monitoring program, Adopt a Stream that could prove useful in monitoring stream crossings should the pipeline be built. Some other states also have similar programs. Nebraska's agency water quality monitoring program is small and largely dependent upon federal funds, which may or may not continue to be available in the future, so it is likely not a useful tool for monitoring potential impacts during construction or operation. However, Adopt a Stream volunteers, with appropriate on-line or in-person training, might be helpful in such stream monitoring efforts.	Comment acknowledged.
959	42	Hovorka	Duane	Nebraska Wildlife Federation	An EIS must consider the cumulative impacts of the proposed federal agency action together with past, present and reasonably foreseeable future actions, including all federal and non-federal activities. As we noted above in our comments concerning migratory birds, we believe the Keystone XL pipeline project cannot be considered in isolation from the tar sands oil production in Alberta that the pipeline is designed to serve. The presence of the pipeline, once constructed, will provide capacity that will enable -- and 'sunk costs' of investment that will actually spur -- greatly expanded development of tar sands oil production.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information on current and future production. As noted in that response, without the proposed Project, oil sands development would continue at or above the current level until at least 2020, with or without the proposed Project.
959	43	Hovorka	Duane	Nebraska Wildlife Federation	In their comments, groups like the National Wildlife Federation (NWF) have made important arguments about the likely impact of the project in increasing greenhouse gas emissions. We believe those arguments are sound, and believe the State Department failed to adequately assess or address these impacts.	Consolidated Response GHG-1 addresses the greenhouse gas life-cycle analyses presented in the revised EIS.
959	44	Hovorka	Duane	Nebraska Wildlife Federation	The DEIS does not does not adequately analyze the impacts of expanded U.S. pipeline carrying capacity and refining of heavy crude from the Canadian tar sands. The DEIS does not consider the environmental impacts of tar sands extraction or the indirect end use impacts of increased consumption of tar sands oil. Thus we agree with NWF's view that the DEIS fails to satisfy NEPA's indirect and cumulative analysis requirement.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information on current and future production. As noted in that response, without the proposed Project, oil sands development would continue at or above the current level until at least 2020, with or without the proposed Project. As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries.
959	47	Hovorka	Duane	Nebraska Wildlife	As we noted in oral testimony we provided May 6, the State Department provided a very short window for organizations	The comment period for the draft EIS from April 16 through July 2 was substantially beyond the 45-day time period

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
				Federation	and individuals to read, digest, assess and understand a very long and complex Draft Environmental Impact Statement. That is especially true for small state and local organizations, like ours, that have only a small staff and very limited resources. We appreciate the Department of State's willingness to extend the current comment deadline to July 2. Without that extension, even the limited comments we provided above would not have been possible. However, there were issues we wanted to investigate, such as the potential impact on Nebraska fisheries, including rare species like the northern redbelly dace that occurs in the Nebraska Sandhills, but were unable to because of the limited time provided to review the DEIS and craft comments. We believe further time for the State Department, federal and state agencies, organizations and individuals to assess and understand the many issues raised by the project and the DEIS is certainly warranted.	required by the Council on Environmental Quality's regulations to implement NEPA.
1549	2	Hovorka	Duane	Nebraska Wildlife Federation	The Nebraska Sandhills is a very unique landscape with some unusual soils, and it has only been stabilized relatively recently. It's a fragile system. Strong concern for the impacts of putting a pipeline in this fragile, changing system.	Identification of sensitive environments crossed by the proposed Project is discussed in Consolidated Response ENV-1 and ENV-3. Issues related to the Sand Hills area are addressed in Consolidated Response ERO-1.
1549	3	Hovorka	Duane	Nebraska Wildlife Federation	Concern that the Nebraska sandhills ecosystem will become even more fragile in the future with global warming. This will exacerbate pipeline impacts.	Consolidated Response ENV-6 addresses concerns regarding the influence of climate change on the potential impacts of the proposed Project, and Section 4.14 of the EIS was revised to add information on the influence of climate-change on potential Project impacts.
1549	4	Hovorka	Duane	Nebraska Wildlife Federation	Our other concerns involve wetlands and streams in the area; there are some very important wetlands and wetland complexes that are involved; some of them like the wetlands along the Platte, or some fairly -- we've lost a lot of overnight percent of our Platte River wetlands. SO there are so pretty significantly important wetlands in those areas. You've got Sandhill fens that provide some good habitat up there.	Keystone will follow the Construction, Mitigation, and Reclamation Plan (Appendix B of the EIS) for construction through wetlands under a U.S. Army Corps of Engineers (USACE) Section 404 Nationwide Permit. Keystone has used the cited guidelines to avoid and minimize Proposed Project impacts to wetlands. Wetlands next to the Platte River would be crossed with the Horizontal Directional Drilling crossing of the Platte River. Additional information about HDD can be found in Section 2.2.2.5 of the EIS. No fen wetlands were identified as crossed by the proposed Project. See Section 3.4 of the EIS for further information on wetland impacts and mitigation.
1549	5	Hovorka	Duane	Nebraska Wildlife Federation	It appears that the applicants appear to rely on the federal and state wetland permitting process so that, in order to deal with wetland mitigation. Well, that's fine, except Nebraska has no state permitting process for wetlands. So what happens is it's not a permit system; it's more of a consultation system, that the contractors can come in, can consult with the Department of Environmental Quality, do whatever mitigation they think is appropriate. So again we just want to make sure that that's part of the discussion, that that consultation is actually going to happen before the construction happens, and make sure that there's proper mitigation for whatever wetland impacts there are going to be along the way.	All wetlands will receive construction mitigations as described in Keystone's Construction, Mitigation, and Reclamation Plan (Appendix B of the DEIS) and any other applicable guidance from the U.S. Army Corps of Engineers. Keystone has committed to follow the same construction, mitigation, and reclamation plan for all wetland crossings regardless of whether the wetland qualifies as jurisdictional under the U.S. Army Corps of Engineer Section 404 permits. The only difference would be the requirement for compensatory mitigation for permanent wetland losses. Most wetlands would be restored after pipeline construction. Permanent wetland impacts and requirements for compensatory mitigation will be determined during permitting under the U.S. Army Corps of Engineer Section 404 permits. Keystone is currently consulting with the state of Nebraska concerning impacts to wetlands from Pump Station 22. See additional discussion of this issue in general Consolidated Response WAT-2.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
1549	6	Hovorka	Duane	Nebraska Wildlife Federation	There are also important stream systems in the area, especially in the northern part of Sandhills, including some cold water streams up there. You've got some migratory habitat in some of those rivers, that whooping crane have used and of course a lot of other birds. And those streams hold some pretty rare species like the Northern Redbelly Dace. So certainly a question that we have is whether there's going to be impacts; those are very small streams, and so the construction itself could have some impacts; but also, of course, the potential for a leak in one of those areas could have a pretty big impact on a pretty small population.	Section 3.7.3 of the EIS addresses potential impacts to fisheries resources due to construction of the proposed Project. Section 3.8 addresses threatened and endangered species and sensitive species. Section 3.13 of the EIS addresses reliability and safety issues, including calculations of the probability of a spill from the proposed Project and the potential environmental impacts associated with spills.
1549	9	Hovorka	Duane	Nebraska Wildlife Federation	whole climate change area. Clearly, that tar sands oil project is environmentally -- it's a disaster. You know, what they're doing in Alberta is destroying boreal forests and using huge amounts of energy and contaminating fresh water, realize that the draft EIS doesn't go to what are the impacts in Canada; it looks at the environmental impacts in the United States, but yet that needs to be part of the discussion....if you look at the climate change, the greenhouse gas implications, it makes our job of mitigating climate change harder; and so I think that huge increase in pipeline capacity that's being contemplated will enable a rapid expansion of those tar sands production in Alberta, and that's a significant concern.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project. Consolidated Response GHG-1 addresses GHG life-cycle analyses. Consolidated Response GHG-2 addresses the potential causal connection of implementation of the proposed Project and expanded oil sands production in Alberta and increases in refining.
1560	1	Hovorka	Duane		Concerned about climate change and greenhouse gases.	Consolidated Response GHG-1 addresses the greenhouse gas life-cycle analyses presented in the revised EIS. Climate change is addressed in Section 3.14.3.14. As noted in that Section, implementation of the proposed Project is unlikely to result in a measureable climate change.
1560	50	Hovorka	Duane		Representing the Nebraska Wildlife Federation. Especially concerned about the unique nature of the Nebraska Sandhills, that it is very prone to erosion due to the wind. Safety concerns if pipeline is then exposed to the surface from erosion.	Issues related to the Sand Hills area are addressed in Consolidated Response ERO-1.
1560	51	Hovorka	Duane		Concerned about the Ogallala aquifer.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
1560	52	Hovorka	Duane		Concerned about effects on ground water.	Consolidated Response WAT-1 and Section 3.3.2 addresses the potential impacts to groundwater due to construction and normal operation of the proposed Project. Section 3.13 of the EIS addresses reliability and safety issues, including calculations of the probability of a spill from the proposed Project and the potential environmental impacts associated with spills, including potential impacts to groundwater.
1560	54	Hovorka	Duane		Concerned about impacts to Boreal Forests in Canada.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project. Consolidated Response GHG-4 addresses concerns regarding the loss of boreal forest and peat bogs. Consolidated Response GHG-2 addresses the potential causal connection of implementation of the proposed Project and expanded oil sands production in Alberta and increases in refining.
1560	55	Hovorka	Duane		Concerned about impacts to clean water in Canada.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
						information regarding development of oil sands projects with and without the proposed Project. Consolidated Response GHG-2 addresses the potential causal connection of implementation of the proposed Project and expanded oil sands production in Alberta and increases in refining.
1560	56	Hovorka	Duane		Concerned about stream and river crossings in U.S.	Consolidated Response WAT-1 and Section 3.3.2 address stream crossing methods and the associated potential water quality impacts.
1560	57	Hovorka	Duane		Concerned about the wetlands and Nebraska has no state wetland permitting process. Wants to make sure contractors use state consultation program for wetlands.	Keystone is currently consulting with the Nebraska Department of Environmental Quality for permanent wetland impacts due to the location of Pump Station 22. See Section 3.4 of the EIS for further information on wetland impacts and mitigation.
972	1	Howard	Andrea		I highly oppose the Pipeline coming through my State of Nebraska. The pipeline is full of risks with potential tragic results -- the worst being contaminating our aquifer. No pipeline in Nebraska!	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
1488	1	Howard	Julie	Circle Chamber of Commerce & Agriculture	I am writing in support of TransCanada's proposed Keystone XL crude oil pipeline project and urge the US Department of State to grant the necessary permits for the project. Securing stable and affordable energy from our North American allies through projects such as the Keystone pipelines in our national interests. Considering the economic and energy security benefits of these vital resources, we should continue to expand America's access to safe and affordable energy to help ensure improved domestic and global energy security and stable prices for consumers. This project has the potential to increase access to land-based sources of oil from a trading partner with whom we are closely allied, all criteria that is met by the Keystone XL... Provided the project has a limited impact on the environment, this project could be an important part of the solution to our energy supplies. Please reject the requests by a number of advocacy groups to suspend the permitting process and continue with the final review. Thank you for the opportunity to comment and to express my opinions on this matter.	Comment acknowledged.
1488	2	Howard	Julie	Circle Chamber of Commerce & Agriculture	It is expected that the project will provide a powerful private sector economic stimulus in the areas where it will be built. During construction, Keystone XL will create more than 13,000 jobs funded with private investment. In addition, local governments will have a steady source of income from economic activity associate with construction and from property taxes the pipeline company will pay.	Consolidated Response ECO-1 addresses potential socioeconomic impacts, and Consolidated Response TAX-1 addresses concerns regarding taxes.
1562	1	Howard	Steven	Dowd Howard & Corrigan, LLC	I am writing in reference to the Keystone XL Project and what Keystone XL means to the Nebraska workers, the state of Nebraska and the United States. The Keystone XL Project will create thousands of jobs - approximately 10,000 construction jobs alone, many of which shall be union jobs with family supporting wages. In addition, over 340,000 additional US jobs will be generated in related manufacturing and service industries as a result of the pipeline. With nearly 15 million Americans out of work, these are jobs Nebraska and America need now!	Consolidated Response ECO-1 and Section 3.10.2.2 of the EIS address potential socioeconomic impacts.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
1562	3	Howard	Steven	Dowd Howard & Corrigan, LLC	With so much at stake, I am hopeful that Secretary of State Hilary Clinton shall approve the Keystone XL Project. Thank you for your consideration of these comments on this most important matter.	Comment acknowledged.
128	1	Howe	Susan		I am adamantly opposed to the proposed routing of the oil pipeline anywhere near the Ogallala Aquifer. As the disaster in the Gulf has demonstrated, there is absolutely no way that the safety of our water supply can be assured in perpetuity if this pipeline is run over/through the Aquifer. I beg of you to deny permission for construction of the Keystone pipeline along the proposed route!	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
229	1	Howe	Tyler	Eastern Band of Cherokee Indians	The Tribal Historic Preservation Office of the Eastern Band of Cherokee Indians (EBCI THPO) is in receipt of the information for the above-referenced project and would like to thank you for the opportunity to comment on these proposed National Historic Preservation Act (NHPA) Section 106 activity. However, the above referenced project is outside the aboriginal territory of the Cherokee people. At this time the EBCI THPO does not wish to make comments on the proposed federal undertaking. The EBCI THPO defers this specific undertaking to those federally recognized Indian tribes whose cultural territory falls within the APE for the above referenced projects. Please find enclosed a state and county summary depicting the Cherokee traditional territory. The counties listed are those in which we should continue to be consulted regarding cultural resource issues and notices of federal undertakings as defined in Section 106 of 36 CFR 800. Should future undertakings fall within said counties, the EBCI THPO requests all cultural resource data, including Phase I archeological reports, topo maps, historical research, or archives research be forwarded to this office for comment.	Consolidated Response CUL-1 and Section 3.11.4.3 of the EIS address the consultation process between DOS and Indian tribes. As noted in Consolidated Response CUL-1, a Programmatic Agreement (PA) has been developed for the Project under Section 106 of the National Historic Preservation Act. The PA includes mitigation measures for known adverse effects and provides a process for ongoing surveys to be conducted in areas where access was not granted during the EIS process. The Traditional Cultural Property (TCP) reports (noted in Section 3.11.4-3 of the EIS) may not be disclosed due to concerns regarding confidentiality. Potential impacts to cultural resources are addressed in Section 3.11.3.1 of the EIS. DOS considers this assessment to be in compliance with NEPA environmental review requirements.
136	1	Howe,Jr.	Herbert		I am absolutely opposed to the Keystone XL Pipeline.	Comment acknowledged.
136	2	Howe,Jr.	Herbert		The route of the pipeline goes right through a region under which lies one of this country's greatest water resource: the Ogallala Aquifer. When a leak occurs in the pipeline it will destroy the source of water that makes America's great breadbasket so productive.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
1318	1	Huff	Theresa		Dear Ms. Orlando: Recently a number of advocacy groups sent a letter seeking suspension of the permitting of theKeystone XL pipeline. I encourage you to reject the request and to continue to review the proposed project.	Comment acknowledged.
1318	3	Huff	Theresa		At the same time, construction of this project stands to bring significant economic benefits to the areas where it will be built.	Comment acknowledged.
1318	4	Huff	Theresa		Provided it has limited impact on the environment, this project could be an important part of thesolution to our energy supplies. The permitting processes in place are appropriate and should proceed so that a final determination can be made about the impacts of the project and whether it is in the national interest.Please reject the request to suspend the process and continue with the review. Sincerely,	Comment acknowledged.
666	1	Hughes	Kate		Please tell the state dept that we do not want the Keystone XL in NE; it will put the Ogallala Aquifer at risk.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
671	2	Hughes	Kate		The Ogallala Aquifer is fragile, and we do not want any oil in it.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
671	3	Hughes	Kate		There have been many spills in these pipelines, and most are found by citizens, not by the company that is supposed to monitor them.	Consolidated Response OIL-3 addresses the leak detection capabilities of the proposed Project, including the SCADA system, supplementary leak detection methods, physical leak detection methods, and concerns related to smaller leaks from the pipeline that may be under the SCADA detection threshold.
1285	1	Hughes	Lorraine		Recently a number of advocacy groups sent a letter seeking suspension of the permitting of the Keystone XL pipeline. I encourage you to reject the request and to continue to review the proposed project.	Comment acknowledged.
1285	3	Hughes	Lorraine		Construction of this project stands to bring significant economic Benefits to the areas where it will be built.	Comment acknowledged.
1285	5	Hughes	Lorraine		The permitting processes in place are appropriate and should proceed so that a final determination can be made about the impacts of the project and whether it is in the national interest.	Comment acknowledged.
1285	6	Hughes	Lorraine		Please reject the request to suspend the process and continue with the review.	Comment acknowledged.
1292	1	Humble	Isaac		Thank you for reading these concerns, I'm writing them down as any one living in a democratic society should. Because I don't think this project is what the people need or want.	The commenter's opinion is noted.
1292	2	Humble	Isaac		The environmental implications are irreversible.	Section 3 of the EIS addresses the impacts of construction and operation of the proposed Project. Section 3.13 of the EIS addresses the risk and environmental impacts of a crude oil spill from the proposed Project.
1346	1	Hume	Jeff	Continental Resources	On behalf of Continental Resources, Inc, I am writing to express my support for TransCanada's Keystone XL (KXL) crude oil pipeline, and to urge that the Department of State continue its permitting process for this important energy infrastructure project.	Comment acknowledged.
1346	3	Hume	Jeff	Continental Resources	I strongly encourage the Department of State to reject calls to halt its rigorous permitting process for this vital national energy infrastructure project. This process, fully compliant with the National Environmental Policy Act and under the auspices not only of the Department of State but an additional eleven cooperating agencies, is fully sufficient to determine whether or not this vital national energy infrastructure project will meet our rigorous environmental standards, and therefore believe the process should continue.	Comment acknowledged.
538	1	Hummel	Jacquelyn	Nebraska Wildlife	Laying the pipeline in western NE will endanger wildlife and humans. It will set us up for another disaster re: Gulf Oil Spill. It will be a dangerous undertaking that neither Nebraskans or the country can afford.	The impacts associated with implementation of the proposed Project are addressed in Section 3.0 of the EIS. As noted in that section, construction and normal operation the proposed Project would not result in significant environmental impacts. Section 3.13 of the EIS addresses reliability and safety issues, including calculations of the probability of a spill from the proposed Project and the potential environmental impacts associated with spills.
1030	1	Hunt	Rich		LET THEM BUILD IT !!	Comment acknowledged.
888	1	Hunt	Christine		As we have seen from the BP oil disaster, nothing is guaranteed. Nebraska's water and land is too precious to risk.	Issues related to the Northern High Plains Aquifer System are addressed in Consolidated Responses AQF-1 through AQF-4.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					We, as Nebraskans, are the only ones who will truly protect our resources because we are the ones who truly value them. As such, it is our responsibility to ensure their protection. Do not allow the Keystone XL Pipeline Project. Protect Nebraska's precious resources and its people.	Consolidated Response AQF-3 provides information on hypothetical spills from the Project over two areas of the Northern High Plains Aquifer System.
1033	1	Hurd	Joseph		This pipeline should not be built over the Ogallala Aquifer. Nor should it be built over any porous (sandy) land where a spill would easily percolate into the aquifer before it could be contained. This ultimate resource of our state is too precious to risk in an accident. Please re-route to a safer pathway.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. Consolidated Response ALT-1 addresses potential alternative routes, including routes that would avoid much of the Northern High Plains Aquifer system.
1174	2	Husarek	Michael	Husarek's Consulting	It is of the upmost importance that adequate inspection during the installation of the pipeline and a scheduled inspection with soil sampling of the vadose adjacent to the pipeline be established. for hydrocarbons and VOC, which would embrace the standards associated with the Underground Storage Tank Program to provide adequate aquifer protection. Please ensure that legislation be promulgated to include these concerns.	Consolidated Response SAF-1 describes the regulatory requirements of the Pipeline and Hazardous Materials Safety Administration (PHMSA) that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project. It also describes the inspections and reviews of the proposed Project that PHMSA would conduct to ensure compliance with those regulatory requirements. Those inspections do not include the types of sampling requested by the commenter. The Department of State is not responsible for creating legislation for pipeline regulations or standards. PHMSA is responsible for pipeline regulation, and any specific requests for changes to pipeline regulations should be directed to PHMSA.
1164	1	Hutchinson	Sarah		I live near Rose, NE. I am completely against the pipeline coming through the Sandhills. [The Ogallala aquifer is a huge mass of water under the ground if something was to ever happen to that body of water not only would it harm the people who live here but,] it would also ruin the Sandhills.	Identification of sensitive environments crossed by the proposed Project is discussed in Consolidated Response ENV-1 and ENV-3. Issues related to the Sand Hills area are addressed in Consolidated Response ERO-1. Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
1164	2	Hutchinson	Sarah		The Ogallala Aquifer is a huge mass of water under the ground if something was to ever happen to that body of water not only would it harm the people who live here.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
1164	3	Hutchinson	Sarah		[... The Ogallala aquifer is a huge mass of water under the ground] if something was to ever happen to that body of water not only would it harm the people who live here ...	Issues related to the High Plains Aquifer System are addressed in Consolidated Response AQF-1 through AQF-4. Consolidated Response AQF-3 provides information on hypothetical spills from the Project over two areas of the Northern High Plains Aquifer System.
1180	1	Hutchinson	Susan&Dave		I am opposed to the pipeline project going through the east side of the Ogallala Aquifer.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
1180	3	Hutchinson	Susan&Dave		While you think there will not be leaks, this is not a 100% guarantee... The pipelines across the world do occasionally leak, including the big one in Alaska. Contaminating the Ogallala aquifer would be a tragedy.	Section 3.13 of the EIS addresses reliability and safety issues, including calculations of the probability of a spill from the Project and the potential environmental impacts associated with spills. As noted in that section, the likelihood of a spill from the Project is low, but it is not zero. Issues related to the Northern High Plains Aquifer System are addressed in Consolidated Responses AQF-1 through AQF-4. Consolidated Response AQF-3 provides information on hypothetical spills from the Project over two areas of the Northern High Plains Aquifer System.
1180	4	Hutchinson	Susan&Dave		A contamination to the aquifer would affect millions of acres of productive agricultural ground as well as water for thousands of people.	Issues related to the High Plains Aquifer System are addressed in Consolidated Response AQF-1 through AQF-4. Consolidated Response AQF-3 provides information on

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
						hypothetical spills from the Project over two areas of the Northern High Plains Aquifer System. As noted in those responses, a spill over the Northern High Plains Aquifer system would affect millions of acres of agricultural land.
510	1	Hyland	Judy		NOOOOOOO, dont do it! We dont need a disaster like the Gulf Oil spill. Just leave things ALONE! The environment is being destroyed all because of OIL! MONEY, MONEY, MONEY...it's NOT WORTH THE RISK!	As described in Consolidated Response GLF-1, the risks associated with the proposed Project are substantially different from those associated with the BP Deepwater Horizon Project.
103	1	Iacobucci	Marcia		Do not allow TransCanada to build an oil pipeline through the Sandhills. Why? Look no further than the Gulf of Mexico to see the disastrous possibilities.	Issues related to the Sand Hills area are addressed in Consolidated Response ERO-1. As described in Consolidated Response GLF-1, the risks associated with the proposed Project are substantially different from those associated with the BP Deepwater Horizon Project.
820	1	Ibarra	Lisa		Please stop this madness!	The commenter's opinion is noted.
667	1	Inslee	Jay	Congress	The Honorable Hillary Clinton, Secretary of State, Dear Madam Secretary: As members of the House of Representatives who are concerned with the public health and the preservation of our natural resources and environment. We write to express our concern regarding the permitting process for TransCanada's proposed Keystone XL tar sands oil pipeline. This pipeline would deliver up to 900,000 barrels per day of tar sands oil from Alberta, Canada over 2,000 miles to refineries on the U.S. Gulf Coast, more than doubling U.S. consumption of tar sands oil. Because the issuance of a presidential permit to build this pipeline would have significant energy and environment implications for our nation for many years to come. We believe the permitting process should be done with the full consideration of the Administration's clean energy and climate change priorities. To issue a presidential permit for this pipeline, the Department of State must determine whether the project is in the national interest, and a complete Environmental Impact Statement (EIS) should inform this determination. However, the Department of State recently released a Draft EIS for the pipeline that does not adequately consider the project's climate impacts.	The greenhouse gas assessment has been updated in the EIS. As noted in Consolidated Response ENR-1, the environmental review, including preparation of this EIS, has been conducted consistent with the DOS regulations pertaining to NEPA (22 CFR Part 161) as well as the Council on Environmental Quality (CEQ) regulations for implementing NEPA (40 CFR Part 1500). As a result, DOS considers the EIS to be in full compliance with the requirements of a NEPA environmental review.
667	2	Inslee	Jay	Congress	However, the Department of State recently released a Draft EIS for the pipeline that does not adequately consider the project's climate change impacts. We believe that a full life cycle assessment of the greenhouse gas emissions for tar sands would provide the Department of State with necessary information to determine whether issuing a presidential permit for the pipeline is consistent with the Administration's clean energy and climate change priorities. Numerous scientific studies have found tar sands oil to produce much higher lifecycle greenhouse gas emissions than convention oil. Further, we also believe that given the Administration's commitment to transparency, it is important for the Department of State to clearly and openly articulate its criteria for weighing the pipeline's climate change impacts against other considerations. At present, our understanding is that the determination of national interest is a highly discretionary process. We believe a decision that could have substantial implications for America's clean energy future should be made with the same level of transparency that the Administration	Consolidated Response GHG-1 addresses the greenhouse gas life-cycle analyses presented in the revised EIS. Climate change is addressed in Section 3.14.3.14. As noted in that Section, implementation of the proposed Project is unlikely to result in a measureable climate change. Consolidated Response P&N-9 describes the National Interest Determination process. This process includes public review and review by cabinet-level agencies. DOS coordinated extensively with CEQ, EPA, BLM, and DOE -- as well as other federal and state agencies and Indian tribes -- throughout the NEPA environmental review process. Although no GHG thresholds currently exist relevant to the proposed Project, the DOS assessment of GHG emissions was conducted in accordance with CEQ guidance, including CEQ's draft guidance for GHG. The CEQ regulations for implementing NEPA do not require delaying NEPA environmental reviews for the completion of promulgation of regulations that are in draft form during the review period.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					has exercised in other matters. Therefore, we request that the permitting process continue after the following conditions are adequately developed, assess, and incorporated: The Council on Environmental Quality's pending National Environmental Policy Act (NEPA) Guidance on the Consideration of the Effects of Climate Change and Greenhouse Gas Emissions should be applied to this project. The permitting process for this pipeline, which will likely have significant greenhouse gas and climate change implications, should not proceed until this guidance is finalized and can be reviewed and incorporated into the EIS. The Environmental Protection Agency should conduct a comprehensive life-cycle greenhouse gas assessment for tar sands oil. We should only move forward after this assessment is complete and the full impact of tar sands oil can be understood. The Department of State should collaborate closely with the Council on Environmental Quality to ensure that a robust and transparent inter-agency review process is conducted, as directed by Executive Order 13337. This will help ensure that all agencies with relevant expertise can participate and that the full environmental and social impacts of this project are adequately assessed. The Department of State should develop specific criteria for weighing the pipeline's climate change impacts against other considerations in making its determination of national interest. These criteria should be developed through a transparent inter-agency process.	
195	1	Irby	Joe		The Department of State should not give permits for pipelines importing the world's dirtiest fuel while the rest of the country fights to clean up the mess from poor decisions of the past. Tar sands will increase our transportation emissions, counteract existing efforts to fight global warming, and undermine U.S. energy independence by continuing our dependence on foreign oil. By expanding the U.S. market for tar sands oil, this pipeline will increase air pollution at American refineries and spur further expansion of the tar sands industry in Canada an industry that has caused severe water and air contamination and destroyed hundreds of square miles of wetlands and forest.	Consolidated Response OIL-4 addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils. Consolidated Response P&N-1 addresses the need that the Project has been proposed to meet, including information on crude oil supply and demand from an analysis specific to the proposed Project. As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries. In addition, Consolidated Response GHG-2 addresses the potential causal connection of implementation of the proposed Project and expanded oil sands production in Canada and increases in refining. Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project.
798	1	Jackson	Rebecca		You must stop the Keystone XL pipeline! ...	Consolidated Response ENR-1 provides information on the Department of State's environmental review process, the National Interest Determination process, and the need to complete those reviews before approving or denying the Presidential permit for the proposed Project.
158	2	James	Wesley		The pipeline crosses two environmentally sensitive areas on our farm – Redwater River and Buffalo Spring Creek. In addition, we have four groundwater wells that are hydraulically	Consolidated Response ENV-5 addresses requests for the use of the horizontal direction drilling method for all wetlands and waterbodies. Consolidated Response WAT-1 addresses

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					connected to the Buffalo Spring Creek alluvium and provide domestic and livestock water supply to the farm.	concerns regarding potential water quality impacts. Additionally, there are many areas along the proposed Project corridor where the pipeline may encounter shallow groundwater. It is a common industry practice to install pipelines in areas of shallow groundwater. Consolidated Response SAF-1 describes the regulatory requirements and Project-specific Special Conditions that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project in a manner that protects the health and safety of the public and the environment. Key safety measures include cathodic protection and pipeline coating specifications, construction methods, and operation, monitoring, and maintenance procedures that would protect the pipeline from corrosion in saturated conditions.
158	3	James	Wesley		While TransCanada has considerable experience in operating gas pipelines, it has very limited experience in operating crude oil pipelines (3.13.2.2). There are three major differences in operating a gas pipeline and operating a crude oil pipeline that were not addressed in the EIS. 1. In order to compute the maximum pressure generated in the operation of the pipeline, the analysis must consider the momentum of the crude oil. A valve closure in the pipeline will generate a pressure surge. TransCanada evidently did not conduct an unsteady flow analysis for the operation of the pipeline. 2. If the pressure in the pipeline drops below the vapor pressure of the crude oil, column separation occurs. When the two segments of crude oil slam together, the pipeline could rupture. Column separation is most likely to occur when the electrical power for one pumping station is interrupted while the other pumping stations continue to operate. 3. Natural gas pipelines are driven by compressors while crude oil pipelines are driven by centrifugal pumps. Typically the cutoff pressure of a centrifugal pump is about 20% greater than the operating pressure or (1440*1.2) 1730 psi. Assuming the pipeline valve at Circle (PS 12) is closed and the pumps at Ft Peck (PS 11) continue to operate. The pipeline at Redwater River crossing is estimated to be about 270 ft below the elevation of the pumps at Ft Peck and the pressure in the pipeline at Redwater would be 1840 psi which is greater than the yield pressure of 1800 psi.	All issues related to design specifics and operation of the proposed pipeline system are under the jurisdiction of the Pipeline and Hazardous Materials Safety Administration (PHMSA), as explained in Sections 2.3 and 3.13.1 and in Consolidated Response SAF-1. The EIS describes the basic elements of design, construction, and operation that need to be considered in assessments of the potential impacts of construction and normal operation. As a result, not all equipment that would be installed if the proposed Project is approved is listed and not all operating conditions are listed. The probability of a spill presented in Sections 3.13.3 and 3.13.4 are based on PHMSA incident data, and the impacts of a spill presented in Sections 3.13.5 and 3.13.6 describe what would likely occur if oil were to be released, irrespective of the reason for the release. In essence this section answers the question "what if" and does not rely on specific causes.
158	4	James	Wesley		The testing of the pipeline will be conducted in sections of 30 to 50 miles with a minimum pressure of 1800 psi at the highest elevation in the section (2.3.2.6). Assuming that there is a 300 ft difference in elevation in the test section, the maximum pressure in the pipeline would be 1930 psi. The yield stress in the pipe would be exceeded and the pipe would not return to its original diameter after the test is complete. The pipe diameter will be larger and the pipe walls will be thinner. The bursting pressure of the pipe would no longer be 2060 psi but would be reduced because of the damage to the pipe caused by the hydrostatic testing.	All issues related to design specifics and operation of the proposed pipeline system are under the jurisdiction of the Pipeline and Hazardous Materials Safety Administration (PHMSA), as explained in Sections 2.3 and 3.13.1 and in Consolidated Response SAF-1. The EIS describes the basic elements of design, construction, and operation that need to be considered in assessments of the potential impacts of construction and normal operation. As a result, not all equipment that would be installed if the proposed Project is approved is listed and not all operating conditions are listed. The probability of a spill presented in Sections 3.13.3 and 3.13.4 are based on PHMSA incident data, and the impacts of a spill presented in Sections 3.13.5 and 3.13.6 describe what would likely occur if oil were to be released, irrespective of the reason for the release. In essence this section answers the

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
						question "what if" and does not rely on specific causes.
158	5	James	Wesley		Viscosity of the oil is necessary to determine the friction factor and compute the headloss in the pipeline. The oil in the pipeline is a combination of crude oil and synthetic oil.	Consolidated Response OIL-4 addresses the composition of the Canadian crude oil that would be transported by the proposed proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils. The proposed proposed Project would transport batches of crude oil from Canada; each batch would be a specific type of crude oil from a producer and the viscosity would be the same within each batch. Specific aspects of operation such as the friction factor and headloss in the pipeline are not a component of the environmental review of the proposed proposed Project, but would be considered by PHMSA.
158	7	James	Wesley		Modulus of elasticity of the oil is necessary to compute the velocity of the pressure wave for unsteady flow analysis.	All issues related to design specifics and operation of the proposed pipeline system are under the jurisdiction of the Pipeline and Hazardous Materials Safety Administration (PHMSA), as explained in Sections 2.3 and 3.13.1 and in Consolidated Response SAF-1. The EIS describes the basic elements of design, construction, and operation that need to be considered in assessments of the potential impacts of construction and normal operation. As a result, not all equipment that would be installed if the proposed Project is approved is listed and not all operating conditions are listed. The probability of a spill presented in Sections 3.13.3 and 3.13.4 are based on PHMSA incident data, and the impacts of a spill presented in Sections 3.13.5 and 3.13.6 describe what would likely occur if oil were to be released, irrespective of the reason for the release. In essence this section answers the question "what if" and does not rely on specific causes.
158	8	James	Wesley		Pump characteristic curve for the pumps at the pumping stations (available from the pump manufacturer). The information is necessary to compute the pressure and discharge rate for both steady and unsteady state operation of the pipeline.	All issues related to design specifics and operation of the proposed pipeline system are under the jurisdiction of the Pipeline and Hazardous Materials Safety Administration (PHMSA), as explained in Sections 2.3 and 3.13.1 and in Consolidated Response SAF-1. The EIS describes the basic elements of design, construction, and operation that need to be considered in assessments of the potential impacts of construction and normal operation. As a result, not all equipment that would be installed if the proposed Project is approved is listed and not all operating conditions are listed. The probability of a spill presented in Sections 3.13.3 and 3.13.4 are based on PHMSA incident data, and the impacts of a spill presented in Sections 3.13.5 and 3.13.6 describe what would likely occur if oil were to be released, irrespective of the reason for the release. In essence this section answers the question "what if" and does not rely on specific causes.
158	9	James	Wesley		In order to compute the pressure in the pipeline during power failure, it is necessary to know the steady state rotational speed of the pump and the rotational inertia of the pump shaft and impeller and the motor shaft and armature (available from manufacturer).	All issues related to design specifics and operation of the proposed pipeline system are under the jurisdiction of the Pipeline and Hazardous Materials Safety Administration (PHMSA), as explained in Sections 2.3 and 3.13.1 and in Consolidated Response SAF-1. The EIS describes the basic elements of design, construction, and operation that need to be considered in assessments of the potential impacts of construction and normal operation. As a result, not all equipment that would be installed if the proposed Project is approved is listed and not all operating conditions are listed.

						The probability of a spill presented in Sections 3.13.3 and 3.13.4 are based on PHMSA incident data, and the impacts of a spill presented in Sections 3.13.5 and 3.13.6 describe what would likely occur if oil were to be released, irrespective of the reason for the release. In essence this section answers the question "what if" and does not rely on specific causes.
158	10	James	Wesley		In order to compute the pressure surge in the pipeline caused by a main line valve closure, it is necessary to know the headloss through the valve for a full range of valve openings (available from manufacturer).	All issues related to design specifics and operation of the proposed pipeline system are under the jurisdiction of the Pipeline and Hazardous Materials Safety Administration (PHMSA), as explained in Sections 2.3 and 3.13.1 and in Consolidated Response SAF-1. The EIS describes the basic elements of design, construction, and operation that need to be considered in assessments of the potential impacts of construction and normal operation. As a result, not all equipment that would be installed if the proposed Project is approved is listed and not all operating conditions are listed. The probability of a spill presented in Sections 3.13.3 and 3.13.4 are based on PHMSA incident data, and the impacts of a spill presented in Sections 3.13.5 and 3.13.6 describe what would likely occur if oil were to be released, irrespective of the reason for the release. In essence this section answers the question "what if" and does not rely on specific causes.
158	11	James	Wesley		The Keystone pipeline leak detection system can only detect leaks greater than 2% of the flow rate in the pipeline (2.4.2.1). When operating at full capacity (900,000 BPD), the leak detection system can only detect leaks greater than 18,000 BPD. The pipeline is only inspected visually by TransCanada once every two weeks. A leak in an isolated area could amount to as much as 250,000 barrels of oil before the pipeline is shut down. TransCanada is relying too much on public and landowners visual observation in their leak detection system. Since the leak detection system is not very sensitive to leaks, TransCanada should be required to visually inspect the pipeline every two days. Pipeline companies do not want to have an overly sensitive leak detection system which may result in shutting down the pipeline when there is not a leak. A change in the physical characteristics of the oil in the pipeline could trigger a SCADA leak alarm event. Their claim that the pipeline would be shut down in 12 minutes probably only applies to a major pipeline rupture. In most SCADA leak alarm events, the pipeline operator would probably want to confirm that there is an actual pipeline leak before shutting down the pipeline. Should the alarm go off at night, this might take a ground crew as much as a day to verify that the pipeline is leaking. A leaking rate at 3% of pipeline capacity could discharge as much as 27,000 barrels of oil before the pipeline is shut down. If there is a complete rupture of the pipeline when the pumping rate is 900,000 BPD, the discharge in 12 minutes would be 7500 barrels. The spill volume would be increased by the expansion of the oil in the pipeline when the operating pressure in the pipeline is reduced to zero or approximately 1000 barrels of oil between pumping stations. The spill volume would be the 8500 barrels of oil plus the leakage from the rupture after the pipeline is shut down. Isolation valves are spaced at approximately 25	Consolidated Response OIL-1 and Section 3.13.4 address the likelihood of spills from the proposed Project. Consolidated Response OIL-2 and Section 3.13.4.2 address maximum spill volumes from the proposed Project. Consolidated Response OIL-3 and Section 3.13.2.1 address small releases from the proposed Project. As described in Consolidated Response SAF-1, the Pipeline and Hazardous Materials Safety Administration (PHMSA) has regulatory requirements that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed proposed Project. In addition, PHMSA developed 57 proposed Project-specific Special Conditions that Keystone has agreed to implement. Incorporation of those conditions would result in a proposed Project that would have a degree of safety over any other typically constructed domestic oil pipeline system under current code and a degree of safety along the entire length of the pipeline system similar to that which is required in HCAs as defined in 49 CFR 195.450. If the proposed Project is implemented, Keystone would be required to meet the inspection and monitoring requirements of PHMSA. The Department of State does not have the authority to impose additional inspection or monitoring requirements on Keystone. Requests for such addition requirements beyond the existing federal regulatory requirements should be directed to PHMSA.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					miles and there would be (25*5280*6.71*7.48/42) 158,000 barrels of oil in the ruptured section of the pipeline. Since the pressure is the greatest in the low section of the pipeline, the rupture is most likely to occur at a stream crossing where the potential for damage to the environment is greatest and there is potential for considerable more oil to leak from the rupture after the pipeline is shut down.	
158	12	James	Wesley		<p>Pipeline Risk: The EIS did not adequately show the danger that the pipeline presents to the environment and to the people living near the pipeline. During normal operations of the pipeline, the pressure will vary along the pipeline. At the discharge of a pumping station, the operating pressure will be 1440 psi and at the intake to the downstream pumping station about 50 miles downstream, the operating pressure will be approximately 200 psi. The hydraulic head for oil with a specific gravity of 0.93 would be 3570 ft at the high pressure end of the 50-mile pipeline segment and 500 ft at the low pressure end of the pipeline segment. Using the orifice equation with a coefficient of 0.58, the discharge velocity of oil flowing from a rupture in the pipeline would be 280 fps at the high pressure end and 100 fps at the low pressure end of the pipeline segment. If the rupture was oriented 45 degrees above the horizon, at the high pressure end of the pipeline the oil would spray a distance of 2400 ft and reach a height of 600 ft and at the low pressure end of the pipeline segment the oil would spray a distance of 340 ft and reach a height of 80 ft. The pipeline has the potential to adversely impact a large area along the pipeline route. At the high pressure end of the pipeline segment, a rupture with an area of 3.0 sq in. would discharge oil at a rate of 90,000 BPD while a rupture with an area of 3.0 sq in. at the low pressure end of the pipeline segment would discharge oil at a rate of 32,000 BPD. With fire being associated with 4% of pipeline ruptures, the pipeline has the potential of presenting considerable risk to the environment and to the people living near the pipeline. The above discussion was for normal operating conditions. If a main line valve is closed and the pumps continue to run, then the pipeline will be pressurized to approximately 1730 psi all along the pipeline between the valve and the pumping station. The pipeline could adversely affect the environment and people living within a half mile of the pipeline.</p>	<p>Keystone has withdrawn its application for a Special Permit as described in Consolidated Response REG-1. As a result, the maximum operation pressure would be lower than stated in the DEIS; the EIS has been revised accordingly.</p> <p>All issues related to design specifics and operation of the proposed pipeline system are under the jurisdiction of PHMSA, as explained in Sections 2.3 and 3.13.1 and in Consolidated Response SAF-1. The EIS describes the basic elements of design, construction, and operation that need to be considered in assessments of the potential impacts of construction and normal operation. As a result, not all equipment that would be installed if the Project is approved is listed and not all operating conditions are listed.</p> <p>The probability of a spill presented in Section 3.13.4 are based on PHMSA incident data, and the impacts of a spill presented in Sections 3.13.5 and 3.13.6 describe what would likely occur if oil were to be spilled, irrespective of the reason for the spill.</p>
158	14	James	Wesley		<p>Over Pressure Conditions: Section 2.4.3.1 of the EIS requires that the pipeline be equipped with field devices that limit the maximum pressure to 110 percent of MOP or 1580 psi. Installing pressure sensors upstream and downstream of valves only allow the monitoring of pressure. The EIS did not list the field devices that will be installed along the pipeline to limit the maximum pressure to 1580 psi.</p>	<p>All issues related to design specifics and operation of the proposed pipeline system are under the jurisdiction of the Pipeline and Hazardous Materials Safety Administration (PHMSA), as explained in Sections 2.3 and 3.13.1 and in Consolidated Response SAF-1. 						reason for the release. In essence this section answers the question "what if" and does not rely on specific causes.
158	16	James	Wesley		Statistics: PHMSA statistical data for crude oil trunk lines in the U.S. for the 10-yr period 1998 to 2007 indicate that the 1673 miles of TransCanada pipeline in the U.S. can expect to have 3.9 oil spills of 50 barrels or more per year with an annual spill volume of 1400 barrels (Sec 3.13.3.2). However, these statistics were based on pipelines that were designed to PHMSA standards, not the large 36-in. diameter, thin-wall pipe operating at the extremely high pressure of 1440 psi that TransCanada intends to use. It can be expected that after 20 years of operation, the TransCanada pipeline will have a higher frequency of oil spills than 3.9 per year and much larger spill volume.	Keystone has withdrawn the Special Permit request (see Consolidated Response REG-1) and would construct the pipeline in accordance with PHMSA regulations and in accordance with the 57 Project-specific Special Conditions (see Appendix U of the EIS) developed by PHMSA and agreed to by Keystone. Consolidated Response SAF-1 describes the regulatory requirements and the Special Conditions (see Appendix U of the EIS) that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project in a manner that protects the health and safety of the public and the environment. Consolidated Responses OIL-1 and OIL-2 address the likelihood of spills, and updated statistics based on PHMSA data are provided in the Section 3.13.1.2 of the EIS. Section 3.13 of the EIS was revised to update spill incident statistics and projections, provide additional information on composition of the crude oil that would be transported by the proposed Project, additional information on potential impacts to the Northern High Plains Aquifer system, and other key information. This section addresses reliability and safety issues, including calculations of the probability of a spill from the proposed Project and the potential environmental impacts associated with spills.
1302	1	James	Frank	Dakota Rural Action	Dakota Rural Action is a grassroots family agriculture and conversation group that organizes SouthDakotans to protect our family farmers and ranchers, natural resources and unique way of life. We represent over 950 South Dakotans across the state. Many of our members in Western South Dakota are directly impacted by the Keystone XL project, but all of our members are concerned about the impacts this project will have on our state and the nation. Dakota Rural Action's review of the KXL Draft Environmental Impact Statement has found it inadequate to justify construction of the massive KXL Pipeline project or the taking of the hundreds of miles of private land, the disruption of farming and ranching operations, the damage to roads, the risk of water contamination, and the risk of leaks and spills to the environment,	As noted in Consolidated Response ENR-1, the environmental review, including preparation of this EIS, has been conducted consistent with the DOS regulations pertaining to NEPA (22 CFR Part 161) as well as the Council on Environmental Quality (CEQ) regulations for implementing NEPA (40 CFR Part 1500). As a result, DOS considers the EIS to be consistent with the requirements of a NEPA environmental review.
1302	2	James	Frank	Dakota Rural Action	The Department of State should at minimum expand its EIS to include: 1. A thorough, independent, and detailed analysis of the NEED for the pipeline. What evidence has been demonstrated of a need for the Keystone XL Pipeline? We have seen considerable evidence of an already overbuilt pipeline capacity for the tar-sands. The staggering investment involved in building yet another trans-continental pipeline will increase our dependence on foreign oil while potentially minimizing domestic oil production and refinement and slowing or hampering the development of sustainable energy alternatives such as wind and solar. Recent research done by Plains Justice concludes that pipeline capacity from Canada to the United States is already overbuilt. "Should the proposed Keystone XL Pipeline (phase 2 of the Keystone Pipeline System) be built, export capacity to the Midwest would	Consolidated Response P&N-1 describes the need that the Project has been proposed to meet and provides an explanation of the thorough and independent analysis of need that was conducted for the EIS. As noted in that response, the Project has been proposed to meet the heavy crude oil needs of refineries in the Gulf Coast area, not for the U.S. in general. In addition, the Alberta Clipper and existing Keystone pipeline projects serve other markets and do not meet the demands of the Gulf Coast refineries. Keystone obtained all necessary permits for the existing Cushing Extension. As described in Section 1.0 of the EIS, Keystone applied for a Presidential permit for the Keystone XL Project, which includes a segment from near Morgan, Montana to the northern end of the Cushing Extension, and

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					increase to 167% of 2009 capacity. Past development rates in Canada and current economic trends indicate that much of the Keystone XL's capacity will not be needed for years, possibly not until well after 2020, with the result that per barrel pipeline shipping rates will be much higher than estimated. Further, shippers have alleged substantial costoverruns in the Keystone Pipeline that will also increase shipping rates. Combined, total land cost overrun increases will cut into shipper profits and increase costs at the pump," said Plains Justice Policy Brief, "The Keystone XL Pipeline: Not Needed, Too Expensive, Better Solutions." TransCanada has admitted that it plans to first build the "Cushing Extension" from Cushing, OK to the Gulf Coast. The portion from Hardisty, Alberta to Steele City, NE which crosses the international border and requires a Presidential Permit is not planned for construction until some subsequent time. Why is the Department of State considering the permitting of the Hardisty- Steele City portion of the KXL pipeline when it is not the eminent construction in question? The pipeline which would be constructed first, the "Cushing Extension," does not involve an international border and does not necessitate a Presidential Permit. DRA would like to see the Department of State hold off on considering and/or granting a Presidential Permit for the Hardisty- Steele City portion until the "Cushing Extension" has been built, operated, and proven.	from the southern end of the Cushing Extension to delivery points in Texas. Keystone would initiate construction on the Project as soon it obtains all permits, authorizations, and approvals.
1302	3	James	Frank	Dakota Rural Action	The Department of State should at minimum expand its EIS to include: 2. A complete analysis of the impacts of Department of Transportation actions; In regard to the Emergency Response Plan (not reviewed in the DEIS) or in granting the pipeline thickness waiver and the correlating impact to low consequence areas. On the heels of the sobering Gulf Coast spill, it is absolutely imperative that any pipeline built, most particularly one of Keystone XL magnitude, be accompanied by a vanguard of the most current, comprehensive and well-executed safety measures and features and an all-encompassing and entirely workable and accessible Emergency Response Plan. Good plans come from thorough review by independent experts and public involvement in decisions about emergency response planning. It is the public that will be at risk, and the public who should have a say in questions of how much equipment is available, where it is located, how many personnel are available and where they are located, and appropriate and sufficient training for emergency first responders.	Consolidated Response RES-1 addresses issues related to preparation and review of the emergency response plan for the proposed Project. Keystone has withdrawn its application for a Special Permit as described in Consolidated Response REG-1. As described in Consolidated Response SAF-1, the Pipeline and Hazardous Materials Safety Administration (PHMSA) has regulatory requirements that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project in a manner that protects the health and safety of the public and the environment. In addition, PHMSA developed 57 Project-specific Special Conditions that Keystone has agreed to implement. Incorporation of those conditions would result in a Project that would have a degree of safety over any other typically constructed domestic oil pipeline system under current code and a degree of safety along the entire length of the pipeline system similar to that which is required in HCAs as defined in 49 CFR 195.450.
1302	4	James	Frank	Dakota Rural Action	3. A complete life cycle analysis by EPA, of tar-sands greenhouse gas emissions, climate risk issues, and sweet crude or other energy alternatives	Consolidated Response GHG-1 addresses the greenhouse gas life-cycle analyses presented in the revised EIS.
1302	5	James	Frank	Dakota Rural Action	4. A comprehensive analysis of the many varied site-specific environmental impacts and considerations involving water crossings, soil types and profiles, livestock and wildlife implications, vegetation and re-vegetation, cultural and paleontological resources, and construction and reclamation, as understood and identified by those people and land owners who will be directly impacted along the path of the pipeline.	All substantive scoping comments and comments received on the draft EIS were considered and responded to during preparation of the final EIS.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					When it comes to assessing the actual impact of any given project disturbance on the land, water, and environment, there is no more informed and practically knowledgeable source of on-the-ground information than the land owners and people in the communities, many of whom have spent their entire lives and have generational history on the land in question and in stewardship of the resources which will be affected. Dakota Rural Action urges the weighty consideration of any and all landowner comment involving place specifications of land, water, and natural resources and a healthy balance of those considerations against the identified merits of the Keystone XL project.	
1302	6	James	Frank	Dakota Rural Action	Regarding paleontological resources, Peter Larson of Black Hills Institute of Geological Research has said, "This proposed construction is routed through the heart of some of the most important paleontological deposits in this country, and there is no doubt that excavation equipment will encounter important specimens within the Hell Creek Formation. Many colleagues and I are very concerned that paleontological discoveries made during the construction of this pipeline might be "swept under the rug" to avoid construction delays and added cost to the project." Larson believes that the importance of the research and the scientific and economic value to the land owners warrants independent paleontological monitoring of the project and retrieval of fossils encountered during excavation.	Additional surveys were conducted after the draft EIS was published. The results of these studies are presented in the final EIS. In addition, there would be a Paleontological Monitoring and Mitigation Plan developed for the proposed Project prior to construction as described in Section 3.1.2.2.
1302	9	James	Frank	Dakota Rural Action	In addition the building of this pipeline does not guarantee a continued supply of cheap fuel for our country. "Last year Goldman Sachs said that tar sands projects require long-term oil prices greater than \$80 per barrel just to break even. (Goldman Sachs, Canadian Oil Fields Fieldtrip, 2009). At that price point Deutsch Bank forecasts a permanent shift in consumer demand toward more energy efficient products, concluding that "the value of high [capital expenditure] intensity, long lead time, currently un-developed oil, such as Canadian heavy oil sands ... could be far lower than the market currently expects." (Deutsch Bank Global Market Research, Development at the End of the Oil Age, 2009," said a June 8, 2010 Environmental Entrepreneurs letter sent to Secretary of State Clinton. Tar Sands is also worse for the environment than conventional fuel sources. Ken Green, Resident Scholar at the American Enterprise Institute said, extraction of crude from oil sands in Canada emits more carbon dioxide than conventional oil production.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project. Consolidated Response GHG-1 addresses GHG life-cycle analyses.
1302	11	James	Frank	Dakota Rural Action	One ongoing concern for many people including our members is this pipeline is being built to get the tar sands to a coast for shipment to other countries. If this is even an option being considered it should negatively impact the pipeline when weighted for national impact. US citizens should not be asked to bear the burden of this pipeline if any portions of the tar sands or its products are destined for other countries. We are not interested in giving up our enjoyment of our property so TransCanada can increase profits through foreign sales. We urge the Department of State to take all of the time needed to	Consolidated Response P&N-1 addresses the need for the proposed Project, including the crude oil needs of refineries in the Gulf Coast area. Those refineries are the major suppliers of refined products to East Coast and Midwest markets and would be expected to use the Canadian crude oil transported by the proposed Project to provide refined products to those markets. Consolidated Response P&N-2 and Section 1.4.2 of the EIS provide information on the export of refined product from Gulf Coast refineries.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					completely explore these concerns before issuing the Presidential Permit.	
1440	1	James	Wesley		$P \cdot D = 2 \cdot S \cdot t$ or $t = P \cdot D / (2 \cdot S)$ where P=Pressure in pipeline =140 psi, D=Diameter of pipeline = 36 inches, t=Thickness of pipe wall inches, S = Allowable stress in pipe = F*Yield stress = F*70000, F=Design Factor = 0.5 is industry standard for all water pipelines. TransCanada uses 0.5 for their pumping stations t = 0.743 inches TransCanada can use F = 0.72 for special permit t = 0.515 inches TransCanada proposes to use F = 0.8 in Montana t = 0.463 inches TransCanada saves money by installing a cheaper pipe and the little people (as BP refers to average people) in Montana must live beside a dangerous pipeline. Oil Spray from Pipeline Rupture Keystone operating pressure is 1440 psi and oil from a pipeline rupture can spray 2400 ft on either side of the pipeline. Discharge Velocity from pipe = $0.58 (2g \cdot H)^{.5} = 278$ fps	<p>Keystone has withdrawn its application for a Special Permit as described in Consolidated Response REG-1. As described in Consolidated Response SAF-1, the Pipeline and Hazardous Materials Safety Administration (PHMSA) has regulatory requirements that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project. In addition, PHMSA developed 57 Project-specific Special Conditions that Keystone has agreed to implement. Incorporation of those conditions would result in a Project that would have a degree of safety over any other typically constructed domestic oil pipeline system under current code and a degree of safety along the entire length of the pipeline system similar to that which is required in HCAs as defined in 49 CFR 195.450.</p> <p>As noted in Section 3.15.5.1, if a leak would occur on the upper hemisphere of the pipeline, it was Keystone estimated that the maximum spray zone for an exposed portion of the pipeline would be in the range of 75 to 400 feet (i.e., the areal extent of the release to land would be limited to a few acres or less in the immediate area of the release point and downwind of the release point).</p>
1440	2	James	Wesley		For $\beta = 45$ degrees $D_x = 1200$ ft, $D_y = 600$ ft Hydrostatic Testing t = 0.463 inches. The pipeline is required to be hydrostatically tested at pressure of 1.25 times 1440 psi or 1800 psi. Test sections will be 30 to 50 miles long with a minimum pressure of 1800 psi. If there is a 300 ft difference in elevation in the test section, the maximum pressure will be 1930 psi and the pipe will be permanently deformed. Minimum Wall Thickness. The minimum wall thickness of the pipe may not be less than 90 percent of the nominal wall thickness of 0.463 inches or 0.417 inches. Hydrostatic Testing t = 0.417 inches [figure] Since the maximum stress in the pipeline during hydro static testing is greater than the rupture stress, the pipeline is likely to rupture during hydrostatic testing.	Keystone has withdrawn its application for a Special Permit as described in Consolidated Response REG-1. All issues related to design specifics and operation of the proposed pipeline system are under the jurisdiction of PHMSA, as explained in Sections 2.3, 2.3.1, and 3.13.1. Special Conditions 8, 22, and 23 address hydrostatic testing, including in the mill and in the field.
1440	3	James	Wesley		The pipeline design has no allowance for internal/external corrosion or stress corrosion cracking, the two most common causes of pipeline failure. No matter how well the pipeline is designed and protected, it will be subjected to external damage during construction, coating disbondment, mill defects and third party damage. The pipeline is designed to rupture during normal operation. Conclusion TransCanada has considerable experience in operating gas pipelines but has very limited experience in operating crude oil pipelines. TransCanada apparently does not have the expertise to conduct an unsteady flow analysis of the pipeline. The EIS did not show the pressure surge caused by valve closure, the pipeline pressures during a power failure or the cutoff pressure of their pumps. TransCanada has requested to use MOP of 0.8 SMYS design standard in order to maximize their profits at the expense of the environment and the landowners. It is apparently cheaper to build an unsafe pipeline and pay	Consolidated Response OIL-4 addresses the composition of the Canadian crude oil that would be transported by the proposed Project, including concerns relative to the corrosivity and erosivity of the crude oil. As noted in that Consolidated Response, that crude oil is similar in composition and properties to other heavy crude oils that are currently transported within the U.S. pipeline system and similar in composition and properties to other heavy crude oils that are currently refined in PADD III. Keystone has withdrawn its application for a Special Permit as described in Consolidated Response REG-1. All issues related to design specifics and operation of the proposed pipeline system are under the jurisdiction of PHMSA, as explained in Sections 2.3, 2.3.1, and 3.13.1.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					damages for oil spills than to build a safe pipeline. If it is not now economical feasible to build a pipeline using MOP of 0.72 SMYS design standard then wait a few years, the build a safe pipeline. The environment and landowners need the extra protection provided by the MOP of 0.72SMYS design standard.	
287	1	Janecek	Karla		With the recent oil pipeline breakage in the gulf, if something like that would happen in the Ogallala Aquifer, it would ruin our source of drinking water which comes from underground in the Aquifer.	As described in Consolidated Response GLF-1, the risks associated with the proposed Project are substantially different from those associated with the BP Deepwater Horizon Project. Issues related to the Ogallala aquifer are addressed in Consolidated Responses AQF-1 through AQF-4.
287	2	Janecek	Karla		The aquifer supplies drinking water to most of the Nebraska families, what would happen if that water was contaminated by oil? Has someone totally lost their mind? I can't believe this was even a suggestion taken seriously. Leave our natural resources in tack and without danger of an oil spill.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
1201	1	Jardine	Keith		I am writing to you concerning the projected pipeline that will be crossing our great state of Nebraska. I am not for it, and have talked with many people who are also against it.	Comment acknowledged.
1201	2	Jardine	Keith		I am in the irrigation business, and am concerned what might happen to our Ogallala Aquifer if the line did have and a leak. As many of you are aware the water below the surface of Nebraska is the life blood of our state. If it wasn't for the water, Nebraska fields would dry up and the millions of people would feel the effects of the catastrophe that is waiting to happen.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
1201	3	Jardine	Keith		It may not be in my lifetime or yours, but because of electrolysis that occurs to metal buried below the ground in our soil, leaks will eventually happen.	As described in Section 2.3.1.2 of the EIS, to avoid or minimize external corrosion, the entire pipeline would be coated pipe with a corrosion-protectant bond and the Project would include a cathodic protection system that would be in compliance with the Pipeline and Hazardous Materials Safety Administration (PHMSA) and with the 57 Project-specific Special Conditions (see Appendix U of the EIS) developed by PHMSA. As part of those requirements and in accordance with its Integrity Management Program, Keystone would conduct internal monitoring of the pipeline and would replace sections of pipe that have unacceptable corrosion levels as defined by PHMSA.
1286	1	Jarrett	Terry	Missouri Public Service Commission	I write in support of Trans Canada's Keystone XL crude oil pipeline project and urge the department to grant a permit for the pipeline.	Comment acknowledged.
1286	5	Jarrett	Terry	Missouri Public Service Commission	Securing stable and affordable energy from our North American allies through projects such as the Keystone pipeline is in the national interest.	Comment acknowledged.
1286	6	Jarrett	Terry	Missouri Public Service Commission	Considering the economic and energy security benefits of these vital resources, we should continue to expand America's access to safe, affordable energy to help ensure improved domestic and global energy security and stable prices for consumers.	Comment acknowledged.
1286	8	Jarrett	Terry	Missouri Public Service Commission	Additional pipeline capacity will help consumers and businesses throughout the United States.	Comment acknowledged.
1286	9	Jarrett	Terry	Missouri Public	This project also stands to provide a powerful private sector	Consolidated Response ECO-1 and Section 3.10.2.2 of the

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
				Service Commission	economic stimulus. During construction, Keystone XL will create more than 13,000 jobs funded with private investment.	EIS address the potential socioeconomic impacts of the proposed Project.
1286	10	Jarrett	Terry	Missouri Public Service Commission	Local governments will have a steady source of income from economic activity associated with construction and from property taxes the pipeline company will pay.	Comment acknowledged.
1286	11	Jarrett	Terry	Missouri Public Service Commission	Rejection of the permit or suspension of the review would sacrifice the significant economic benefits this project stands to deliver and force U.S. consumers to rely on other sources of crude oil not economically and politically allied with U.S. interests. This would be a mistake.	Comment acknowledged.
1286	12	Jarrett	Terry	Missouri Public Service Commission	I urge the granting of the permit.	Comment acknowledged.
593	1	Jarvis	Laraina		Keystone XL is not in America's national interest. I am writing to submit my concerns about the impacts the proposed Keystone XL pipeline would have on the climate and communities--and to urge you to deny a permit for this	Impacts associated with construction and normal operation of the proposed Project are presented in the resources sections of Section 3.0 of the EIS. As described in those sections, construction and normal operation of the proposed Project would not result in significant impacts. Consolidated Response P&N-9 addresses the DOS National Interest Determination process.
885	1	Jasa	Linda		I am not in favor of a pipeline over the aquifer. The Gulf incident (and others around the world) proves that we are not able to prevent pollution of our water.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. As described in Consolidated Response GLF-1, the risks associated with the proposed Project are substantially different from those associated with the BP Deepwater Horizon Project.
923	1	Jasa	Rick		There should not be a pipeline over the aquifer.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
957	1	Jasa	Rick	Jasa Transit, Inc.	I do not believe oil companies or there affiliates can be relied upon to do this safely. This covers a large area of the underground water supply in Nebraska. Additionally the pipeline companies have done nothing to repair or maintain their existing pipeline system which is extremely old and in bad condition. You need to make them start there and show good business and conservation practices.	Although old pipeline systems are of concern, they are not a part of the NEPA environmental review of the proposed Project. As described in Consolidated Response SAF-1, the Pipeline and Hazardous Materials Safety Administration (PHMSA) has regulatory requirements that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project in a manner that protects the health and safety of the public and the environment. In additions to its existing regulations, PHMSA developed 57 Project-specific Special Conditions that Keystone has agreed to implement and to incorporate into its manual for operations, maintenance, and emergencies that is required by 49 CFR 195.402. PHMSA has the legal authority to inspect and enforce any items contained in a pipeline operator's operations, maintenance, and emergencies manual, and would therefore have the legal authority to inspect and enforce the regulations and the Special Conditions if the proposed Project is approved. Incorporation of those conditions would result in a Project that would have a degree of safety over any other typically constructed domestic oil pipeline system under current code and a degree of safety along the entire length of the pipeline system similar to that which is required in HCAs as defined in 49 CFR 195.450.
1064	2	jazzdic@gpcom	Deb		And I feel somewhere down the line it will affect the Ogallala	Issues related to the Northern High Plains Aquifer system are

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
		net			Aquifer. They need to protect it somehow and someday.	addressed in Consolidated Responses AQF-1 through AQF-4.
253	2	Jeanes	Bryan	Wood County Judge	As I understand it, Keystone XL will create more than 13,000 high-wage construction and manufacturing jobs during the project's 2011-2012 construction schedule. Many of those jobs will be created in rural Texas and in our county, where too many of our residents continue to find it difficult to find good jobs. With Keystone XL, they will have an opportunity to rebuild their lives by working on the project or for businesses that provide supplies, goods and services for its construction and operation.	Consolidated Response ECO-1 addresses potential socioeconomic impacts, and Consolidated Response TAX-1 addresses concerns regarding taxes.
253	3	Jeanes	Bryan	Wood County Judge	In addition to the jobs Keystone XL will create, the project will generate substantial economic benefits for the United States and in states and communities along the proposed route. Like our county, in many cases these are areas where economic performance has stagnated or is shrinking.	Comment acknowledged.
253	4	Jeanes	Bryan	Wood County Judge	I enthusiastically support the Keystone XL Pipeline Project and encourage the Department of State to confirm the findings of the Draft Environmental Impact Statement, which found that the proposed Keystone XL Pipeline would have "limited adverse environmental impact during construction and operation."	Comment acknowledged.
1455	1	Jeffords	Stephanie	Association for Rural Land Owners	We understand there is a Draft Environmental Impact Statement (DEIS) that was not readily available to landowners to review or afforded the time to comment. Even so, the 2,000 page document appears to be limited in scope. It does not adequately address or omits pertinent information and risks. Additionally, the risks involved with the XL pipeline extend beyond environmental. There is nothing that addresses the economic, health, and legal risks.	Consolidated Response CMT-6 addresses issues related to the availability of paper copies of the draft EIS. Section 3.13 of the EIS addresses reliability and safety issues, including calculations of the probability of a spill from the proposed Project and the potential environmental impacts associated with spills. The impacts associated with implementation of the proposed Project are addressed in Section 3.0 of the EIS. As noted in that section, construction and normal operation the proposed Project would not result in significant environmental impacts. The assessment of impacts included economic impacts (Sections 3.10.2 and 3.13.6.7) and health risks associated with an spill from the pipeline (Section 3.13.5.6). An assessment of legal risks is not part of the NEPA environmental review process.
1455	2	Jeffords	Stephanie	Association for Rural Land Owners	Environmental risks. The environmental risks, by themselves, are cause for concern. All the land owners contacted were unaware that the pipeline was going to be 3 feet in diameter, pumping 900,000 barrels of tar sand oil per day, under pressure. Just the heat from the pipeline will cause a change in the ecosystem affecting the landowner's crops and livestock. What that affect will be is not adequately addressed in the DEIS. Any leak or pipe breakage in these rural areas could go undetected for several days and would result in serious pollution of waterways and reservoirs of drinking water meant for human and animal consumption.	The issue of increased soil temperature in the vicinity of the pipeline and the potential impacts associated with that temperature increase are addressed in Section 3.5.5 and in Appendix L. Section 3.13 of the EIS addresses reliability and safety issues, including calculations of the probability of a spill from the Project and the potential environmental impacts associated with spills. Consolidated Response OIL-3 and Section 3.13.5 of the EIS describe the leak detection system for the Project.
1455	3	Jeffords	Stephanie	Association for Rural Land Owners	Pollution of our water is the most serious of all concerns. Imagine 900,000 barrels of polluted tar sand oil pumped into our rivers, streams, lakes, and aquifers per day. None of the landowners contacted were aware that 1/4 mile of their land was required for a right of way and clear cutting of all forage along rivers and tributaries would ensue. The DEIS fails to adequately address erosion of the landowner's land and	Issues related to the potential for erosion adjacent to streambanks and private land area are addressed in Consolidated Response ERO-2. Consolidated Response GEO-1 addresses landslide potential along the proposed route. Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. Issues related to development of oil sands

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					potential increased flooding downstream in more populated areas. The DEIS offers no safeguards when crossing waterways. Leakage or a break in the pipeline is a serious cause for concern since landowners have already witnessed numerous leaks/breaks in smaller existing pipelines from just the land settling. Recently, there has been an increase in seismic activity over the past two years. Oklahoma sits in earthquake hazard zones. Economic concerns. The landowners are told that there will be an increase in job opportunities and influx of money from taxes on the pipeline. This is deceiving. There are only about 50 part-time jobs that may become available. TransCanada is also pursuing tax exemption. Some refineries in Oklahoma are now aware of the increased cost to refine tar sands and are attempting to get out of their contract. They will have to use 3-5 barrels of water to clean only 1 barrel of dirty oil. Even then it is still dirtier than coal. So we will have to use our precious water resources to refine the oil as well as push Oklahoma into a greater carbon emissions status, causing us to lose federal dollars. Even more alarming is China's recent investment of \$7 billion dollars in production facilities in the Canadian Tar Sands. This puts the US in a compromising position.	projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project. Consolidated Response ECO-1 addresses potential socioeconomic impacts. In addition, as noted in Section 2.0, the construction ROW would be 110 feet wide in most locations.
1129	1	jelam@neb.rr.com	John		Anything that endangers a resource as valuable as the Ogallala Aquifer is a bad idea. The proposed Keystone pipeline does just that.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
85	1	Jensen	Jeff		The question is not if but when the pipeline leaks...An oil leak can be cleaned up, this other stuff cannot.	Consolidated Response OIL-1 addresses the likelihood of spills from the Project. Consolidated Response OIL-4 addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils.
85	2	Jensen	Jeff		The Tar Sands oil is the worst quality of oil there is. The chemicals they have to add to it to make it flow are so poisonous that once it gets into your ground water it is contaminated forever!	Consolidated Response OIL-4 addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils.
85	3	Jensen	Jeff		Tell Canada to leave tar sands oil in Canada.	Consolidated Response P&N-9 describes the Presidential Permit and National Interest Determination process.
85	5	Jensen	Jeff		Little old keystone will have the pipeline under some little subsidiary company that when it starts leaking, will not be able to afford to clean it up. So who will pay for it?	Consolidated Response LIA-1 addresses Keystone's liability if there is a spill of hazardous materials or fuel during construction or a spill of crude oil from the proposed Project.
85	6	Jensen	Jeff		If there is oil to be piped to the coast why not the oil in North Dakota? The quality is good enough that you do not have to add anything to it to make it flow. Therefore when it does leak it can be cleaned up, plus it is from the U.S.A... U.S. oil for U.S. people.	The Project has been proposed to transport crude oil from the Canadian oil sands projects. Consolidated Response ALT-3 addresses issues related to a potential pipeline connection to the Keystone XL Project in Montana that would transport oil produced in Montana and North Dakota.
821	2	Jervy	Benjamin	GOOD Projects	Further, approving this pipeline guarantees higher levels of air pollution affecting the Texas communities near the refineries. All studies that have been released that claim otherwise are, to my mind and by my experience, dreadfully naive. There has never been an instance of tar sands oil being refined in an area and the air quality maintaining it's levels. In every instance, pollution gets worse, and public health suffers.	As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries. Consolidated Response OIL-4 also addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
						similar in composition to other heavy crude oils.
821	3	Jervey	Benjamin	GOOD Projects	There is also the chance (slim, but certainly there) of the pipeline rupturing and laying ruin to some beautiful, productive, and/or economically-essential stretch of our great nation.	Section 3.13 of the EIS addresses reliability and safety issues, including calculations of the probability of a spill from the Project and the potential environmental impacts associated with spills. RES-1 addresses response plans that would include requirements to restore areas affected by oil and cleanup-related activities.
821	4	Jervey	Benjamin	GOOD proposed Projects	A pipeline of this sort would also be an easy target for potential terrorist attacks (much more so than, say, a wind farm or concentrated solar tower).	Consolidated Response TER-1 addresses potential terrorism associated with the proposed Project.
821	5	Jervey	Benjamin	GOOD Projects	This is an assault on the American people. If the State Department is serious about ensuring our independence from foreign-born energy, and if it is serious about alleviating the great security "risk multiplier" that is climate change, it will refuse this pipeline permit and instead work on securing our great, prosperous, healthy and safe clean energy future.	Consolidated Response ALT-2 addresses the use of alternative technologies and alternative energy sources.
340	1	Jessop	Jeff		I am hoping that the Keystone project can be averted. We need to wean ourselves from our petroleum addiction. The world is watching the human-made disaster in the Gulf, where we have unleashed a genie that no one foresaw.	Consolidated Response ALT-2 addresses the use of alternative technologies, alternative energy sources, and conservation of energy. As described in Consolidated Response GLF-1, the risks associated with the proposed Project are substantially different from those associated with the BP Deepwater Horizon Project.
340	2	Jessop	Jeff		We should do all we can to change plans that have such potential for environmental harm -- save the Ogallala aquifer, save our water supply from similar danger by not proceeding with the plans for the Keystone pipeline.	Issues related to the High Plains Aquifer System are addressed in Consolidated Responses AQF-1 through AQF-3.
1550	1	Jewett	Chastity	National Wildlife Federation, Shine River Sioux Tribe	In the draft EIS it fails to acknowledge that the water resources will be impacted, but nowhere does it assess the quantity or extend of impact on water resources that aren't protected, and a lot of these places aren't protected by the Clean Water Act.	Consolidated Response WAT-1 and Section 3.3.2 addresses stream crossing methods and the associated potential water quality impacts.
1550	2	Jewett	Chastity	National Wildlife Federation, Shine River Sioux Tribe	It also fails to look at the serious impacts on wildlife from oil spills or leakages.	Section 3.13 of the EIS addresses reliability and safety issues, including calculations of the probability of a spill from the proposed Project and the potential environmental impacts associated with spills, including potential impacts to wildlife (see Section 3.13.6.4 of the EIS).
1550	5	Jewett	Chastity	National Wildlife Federation, Shine River Sioux Tribe	tar sands oil is incredibly dirty and in order for them to even put it into the pipelines it takes three barrels of water for one barrel of tar sands oil, and that doesn't make any sense. And I grew up in the prairie where a lot of times we didn't have a lot of water, and for us to be wasting water like that doesn't make any sense for the long term, or for right now.	As noted in Consolidated Response OIL-4, the composition of crude oil that would be transported by the proposed Project would be essentially the same as that of other heavy crude oils refined in the U.S. Also see Consolidated Response CAN-1.
1550	6	Jewett	Chastity	National Wildlife Federation, Shine River Sioux Tribe	I don't think the draft EIS actually adequately addresses the issues of species fragmentation. And now with the pipeline it's going to make it a lot easier for predators to get at those game birds and the songbirds and all the other birds because there's a pipeline that goes right there.	Potential habitat fragmentation impacts are discussed in Section 3.6.2 including facilitation of predator movements. Adequacy of the wildlife assessment is discussed in Consolidated Response WIL-1.
1550	7	Jewett	Chastity	National Wildlife Federation, Shine River Sioux Tribe	I don't think that anywhere in the DEIS it -- it talks about the pockets of prairie waters, the wetlands that exist up here. Folks know that sometimes there are wetlands in the middle of the prairie, and I don't think that anywhere it addresses the impacts on those intermittent and those streams that come up	Consolidated Response WAT-1 and Section 3.3.2 addresses stream crossing methods and the associated potential water quality impacts. Sections 3.4.3 through 3.4.5 address potential impacts to wetlands.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					during the springtime and the isolated wetlands and prairie potholes. And like I said before, a lot of these rivers are no longer protected by the Clean Water Act so there's no way for us to have any recourse should anything happen.	
1550	8	Jewett	Chastity	National Wildlife Federation, Shine River Sioux Tribe	I think that the fact that we're continuing to drill oil and go after dirty energy sources is really backwards considering what happened recently with what happened in the Gulf of Mexico. ...This is a really dirty energy source, and with the technology and the mines and the capabilities that we have as a nation we should be able to be putting our resources into clean energy sources.	Consolidated Response P&N-5 addresses issues related to investments in other technologies.
3	1	Johnson	Stephanie	Tri-State Neighbor	By way of introduction, my name is Stephanie Johnson and I am special sections editor at Tri-State Neighbor newspaper in Sioux Falls, SD. I grew up in Perkins County where my family has a ranch. I'd like to voice my displeasure about the Keystone XL oil pipeline project. Please, South Dakota, do not promote or allow this project. Please feel free to contact me if you see fit. Thanks for accepting my comments.	Comment acknowledged.
3	2	Johnson	Stephanie	Tri-State Neighbor	I am concerned about the Keystone project because it has no benefit for anyone except oil companies.	Consolidated Response ECO-1 addresses potential socioeconomic impacts, and Consolidated Response TAX-1 addresses concerns regarding taxes. Consolidated Response P&N-1 addresses the need that the Project has been proposed to meet.
3	3	Johnson	Stephanie	Tri-State Neighbor	America does not need to make more non-renewable oil available by way of a pipeline that disturbs South Dakota prairie and other natural resources.	Comment acknowledged.
3	5	Johnson	Stephanie	Tri-State Neighbor	What can farmers and ranchers possibly gain from this?	Consolidated Response ECO-1 addresses potential socioeconomic impacts. Consolidated Response TAX-1 addresses issues regarding tax benefits from the proposed Project, including the county and state property taxes that would be generated by the proposed Project.
3	6	Johnson	Stephanie	Tri-State Neighbor	What can our state and nation gain? The answer is nothing. Allowing projects such as this only increases our oil addiction. It doesn't matter if that oil is domestic or foreign.	Consolidated Response P&N-1 addresses the need that the Project has been proposed to meet. Section 3.10.2 of the EIS describes the economic benefits of the Project to South Dakota.
174	1	Johnson	Janet		I am concerned that the proposed pipeline through the Nebraska Sandhills is a project we will deeply regret in the future.	Issues related to the Sand Hills area are addressed in Consolidated Response ERO-1.
174	2	Johnson	Janet		The fact that TransCanada is seeking the use of thinner pipe walls and higher pressure oil flows while at the same time claiming to be using very safe techniques sounds too much like BP and the disaster in the Gulf of Mexico.	Keystone has withdrawn its application for a Special Permit as described in Consolidated Response REG-1. As described in Consolidated Response SAF-1, the Pipeline and Hazardous Materials Safety Administration (PHMSA) has regulatory requirements that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project in a manner that protects the health and safety of the public and the environment. In addition, PHMSA developed 57 Project-specific Special Conditions that Keystone has agreed to implement. Incorporation of those conditions would result in a Project that would have a degree of safety over any other typically constructed domestic oil pipeline system under current code and a degree of safety along the entire length of the pipeline system similar to that which is required in HCAs

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
						as defined in 49 CFR 195.450.
174	3	Johnson	Janet		My first choice is that we would not have this pipeline at all. If we must, then reroute it away from the aquifer area.	Consolidated Response ALT-1 addresses potential alternative routes, including routes that would avoid much of the Northern High Plains Aquifer system.
174	4	Johnson	Janet		This project should be highly regulated and then we should follow through and make sure the regulations and safety factors are being followed.	As described in Consolidated Response SAF-1, the Pipeline and Hazardous Materials Safety Administration (PHMSA) has regulatory requirements that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project in a manner that protects the health and safety of the public and the environment. In additions to its regulations in 49 CFR Parts 194 and 195, PHMSA developed 57 Project-specific Special Conditions that Keystone has agreed to implement and to incorporate into its manual for operations, maintenance, and emergencies that is required by 49 CFR 195.402. PHMSA has the legal authority to inspect and enforce any items contained in a pipeline operator's operations, maintenance, and emergencies manual, and would therefore have the legal authority to inspect and enforce the regulations and the Special Conditions if the proposed Project is approved. Incorporation of those conditions would result in a Project that would have a degree of safety over any other typically constructed domestic oil pipeline system under current code and a degree of safety along the entire length of the pipeline system similar to that which is required in HCAs as defined in 49 CFR 195.450.
728	1	Johnson	Cynthia		A resounding NO! to the Keystone Pipeline...	Comment acknowledged.
728	2	Johnson	Cynthia		...I prefer to take my drinking water without oil.	Concerns regarding potential risk to Northern High Plains Aquifer system and other aquifer systems are addressed in AQF-1.
730	1	Johnson	Chelsea		As a young person (I am 19 year old), I am concerned for my future, especially with a project like this on the table... The Keystone XL Pipeline is not something that should be invested in. ...With this in mind, it is terrifying to acknowledge the fact that our economy, our entire way of life, is based upon the consumption of oil. It is worse to acknowledge that food makes it to the table through the consumption of oil--which is admittedly harmful to our well-being and to our environment's well-being. So why do we keep investing millions upon millions of dollars to search for new oil sites then dredging it up to the surface so that it can be combusted and pollute the air? In no way does it make sense to spend money on this project. I am a native Nebraskan. Please, please do not give the "okay" for this project. It is counterproductive to a sustainable environment and economy.	Consolidated Response P&N-1 addresses the need that the Project has been proposed to meet. Consolidated Response ALT-2 addresses the use of alternative technologies, alternative energy sources, and conservation of energy. Consolidated Response P&N-5 addresses issues related to investments in other technologies.
730	2	Johnson	Chelsea		..."Oil" from the tar sands is not even oil. It is bitumen, which is used in asphalt, and it is worse on the environment to harvest than the oil in traditional oil fields...	Consolidated Response OIL-4 addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils. Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project.
730	3	Johnson	Chelsea		This pipeline would run over the largest freshwater aquifer in	Issues related to the Northern High Plains Aquifer system are

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					North America. We cannot afford to have this source contaminated if a spill or leak would occur...	addressed in Consolidated Responses AQF-1 through AQF-4.
744	1	Johnson	George&Margaret		Keep this pipeline away from the Nebraska Sand Hills.	Identification of sensitive environments crossed by the proposed Project is discussed in Consolidated Response ENV-1 and ENV-3. Issues related to the Sand Hills area are addressed in Consolidated Response ERO-1.
802	1	Johnson	Lana		Obviously, as witnessed by the Gulf disaster, this is a nightmare waiting to happen in the world's only sandhill environment. I hope we aren't so stupid and short-sighted to endanger our ground water like we have the gulf. PLEASE PLEASE PLEASE I beg you to NOT let them build this pipeline through the sandhills of Nebraska. It will be ruined at some point for sure. We cannot build things that completely and always are 100% solid to not break at some point. We have to protect our environment a little for the kids even if it means higher gas prices, less gas or walking. Please don't let them do this. I beg you to stop it now!	Issues related to the Sand Hills area are addressed in Consolidated Response ERO-1. Consolidated Response ENR-1 provides information on the Department of State's environmental review process, the National Interest Determination process, and the need to complete those reviews before approving or denying the Presidential permit for the proposed Project.
829	1	Johnson	Andy	Black Hills State University	Student members of this group are opposed to the Keystone XL pipeline for a variety of reasons: 1) The pipeline will pass through lands where we live, work, and play. The disaster in the Gulf of Mexico demonstrates the danger of our current pursuit of petroleum for feeding our cars at any cost. We do not want to risk a major oil spill in the farmlands of South Dakota.	The impacts associated with implementation of the proposed Project are addressed in Section 3.0 of the EIS. As noted in that section, the proposed Project would not result in significant environmental impacts. Consolidated Response P&N-1 addresses the need for the proposed Project.
829	2	Johnson	Andy	Black Hills State University	The DEIS did not adequately address the "no action" option. Student members believe that the "no action" option is preferred. It is time for our nation to cut back on petroleum use, not continue to expand it. We do not need this pipeline.	Consolidated Response P&N-1 addresses the need that the Project has been proposed to meet. Section 4.1 of the EIS has been expanded and updated.
829	3	Johnson	Andy	Black Hills State University	3) We do not regard this pipeline as a benign change to our environment, and we do not believe that its benefits - which will accrue exclusively to private corporations - could possibly outweigh the costs that will be borne by farmers and ranchers. This pipeline would represent a particularly heinous example of "externalized costs" that will not, and could not be covered by the corporations involved.	Consolidated Response ECO-1 addresses potential socioeconomic impacts, and Consolidated Response TAX-1 addresses concerns regarding taxes. The impacts associated with implementation of the proposed Project are addressed in Section 3.0 of the EIS. As noted in that section, construction and normal operation the proposed Project would not result in significant environmental impacts. Section 3.13 of the EIS addresses reliability and safety issues, including calculations of the probability of a spill from the proposed Project and the potential environmental impacts associated with spills. Issues related to the High Plains Aquifer System are addressed in Consolidated Response AQF-1 through AQF-4. Consolidated Response AQF-3 provides information on hypothetical spills from the Project over two areas of the Northern High Plains Aquifer System. Consolidated Response LIA-1 addresses Keystone's liability if there is a spill of hazardous materials or fuel during construction and from a spill of crude oil from the Project.
990	1	Johnson	Jennifer		Please do not route this pipeline through Nebraska! The Sandhills are unique and precious, and the Ogallala aquifer is a valuable natural resource as well.	Issues related to the Sand Hills area are addressed in Consolidated Response ERO-1. Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
1075	1	Johnson	Merri&Brad		We fully support responsible gas and oil production. But we are extremely concerned about a buried pipeline across the Nebraska Sandhills that has the potential to contaminate the	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					Ogallala Aquifer.	
1075	2	Johnson	Merri&Brad		The reassurance that a leak will be quickly detected and contained rings pretty hollow in light of the current Gulf oil leak. That may not be a fair comparison, but it certainly highlights the need to take NO shortcuts in construction and containment measures.	Consolidated Response SAF-1 describes the regulatory requirements and the 57 Project-specific Special Conditions (see Appendix U of the EIS) developed by the Pipeline and Hazardous Materials Safety Administration (PHMSA) that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project. It also describes the inspections and reviews of the proposed Project that PHMSA would conduct to ensure compliance with those regulatory requirements.
1167	1	Johnson	Diane		I also have concerns about the pipeline that will run through Nebraska. Water is our most valuable resource.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
1167	2	Johnson	Diane		There would never be a way to repair the damage to our aquifer.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
1167	3	Johnson	Diane		...Water is our most valuable resource and helps provide income for the many farmers in this state. Safety nets should be the number one priority to ensure the continuation of Nebraska's livelihood in agriculture. ... and Nebraska would become a wasteland where farming is the major source of income.	Issues related to the High Plains Aquifer System are addressed in Consolidated Response AQF-1 through AQF-4. Consolidated Response AQF-3 provides information on hypothetical spills from the Project over two areas of the Northern High Plains Aquifer System. As noted in those responses, a spill over the Northern High Plains Aquifer system would not devastate the economy of Nebraska.
1167	4	Johnson	Diane		Please help voice our concerns about the regulations of proper installation and maintenance so that we do not end up like the Gulf Coast.	Consolidated Response SAF-1 describes the regulatory requirements of the Pipeline and Hazardous Materials Safety Administration (PHMSA) that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project. It also describes the inspections and reviews of the proposed Project that PHMSA would conduct to ensure compliance with those regulatory requirements.
1184	1	Johnson	Rheta		How many times do we need to learn these lessons? The Ogallala Aquifer is too important to risk the environmental hazards these pipelines represent.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
1184	2	Johnson	Rheta		Please stop this insanity before it starts!	Consolidated Response ENR-1 provides information on the Department of State's environmental review process, the National Interest Determination process, and the need to complete those reviews before approving or denying the Presidential permit for the proposed Project.
1197	1	Johnson	Dominique		To whom it may concern: I strongly urge you to deny permits to TransCanada, and stop the construction of the Keystone XL pipeline through our communities and lands... I'm shocked that you would think to allow such a dangerous and destructive pipeline to cross into the U.S., and demand that you stop the building process at once.	Section 3 of the EIS addresses the impacts of construction and operation of the proposed Project. Section 3.13 of the EIS addresses the risk and environmental impacts of a crude oil spill from the proposed Project.
1197	2	Johnson	Dominique		Tar sands oil production is incredibly toxic and puts American communities and wildlife populations at risk, ...	Consolidated Response OIL-4 addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils. Communities would not be exposed to crude oil transported by the proposed project during normal operation. Section 3.13 of the EIS addresses reliability and safety issues, including calculations of the probability of a spill from the proposed Project and the potential environmental impacts associated with spills, including potential impacts to wildlife. As described in

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
						Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries.
1315	1	Johnson	Joel	WELSPUN Global Trade LLC	I work for a company called Welspun, which is one of the world's largest pipe manufacturing companies. We have worked directly for TransCanada for many years and have supplied hundreds and hundreds of miles of line pipe in the US, Canada and Mexico for their projects. We have supplied pipe for TransCanada from our Little Rock facility as well as our India-based facilities. All are among the world's most modern and capable facilities, meeting the highest quality requirements.	Comment acknowledged.
1315	2	Johnson	Joel	WELSPUN Global Trade LLC	I know from working with TransCanada over the years that their top priority is pipeline safety. This, in turn drives their very high quality expectations from their suppliers. TransCanada's requirements are very clear and precise.	Comment acknowledged.
1315	3	Johnson	Joel	WELSPUN Global Trade LLC	The KXL project will directly generate 600 jobs at our Little Rock facility over the next two years to produce the pipe. I provide the following attached support letters from the local and state chamber of commerce for the State of Arkansas and City of Little Rock. I request that these letters be put into public record. These organizations understand the positive impact that the KXL project will have on Little Rock, not only in the direct employment of 600 workers at Welspun's Little Rock facility, but also on the many hundreds of indirect jobs this project will provide in the Little Rock region.	Comment acknowledged.
1315	5	Johnson	Joel	WELSPUN Global Trade LLC	As a manufacturer of pipelines around the world we take the stringent requirements from companies like TransCanada for the KXL Project and carefully interpret the specifications to ensure that we meet or exceed all requirements. For example let me walk you through the process of how we proceed from specification to producing the pipe - focusing at all times the rigorous testing regimen to ensure that high quality is built into the pipeline; We exhaustively review the customer specifications• We produce complete Quality Assurance Procedures from steel supply to pipe forming and rolling to coating as well as transportation to the destination of the pipeline. We write our raw material specification based on the customer's requirements We shortlist raw material suppliers and award the work only to the highest quality approved suppliers in cooperation with our customers• While the vendors are producing the material we audit and witness the production at critical stages and intervals We transport the steel to our pipe mills according to international standards such as API and ISO standards among others We mechanically test the steel supply at our premises to ensure that the steel suppliers meet the requirements We check the test certificates from the material suppliers and compare versus our requirements as well as the customers. After physical dimensional checks on the steel we load the coil/plate and the process of unwinding the coil - the first non destructive test is 100% of the coil is ultrasonically tested to ensure	Comment acknowledged.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					<p>perfect base material prior to welding. We form the sheet of steel into a tubular/pipe form and tack weld the edges using the GMAW welding process. After forming we plasma cut the pipe to lengths required by the customer - for the KXL Project this means approximately 80' lengths. At this stage we assign unique traceability numbers for each pipe which can be used to trace the pipe back to the original steel information - all testing for the life of the pipe is attached to these pipe numbers. The cut pipe travels to separate inside and outside welding stations - this completes the welds. The pipe is then cleaned and another quality test is performed - 100% of the weld is tested using ultrasonic and radioscopic methods - after this step we have checked 100% of the body of the pipe and then we have checked 100% of the weld which we have performed. After this test each pipe is submitted to full scale testing in our Hydrotest machine - each and every pipe is filled with water and put under pressure to 100% SMVS levels. Please note that this far exceeds the normal operation of the pipeline in the field. Pipe is carefully measured at this stage to determine if any expansions have taken place. Once again we test the weld seam after hydrotesting - 100% of the weld is examined using ultrasonic testing methods. Immediately after this the ends of each pipe are also manually ultrasonically tested and then the ends are also X-rayed to ensure the quality requirements are met. Our internal quality control personnel and system monitor the process which I explained and destructive testing of pipe samples are taken to ensure that all requirements are met - for example impact testing, drop weight tear testing, hardness, yield and ultimate strength testing. After all testing has passed, we send the pipe to a onsite coating facility which applies a fusion bonded epoxy coating system which provides a barrier to corrosion. A battery of testing is done on this process as well and after that the pipe is shipped by barge, rail or truck to the destination of the pipeline. We deliver the pipe with complete stencils on the pipe noting the pipe number and details as well as barcodes which can be used by TransCanada to track all quality data backwards right from steel forming to pipe to coating and shipment. At any point of the process our customer, regulators and industry association inspectors or auditors are free to audit and check the mill to compare our practice versus the documented standards. Since we have commenced operations we have had 2 full API / ISO full scale audits, numerous audits and inspections by TransCanada and others as well as in the last 6 months had visits from PHMSA - one of which was a formal audit by PHMSA. Safety is also our top priority at Welspun, and our most important concern is that our pipe supply meets the requirements of the customer and all regulatory agencies. The United States needs a safe and reliable supply of energy, with the help and full cooperation of TransCanada, Welspun is supplying the safest and highest quality pipe for a safe and reliable system to deliver this energy. Welspun is pleased to be a trusted partner in this project; in doing so we will generate hundreds of direct jobs and thousands of indirect jobs. I urge you to speed up the</p>	

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					permitting process to allow this project to happen according to the schedule which is required.	
1441	2	Johnson	Orrin		Another concern is damage to the water table which lies near the surface.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
1441	3	Johnson	Orrin		Also a concern is what happens if/when these pipes are no longer needed, then flushed and pumped full of other gasses or fluids so that they can lay buried underground, supposedly without being crushed or leaking? It seems likely that future generations will suffer. I urge you not to give approval to the pumping of oil through these thin pipes. Or declare an indefinite moratorium until an independent study can guarantee safety, which seems unlikely given the oil companies' track record.	Responses related to taking the Project out of service at the end of the life of the Project are presented in Consolidated Response DEC-1. Keystone has withdrawn its application for a Special Permit as described in Consolidated Response REG-1. As described in Consolidated Response SAF-1, the Pipeline and Hazardous Materials Safety Administration (PHMSA) has regulatory requirements that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project. In addition, PHMSA developed 57 Project-specific Special Conditions that Keystone has agreed to implement. Incorporation of those conditions would result in a Project that would have a degree of safety over any other typically constructed domestic oil pipeline system under current code and a degree of safety along the entire length of the pipeline system similar to that which is required in HCAs as defined in 49 CFR 195.450. Consolidated Response ENR-1 provides information on the Department of State's environmental review process, the National Interest Determination process, and the need to complete those reviews before approving or denying the Presidential permit for the proposed Project.
1441	4	Johnson	Orrin		Finally, the way I read this pipeline proposal, once it is approved, should the oil company/companies, at some future date, choose to add pumping stations to increase the rate or volume of flow, nothing could stop them from doing so. This proposal is very flawed. Please do not give the go-ahead.	Additional pumping stations or facilities would need to go through applicable permitting processes, including environmental permitting.
1442	1	Johnson	Francis&Shirley		Please do not let a permit for this project to go through. I own 3 quarter's that this is going through and have had no right for anything. It doesn't seem fair that a foreign company can come in and devalue our land like it is.	As described in Section 1.0 of the EIS and in Consolidated Response RES-2, TransCanada-Keystone Pipeline LP (Keystone) is not a foreign corporation. It is a limited partnership organized under the laws of the state of Delaware. Keystone has the same rights as other pipeline companies in the U.S. to propose projects. Consolidated Response ENR-1 provides information on the Department of State's environmental review process, the National Interest Determination process, and the need to complete those reviews before approving or denying the Presidential permit for the proposed Project.
1442	3	Johnson	Francis&Shirley		Also of a first meeting we were told that a pumping station had to be 1/2 mile away from a home. My son and family will be closer than 1/2 mile with 2 young children. Also a neighbor with 2 young children. Why can they do this? At least we ask that this pumping station be moved.	As described in Consolidated Response SAF-1, the Pipeline and Hazardous Materials Safety Administration (PHMSA) has regulatory requirements that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project. In addition, PHMSA developed 57 Project-specific Special Conditions that Keystone has agreed to implement. Incorporation of those conditions would result in a Project that would have a degree of safety over any other typically constructed domestic oil pipeline system under current code and a degree of safety along the entire length of the pipeline system similar to that which is required in HCAs as defined in 49 CFR 195.450.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
						Consolidated Response NOI-1 addresses issues related to noise from pump stations.
1442	4	Johnson	Francis&Shirley		We're very unhappy with all the cost this has caused us. Running 70 miles to meetings and getting nothing out of them. NO ANSWERS. The last meeting we went to everyone opposed the pipeline. We have wasted many hours trying to get some answers and we are busy farmers trying to make a living off of our land. Thank you. I hope you read this and we can get something done. The only thing that has been done is to tell us what THEY are going to do. PLEASE HELP US.	The Notice of Intent (see Consolidated Response PNOI-1) and the draft EIS provided information on the proposed Project. Consolidated Response REQ-1 addresses requests for additional information, including detailed maps of the proposed route. Consolidated Response REQ-2 provides information for request of locations of paper copies of the EIS and that copies of the draft EIS, other specific information, or references be sent directly to the commenter.
1491	1	Johnson	Glen	Int'l Union of Operating Engineers Local 49	The International Union of Operating Engineers Local 49 respectfully asks that Secretary of State Hillary Clinton give the necessary approvals for the Keystone XL pipeline project. This project will create over 10,000 jobs supporting the hard-working families of North and South Dakota. In fact, the demand for skilled workers may be so great that the pipeline will provide work for our members in neighboring states, as well. Our nation needs petroleum and where better to get our imports than Canada. Our members and their families have suffered greatly during this recession; they are in desperate need of these jobs. We urge approval of this project for the hard-working families of Local 49.	Consolidated Response ECO-1 addresses potential socioeconomic impacts, and Consolidated Response TAX-1 addresses concerns regarding taxes.
1540	91	Johnson	Darrell	Indigenous Environmental Network	There are those wealthy people who wish to construct the oil pipeline through the heart of America and they wish to do so even if it would endanger the health and lives of American people who may live next to danger.	The commenter's opinion is noted.
1540	92	Johnson	Darrell	Indigenous Environmental Network	I am not against progress because progress usually benefits the general population as a whole and makes life more comfortable. But if the attempt to develop and to provide comfort for the public endangers the life of even one citizen, I would not agree to participate in any way in a construction or building project, nor would I support it.	The commenter's opinion is noted.
1540	93	Johnson	Darrell	Indigenous Environmental Network	The threat of the contamination of our drinking water and crops, which make up the foods that we consume is unacceptable now or in the future. Even the water which the livestock drink must not be contaminated by the deadly carcinogens which exist in the pipeline itself.	Consolidated Response OIL-4 addresses the composition of the Canadian crude oil that would be transported by the proposed Project, including concerns relative to the corrosivity and erosivity of the crude oil. As noted in that Consolidated Response, that crude oil is similar in composition and properties to other heavy crude oils that are currently transported within the U.S. pipeline system and similar in composition and properties to other heavy crude oils that are currently refined in PADD III. Issues related to aquifers along the proposed Project corridor are addressed in Consolidated Responses AQF-1 through AQF-4. Consolidated Response WAT-1 addresses concerns regarding potential water quality impacts.
1540	94	Johnson	Darrell	Indigenous Environmental Network	The assurance that no lethal and no deadly carcinogens will escape from the pipeline itself and enter into the surrounding area, causing cancer or any other disease to plant life, animal life or human life, must be honestly made and proven by those advocates of the construction of the pipeline.	Section 3.13 of the EIS addresses reliability and safety issues, including calculations of the probability of a spill from the Project and the potential environmental impacts associated with spills. As noted in that section, there is no guarantee for any pipeline system that a spill would not occur.
1540	96	Johnson	Darrell	Indigenous Environmental	A leak in a sensitive spot like in or near any of your lakes or streams would contaminate a significant amount of habitat and	Section 3 of the EIS addresses the impacts of construction and operation of the proposed Project. Section 3.13 of the

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
				Network	may kill fish and wildlife.	EIS addresses the risk and environmental impacts of a crude oil spill from the proposed Project.
1540	99	Johnson	Darrell	Indigenous Environmental Network	The heavy sour crude that will be carried in the XL pipeline is not your normal crude oil, it contains high levels of sulfur and heavy metals. Adding the uncontrolled mixture of diluents increases the impurities in what will be getting pumped across the heart of America. The material to be carried in the XL pipeline is classified as light hydrocarbon diluents, an uncontrolled mixture of the first draw off of the dirty heavy crude, the lighter sweet crude and liquid petroleum used to generate natural gas as they are being refined. The light hydrocarbons are not cleaner, safer materials. They move easily on any water surface, including through aquifers, thus they may very readily contaminate groundwater, soil, wildlife, and human life.	Consolidated Response OIL-4 addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils. As a result, oil spills from the proposed Project that reach water would exhibit behavior similar to that of other heavy crude oils in the environment and would not require special cleanup procedures. Section 3.13 of the EIS addresses reliability and safety issues, including calculations of the probability of a spill from the proposed Project and the potential environmental impacts associated with spills.
1543	27	Johnson	Robert		I also have a pipeline that runs just south of my mailbox all the way into North Dakota that is a DOT line. As far as I know there has never been a leak in that line. But it's more highly regulated than the flow lines.	Comment acknowledged.
1543	29	Johnson	Robert		South Dakota has to do something to better regulate flow line leaks.	Comment acknowledged.
1543	30	Johnson	Robert		They have done a very good job with the DOT lines.	Comment acknowledged.
1543	31	Johnson	Robert		There are also some good things about TransCanada. They're going to bring in quite a bit of tax base to Harding Country, which is really helpful.	Comment acknowledged.
1543	32	Johnson	Robert		The electricity that gets used will bring in gross receipts tax that's going to go to help the schools and that will really help.	Comment acknowledged.
1543	33	Johnson	Robert		But we do need to take care of the landowners and make sure that the reclamation is done right.	Keystone would be required to complete the reclamation committed to in the permits it receives, including the Presidential Permit. Those commitments are described in Section 2.3 of the EIS and in Keystone's Construction, Mitigation, and Reclamation Plan presented in Appendix B of the EIS.
1543	35	Johnson	Robert		I hope they do get the permit to build the pipeline and that they take care of everybody on the route.	Comment acknowledged.
1544	68	Johnson	Joel		TransCanada's top priority is pipeline safety. They have very high expectations from their suppliers.	Comment acknowledged.
1544	69	Johnson	Joel		The KXL project will directly generate over 600 jobs in Little Rock over the next two years.	Consolidated Response ECO-1 and Section 3.10.2.2 of the EIS address potential socioeconomic impacts.
1544	70	Johnson	Joel		PHMSA has been to our pipe manufacturing facility three times in the last six months, including a formal audit two weeks ago.	Comment acknowledged.
1544	71	Johnson	Joel		To meet the schedule for the KXL project, we will use subcontractors ranging from Louisiana to here in Houston, creating a large number of jobs and a positive economic impact.	Comment acknowledged.
1544	72	Johnson	Joel		We need a secure energy supply like this for our country.	Comment acknowledged.
1544	73	Johnson	Joel		I urge this pipeline be granted the necessary permits to proceed in a timely fashion.	Comment acknowledged.
1546	89	Johnson	Joel	Welspun	Knows from working with TransCanada over the years that	Comment acknowledged.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					safety is their first priority.	
1546	90	Johnson	Joel	Welspun	KXL project will generate 600 jobs at Little Rock pipe-making facility over the next two years.	Consolidated Response ECO-1 and Section 3.10.2.2 of the EIS address potential socioeconomic impacts.
1546	92	Johnson	Joel	Welspun	The pipeline system will be operated at 80% of SMYS, and therefore will be field tested to a minimum of 100% SMYS, and that immediately triggers a need to adjust the mechanical and dimensional properties of the delivered pipe, to ensure that such testing can be executed. In this respect, an in-line statistical process control program is used to monitor the incoming plate and coil properties, namely the raw materials that we use, and automatically requiring an increase in the testing frequency, once a certain threshold is reached.	Keystone has withdrawn its application for a Special Permit as described in Consolidated Response REG-1. As described in Consolidated Response SAF-1, the Pipeline and Hazardous Materials Safety Administration (PHMSA) has regulatory requirements that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project in a manner that protects the health and safety of the public and the environment. In addition, PHMSA developed 57 Project-specific Special Conditions that Keystone has agreed to implement. Incorporation of those conditions would result in a Project that would have a degree of safety over any other typically constructed domestic oil pipeline system under current code and a degree of safety along the entire length of the pipeline system similar to that which is required in HCAs as defined in 49 CFR 195.450.
1546	93	Johnson	Joel	Welspun	The increase in testing frequency aids in the probability of conformance, and the evaluation that is performed on pertinent mechanical and dimensional properties, such as the yield strength, the tensile strength, the wall thickness, the pipe diameter and modality. To compliment the above activity, we use real time control charts in the manufacturing facilities to provide a timely feedback to our operators and quality control personnel. We can make immediate adjustments if those trends go towards a negative data result. The stability of these properties ensures the yield strength and the aspects that I mentioned, ensures that the pipeline will perform satisfactorily during high pressure testing, and subsequent operation.	Comment acknowledged.
1546	95	Johnson	Joel	Welspun	Welspun has also developed statistical models that are used to extrapolate random sample test data to the exact performance of the entire pipe population. Again, ensuring that all pipes delivered are the highest quality and conform with the requirements of the government specifications.	Comment acknowledged.
1546	96	Johnson	Joel	Welspun	Company uses high technology testing regimes, meets or exceeds all requirements. Welcomes people to audit factories and compare their practices to the documented standards.	Comment acknowledged.
1546	97	Johnson	Joel	Welspun	Urges that the permitting process be sped up, to allow project to move forward.	Comment acknowledged.
1550	45	Johnson	Darrell	Indigenous Environmental Network	[commenter quoting article] "Although the oil sands construction frenzy ended in 2008, it has left behind a number of festering problems. A glut of pipeline capacity is among the more serious remnants...Not only are oil producers trying to back out from the Alberta Clipper, but Enbridge itself has battled an effort by TransCanada Corporation to build another major pipeline called Keystone XL to export crude to the U.S. That dispute too arises from a key problem facing the oil patch. There are simply too many pipelines and not enough crude"...What I'm saying here basically is that they're building too many pipelines.	As noted in Consolidated Response P&N-1, the Project has been proposed to meet the heavy crude oil needs of refineries in the Gulf Coast area, not for the U.S. in general. There is not sufficient pipeline capacity to that location. The Alberta Clipper and existing Keystone pipeline projects serve other markets and do not meet the demands of the Gulf Coast refineries. Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information on current and future production.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
1550	46	Johnson	Darrell	Indigenous Environmental Network	And along with that problem is that they're also not mentioning the dangers involved with these diluents with this crude oil....And one of these chemicals in this pipeline is benzene, and it causes cancer. It's a carcinogen. And it's not a question of if; it's a matter of when. Once that gets into your water, your ecosystems, your health, your water is done for, and that's a true fact	Consolidated Response OIL-4 addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils. Potential impacts associated with a release of oil from the proposed Project are addressed in Sections 3.15.5.6 and 3.15.6 of the EIS.
1556	59	Johnson	Darrell	Leech Lake Reservation	We were very uninformed, though they claim that they had done these meetings previously, so this was done very, very rapidly. They had a number of people coming out, claiming to have proposed these meetings. Well, many of these meetings weren't very well advertised. Most of our Tribal membership back home are against this pipeline.	Consolidated Response CMT-2 addresses issues related to comment meetings on the draft EIS and requests for additional public involvement.
1556	60	Johnson	Darrell	Leech Lake Reservation	Our major concern, what got my attention was the diluents with the pipeline. This is a very poisonous mixture. One of them is benzene. Benzene once that gets into your water it's very flowable. It'll go right into your water, your soil. And friends, this pipeline probably claims to have a very good track record for safety, but from what I heard the other night they've only done one pipeline and that doesn't leave a very good track record for performance.	Consolidated Response OIL-4 and Section 3.13.5.1 of the EIS address the composition of the Canadian crude oils that would be transported by the proposed Project. As noted in that response the EIS section, the Canadian crude oil that would be transported is similar in composition to other heavy crude oils. As for other crude oil, there is a very small amount of benzene and other volatiles in the transported crude oil. Those volatiles evaporate from the water in a matter of minutes to hours and dissipate to non-detectable (and non-harmful) concentrations in the air within minutes to a few hours, depending primarily on the winds.
1556	61	Johnson	Darrell	Leech Lake Reservation	To me, my perspective --and I'm not a scientist, but to me this is insanity what we're doing. And this is what I wanted to share with you. We should be looking at the big picture. Who's behind it? Is this a national security issue? Why are federal agencies so involved, you know national security with you say the Secretary of State or you're working with?	Consolidated Response REG-2 addresses issues related to commentor's concerns about the Department of State's involvement. Consolidated Response P&N-9 addresses the National Interest Determination process.
1560	1	Johnson	Francis		Pumping station is to be less than half a mile from her son's house. Noise level is very annoying. Pumping stations were supposed to be at least 1/2 mile away from houses.	Consolidated Response NOI-1 and Section 3.12.2 of the EIS address issues related to noise from pump stations. DOS is not aware of any regulation that requires a distance of 0.5 mile between a pump station and a residence.
1560	29	Johnson	Francis		Need a 30-day clause with interest afterwards for reimbursement of crop damage from pipeline.	Consolidated Response EAS-2 addresses issues related to easement negotiations. As noted in that response, DOS has no legal authority in the easement negotiation process.
1560	40	Johnson	Kimberly		Benefits of oil sands do not outweigh the costs of using these high carbon fuels.	The commenter's opinion is noted.
1560	41	Johnson	Kimberly		Building this pipeline requires an almost total destruction of some of the most pristine areas in the Canadian Boreal Forest.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project. Consolidated Response GHG-4 addresses concerns regarding the loss of boreal forest and peat bogs. Consolidated Response GHG-2 addresses the potential causal connection of implementation of the proposed Project and expanded oil sands production in Alberta and increases in refining.
1560	42	Johnson	Kimberly		Concerned about all the water resources becoming contaminated along the pipeline. It takes 3 barrels of water to extract 1 barrel of oil and this water becomes toxic waste. This will be dumped into our groundwater or water systems.	The commenter is referring to one of the extraction processes used for the Canadian oil sands projects. The discharges from extraction occur in Canada, not the U.S. Issues related to development of oil sands projects in Canada are addressed

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
						in Consolidated Response CAN-1. The impacts associated with implementation of the proposed Project in the U.S. are addressed in Section 3.0 of the EIS. As noted in that section, construction and normal operation the proposed Project would not result in significant environmental impacts. Section 3.13 of the EIS has been revised and addresses reliability and safety issues, including calculations of the probability of a spill from the proposed Project and the potential environmental impacts associated with spills.
1556	59	Johnson	Darrell	Leech Lake Reservation	We were very uninformed, though they claim that they had done these meetings previously, so this was done very, very rapidly. They had a number of people coming out, claiming to have proposed these meetings. Well, many of these meetings weren't very well advertised. Most of our Tribal membership back home are against this pipeline.	Consolidated Response CMT-2 addresses issues related to comment meetings on the draft EIS and requests for additional public involvement. Consolidated Response CUL-1 and Section 3.11.4.3 of the EIS address the consultation process between DOS and Indian tribes. As noted in Consolidated Response CUL-1, a Programmatic Agreement (PA) has been developed for the Project under Section 106 of the National Historic Preservation Act. The PA includes mitigation measures for known adverse effects and provides a process for ongoing surveys to be conducted in areas where access was not granted during the EIS process. The Traditional Cultural Property (TCP) reports (noted in Section 3.11.4-3 of the EIS) may not be disclosed due to concerns regarding confidentiality. Potential impacts to cultural resources are addressed in Section 3.11.3.1 of the EIS. DOS considers this assessment to be in compliance with NEPA environmental review requirements.
214	1	Johnston	Maxine		I oppose the permitting of this pipeline. Keystone will adversely impact 22,400 or more acres, including 91 streams (32 in Texas).	Section 3.9 of the EIS addresses potential land use impacts. Section 3.3 of the EIS addresses potential impacts to water resources.
214	2	Johnston	Maxine		I oppose the permitting of this pipeline...2. Impacts include dirty tar sands pollutants added to existing pollution.	As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries.
214	3	Johnston	Maxine		I oppose the permitting of this pipeline...3. Comment period should be extended 60 days to allow more comment from affected landowners who are completely unaware of this threat.	Consolidated Response CMT-1 addresses issues related to the length of the comment period for the draft EIS and supplemental draft EIS.
403	1	Johnston	Cynthia		No to this pipeline! It will cross and endanger the Sand Hills and the Ogallala Aquifer. It does not have to be placed here. If there absolutely, positively has to be another pipeline, it should follow the existing pipeline route.	Consolidated Response ALT-1 and Section 4.3 of the EIS address potential alternative routes, including use of the existing Keystone Oil Pipeline System route.
572	1	Johnston	Rock&Cynthia		Keep this pipeline far away from the Sandhills and the Ogallala Aquifer. No to the pipeline.	Issues related to the Sand Hills area are addressed in Consolidated Response ERO-1. Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
1128	2	Johnston	Cynthia		The Ogallala Aquifer is much to precarious and important to our world to endanger - and yes, the pipeline will endanger the aquifer.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
1128	3	Johnston	Cynthia		Not to mention the displacement of families, ranches,	There would not be displacement of families, ranches or

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					communities, plants and animals.	communities associated with implementation of the proposed Project. Impacts to plants and animals are addressed in Sections 3.4 through 3.8, including information on displacement where relevant.
830	1	Johnstone	MynaLee	NDP	There is a massive movement growing in Canada to have the Alberta Tarsands shut down. We would not want the USA to support the tarsands project with the use of the pipelines project. Presently, our Conservative government is operating with a minority government. Opposition parties are being asked to form a Coalition to support our environmental demands and a fall election could very well see a change in policy. Municipalities all across Canada are committing themselves to addressing the problems of Climate Change, protecting the environment and encouraging plans to get off fossil fuels. Dead birds, and growing cancers amongst people in the downwind from the tarsands, and water shortages will not be tolerated. the BC government is also under pressure to stop pipelines and tankers. With that awful oil spill in the Gulf and the negligent BP corporation, the public is fast losing its patience and will no longer support corporate crime. This growing concerns for our environment will lead to stricter laws for protection, fines and the promotion of sustainable energy projects.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information on current and future production. As noted in that Consolidated Response, without the proposed Project, oil sands development would continue at or above the current level until at least 2020, with or without the proposed Project.
377	1	Jones	Julianne		I would like to express my support for the U.S. Department of State's Draft Environmental Impact Statement (DEIS) on the Keystone XL pipeline project, which concluded that the delivery of secure and affordable supplies of Canadian energy to American consumers would have minimal impacts on the environment. As discussed in the DEIS, the evaluation studied the project's potential impact on a number of environmental matters. I appreciate the efforts by the State Department to evaluate the potential environmental consequences of the Keystone project and agree with the Agency's findings that the proposed project would result in limited adverse environmental impacts during both the construction and operation. Upon completion, the proposed project will consist of three new pipelines that will span approximately 1,380 miles across the United States from Canada, which will carry about 700,000 barrels of crude per day initially, eventually increasing to 900,000 barrels.	Comment acknowledged.
377	3	Jones	Julianne		Since the U.S. imported 1.5 million barrels of oil daily from the Canadian oil sands last year and that number is expected to climb to 4.3 million barrels a day over the next two decades, I ask the federal government to consider the benefits of projects like the Keystone XL.	Comment acknowledged.
1121	2	Jones	Berwyn		Transmitting tar sands crude oil though the Ogallala aquifer in Nebraska is too risky. An accident could destroy the water source for agriculture and domestic use.	Consolidated Response OIL-4 addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils. Issues related to the Northern High Plains Aquifer System are addressed in Consolidated Responses AQF-1 through AQF-4. Consolidated Response AQF-3 provides information on hypothetical spills from the Project over two areas of the Northern High Plains Aquifer System.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
1121	3	Jones	Berwyn		... This stuff is the worst kind of polluter, and uses too much energy in refining to be ecologically viable.	Consolidated Response OIL-4 addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils. As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in substantial changes to operations in Gulf Coast refineries.
1220	1	Jones	David&Carol		We need to protect our water resources'. This pipeline is not a good idea. Just say "no".	Consolidated Response WAT-1 addresses concerns regarding potential water quality impacts.
844	1	Josoff	Amber		Do not allow this pipeline to travel across Nebraska. It will leak at some point regardless of all possible precautions.	Consolidated Response ALT-1 addresses potential alternative routes, including routes that would avoid much of the Northern High Plains Aquifer system. Consolidated Response OIL-1 provides a summary of the range of spill frequency estimates addressed in the EIS. Concerns regarding potential risk to Northern High Plains Aquifer system and other aquifer systems are addressed in AQF-1.
1109	2	Jostes	Richard		[Keystone pipeline will have thinner walls than older pipelines? That means less weight,] more speed per mile in the construction process, and less labor cost because of fewer days needed on the job...When construction companies and technology conspire to minimize labor cost we get happy stockholders. But they ride the cost "elevator" down to its lowest common denominator, and then when stockholder demand more the only options left are to cheat or innovate. What if they decide to cheat here in Nebraska, out there in the sand "where no one's looking?" American's have proven in recent years we are comfortable with cheating.	Keystone has withdrawn its application for a Special Permit as described in Consolidated Response REG-1. As described in Consolidated Response SAF-1, the Pipeline and Hazardous Materials Safety Administration (PHMSA) has regulatory requirements that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project in a manner that protects the health and safety of the public and the environment. In addition, PHMSA developed 57 Project-specific Special Conditions that Keystone has agreed to implement. Incorporation of those conditions would result in a Project that would have a degree of safety over any other typically constructed domestic oil pipeline system under current code and a degree of safety along the entire length of the pipeline system similar to that which is required in HCAs as defined in 49 CFR 195.450.
1109	3	Jostes	Richard		[Vote "no" until there are assurances] of safeguards that their technology will catch the mistakes despite the speed of their construction operations.	As described in Consolidated Response SAF-1, the Pipeline and Hazardous Materials Safety Administration (PHMSA) has regulatory requirements that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project in a manner that protects the health and safety of the public and the environment. In addition, PHMSA developed 57 Project-specific Special Conditions that Keystone has agreed to implement. Incorporation of those conditions would result in a Project that would have a degree of safety over any other typically constructed domestic oil pipeline system under current code and a degree of safety along the entire length of the pipeline system similar to that which is required in HCAs as defined in 49 CFR 195.450. It also describes the inspections and reviews of the proposed Project that the Pipeline and Hazardous Materials Safety Administration would conduct to ensure compliance with those regulatory requirements.
1109	4	Jostes	Richard		Vote "no" until there are assurances of safeguards that their technology will catch the mistakes despite the speed of their construction operations. Thanks for the opportunity to comment.	Consolidated Response SAF-1 describes the regulatory requirements and Project-specific Special Conditions that Keystone would comply with to construct, operate, maintain, inspect, and monitor the proposed Project. It also describes

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
						the monitoring, inspections, and reviews of the proposed Project that the Pipeline and Hazardous Materials Safety Administration would conduct to ensure compliance with those regulatory requirements.
1202	1	Joyce	Charles	AquaTerra	I wanted to express my support of the Keystone Pipeline.	Comment acknowledged.
1202	3	Joyce	Charles	AquaTerra	The state stands to benefit both directly by increased jobs in the short term but increased tax revenue from the operation of the pipeline within the confines of the state.	Comment acknowledged.
249	1	Judge	Chris	Cherokee County Judge	As we understand it, Keystone XL will create more than 13,000 high-wage construction and manufacturing jobs during the project's 2011~2012 construction schedule. Many of those jobs will be created in rural and in my districts, where too many of our residents continue to find it difficult to find good jobs. With Keystone XL, they will have an opportunity to work on the project or for businesses that provide supplies, goods and services for its construction and operation.	Consolidated Response ECO-1 addresses potential socioeconomic impacts, and Consolidated Response TAX-1 addresses concerns regarding taxes.
249	2	Judge	Chris	Cherokee County Judge	In addition to the jobs Keystone XL will create, the project will generate substantial economic benefits for the United States and in states and communities along the proposed route. Like our counties, in many cases these are areas where economic performance has stagnated or is shrinking. It is my understanding that TransCanada commissioned a study to measure the projects economic stimulus to the U.S. and the states along the route. The study found that in the U.S. Keystone XL would generate \$20.9 billion in total expenditures, \$9.6 billion in output (gross product), personal income of \$6.5 billion and 118,935 person years of employment (jobs).	Consolidated Response ECO-1 addresses potential socioeconomic impacts, and Consolidated Response TAX-1 addresses concerns regarding taxes.
249	3	Judge	Chris	Cherokee County Judge	In addition, the report concluded that during construction, Keystone XL would generate \$486.36 million in tax revenue for state governments along the route and \$99.1 million for local taxing entities where the pipeline is located. In Oklahoma, the study found Keystone XL expenditures during construction would total \$1.2 billion and generate an economic gross product of nearly \$1.1 billion. Keystone 'XL construction also would generate more than \$7.7 million in tax revenue for local government and \$31.4 million for state government.	Consolidated Responses TAX-1 and ECO-1 address the estimated increases in the tax base and the jobs generated by the proposed Project. Also see the revisions to Sections 3.10.2.3 and 3.10.2.4 of the EIS.
249	6	Judge	Chris	Cherokee County Judge	As county officials from the State of Texas, I strongly encourage the U.S. Department of State to approve an energy infrastructure project that not only will Strengthen long-term energy security in the United States, but also will provide a powerful private sector economic stimulus to the communities along the pipeline route during its construction at a time when our economy continues to struggle.	Comment acknowledged.
249	7	Judge	Chris	Cherokee County Judge	As we understand it, Keystone XL will create more than 13,000 high-wage construction and manufacturing jobs during the project's 2011-2012 construction schedule. Many of those jobs will be created in Texas and in our county, where too many of our residents continue to find it difficult to find good jobs. Additionally, the Keystone XL project will benefit businesses that provide supplies, goods and services for its construction and operation.	Consolidated Response ECO-1 and Section 3.10.2.2 of the EIS address the potential socioeconomic impacts of the proposed Project.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
249	8	Judge	Chris	Cherokee County Judge	In addition to the jobs Keystone XL will create, the project will generate substantial economic benefits for the United States and in states and communities along the proposed route. Like our counties, in many cases these are areas where economic performance has stagnated or •is shrinking. It is our understanding that TransCanada commissioned a study to measure the project's economic stimulus to the U.S. and the states along the route. The study found that in the U.S., Keystone XL would generate \$20.9 billion in total expenditures, \$9.6 billion in output of (gross product), personal income of \$6.5 billion and 118,935 person years of employment (jobs).	Consolidated Response ECO-1 addresses potential socioeconomic impacts, and Consolidated Response TAX-1 addresses concerns regarding taxes.
249	9	Judge	Chris	Cherokee County Judge	In addition, the report concluded that during construction Keystone XL would generate \$486.36 million in tax revenue for state governments along the route and \$99.1 million for local taxing entities where the pipeline is located. In Texas, the study found Keystone XL expenditures during construction would total \$5.4 billion and generate an economic gross product of nearly \$2.86 billion. Keystone XL construction also would generate more than \$64.5 million in tax revenue for local government and \$152 million for state government.	Consolidated Responses TAX-1 and ECO-1 address the estimated increases in the tax base and the jobs generated by the proposed Project. Also see the revisions to Sections 3.10.2.3 and 3.10.2.4 of the EIS.
249	13	Judge	Chris	Cherokee County Judge	We enthusiastically support the Keystone XL Pipeline Project and encourage the Department of State to confirm the findings of the Draft Environmental Impact Statement, which found that the proposed Keystone XL Pipeline would have "limited adverse environmental impact during construction and operation."	Comment acknowledged.
1542	35	Judice	Paul		In the days when my dad worked at the Gulf Oil refinery, we could all count on getting a job. Your kids could grow up and get a decent job, buy a boat and a couple of cars and earn a decent living. That's not the way it is now. The \$7 billion Bolero Expansion has created 300 permanent jobs. Now we are going to have all these contractors good for maybe 3 years, but it's not good for us	Consolidated Response ECO-1 and Section 3.10.2.2 of the EIS address potential socioeconomic impacts.
1542	36	Judice	Paul		They tear up the roads and we have to deal with that.	Consolidated Response RDS-1 addresses concerns about the condition of roadways and roadway structures associated with construction and operation of the proposed Project. As noted in that response, Keystone would be responsible for roadway improvements and restoration if damage occurs due to Project-related activities.
1542	40	Judice	Paul		I also worked for the State of Texas a couple of times "enforcing" 40CFR 60, Code of Federal Regulation. You know how TCEQ operates? It depends on who is Governor. It depends on who is President. It depends on what us citizens will tolerate.	The commenter's opinion is noted.
1542	41	Judice	Paul		There is no need for us to dirty this place up any more. What's going to come out of that? They're all building this deep coke, it's nasty stuff.	Consolidated Response P&N-1 addresses the need that the Project has been proposed to meet. Gulf Coast refineries with petroleum coke from the refining of heavy oil are required to store the material in accordance with relevant regulatory requirements.
1542	44	Judice	Paul		We don't need this. Canada doesn't need it. They are tearing up virgin forest to get this kind of stuff and we just don't need that.	Consolidated Response P&N-1 addresses the need that the Project has been proposed to meet. Issues related to development of oil sands projects in Canada are addressed in

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
						Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project.
194	1	Kaminski	Ronald	Laborers' Local #1140	I am sending this email in support of the Keystone XL pipeline. I am the Business Manager of Laborers' Local #1140 in Omaha Nebraska. Our Union has constructed pipelines in the State of Nebraska for years, which has employed 100's of residents in the state. Our union membership is in support of this pipeline and we hope you decide to grant this application.	Comment acknowledged.
496	1	Kann	Katherine	Linfield College	I am completely against the construction of this pipe line! Placement is awful because it will go directly over the Sand Hills, which is home to the largest and most beautiful bird migration in the US. We need to protect the Sand hills cranes! I don't care how much oil we "need" - it will never be worth destroying our planet and oppressing our people for it. What we really need is to move away from our dirty, corrupt dependence on oil and begin the transition to a clean, healthy energy future. Building this pipeline is a step in the wrong direction! Please do not build it!	Consolidated Response P&N-1 addresses the need that the Project has been proposed to meet. Issues related to the Sand Hills area are addressed in Consolidated Responses ERO-1 and ENV-1.
496	2	Kann	Katherine	Linfield College	Additionally, it will go over the Ogallala Aquifer, which is one of the world's largest water tables.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
496	3	Kann	Katherine	Linfield College	If that's not enough, this pipeline will destroy tribal lands that belong to indigenous American peoples.	Consolidated Response CUL-1 and Section 3.11 of the EIS address protection of historic properties and the consultations conducted in compliance with Section 106 of the National Historic Preservation Act, including consultation with Indian tribes.
507	1	Karre	Lonnie		In light of the recent Gulf oil disaster I am against this. In the Gulf there exists the opportunity to clean it up. Whereas a leak in the pipe would seep down and contaminate the Ogallala Aquifer. This too big of a chance to take no matter how many reassurances we are given. It is equally as bad when you look at the map of future expansion.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. As described in Consolidated Response GLF-1, the risks associated with the proposed Project are substantially different from those associated with the BP Deepwater Horizon Project.
524	1	Karre	Susan		This proposed location for the pipeline could result in accidental contamination of the Ogallala Aquifer - the drinking and irrigation water source for the entire Midwest. This would be even more catastrophic than the recent Gulf spill. The potential for damage to our drinking water cannot possibly be ignored. I believe we have to take full advantage of our own oil resources, and as quickly as possible, but please place the pipeline either above ground or routed through less vulnerable territory.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. Consolidated Response ALT-1 addresses potential alternative routes, including routes that would avoid much of the Northern High Plains Aquifer system. Issues related to an aboveground pipeline are addressed in Consolidated Response CST-1.
506	1	Kassner	Maridel	McCone County	I am the Clerk and Recorder for McCone County. We struggle each year with not enough funds to operate our departments. Budgets have become a nightmare with less and less funding being received from Federal and State funds. We need growth and the pipeline in McCone County.	Comment acknowledged.
506	2	Kassner	Maridel	McCone County	I think it is time that the future of our county and it's needs become an important issue!! I don't think the taxpayers want their taxes to continue to go up. They probably will still want their roads bladed; however, it is getting to the point that we have to make choices as to whether to purchase fuel to maintain the roads or not do any maintenance at all because	Comment acknowledged.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					we can't afford the repairs on the equipment. Insurance has become unaffordable for our employees. Pay increases are minimal and sometimes frozen. Moral is bad with this kind of budget restraints but the complaints continue to come in. We need job opportunities to bring our young people back home. Not all of them have the opportunity to have a farm to go back home to. It's getting harder and harder to keep the main street business open. Larger box stores are hard to compete with. We lose another tax dollar in our taxable value everytime a business closes and doesn't reopen. Thank you for your positive action towards the pipeline in Montana. WE NEED IT!!!	
1415	1	Kassner	Brian	Midland Lumber, LLC	Midland Lumber LLC, of Circle, MT is in support of the Keystone XL Pipeline project. This project will be very beneficial to our business. Midland Lumber is a small family owned business in the Circle community. We have many businesses under one roof. Midland Lumber consists of a small gift shop, a gun shops, a liquor store and of course a lumber yard as well. We think that the pipeline will help us and the community as well. We look forward to seeing the pipeline come through McCone County.	Comment acknowledged.
1544	22	Kast	Hans		The corporate and primary mission [of my engineering firm based in Houston] is to protect the health, safety and environment of the people, property and the environment in general. As a professional engineer, I do not take this responsibility lightly, and I am in full support of this project.	Comment acknowledged.
1544	23	Kast	Hans		TransCanada is one of the clients who we serve. They are perhaps the premier company in the industry as far as putting safety, the environment and social responsibility, first. This corporate value is not only communicated, but demonstrated through their actions over the last several years.	Comment acknowledged.
1544	24	Kast	Hans		This project supports 4 to 500 of our direct and indirect hired employees. It's a long term, stable job for surveyors, engineers, project managers, material expeditors, schedulers, agents, safety and environmental representatives, accountants, administrators, construction managers, mapping and drafting, and back office support. So you can see, there's a lot of people dependent on not only this project, but TransCanada performing on their promises.	Comment acknowledged.
1544	25	Kast	Hans		There's an army of construction contractors that will be on this job as well, 5 to 6000 during peak construction. This is support for local and regional project vendors, suppliers, consultants and other subcontractors, and supporting hundreds, if not thousands, of existing and new jobs created for our Gulf Coast refineries.	Consolidated Response OIL-4 addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils. Sections 2.3 and 3.13 of the EIS describe the design features, safety precautions, construction procedures, monitoring procedures, maintenance practices, and other required actions that Keystone will implement to avoid or minimize corrosion and other damage to the pipeline.
1544	26	Kast	Hans		The industry also supports regional ancillary services, such as hotels, restaurants and other goods and services.	Comment acknowledged.
1544	27	Kast	Hans		On a national level, doing business with a stable trading partner in Canada, versus reliance on politically unstable countries, such as Venezuela, Iraq, Nigeria, etc., is just good	Comment acknowledged.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					energy policy.	
1544	28	Kast	Hans		Moving oil via a pipeline rather than over the oceans and in the Gulf of Mexico is a much safer and more environmentally friendly mode of transport.	Comment acknowledged.
1544	29	Kast	Hans		We are proud to be a service provider to TransCanada and happy to be associated with them and this project.	Comment acknowledged.
430	1	Kasten	Tod		This is a great economic project for MT. Good tax base and some jobs. Much needed in eastern MT.	Comment acknowledged.
431	1	Kasten	David		This type of positive economic project is just what eastern Montana needs. More tax base and good jobs are needed. These projects can be successfully done with the best known technology and know how.	Comment acknowledged.
1465	1	Kasten	Dave		To State and Federal Agencies involved. I have already stated on the record at a public meeting in Circle, Montana that I am in full support of building the proposed Keystone XL pipeline. However, I would like to take the opportunity to follow up as this project is very important to the security of our Nation. The proposed Keystone XL pipeline will provide a secure and reliable supply of oil to U.S. refineries.	Comment acknowledged.
1465	2	Kasten	Dave		The rural area of Montana that I represent will have major positive impacts not only during the construction phase but also with the long term increase of property tax value. It will also have a long term increase in opportunities and activities for the people in a very rural area. I urge all State and Federal Agencies to work with Keystone XL to build this essential pipeline.	Comment acknowledged.
1545	19	Kasten	Dave	State Representative	This community needs a project...we want to do this pipeline.	Comment acknowledged.
1420	1	Kays	Mike	McCone Electric Co-Op., Inc	The Board of Directors and Management of McCone Electric Co-op., Inc. are writing in support of TransCanada's Keystone XL crude oil pipeline project and urge the department to grant a permit for the pipeline. As one of the locally-owned electricity suppliers for this project, we offer a perspective on the merits of the project from those whom will be impacted the most ... We urge the granting of the permit. Thank you for the opportunity to comment.	Comment acknowledged.
1420	3	Kays	Mike	McCone Electric Co-Op., Inc	Considering the economic [and energy security] benefits of these vital resources, we should continue to expand America's access to safe, affordable energy to help ensure [improved domestic and global energy security and] stable prices for consumers... This project also stands to provide a powerful private sector economic stimulus. During construction. Keystone XL will create more than 13,000 jobs funded with private investment. In addition, local governments will have a steady source of income from economic activity associated with construction and from property taxes the pipeline company will pay... Rejection of the permit or suspension of the review would sacrifice the significant economic benefits this project stands to deliver and force U.S. consumers to rely on other sources of crude oil not economically and politically allied with U.S. interests. This would be a mistake.	Consolidated Response ECO-1 addresses potential socioeconomic impacts, and Consolidated Response TAX-1 addresses concerns regarding taxes.
1420	5	Kays	Mike	McCone Electric	Pipelines are the safest, most reliable, economical and	Comment acknowledged.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
				Co-Op., Inc	environmentally favorable way to transport oil and petroleum products, as well as other energy liquids, throughout the U.S.	
422	1	Kazinka	Matt		This proposal is a pipeline to nowhere - a bad idea for our economy and our environment. what few benefits that come from this will be piped directly to a few at the top. The communities this effects will be left with a pollution-spitting refinery and empty pockets.	Consolidated Response P&N-1 addresses the need that the Project has been proposed to meet. Consolidated Response ECO-1 addresses potential socioeconomic impacts, and Consolidated Response TAX-1 addresses concerns regarding taxes. As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries.
422	3	Kazinka	Matt		This proposal is a pipeline to nowhere -	The commenter's opinion is noted.
1389	1	Keffer	Jim	Texas House of Representatives	As members of the Texas House of Representatives and the official delegates on the Energy Council representing Texas, we write in support of TransCanada's Keystone XL crude oil pipeline project and urge the department to grant a permit for the pipeline... This would be a mistake. We urge the granting of the permit. Thank you for the opportunity to comment.	Comment acknowledged.
1389	3	Keffer	Jim	Texas House of Representatives	Like you we expect this project and its operator to meet high expectations regarding the environment and safety standards... Pipelines are the safest, most reliable, economical and environmentally favorable way tottransport oil and petroleum products, as well as other energy liquids, throughout the U.S.America depends on the more than 168,000 miles of liquid pipelines to move energy and raw materials our country relies on.	Comment acknowledged.
1389	4	Keffer	Jim	Texas House of Representatives	As stewards of the land and as private property advocates; we also expect TransCanada to treat property owners fair and square.	Comment acknowledged.
1389	6	Keffer	Jim	Texas House of Representatives	Texas is fortunate to have an immense refining network along the gulf coast and the proposed Keystone Pipeline is a huge undertaking to provide oil to Texas refineries that provide 27 percent of the United State's refining capacity.	Comment acknowledged.
1389	7	Keffer	Jim	Texas House of Representatives	Considering the economic [and energy security] benefits of these vital resources; we should continue to expand America's access to safe, affordable energy to help ensure [improved domestic and global energy security] and stable prices for consumers... This project also stands to provide a powerful private sector economic stimulus. During construction, Keystone XL will create more than 13,000 jobs funded with private investment. In addition, local governments will have a steady source of income from economic activity associated with construction and from property taxes the pipeline company will pay. Rejection of the permit or suspension of the review would sacrifice the significant economic benefits this project stands to deliver.	Comment acknowledged.
1389	9	Keffer	Jim	Texas House of Representatives	America depends on the more than 168,000 miles of liquid pipelines to move energy and raw materials our country relies on. Additional pipeline capacity will help consumers and businesses throughout the United States.	Comment acknowledged.
4	1	Keil	Linda		I am a farmwife in northcentral Montana. I grew up on a farm	Consolidated Response P&N-1 addresses the need that the

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					at Conrad, Montana. The nearest oil refinery is 60 miles south of Conrad in Great Falls, Montana. I believe the pipeline to Texas idea should be eliminated so as not to disturb the farms of eastern Montana. Texas is not the center of the universe.	Project has been proposed to meet.
117	1	Keith	Brenda		I am astounded to hear that we would allow this pipeline into our aquifer when we have the information out there that would tell us that this could very, very easily result in damage to something so important to us - water.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
117	3	Keith	Brenda		Using a pipeline that is a bit less pricey and a bit less safe - come on now! Why would we, who are now becoming more and more aware of what we are doing to the environment, allow this company to use something less than the BEST of what is out there!	Keystone has withdrawn its application for a Special Permit as described in Consolidated Response REG-1. As described in Consolidated Response SAF-1, the Pipeline and Hazardous Materials Safety Administration (PHMSA) has regulatory requirements that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project in a manner that protects the health and safety of the public and the environment. In addition, PHMSA developed 57 Project-specific Special Conditions that Keystone has agreed to implement. Incorporation of those conditions would result in a Project that would have a degree of safety over any other typically constructed domestic oil pipeline system under current code and a degree of safety along the entire length of the pipeline system similar to that which is required in HCAs as defined in 49 CFR 195.450.
117	4	Keith	Brenda		Please listen to these folks who are being affected by this! Whoever makes this final decision needs to go to bed at night knowing they have done right by everyone, not by what seems to be those folks with the money to influence decisions. Think this over one more time and go at it wisely! At this point in time it would seem that some bad stuff is out there. Don't be caught a few years from now regretting agreeing to this idea!	Consolidated Response EAS-2 addresses issues related to easement negotiations and eminent domain. DOS has no legal authority in the easement negotiations or in eminent domain proceedings.
1182	1	Keller	Ellie		I strongly object to the pipeline going over our Ogallala Aquifer. This has provided water for the citizens of Nebraska for the last 75 years that I know of and is still needed to supply that water.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
1182	2	Keller	Ellie		We DO NOT NEED ANY oil spill into our water supply that has been provided by God when he created the earth. Thank you for your attention in this matter.	Consolidated Response WAT-1 addresses concerns regarding potential water quality impacts. Issues related to aquifers along the proposed Project corridor are addressed in Consolidated Responses AQF-1 through AQF-4.
1007	1	Kelley	Linelle		I believe that if we can't be certain that the Ogallala Aquifer will be protected from any harm, that the Keystone Pipeline should be scrapped. Our underground water is too valuable to risk.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
110	1	Kellum	Lidia		Please say NO to Keystone XL pipeline; it's too toxic for Tx.	Consolidated Response OIL-4 addresses the composition of the Canadian crude oil that would be transported by the proposed Project, including concerns relative to the corrosivity and erosivity of the crude oil. As noted in that Consolidated Response, that crude oil is similar in composition and properties to other heavy crude oils that are currently transported within the U.S. pipeline system and similar in composition and properties to other heavy crude oils that are currently refined in PADD III.
428	1	Kelly	Thomas	Creighton	Many environmentalists maintain that the Tar Sands is the	Issues related to development of oil sands projects in Canada

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
				University	most environmentally destructive project in the world. It takes about 3 barrels of water to extract one barrel of oil. Over 90% of this water, 400 million gallons per day, ends up as toxic waste dumped in massive pools that contain carcinogenic substances like cyanide. In addition, it involves the clear cutting of great sections of the Boreal forest. You can see the damage from the trailer of a new documentary. See http://www.youtube.com/watch?v=pdFT3bZtnok Apart from the leak problem, the clear cutting of forests, and the toxic waste, Jim Hansen, one of the leading climate scientists in the world has argued that the Tar Sands must be stopped if we have a chance to stop catastrophic global warming. The extraction process of oil from the Tar Sands produces 2 to 3 times more carbon dioxide pollution than conventional oil. I am asking you to do 2 things. 1. Please support climate legislation that puts a price on carbon 2. Please stop the expansion of the Tar Sands project. Once the infrastructure is built it makes it exponentially tougher to stop the Tar Sands from being exploited.	are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project. Consolidated Response GHG-1 addresses GHG life-cycle analyses. Consolidated Response GHG-2 addresses the potential causal connection of implementation of the proposed Project and expanded oil sands production in Alberta and increases in refining. The Department of State (DOS) is tasked with conducting an environmental review of the proposed Project and determining whether or not to issue a Presidential Permit for the Project. Addressing potential climate legislation and oil sands production in Canada is not a part of that process.
609	1	Kelly	Raquel		Please do not complete this project. We cannot afford to have another compromised water source. Please reconsider - our world is too fragile. Thank you from my family and all of our families yet to come.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
1547	1	Kelso	Sue	Landowner	Objects to the pipeline route coming diagonally across her family farm property, where sister was planning to build a house.	Consolidated Response PVT-2 addresses concerns regarding the proximity of the proposed project to existing structures and facilities and routing concerns across private property.
1547	2	Kelso	Sue	Landowner	Objects to what she sees as inappropriate negotiations with her family ending in property takings. [long discussion in transcript]	As noted in Consolidated Response EAS-2, state laws dictate under what circumstances eminent domain may be used and define the eminent domain process within the state. DOS has no legal authority in the easement negotiations or in eminent domain proceedings.
1559	23	Kendal	Al		In favor of pipeline. It will bring jobs, money spent in local economies by workers and tax revenues once it is built. Although alternative energy is better, it will not happen overnight and Americans currently depend on oil.	Consolidated Response ECO-1 addresses potential socioeconomic impacts associated with construction and normal operation of the proposed Project.
1554	25	Kendall	Al		I've been doing this for 30 years and I've never known anybody to get rich in pipeline construction, however they are paid quite well and they spend that money around the community. And they'll need probably every RV space we can find, they'll need motels, a lot of them rent apartments, lease apartments, they will be hitting the convenience stores and grocery stores, clothing and food stores, obviously restaurants.	Consolidated Response ECO-1 and Section 3.10.2.2 of the EIS address potential socioeconomic impacts.
1554	26	Kendall	Al		prior to and during construction we have our purchasing agent run through the course of the pipeline, along the route, and sign up vendors for various supplies and tools and welding supplies and rental equipment, and 1 of the big ones is fuel. There will be, some local fuel company will reap the benefits, probably more than 1, probably go through a minimum of a tanker of fuel a day. In addition to that, once complete and in the ground, this pipeline will generate county tax revenues along the route for years to come, for the life of the pipeline.	Consolidated Response ECO-1 addresses potential socioeconomic impacts, and Consolidated Response TAX-1 addresses concerns regarding taxes.
1554	27	Kendall	Al		One of the things that I like about the crude from Canada is it's	Comment acknowledged.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					a little bit of a friendly source, it's reliable, and going to Gulf Refineries offsetting some Middle East and South American suppliers.	
1559	9	Kendall	Glenda		Concerned about safety of pipeline. What safeguards and protections are being used? Oil will be under high pressure, wants every safeguard in place.	As described in Consolidated Response SAF-1, the Pipeline and Hazardous Materials Safety Administration (PHMSA) has regulatory requirements that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project in a manner that protects the health and safety of the public and the environment. In addition, PHMSA developed 57 Project-specific Special Conditions that Keystone has agreed to implement. Incorporation of those conditions would result in a Project that would have a degree of safety over any other typically constructed domestic oil pipeline system under current code and a degree of safety along the entire length of the pipeline system similar to that which is required in HCAs as defined in 49 CFR 195.450.
1559	10	Kendall	Glenda		Wants to know who is going to inspect this pipeline?	As noted in Consolidated Response SAF-1, Keystone must comply with the Pipeline and Hazardous Materials Safety Administration (PHMSA) regulatory requirements for design and construction, and PHMSA would conduct on-site inspections during construction. There would also be on-site Environmental Inspector during construction as described in Section 2.3.5.2 of the EIS. During operation, Keystone would be required to monitor and inspect the system as required by PHMSA regulations and Special Conditions developed by PHMSA, and the regulations and Special Conditions also require that Keystone report the findings of those inspections and monitoring activities to PHMSA.
1559	11	Kendall	Glenda		Concerned about the route of the pipeline. Why not go straight from Oklahoma to East Texas to Beaumont? No water in this area. Wants pipe further from Lake Columbia.	The proposed route would be substantially shorter than a route to Beaumont, which would require a pipeline from there to the delivery point in the east Houston area. As a result, the proposed route would have substantially less area of impact than a Beaumont alternative and would traverse less densely populated areas. Lake Columbia is about 8 miles from the proposed route. Consolidated Response SAF-1 describes the regulatory requirements that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project.
1072	1	Kennedy	Sharon		Dear Government Officials, I want to express my opposition to a pipeline through the beautiful Sandhills of Nebraska. The disruption of soil/sand to place the pipe is too risky. It is a fragile, pristine place that Nebraska can be proud of.	Identification of sensitive environments crossed by the proposed Project is discussed in Consolidated Response ENV-1 and ENV-3. Issues related to the Sand Hills area are addressed in Consolidated Response ERO-1. Consolidated Response ALT-1 addresses potential alternative routes, including routes that would avoid much of the Northern High Plains Aquifer system and the Sand Hills area.
1072	2	Kennedy	Sharon		If we lay pipe and allow oil drilling and flow, we also take the risk of polluting the precious aquifer.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
1072	3	Kennedy	Sharon		Nebraska has an opportunity to show that we are the progressive state because we value the land and water. Thank you for listening to someone who grew up in this beautiful area and does not want to see it changed or harmed by humans.	Comment acknowledged.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
1276	4	Kennedy	Barry	Nebraska Chamber of Commerce & Industry	This project will create significant jobs and tax revenue in Nebraska. The estimates of the project are \$1 billion of investment in the state of Nebraska. This includes jobs for more than 1,200 construction workers during construction.	Consolidated Response ECO-1 addresses potential socioeconomic impacts, and Consolidated Response TAX-1 addresses concerns regarding taxes.
1276	5	Kennedy	Barry	Nebraska Chamber of Commerce & Industry	We anticipate that with the Keystone project (already constructed), the two pipelines will generate more than \$28 million in estimated initial annual property tax. The economic benefits to the local power providers will also be significant.	Comment acknowledged.
1276	6	Kennedy	Barry	Nebraska Chamber of Commerce & Industry	We are confident that strong measures will be taken to ensure the quality of our water.	Comment acknowledged.
1549	11	Kennedy	Marjorie	Friends of the Matagorda River	Concern about any impacts on the Matagorda River	The Matagorda River would not be crossed by the proposed Project. See Appendix E for a list of waterbodies crossed by the proposed route.
1549	13	Kennedy	Bruce	Wachiska Audubon Society	Concern about the fragile Nebraska Sandhills ecosystems.	Identification of sensitive environments crossed by the proposed Project is discussed in Consolidated Response ENV-1 and ENV-3. Issues related to the Sand Hills area are addressed in Consolidated Response ERO-1.
1549	15	Kennedy	Bruce	Wachiska Audubon Society	This project is not in the best interests of our planet.	The commenter's opinion is noted.
1549	16	Kennedy	Bruce	Wachiska Audubon Society	Nebraskans are very protective of the Niobrara [River], and I guess our major concern would be that if there were a leak in the pipeline, it would really gum up the works for fish and wildlife.	The Niobrara River would be crossed using the horizontal directional drilling method which results in the pipeline being at least 25 feet below the stream bed. This would reduce the potential for an oil spill to reach the river. Section 3.13 of the EIS addresses reliability and safety issues, including calculations of the probability of a spill from the proposed Project and the potential environmental impacts associated with spills.
795	1	Kennick	Michael		I support the building of the Keystone XL Pipeline. Our country needs to be more concerned about energy security. That is, we need to secure our future energy sources. While I support alternative energy, it is naive to believe we can function without oil. I'd rather increase our supply of oil from Canada, than have to turn to the Middle East for more oil. This pipeline is a small step in the right direction. I am confident that it can be built safely, with minimal impact on the environment.	Comment acknowledged.
1025	1	Kenworthy	Michael		I'm also concerned about the safety of our resources, but I fear if government continues along the path they have been going they will regulate free enterprise into the ground. I agree that we need to guard our natural resources, we also need to make sure that government doesn't over reach itself as it has been doing. Please keep me informed.	The commenter's opinion is noted.
1542	22	Kerbin	Charles	Michaels Construction	In 2008, we actually won an award for safety on the project. We didn't have anybody injured, nobody was hurt. We all went back home at night with our fingers and toes.	Comment acknowledged.
1542	23	Kerbin	Charles	Michaels Construction	Keystone preaches safety. They made us believe it, they made us live it.	Comment acknowledged.
1542	24	Kerbin	Charles	Michaels Construction	The people that work on these projects make a decent wage. They're good people. Most of them have health insurance and	Comment acknowledged.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					they turn the money back into the local economy as well as wherever they go home to.	
1542	25	Kerbin	Charles	Michaels Construction	From my point of view and from what I have dealt with in my line of work, which is pipeline, we don't foresee the problems that a lot of people get upset about.	Comment acknowledged.
668	1	Kerres	Mary		I object to the expansion of the pipeline through the sensitive Ogallala Aquifer sites of west/central NE. Route the pipe further to the east, and insist on high gauge pipe.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. Consolidated Response ALT-1 addresses potential alternative routes, including routes that would avoid much of the Northern High Plains Aquifer system. Keystone has withdrawn its application for a Special Permit as described in Consolidated Response REG-1.
600	1	Kessler	Ted		I've read about too many recent spills that the oil industry assured us could never happen. Or that the spills would be detected quickly. These folks cannot be trusted. They will say anything to get approval of this pipeline.	Consolidated Response OIL-1 provides a summary of the range of spill frequency estimates addressed in the EIS. Consolidated Response SAF-1 describes the regulatory requirements and Project-specific Special Conditions that Keystone would comply with to construct, operate, maintain, inspect, and monitor the proposed Project. It also describes the monitoring, inspections, and reviews of the proposed Project that the Pipeline and Hazardous Materials Safety Administration would conduct to ensure compliance with those regulatory requirements.
600	2	Kessler	Ted		There is no reason for the new Keystone pipeline to pass through the Nebraska Sand Hills instead of following an existing pipeline, other than to save a few dollars, but at the risk of polluting the Ogallala Aquifer.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. Consolidated Response ALT-1 addresses potential alternative routes, including routes that would avoid much of the Northern High Plains Aquifer system.
1352	1	Ketchum	J.&D.		As a resident of St. Marie in Valley County, Montana, I support the Keystone XLPipeline project, which also incorporates the transmission line to be built by Big Flat\Electric Cooperative to serve this load.	Comment acknowledged.
530	1	Kiefer	Jesse		I am very concerned about this pipeline being sent over the Nebraskan Sandhills above the Ogallala Aquifer recent events have shown how dangerous this can be and the aquifer is one of the Midwest's largest bodies of water. I urge you to stop this. Whatever rationale there is.. it is not worth the potential costs (and I don't mean monetary costs) for our ecosystems and our future.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
542	1	Kiefer	Holly		Putting a pipeline anywhere near the aquifer is begging for disaster. Not in my backyard, nor any other!	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
1556	57	Killsinsight	Darrell	Rosebud Sioux Tribe	I'm sure we can all sit down and agree that this is a project that's going to commit harm in the future.	Section 3 of the EIS addresses the impacts of construction and operation of the proposed Project. Section 3.13 of the EIS addresses the risk and environmental impacts of a crude oil spill from the proposed Project.
1556	58	Killsinsight	Darrell	Rosebud Sioux Tribe	I'm sure a lot of you in this room are veterans and you don't like a foreign project or something foreign coming into your land and making conquests on yourselves.	As described in Section 1.0 of the EIS and in Consolidated Response RES-2, TransCanada-Keystone Pipeline LP (Keystone) is not a foreign corporation. It is a limited partnership organized under the laws of the state of Delaware. Keystone has the same rights as other pipeline companies in the U.S. to propose projects.
809	2	Kincaid	Clara	Cornell College	Secondly, the pipeline is completely unnecessary. It's likely that America will not even receive the oil transported through	Consolidated Response P&N-1 addresses the need that the Project has been proposed to meet.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					the pipeline.	
100	1	Kinder	Brad		I am writing to oppose the construction of the Keystone XL Oil Pipeline Project... I urge to reconsider plans for the XL pipeline, thinking long term about the health of our shared environment and the world we leave to the future generations.	Consolidated Response ENR-1 provides information on the Department of State's environmental review process, the National Interest Determination process, and the need to complete those reviews before approving or denying the Presidential permit for the proposed Project.
100	2	Kinder	Brad		Specifically, placing the pipeline on the eastern have of the Ogallala aquifer presents serious environmental risks. These risks include groundwater contamination and their associated impacts on surface, drinking, and agricultural water use.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
100	6	Kinder	Brad		The rural location of much of this pipeline again presents too many risks to the environment and impacted landowners, than it does benefits to our energy supply and oil company profits.	Consolidated Response P&N-1 addresses the need that the Project has been proposed to meet, including information on crude oil supply and demand from an analysis specific to the proposed Project.
1294	1	KINDER	PETER	Lieutenant Governor MISSOURI	I write in support of TransCanada's Keystone XL crude oil pipeline project and urge the department to grant a permit for the pipeline.	Comment acknowledged.
1294	5	KINDER	PETER	Lieutenant Governor MISSOURI	Securing stable and affordable energy from our North American allies through projects such as the Keystone pipeline is in the national interest.	Comment acknowledged.
1294	6	KINDER	PETER	Lieutenant Governor MISSOURI	Considering the economic and energy security benefits of these vital resources, we should continue to expand America's access to safe, affordable energy to help ensure improved domestic and global energy security and stable prices for consumers.	Comment acknowledged.
1294	8	KINDER	PETER	Lieutenant Governor MISSOURI	Additional pipeline capacity will help consumers and businesses throughout the United States.	Comment acknowledged.
1294	9	KINDER	PETER	Lieutenant Governor MISSOURI	This project also stands to provide a powerful private sector economic stimulus. During construction, Keystone XL will create more than 13,000 jobs funded with private investment.	Consolidated Response ECO-1 addresses potential socioeconomic impacts, and Consolidated Response TAX-1 addresses concerns regarding taxes.
1294	10	KINDER	PETER	Lieutenant Governor MISSOURI	Local governments will have a steady source of income from economic activity associated with construction and from property taxes the pipeline company will pay.	Comment acknowledged.
1294	11	KINDER	PETER	Lieutenant Governor MISSOURI	Rejection of the permit or suspension of the review would sacrifice the significant economic benefits this project stands to deliver and force U.S. consumers to rely on other sources of crude oil not economically and politically allied with U.S. interests. This would be a mistake.	Comment acknowledged.
1294	12	KINDER	PETER	Lieutenant Governor MISSOURI	I urge the granting of the permit.	Comment acknowledged.
586	1	King	Mary		I strongly object to the location of the pipeline under the Ogallala Aquifer and near pristine NE rivers. I was certainly tentative before the devastation of the Gulf oil spill, but that and the request to use less secure than typical pipelines have turned my "unsure" into a "please, no".	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. GLF-1, Keystone has withdrawn its application for a Special Permit as described in Consolidated Response REG-1.
825	1	Kingery	William		I don't know who is in charge there but the placement of any kind of oil or oil pipeline is not an issue of economics. It is an issue of environment first. You will make enough money where ever it goes and the Sand Hills in Nebraska needs to be	Identification of sensitive environments crossed by the proposed Project is discussed in Consolidated Response ENV-1 and ENV-3. Issues related to the Sand Hills area are addressed in Consolidated Response ERO-1. Consolidated

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					off limits to the Fools in charge. You are destroying everything in our lives, do not touch the Sand Hills with your poison. In fact keep that pipeline out of Nebraska entirely.	Response ALT-1 addresses potential alternative routes, including routes that would avoid much of the Northern High Plains Aquifer system and the Sand Hills area.
372	1	Kinzell	Richard&Suzette		This statement is an addendum to the letter we submitted at the public scoping meeting held in Glasgow, Montana, on 2/26/2009. On that date we had received no communication from the Keystone XL Oil Pipeline Project regarding our concerns about the proposed pipeline being constructed through our small 30 acre subdivision tract. Our concerns seemed to go unheeded. After numerous calls to the Universal Fields Services, right of way agent for the Keystone Project, we received a response that a Mr. Tony MacDonald of Universal Field Services and an engineer for Keystone would do a route walk through with us. This was done with numerous questions being asked about our free flowing springs which the pipeline would cross through. Our objections and concerns were emphasized about damage to our springs, ponds, and riparian/wetland area. After about a month following the walk through, Tony MacDonald called us and at the recommendation of the Keystone engineer, the line would not cross our property but would move farther north to avoid the spring areas. We have recently viewed maps of the proposed route and the pipe center line is still shown as crossing our land. This was also verified by Craig Jones of the Montana Dept of Environmental Quality. On 5/3/2010, we called Tony MacDonald with our concerns about no indicated change in the route on the proposal maps. He reassured us the line would be moved even further north than first estimated and the route "would not" cross our land at all. Since this is the final day for comment on the pipeline and the route across our property hasn't changed on maps we have viewed, we want our statement to be documented as a matter of public record. We hope we aren't being promised one thing and wind up having to go to court over route condemnation issues.	Pipeline routing in Montana is addressed in Consolidated Response EAS-1. Consolidated Response PVT-2 addresses concerns regarding the proximity of the proposed project to existing structures and facilities and routing concerns across private property.
162	1	Kirkegard	JeanneRae	McCone Conservation District	Recently a number of advocacy groups sent a letter seeking suspension of the permitting of the Keystone XL pipeline. I encourage you to reject the request and to continue to review the proposed project. The McCone Conservation District would like to express their support for the TransCanada Keystone Pipeline XL Project. In our opinion this pipeline would not only benefit McCone County but also the surrounding counties and the State of Montana.	Comment acknowledged.
162	2	Kirkegard	JeanneRae	McCone Conservation District	A project of this magnitude would create jobs for the construction phase and after completion it would provide jobs for the maintenance and operations stages. The construction of the pipeline would also create additional business for the local merchants. Eastern Montana has been experiencing economic depression and the economic benefits of construction would boost our rural communities immensely. Second, a project such as this one would have an impact on our taxable valuation which would increase the value of each mill levied.	Consolidated Response ECO-1 addresses potential socioeconomic impacts, and Consolidated Response TAX-1 addresses concerns regarding taxes.
162	3	Kirkegard	JeanneRae	McCone Conservation	However since we represent many who would be directly impacted by this project itself, I would also request that the	Consolidated Response FRM-1 addresses potential ranch of farmland impacts, and Consolidated Response FRM-2

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
				District	utmost consideration be given to those who own the land where this project will pass through and reside. Farmers and Ranchers will certainly lose some of their productive land.	addresses potential impacts to irrigated cropland.
327	1	Kirkegard	Jeanne	McCone Conservation District	Recently a number of advocacy groups sent a letter seeking suspension of the permitting of the Keystone XL pipeline. I encourage you to reject the request and to continue to review the proposed project. The McCone Conservation District would like to express their support for the TransCanada Keystone Pipeline XL Project. In our opinion this pipeline would not only benefit McCone County but also the surrounding counties and the State of Montana.	Comment acknowledged.
327	2	Kirkegard	Jeanne	McCone Conservation District	A project of this magnitude would create jobs for the construction phase and after completion it would provide jobs for the maintenance and operations stages. The construction of the pipeline would also create additional business for the local merchants. Eastern Montana has been experiencing economic depression and the economic benefits of construction would boost our rural communities immensely. Second, a project such as this one would have an impact on our taxable valuation which would increase the value of each mill levied. This project is very important to all who live and work in our community. With such a great potential impact to our local community we are hopeful that this project will begin soon.	Comment acknowledged.
327	3	Kirkegard	Jeanne	McCone Conservation District	However since we represent many who would be directly impacted by this project itself, I would also request that the utmost consideration be given to those who own the land where this project will pass through and reside. Farmers and Ranchers will certainly lose some of their productive land.	DOS takes seriously its responsibilities to thoroughly evaluate the environmental effects of its Presidential Permit decisions consistent with NEPA and other relevant laws and regulations. In conducting the environmental review of the proposed Project, DOS followed NEPA, CEQ regulations and guidance, and all other applicable laws and regulations. In addition, DOS was assisted by a third-party environmental contractor in the environmental review of the proposed Project. That contractor, Cardno ENTRIX, has conducted environmental impact assessments of nearly 30 proposed pipeline projects and has experience in such work throughout the U.S., including in the states along the proposed corridor. DOS also consulted extensively with other relevant federal agencies that have particular technical expertise and authority relevant to the proposed Project. As a result, DOS considers the EIS to be in full compliance with the requirements of a NEPA environmental review.
1103	1	Kirkendall	Janyce		I agree that to build this pipeline through the sand hills, over the aquifer, is a terrible safety issue... and proper safety issues addressed...	As described in Consolidated Response SAF-1, the Pipeline and Hazardous Materials Safety Administration (PHMSA) has regulatory requirements that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project in a manner that protects the health and safety of the public and the environment. In addition, PHMSA developed 57 Project-specific Special Conditions that Keystone has agreed to implement. Incorporation of those conditions would result in a Project that would have a degree of safety over any other typically constructed domestic oil pipeline system under current code and a degree of safety along the entire length of the pipeline system similar to that which is required in HCAs as defined in 49 CFR 195.450.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
						Issues related to the High Plains Aquifer System are addressed in Consolidated Responses AQF-1 through AQF-4.
1103	3	Kirkendall	Janyce		I agree that to build this pipeline through the sand hills, [over the aquifer,] is a terrible safety issue...	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. As described in Consolidated Response SAF-1, the Pipeline and Hazardous Materials Safety Administration (PHMSA) has regulatory requirements that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project in a manner that protects the health and safety of the public and the environment. In addition, PHMSA developed 57 Project-specific Special Conditions that Keystone has agreed to implement. Incorporation of those conditions would result in a Project that would have a degree of safety over any other typically constructed domestic oil pipeline system under current code and a degree of safety along the entire length of the pipeline system similar to that which is required in HCAs as defined in 49 CFR 195.450.
1103	4	Kirkendall	Janyce		I agree that to build this pipeline through the sand hills, over the aquifer, is a terrible safety issue. If the aquifer is ruined, there is no way to clean it, only eons of time.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
532	1	Kirst	Ingrid		I am very concerned about the proposed XL pipeline and its route through so much of our valuable national resources. My biggest concern is that any leaks could quickly contaminate fresh water sources and cause damage to the environment. Even just putting in the pipeline is going to cause damage all along its length to native landscapes and waterways. The pipeline project should not be allowed to continue. We need to reduce our dependence on oil, not cause more problems with it.	Consolidated Response ENR-1 provides information on the Department of State's environmental review process, the National Interest Determination process, and the need to complete those reviews before approving or denying the Presidential permit for the proposed Project. The impacts associated with implementation of the proposed Project are addressed in Section 3.0 of the EIS. As noted in that section, construction and normal operation the proposed Project would not result in significant environmental impacts. Section 3.13 of the EIS addresses reliability and safety issues, including calculations of the probability of a spill from the proposed Project and the potential environmental impacts associated with spills.
1001	1	Klanecky	Irvin		We need to protect the aquifer. If there is anything you can do to make the pipe line from Canada miss the Sandhills, please do it .	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. Consolidated Response ALT-1 addresses potential alternative routes, including routes that would avoid much of the Northern High Plains Aquifer system.
1001	2	Klanecky	Irvin		Maybe we could make them use stronger pipe and not use so much pressure if you can't stop it from going across the sand hills.	Keystone has withdrawn its application for a Special Permit as described in Consolidated Response REG-1. Issues related to the Sand Hills area are addressed in Consolidated Response ERO-1.
31	1	Kleeb	Jane		I am concerned about the potential effects on things like increase cancer rates. Please point me to the studies that have been done and the safety precautions and financial compensation you will have in place if increased cancer rates are shown.	The proposed Project would have minor fugitive emissions from pump stations and from the Cushing tank farm (see Table 3.12.1-10 of the EIS) and no discharges unless there is a spill of crude oil. The emissions would meet regulatory requirements and are not expected to be measureable at locations outside of the pump stations or at locations much beyond the perimeter of the tank farm. Therefore, it is likely that there would be no measureable increase in the risk of cancer due to normal operation of the proposed Project. Section 3.13 of the EIS addresses reliability and safety issues, including calculations of the probability of a spill from the

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
						proposed Project and the potential environmental impacts associated with spills.
31	2	Kleeb	Jane		Will jobs come from local Nebraskans or subcontracted to outside employers who are non-Nebraskans? Jobs should go to clean energy.	Consolidated Response ECO-1 and Section 3.10.2.2 of the EIS address the potential socioeconomic impacts of the proposed Project.
31	4	Kleeb	Jane		Our family homestead in the Sandhills	Issues related to the Sand Hills area are addressed in Consolidated Response ERO-1.
1560	1	Kleeb	Jane		If pipeline is built, Nebraskans should be given the jobs to build and operate it.	Consolidated Response ECO-1 and Section 3.10.2.2 of the EIS address potential socioeconomic impacts.
1560	1	Kleeb	Jane		Concerned that this project produces too much greenhouse gases.	Consolidated Response GHG-1 addresses the greenhouse gas life-cycle analyses presented in the revised EIS.
1560	1	Kleeb	Jane		According to Section 526 of the Energy Independence and Security Act, the U.S. is prohibited from buying oil produced by processes that produce more greenhouse gas emissions than traditional petroleum.	The decision of whether or not to grant a Presidential Permit for the construction and maintenance of facilities at the international border does not implicate Section 526 of the Energy Independence and Security Act.
1560	43	Kleeb	Jane		Concerned about increased cancer risk associated with pipeline. Has read that there are increased cancer rates associated with the pipeline.	It is not clear what articles on the potential for increased cancer rates due to the proposed Project is referring to. The Project would have minor fugitive emissions from pump stations and from the Cushing tank farm (see Table 3.12.1-10 of the EIS) and no discharges unless there is a spill of crude oil. The emissions would meet regulatory requirements and are not expected to be measureable at locations outside of the pump stations or at locations much beyond the perimeter of the tank farm. Therefore, there would be no measureable increase in the risk of cancer due to operation of the Project
1560	44	Kleeb	Jane		Wants to make sure individuals will be duly compensated for medical conditions caused by the pipeline.	Consolidated Response LIA-1 addresses Keystone's liability if there is a spill of hazardous materials or fuel during construction or a spill of crude oil from the proposed Project. Crude oil pipeline spills do not pose a substantial risk to the general public. If people experience sickness that is directly attributable to the accidental release, Keystone would be liable for related medical costs.
96	1	Kleiman	David		I am against the Keystone XL Pipeline. It is hard to believe that it is even being considered.	Comment acknowledged.
96	2	Kleiman	David		The use of tar sands is an environmental disaster that needs to stop. A pipeline would do the opposite and would encourage increased production and implies approval. I am sickened that our country is supportive of the harvesting of the tar sands. Look at some before and after pictures and investigate the environmental effects of the tar sands, please.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information on current and future production. As noted in that Consolidated Response, without the proposed Project, oil sands development would continue at or above the current level until at least 2020, with or without the proposed Project.
96	2	Kleiman	David		The use of tar sands is an environmental disaster that needs to stop. A pipeline would do the opposite and would encourage increased production and implies approval. I am sickened that our country is supportive of the harvesting of the tar sands. Look at some before and after pictures and investigate the environmental effects of the tar sands, please.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project.
1070	1	Klein	Randy		Is this address for making comments on the keystone pipeline going through Nebraska? If so, where can I find more information about this project and the approval process?	Consolidated Response REQ-2 provides information for request of locations of paper copies of the EIS and that copies of the draft EIS, other specific information, or references be sent directly to the commenter.
1095	1	Klein	Marty		Endangering the Ogallala Aquifer for this pipeline is just plain	Issues related to the Northern High Plains Aquifer system are

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					nuts. I can't believe that it is even under consideration, especially after the Gulf oil disaster, which shows the limits of our abilities to control the consequences of accidents. Numerous states, including Nebraska, are dependent on this fresh water source for survival, not just personal and commercial uses. If this aquifer is accidentally contaminated, it would literally ruin the lives of millions of people who depend on it, and have a significantly adverse effect upon the economy and well being of the entire United States. This pipeline project is simply not worth the risk. I think the pipeline itself is a worthy project, but not the planned route that endangers this vital resource.	addressed in Consolidated Responses AQF-1 through AQF-4. Consolidated Response ALT-1 addresses potential alternative routes, including routes that would avoid much of the Northern High Plains Aquifer system. As described in Consolidated Response GLF-1, the risks associated with the proposed Project are substantially different from those associated with the BP Deepwater Horizon Project.
787	2	Klocksinn	Marcia		However, risking the Ogallala Aquifer is not the answer.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
787	3	Klocksinn	Marcia		...And if the oil spill in the Gulf has shown us one thing, it is that these big companies do NOT have adequate disaster prevention and cleanup plans...	Consolidated Response RES-1 addresses issues related to preparation and review of the Emergency Response Plan for the proposed Project. Spill Prevention, Control, and Countermeasure plans are addressed in Sections 2.3 and 3.13.5 of the EIS and in the Construction, Mitigation, and Reclamation Plan presented in Appendix B of the EIS.
787	4	Klocksinn	Marcia		...Furthermore, as a Nebraska voter, I resent that some people appear to think they can propose a pipeline like this in a relatively unpopulated area and get away with it politically!	Consolidated Response ENR-1 provides information on the Department of State's environmental review process, the National Interest Determination process, and the need to complete those reviews before approving or denying the Presidential permit for the proposed Project.
449	1	Klodnicki	Richard		Even if TransCanada were to be required to double-pipe the petroleum, there would be a chance of an accidental spill, but, even more so, with hundreds of miles of pipeline through vast unpopulated areas, the threat of terror attacks should make even the most "Drill, Baby, Drill" enthusiast reconsider support for the pipeline along the present route. The cost of a route further east, although large in dollars, is small in comparison to the damage which could be done to the lives and economy of Nebraska, Nebraskans, and all others in States relying on the precious water in the aquifer. Transport the petroleum, but do it over a safer route.	All pipeline companies must comply with the Pipeline and Hazardous Materials Administration (PHMSA) requirements for construction of oil pipelines in the U.S. There is no PHMSA requirement for double-walled pipe. AQF-6 also addresses the potential for using double-walled or triple-walled pipe. Section 4.3 of the EIS and Consolidated Response ALT-1 address potential alternative routes, including routes that would avoid much of Nebraska. Consolidated Response TERR-1 addresses issues related to terrorism. However, it is not clear why the commenter considers a route east of the proposed route to be less susceptible to terrorist attacks.
449	2	Klodnicki	Richard		The Sand Hills can be described as one huge beach, similar in character to the beaches now being polluted by the Gulf Oil spill. Even if TransCanada were to be required to double-pipe the petroleum, there would be a chance of an accidental spill, but, even more so, with hundreds of miles of pipeline through vast unpopulated areas, the threat of terror attacks should make even the most "Drill, Baby, Drill" enthusiast reconsider support for the pipeline along the present route. The cost of a route further east, although large in dollars, is small in comparison to the damage which could be done to the lives and economy of Nebraska, Nebraskans, and all others in States relying on the precious water in the aquifer. Transport the petroleum, but do it over a safer route.	Issues related to the Sand Hills area are addressed in Consolidated Response ERO-1. Consolidated Response ALT-1 addresses potential alternative routes, including routes that would avoid much of the Northern High Plains Aquifer (NHPAQ) system. Issues related to the NHPAQ system are addressed in Consolidated Responses AQF-1 through AQF-4. Consolidated Response AQF-3 provides information on hypothetical accidental releases from the proposed Project over two areas of the NHPAQ system. As described in Consolidated Response SAF-1, the Pipeline and Hazardous Materials Safety Administration (PHMSA) has regulatory requirements that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project. In addition, PHMSA developed 57 Project-specific Special Conditions that Keystone has agreed to

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
						implement. There is no PHMSA requirement for double-walled pipe and we are not aware of any oil pipeline system that is constructed with double-walled pipe for a 36-inch-diameter transportation pipeline. Issues related to terrorism are addressed in Consolidated Response TER-1.
449	3	Klodnicki	Richard		As a long time professional meteorologist with training in hydrology and as a passenger on airlines flying over and observing the blowouts caused by central irrigation pivots, I full-heartedly agree that to allow TransCanada Keystone XL to run a pipeline anywhere near the Ogallala Aquifer is sheer lunacy. There is no room to allow for any chance at a spill, however small, of petroleum near that national treasure. It is a treasure in the real sense of the word. In the past several decades, farmers and ranchers have experienced significant droughts and were saved only by the availability of the water in the Ogallala Aquifer. Even today, small towns in Nebraska are facing large costs to clean their drinking water which has been polluted by spills from livestock feeding pens and from over chemical fertilization of crop lands. The Sand Hills can be described as one huge beach, similar in character to the beaches now being polluted by the Gulf Oil spill. Even if TransCanada were to be required to double-pipe the petroleum, there would be a chance of an accidental spill, but, even more so, with hundreds of miles of pipeline through vast unpopulated areas, the threat of terror attacks should make even the most "Drill, Baby, Drill" enthusiast reconsider support for the pipeline along the present route. The cost of a route further east, although large in dollars, is small in comparison to the damage which could be done to the lives and economy of Nebraska, Nebraskans, and all others in States relying on the precious water in the aquifer. Transport the petroleum, but do it over a safer route.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. AQF-5, AQF-6 addresses the potential for using double-walled or triple-walled pipe. Consolidated Response ALT-1 addresses potential alternative routes, including routes that would avoid much of the Northern High Plains Aquifer system.
449	4	Klodnicki	Richard		We can't risk an oil spill in Nebraska Sandhills:	Issues related to the Sand Hills area are addressed in Consolidated Response ERO-1. Issues related to the Northern High Plains Aquifer System are addressed in Consolidated Responses AQF-1 through AQF-4.
982	1	Klute	Allen&Darlene	Klute Farms, Inc.	We are very concerned about the pipeline running through our state. We are amazed that anyone is even considering running a pipeline close to our underground water supply.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
982	3	Klute	Allen&Darlene	Klute Farms, Inc.	It would be far better to teach everyone to conserve oil rather than taking a chance on destroying our vital Ogallala Aquifer.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
982	4	Klute	Allen&Darlene	Klute Farms, Inc.	Some claim this oil won't even be used in the US so what is the point!	Consolidated Response P&N-1 addresses the need that the Project has been proposed to meet.
353	1	Kniepkamp	Rick	RK Statewide Auction	The pressure waiver concerns me because the draft EIS does not analyze the risks or potential impacts of spills of alternative thicknesses of pipe, or disclose what areas are "high consequence areas" and what affected lands are the remaining "low consequence areas." The Department of Transportation has said that it will issue a separate Environmental Analysis and proposed special permit allowing a waiver for TransCanada to use thinner pipe outside of "high consequence areas." The draft EIS should have analyzed the real potential risks and impacts of a spill under the waiver-	Keystone has withdrawn its application for a Special Permit as described in Consolidated Response REG-1, and the Pipeline and Hazardous Materials Safety Administration will not be preparing a separate analysis.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					granted scenario.	
353	3	Kniepkamp	Rick	RK Statewide Auction	Lastly, I am concerned about safety issues not addressed in the DEIS. My safety concerns include the pressure waiver I addressed earlier and an emergency response plan that need to be further addressed in future drafts of the DEIS. The DEIS does not contain or evaluate a complete emergency response plan, which the DOT must approve prior to pipeline operations. The largely volunteer emergency personnel and potentially affected property owners and others who live near the pipeline deserve an opportunity to comment on TransCanada's emergency response plan prior to issuance of permits and approval of the plan. The disaster in the Gulf serves as a warning if federal officials had paid more attention to the lack of a plan for dealing with a blow-out of BP's rig before the company was allowed to drill, we would have known before it was too late that there was no plan to contain a catastrophic spill.	Keystone has withdrawn its application for a Special Permit as described in Consolidated Response REG-1. Consolidated Response RES-1 addresses issues related to preparation and review of the emergency response plan for the proposed Project.
657	1	Knutsen	Leif		You Folks: I am trying to be polite here but it is difficult knowing that my elected government is more concerned about big money than the future of humanity. Both Capitalism and by extension Corporations must be charged with respect for earth's life support systems and humanities long term survivability/sustainability first and foremost and the privilege to pursue profits secondary. This axiom needs to be codified into the law of the world. It is becoming obvious that humanity cannot survive with these two powerful human created entities at odds to humanity and a livable Earth's very existence. With Capitalism and Corporations, mankind has created "Robots" with a license to kill. So it has become a battle of kill or be killed. The problem with that is humanity will need the corporation of both to have even a chance of extricating ourselves from our current makings of self destruction. Conversely, Capitalism and Corporations both need to realize that there is no future for them in a dead world without humanity. You will be shut down and you know it. You just have to look around with an honest eye to your rape and pillage. Surely you must admit that course is not sustainable.	The commenter's opinion is noted.
1237	1	Knutsen	Leif		Public Servants: That is, after all, what you are. You are elected or appointed to use the best scientific knowledge to make informed decisions that serve the well being of the citizens of our country, This day in age that concern must also be given to all earth and the life systems dependent upon a healthy earth. Allowing the production of Tar Sands fails on all fronts. For Shame... Disgusted.	Consolidated Response ENR-1 provides information on the Department of State's environmental review process, the National Interest Determination process, and the need to complete those reviews before approving or denying the Presidential permit for the proposed Project. Production in the oil sands area of Canada is under the jurisdiction of Canadian governmental agencies. Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project.
1225	1	Knutson	Roberta		Your remarks about the national energy policy and the financial regulations fuel my helpless feeling that the Obama regime is totally out of touch with the common people and we can do nothing about anything. I am frightened for our state and for our country. We are lucky to have you working on our behalf.	Comment acknowledged.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
1071	1	Kobza	Bill		We know foreign oil companies don't give a damn about our environment. So why would we let something as important as the Aquifer be ruined just for a couple of dollars. Don't you think we should learn from the BP fiasco and not take a chance?	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. As described in Consolidated Response GLF-1, the risks associated with the proposed Project are substantially different from those associated with the BP Deepwater Horizon Project.
509	1	Koch	Melanie		Please change the route for the pipeline. The current route crosses not only some of the NE Sandhills, but the aquifer. Do not put at risk such sensitive ecological areas. Given the current tragedy in the Gulf, I cannot believe that the current plan is being considered.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. Consolidated Response ALT-1 addresses potential alternative routes, including routes that would avoid much of the Northern High Plains Aquifer system. As described in Consolidated Response GLF-1, the risks associated with the proposed Project are substantially different from those associated with the BP Deepwater Horizon Project.
796	1	Kohler	Ken		I am opposed to the Keystone XL Pipeline...	Comment acknowledged.
796	2	Kohler	Ken		...I view the construction and operation of this delivery system as an unnecessary environmental risk...Railways exist to transport this potential environmental hazard to its terminals in an established and tested safe mode. The amount of product to be delivered poses extreme and avoidable environmental and economic damage to neighboring communities and to the beauty of the natural sovereignty of the lands through it will pass.	Section 4.2.3 of the EIS addresses the alternative of rail delivery of the Canadian crude oil, including an explanation of why it is not a reasonable alternative. Impacts associated with construction and normal operation of the proposed Project are presented in the resources sections of Section 3.0 of the EIS. As described in those sections, construction and normal operation of the proposed Project would not result in significant impacts. In addition, as described in Section 3.10.2, there would be economic benefits, not "economic damages," to states, counties, and municipalities along the proposed route during construction and normal operation if the Project is implemented. Section 3.13 of the EIS addresses reliability and safety issues, including calculations of the probability of a spill from the proposed Project and the potential environmental impacts associated with spills.
92	2	Koncz	Anna		Stop drilling!!!! As soon as "Americans" stepped foot on this planet we've done nothing but destroy it hour by hour. Protect what is left of our world. It is my intention to help heal the earth yours should be too.	The commenter's opinion is noted.
215	1	Kramen	Leon		My concern is I have sub irrigated land and if there is a leak it will be in the ground water before you know it. The line is also going to be about 500' from a stock farm pond and stock well. If this toxic shit gets into the pond the cattle will be dead. This is a big concern.	Consolidated Response FRM-2 addresses potential impacts to irrigated cropland. If there is a spill from the proposed Project, Keystone or the incident response team would inform all landowners in the vicinity of the spill that the release had occurred and advise the landowners of the appropriate precautions. Keystone would be liable for all costs associated with cleanup and restoration as well as other compensations, as noted in Consolidated Response LIA-1. If a stockpond or a well used as a source of water is affected, Keystone would provide water until the affected water is proven to be acceptable for use.
1031	1	Krebs	Bonnie		Thanks for voicing your concern over the Ogallala Aquifer. We must protect our precious water supply here in Nebraska. The Gulf oil spill shouldn't take precedence over this part of the U.S.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. As described in Consolidated Response GLF-1, the risks associated with the proposed Project are substantially different from those associated with the BP Deepwater Horizon Project.
556	1	Kreikemeier	Mike		Please keep the Keystone XL pipeline away from the Nebraska Sandhills. The environment is too fragile and the Ogallala Aquifer is too important a resource to risk it being contaminated with oil.	Issues related to the Sand Hills area are addressed in Consolidated Response ERO-1. Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
1485	1	Krem	John		The tar sands project and pipeline is a bad thing for the United States and Canada. The global warming emissions are 20% worse than regular oil, but on top of that, we would be participating in the destruction of large portions of the boreal forest. This is dirty fuel and we should not help Canada's Prime Minister do this to his people, or his country.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including greenhouse gases. As noted in Consolidated Response OIL-4, crude oil produced from Canadian oil sands projects is similar in composition to heavy crude oil currently used in U.S. refineries.
967	1	Kretzschmar	John		The Keystone XL Pipeline Project is being planned and executed by a for-profit company using a business model that puts a premium on maximizing profit for its owners. It is not providing a public service and its primary concern is not preventing leaks. The evidence is already there that it will make decisions that lower the cost of delivery based on its assessment of the risk involved in doing so.	<p>Keystone has withdrawn its application for a Special Permit as described in Consolidated Response REG-1. In Consolidated Response SAF-1, the Pipeline and Hazardous Materials Safety Administration (PHMSA) has regulatory requirements that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project in a manner that protects the health and safety of the public and the environment. In addition, PHMSA developed 57 Project-specific Special Conditions that Keystone has agreed to implement. Incorporation of those conditions would result in a Project that would have a degree of safety over any other typically constructed domestic oil pipeline system under current code and a degree of safety along the entire length of the pipeline system similar to that which is required in HCAs as defined in 49 CFR 195.450. It also describes the inspections and reviews of the proposed Project that PHMSA would conduct to ensure compliance with those regulatory requirements.</p> <p>Because of the financial losses that would be associated with spills from the Project, including the cleanup liabilities as discussed in Consolidated Response LIA-1, preventing leaks and other releases and detecting them if they occur is important to any pipeline company. Sections 2.4 and 3.13.5.5 of the EIS and Consolidated Response OIL-3 describe the systems that would be in place to detect leaks and to shut down the system.</p>
967	2	Kretzschmar	John		TransCanada will not scour the world to find examples of the most rigorous safeguards and redundancies to insure that not a drop of oil will spill on Nebraska's and middle Americas greatest fresh water natural asset, the Ogallala Aquifer.	Consolidated Response SAF-1 describes the regulatory requirements and Project-specific Special Conditions that Keystone would comply with to construct, operate, maintain, inspect, and monitor the proposed Project. It also describes the monitoring, inspections, and reviews of the proposed Project that the Pipeline and Hazardous Materials Safety Administration would conduct to ensure compliance with those regulatory requirements.
967	3	Kretzschmar	John		Even when there are government run programs serving the public good like NASA, which build in the most extreme safeguards and backups, things can and do still go wrong with tragic consequences. If the pipeline is to be built, please make sure that the strictest safeguards are prescribed and vigorously monitored. And please insure that it is NOT constructed anywhere that a mishap could ever leak into this national treasure.	As described in Consolidated Response SAF-1, the Pipeline and Hazardous Materials Safety Administration (PHMSA) has regulatory requirements that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project in a manner that protects the health and safety of the public and the environment. In addition, PHMSA developed 57 Project-specific Special Conditions that Keystone has agreed to implement. Incorporation of those conditions would result in a Project that would have a degree of safety over any other typically constructed domestic oil pipeline system under current code and a degree of safety along the entire length of the pipeline system similar to that which is required in HCAs as defined in 49 CFR 195.450.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
						Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
1560	1	Kruise	Bonnie		TransCanada asked for a waiver from the PHMSA federal pipeline safety regulations, it is not a company to be trusted.	Keystone has withdrawn its application for a Special Permit as described in Consolidated Response REG-1.
1560	1	Kruise	Bonnie		Deny the TransCanada XL Pipeline permit because the purpose of the pipeline is to provide crude tar sands oil to meet the demands for China, not the United States;	Consolidated Response P&N-1 addresses the need for the Proposed Project. As stated in that response and in Sections 1.2 and 2.0, the crude oil would be transported to delivery points in Texas and refined in Gulf Coast refineries. In addition, Consolidated Response P&N-2 addresses issues related to export from the U.S. Gulf Coast.
1560	2	Kruise	Bonnie		If the pipeline breaks and there is an oil leak or spill, no one will claim responsibility for clean up.	Consolidated Response LIA-1 addresses Keystone's liability if there is a spill of hazardous materials or fuel during construction or a spill of crude oil from the proposed Project.
1560	4	Kruise	Bonnie		TransCanada refused to bury the pipe at a depth of 5 feet and restore topsoil in accordance with NCS standards because it is too costly.	<p>The commenter is referring to the existing Keystone Oil Pipeline System. In most areas across land, the pipe of the proposed Project would be buried to a depth of 4 feet below the ground surface, which is deeper than required by the regulations of the Pipeline and Hazardous Materials Safety Administration (see Section 2.3.2.3 of the EIS). That depth and the restrictions of use of the permanent right-of-way would help protect the pipe from damage. In addition, PHMSA Special Condition 19 addresses burial depth and Table 2.3.2-2 of the EIS lists the burial depths.</p> <p>Keystone would segregate topsoil during excavation and replace it after backfilling the trench as described in Section 2.3.2.3.</p>
32	1	Kruise	Jon&Bonnie		The Presidential Permit for the TransCanada XL Pipeline should be denied for the following reasons: 1. The purpose of the TransCanada XL pipeline is to provide transport of crude tar sands oil to meet the demand of China--not the United States. Please refer to the attached article "Canada looks to China to exploit oil sands rejected by US.2. The Alberta Clipper crude oil pipeline and TransCanada's Keystone crude oil pipeline supply enough tar sands crude oil from Canada to meet the demand of the United States. The TransCanada XL pipeline is not needed. Please refer to the attached article "Enbridge Alberta Clipper." In the event that TransCanada sells or transfers the XL Pipeline and the pipeline breaks, leaks, or spills all bets are off as to who would be held responsible for clean up and compensation.	<p>Consolidated Response P&N-1 addresses the need that the Project has been proposed to meet. As noted in that response, the Project has been proposed to meet the heavy crude oil needs of refineries in the Gulf Coast area, not for the U.S. in general. In addition, the Alberta Clipper and existing Keystone pipeline projects serve other markets and do not meet the demands of the Gulf Coast refineries.</p> <p>Consolidated Response P&N-4 provides information on investments by Chinese companies in Canadian oil sands project.</p> <p>Consolidated Response LIA-1 addresses Keystone's liability if there is an accidental release of hazardous materials or fuel during construction and from an accidental release of crude oil from the Project.</p>
32	2	Kruise	Jon&Bonnie		TransCanada is not a reputable company. TransCanada has failed to act in good faith with the State of Nebraska, local Nebraska city governments and Nebraska landowners Here are facts to support this statement: TransCanada refuses to work with the State of Nebraska, landowners, and local city and county governments to protect the environment or take responsibility from damage resulting from pipeline leaks, breaks or spills. Nebraska Senator Cap Dierks introduced LB 755, a bill that would hold landowners harmless for unintentional damages to pipelines on their property.	As described in Consolidated Response SAF-1, the Pipeline and Hazardous Materials Safety Administration (PHMSA) has regulatory requirements that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project in a manner that protects the health and safety of the public and the environment. In addition, PHMSA developed 57 Project-specific Special Conditions that Keystone has agreed to implement. Incorporation of those conditions would result in a Project that would have a degree of safety over any other typically constructed domestic oil

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					<p>Furthermore, pipeline companies would be required to procure insurance policies covering litigation costs for all landowners affected by the pipeline. The bill would have also required pipeline companies to bury pipes at a depth of five feet and restore topsoil in accordance with Natural Conservation Service Standards. Jim Krause, director of U.S. operations for Keystone Pipelines testified in opposition to the bill. Mr. Krause stated, "the liability protections in the bill would reduce an incentive for landowners to follow proper procedures when digging near pipelines. Further, the 5 foot depth requirement for pipe burial would significantly increase the costs of construction and result in greater damage to grounds when trenching." Mr. Obama, let me assure you that landowners who live on their land, and depend their land for their livelihood, and will either pass that land down to the next generation or sell it already have all the incentive needed to follow proper procedures when digging near pipelines on their property that could potentially pollute their land, and this bill would not reduce it. The landowners themselves went to Senator Dierks to introduce this bill to further protect themselves and the land, not to seek a way of avoiding proper procedures. As for the added cost of a 5 foot depth----this is standard procedure when a pipeline crosses a high consequence area and does not result in greater damage to grounds when trenching. Robert Jones, vice-President of TransCanada Keystone Pipeline LP also spoke in opposition to LB 755 stating that the bill's fee would add \$60 million to the annual operating costs of the pipeline. He said the cost would be excessive, considering the project already would produce more than \$20 million in tax revenue. Mr. Obama, let me assure you that this pipeline is projected to produce billions of dollars in profits for TransCanada. If TransCanada cannot afford to add \$60 million to the annual operating costs of the pipeline then they should not be allowed to build the pipeline, they should not be given the Presidential Permit. If they can't afford to build it right and compensate the landowners and the State of Nebraska they have no business building the pipeline in the first place. Please refer to the Attached article "Pipeline Fee a Possibility Under New Bill." Please find attached copy of Legislative Bill 755.</p>	<p>pipeline system under current code and a degree of safety along the entire length of the pipeline system similar to that which is required in HCAs as defined in 49 CFR 195.450.</p> <p>Consolidated Response LIA-1 addresses Keystone's liability if there is a spill of hazardous materials or fuel during construction or a spill of crude oil from the proposed Project.</p> <p>Any changes the State of Nebraska would like to impose on Keystone are matters between the state and Keystone. The Department of State does not have the authority to change PHMSA's regulatory requirements or to intervene in state proceedings.</p>
118	1	Krutz	Mel		To even consider the Keystone Pipeline Project in Nebraska or any state over the Ogallala Aquifer is unsound and unconscionable. The width of their pipe notwithstanding. Time decays all pipe. The Aquifer is an immeasurable treasure.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. As described in Consolidated Response GLF-1, the risks associated with the proposed Project are substantially different from those associated with the BP Deepwater Horizon Project.
118	3	Krutz	Mel		"RELiance ON OIL SANDS GROWS DESPITE ENVIRONMENTAL RISKS," NY Times 5-18-10, which follows, presents further clear vital evidence that the environmental challenges the pipeline presents are serious and devastating. It absolutely must not be built.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information on current and future production. As noted in that Consolidated Response, without the proposed Project, oil sands development would continue at or above the current level until at least 2020, with or without the proposed Project. Consolidated Response OIL-4 addresses the composition of the Canadian crude oil that would be transported by the proposed Project, including concerns relative to the corrosivity and erosivity of the crude oil. As noted in that Consolidated

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
						Response, that crude oil is similar in composition and properties to other heavy crude oils that are currently transported within the U.S. pipeline system and similar in composition and properties to other heavy crude oils that are currently refined in PADD III.
774	1	Kubat	Joseph		Keep this pipeline away from the Nebraska Sand Hills.	Identification of sensitive environments crossed by the proposed Project is discussed in Consolidated Response ENV-1 and ENV-3. Issues related to the Sand Hills area are addressed in Consolidated Response ERO-1. Consolidated Response ALT-1 addresses potential alternative routes, including routes that would avoid much of the Northern High Plains Aquifer system and the Sand Hills area.
901	1	Kubat	Marie		Keep this pipeline away from the Nebraska Sand Hills.	Identification of sensitive environments crossed by the proposed Project is discussed in Consolidated Response ENV-1 and ENV-3. Issues related to the Sand Hills area are addressed in Consolidated Response ERO-1. Consolidated Response ALT-1 addresses potential alternative routes, including routes that would avoid much of the Northern High Plains Aquifer system and the Sand Hills area.
328	1	Kuper	Catherine		Please do not support the building and use of the Keystone XL pipeline. This pipeline will cross sensitive areas of Nebraska, especially the Ogallala Aquifer. The risk of damage to the aquifer is just to hire especially given the recent oil spill in the Gulf of Mexico. We have to take seriously the resources that we have and protect them. I just do not have confidence in large business to protect the environment over profits.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
168	1	Kydney	Bavarly		You are putting our greatest resource at risk. Do you actually believe the reassurances given to you about the safety of this project? The gulf oil spill should give you some reason to reconsider this project. Are you only considering the financial benefits this may bring to Ne.? Today the paper told of the oil threatening the great salt lake because of a broken pipe. I'm sure they were given reassurances about the safety of that project also.What good did it do?	As described in Consolidated Response SAF-1, the Pipeline and Hazardous Materials Safety Administration (PHMSA) has regulatory requirements that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project in a manner that protects the health and safety of the public and the environment. In addition, PHMSA developed 57 Project-specific Special Conditions that Keystone has agreed to implement. Incorporation of those conditions would result in a Project that would have a degree of safety over any other typically constructed domestic oil pipeline system under current code and a degree of safety along the entire length of the pipeline system similar to that which is required in HCAs as defined in 49 CFR 195.450. It also describes the inspections and reviews of the proposed Project that PHMSA would conduct to ensure compliance with those regulatory requirements.
168	2	Kydney	Bavarly		No amount of money can replace the benefits of the aquifer to Nebraska.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
168	3	Kydney	Bavarly		Please don't do this! The Sandhill eco-system is very fragile and cannot quickly recover from a major assault such as this.	Identification of sensitive environments crossed by the proposed Project is discussed in Consolidated Response ENV-1 and ENV-3. Issues related to the Sand Hills area are addressed in Consolidated Response ERO-1.
758	1	Kyler	Shannon		... If there was a spill, is there a concrete plan on how it would be cleaned up? [how will the land around the pipeline be restored??] ...	Consolidated Response RES-1 addresses issues related to preparation and review of the Emergency Response Plan for the proposed Project.
758	2	Kyler	Shannon		This must be stopped!!!!We will not support the creation	Consolidated Response OIL-4 addresses the composition of

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					of more dirty energy!	the Canadian crude oil that would be transported by the proposed Project, including concerns relative to the corrosivity and erosivity of the crude oil. As noted in that Consolidated Response, that crude oil is similar in composition and properties to other heavy crude oils that are currently transported within the U.S. pipeline system and similar in composition and properties to other heavy crude oils that are currently refined in PADD III.
1000	1	Laaker	Damon		I would hope that this pipeline would not be build as proposed. Our water resources are precious and necessary. Contamination is not acceptable even at a "small" risk. Do not build it across the Ogallala Aquifer.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. Consolidated Response ALT-1 addresses potential alternative routes, including routes that would avoid much of the Northern High Plains Aquifer system.
466	1	Ladman	Dorothy		I am against having the pipeline cross Nebraska where if it ruptures it will impact the Ogallala Aquifer, one of the largest underground aquifers in the country. While the gulf of Mexico is getting all the attention because of the massive oil leak there, not much attention has been paid to the pipeline leak in Utah that has threatened the Great Salt Lake lately. There is too much risk involved in piping oil through Nebraska. Let the oil stay in Canada and be refined there!	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. Consolidated Response ALT-1 addresses potential alternative routes, including routes that would avoid much of the Northern High Plains Aquifer system. Consolidated Response P&N-8 addresses issues related to shipping Canadian crude oil to refineries that are closer to the source of oil.
576	2	Lake	Ladd	DRPC	I am against the pipeline extending through any portion of Nebraska near the critical Ogallala Aquifer. Any damage to the water supply would decimate Nebraska's economy.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
576	3	Lake	Ladd	DRPC	I am against the pipeline extending through any portion of Nebraska near the critical Ogallala aquifer. The fact that the company has admitted to a risk of leak (low which is what?) and that they are using thinner materials for the pipes are additional reasons to not allow it to be built along the proposed course. Any damage to the water supply would decimate Nebraska's economy	<p>Consolidated Response OIL-1 addresses the likelihood of spills from the Project. Consolidated Response OIL-2 addresses maximum-sized releases from the Project. Section 3.13 of the EIS was revised to update spill incident statistics and projections, provide additional information on composition of the crude oil that would be transported by the proposed Project, additional information on potential impacts to the Northern High Plains Aquifer system, and other key information. This section addresses reliability and safety issues, including calculations of the probability of a spill from the proposed Project and the potential environmental impacts associated with spills. .</p> <p>Keystone has withdrawn its application for a Special Permit as described in Consolidated Response REG-1. Consolidated Response SAF-1 describes the regulatory requirements that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project in a manner that protects the health and safety of the public and the environment.</p> <p>Issues related to the Northern High Plains Aquifer System are addressed in Consolidated Responses AQF-1 through AQF-4. Consolidated Response AQF-3 provides information on hypothetical spills from the Project over two areas of the Northern High Plains Aquifer System. As noted in those responses, the economy of Nebraska would not be devastated if a spill from the Project entered the aquifer.</p>
1162	1	LaMar	Warren		I do not have a great deal of concern with Keystone Pipeline. I have 50 years of Natural Gas background.	Comment acknowledged.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
1162	2	LaMar	Warren		I do have concern with any Federal oversight with anything any more.	Consolidated Response SAF-1 describes the regulatory requirements and Project-specific Special Conditions that Keystone would comply with to construct, operate, maintain, inspect, and monitor the proposed Project. It also describes the monitoring, inspections, and reviews of the proposed Project that the Pipeline and Hazardous Materials Safety Administration would conduct to ensure compliance with those regulatory requirements.
1532	1	Lamb	George&Rick	Malta Area Chamber of Commerce businesses	The above Malta Area Chamber of Commerce business is in support of the Keystone XL pipeline project which also incorporates the transmission line to be built by Big Flat Electric Cooperative to serve this load.	Comment acknowledged.
1029	1	Lambert	LeRoy		I may be wrong. Why do we have to have a Canadian oil line running across the US to refineries in KS & OK? If they get it that far it will soon go to Huston or the gulf for export. Build refineries in MT & WY or other states.. This should lower the cost of distribution of the finished product and all supplies would not be in one general area.	Consolidated Response P&N-8 addresses issues related to shipping Canadian crude oil to refineries that are closer to the source of oil.
1029	2	Lambert	LeRoy		We know we have terrorist living in the US. Make it harder for them to strike entire supply.	Consolidated Response TER-1 addresses potential terrorism associated with the proposed Project.
1029	1	Lambert	LeRoy		I may be wrong. Why do we have to have a Canadian oil line running across the US to refineries in KS & OK? If they get it that far it will soon go to Huston or the gulf for export. Build refineries in MT & WY or other states. This should lower the cost of distribution of the finished product and all supplies would not be in one general area.	Consolidated Response P&N-8 addresses issues related to shipping Canadian crude oil to refineries that are closer to the source of oil.
1499	1	Lambrech	Mark	Montana Quality Education Coalition & MREA	The Montana Quality Education Coalition (MQEC) and the Montana Rural Education Association (MREA) support TransCanada's construction of the Keystone pipeline system in Montana. These education organizations believe this project will benefit Montana communities and schools. The project will also generate much needed tax revenue for local governments and public schools. MQEC represents 80 public school districts throughout Montana, including AA, A, B, C, independent elementary and Indian Impact schools. Its membership also includes the School Administrators of Montana, the Montana School Boards Association and the Indian Impact Schools of Montana. MREA is a Montana, the Montana School Boards Association and the Indian Impact Schools of Montana. MREA is a statewide organization of 150 K-12 public school districts with a leadership comprised of school administrators and school trustees from four regions across Montana. Thank you for the opportunity to comment on the Draft Environmental Impact Statement for this project. Please contact us if you need additional information.	Comment acknowledged.
1544	187	Land	Carla	Citizen of Channelview	I've heard things here tonight that are really ridiculous. Out in the Gulf right now we have all that oil...coming out of the ground, polluting our Gulf. And we found out, we've been told by our government, because you went in there and found out, it broke because they used a cheaper version...Put the money back in their pocket...This is the part I really don't understand. They came up to you face-to face and told you right up front...That's arrogant. The fact that you all accepted that, I	As described in Consolidated Response GLF-1, the risks associated with the proposed Project are substantially different from those associated with the BP Deepwater Horizon Project.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					don't understand.	
1544	188	Land	Carla	Citizen of Channelview	Seems doubtful jobs will be created when it will just be pipe fitters digging a hole and leaving when the pipe is laid.	Consolidated Response ECO-1 and Section 3.10.2.2 of the EIS address potential socioeconomic impacts.
1544	189	Land	Carla	Citizen of Channelview	They say they're going to watch the lines. Are you going to watch them watch the lines, can any of you tell me? This is a serious question. Does the government watch the people that watch the lines?	Consolidated Response SAF-1 describes the regulatory requirements of the Pipeline and Hazardous Materials Safety Administration (PHMSA) that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project. It also describes the inspections and reviews of the proposed Project that PHMSA would conduct to ensure compliance with those regulatory requirements.
1544	191	Land	Carla	Citizen of Channelview	And we do have a right to get up here and talk about pollution. And that's what's going to happen they're inferior pipe structure, the thinness of it, when it breaks, it's called pollution, sir. When it gets down here in Channelview in these little old plants to be processed and goes through the air that all the people breathe, all this sulfur and stuff, that is pollution.	Keystone has withdrawn its application for a Special Permit as described in Consolidated Response REG-1. Consolidated Response SAF-1 describes the regulatory requirements that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project in a manner that protects the health and safety of the public and the environment. Section 3.13 of the EIS addresses reliability and safety issues, including calculations of the probability of a spill from the proposed Project and the potential environmental impacts associated with spills. As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries. Consolidated Response OIL-4 also addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils.
1544	192	Land	Carla	Citizen of Channelview	If the stuff is so good to these Canadians, why don't they send the stuff to Vancouver? It's closer to the water and they can ship it out from there.	Section 4.1 addresses alternatives means of transporting crude oil from Alberta, Canada to the west coast of Canada.
80	1	Landress	Judy		No Tar sands pipeline through OK and TX!	The commenter's opinion is noted.
1557	31	Landrum	Devonna		Wants information regarding the strength of the steel, the psi in the pipe, and the steel strength in the areas with special permits to allow 80% max? How deep will the pipe be and what is the quality of the pipe? Are they made safer in people's backyards where children play and near ponds?	Keystone has withdrawn its application for a Special Permit as described in Consolidated Response REG-1. The design specifics of the pipe are presented in Section 2.3.1 of the EIS, and Consolidated Response SAF-1 describes the regulatory requirements that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project. It also describes the inspections and reviews of the proposed Project that the Pipeline and Hazardous Materials Safety Administration would conduct to ensure compliance with those regulatory requirements. The burial depth of the pipeline in each type of land traversed is provided in Section 2.3.2.3 and Special Condition 19 presents depth of cover requirements.
1557	33	Landrum	Devonna		How will oil spills be handled for the private landowner in regards to water quality? What is the average cost per foot for the landowner? Are private landowners considered in the tariffs for the county?	Consolidated Response LIA-1 addresses Keystone's liability if there is a spill of hazardous materials or fuel during construction and from a spill of crude oil from the proposed Project. As noted in that response, Keystone would be liable for all costs associated with cleanup and restoration as well as other compensations. If water sources are affected by a spill,

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
						Keystone would be responsible for providing water until the affected source is considered acceptable for use. It is not clear what the commenter is referring to by "average cost per foot for the landowner" and DOS cannot respond to the comment. Keystone would pay property tax on the proposed Project facilities, not the landowners. Landowners would have no involvement in tariffs imposed on the transported crude oil.
1557	34	Landrum	Devonna		Learned that there is a very large reserve of oil within the Continental United States? Why don't we use that?	It is not clear what large reserve the commentor is referring to. DOS is not aware of a large reserve that is being developed with pipeline transport of crude oil to the Gulf Coast.
627	1	Lang	Mike		I am for the pipeline. We can reduce 25 % of our foreign oil usage. Today's engineers and agencies do great plans. Doing things on land versus the ocean are a lot safer and manageable. Construct the pipeline.	Comment acknowledged.
1362	1	Langford	A.Lance	Brigham Oil & Gas, L.P.	This letter is to express Brigham Oil & Gas' support for TransCanada's Keystone XL (KXL) crude oil pipeline, and to urge the Department of State to continue its permitting process for this important energy infrastructure project. ...I strongly encourage the Department of State to reject calls to halt its rigorous permitting process for this vital national energy infrastructure project. This process, fully compliant with the National Environmental Policy Act and under the auspices not only of the Department of State but an additional eleven cooperating agencies, is fully sufficient to determine whether or not this vital national energy infrastructure project will meet our rigorous environmental standards. Therefore I believe the process should continue. I will appreciate your assistance in this matter.	Comment acknowledged.
1362	4	Langford	A.Lance	Brigham Oil & Gas, L.P.	KXL will also facilitate the ongoing development of the Bakken Shale formation within the Williston Basin in the United States of America. The Bakken formation is the only land-based region of the continental United States where oil production has been increasing in recent years. The U.S. Geological Survey estimates there are between 3 billion and 4 billion barrels of technically recoverable oil in the Bakken formation. This is a tremendous national resource that can displace imports from abroad, but will not be developed to its full potential without additional pipeline capacity to access a variety of markets. KXL would alleviate some of the existing congestion in regional pipeline systems and therefore benefit domestic oil production. More importantly, TransCanada is actively working with Bakken producers in Montana and North Dakota to determine if there is sufficient interest and commercial support to provide a connection to KXL for Bakken producers.	Consolidated Response ALT-3 addresses issues related to a potential pipeline connection to the proposed Project in Montana.
1362	5	Langford	A.Lance	Brigham Oil & Gas, L.P.	Such a connection would not only provide access to additional U.S. markets but increase domestic oil production, reduce dependence on foreign oil, increase jobs, and increase tax revenues.	Comment acknowledged.
1464	1	Langston	M.L.	PRICE GREGORY INTERNATIONAL, INC	I write in support of TransCanada's Keystone XL crude oil pipeline project and urge the department to grant a permit for the pipeline.	Comment acknowledged.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
1464	2	Langston	M.L.	PRICE GREGORY INTERNATIONAL, INC	This project is a vital link to secure energy supplies for the United States. According to the U.S. Energy Information Administration, oil and natural gas will continue to supply over 50 percent of U.S. energy needs in 2030. Canada is a valued trading partner and our most reliable supplier of foreign-based crude oil. The Keystone project will have the added benefit of potential links to growing domestic supplies of crude oil in Montana and North and South Dakota.	Comment acknowledged.
1464	4	Langston	M.L.	PRICE GREGORY INTERNATIONAL, INC	Securing stable and affordable energy from our North American allies through projects such as the Keystone pipeline is in the national interest. Considering the economic and energy security benefits of these vital resources, we should continue to expand America's access to safe, affordable energy to help ensure improved domestic and global energy security and stable prices for consumers. Pipelines are the safest, most reliable, economical and environmentally favorable way to transport oil and petroleum products, as well as other energy liquids, throughout the U.S. America depends on the more than 168,000 miles of liquid pipelines to move energy and raw materials our country relies on. Additional pipeline capacity will help consumers and businesses throughout the United States.	Comment acknowledged.
1464	5	Langston	M.L.	PRICE GREGORY INTERNATIONAL, INC	This project also stands to provide a powerful private sector economic stimulus. During construction, Keystone XL will create more than 13,000 jobs funded with private investment. In addition, local governments will have a steady source of income from economic activity associated with construction and from property taxes the pipeline company will pay. Rejection of the permit or suspension of the review would sacrifice the significant economic benefits this project stands to deliver and force U.S. consumers to rely on other sources of crude oil not economically and politically allied with U.S. interests. This would be a mistake. I urge the granting of the permit. Thank you for the opportunity to comment.	Consolidated Response ECO-1 addresses potential socioeconomic impacts, and Consolidated Response TAX-1 addresses concerns regarding taxes.
1548	18	Lanzrath	Ralph		In favor of the pipeline as a means of reducing our national debt.	Comment acknowledged.
400	1	Larsen	Susan		This pipeline crosses the great aquifer. It's stupid to risk a leak into the source of clean drinking water for such a large segment of the population. Another federal bailout to purchase "safe drinking water"? We have safe drinking water. We need to keep it. People in east coast cities have been drinking chlorine for so long, they don't know what water really is. We do not want to be like them.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
307	1	Larson	Kenton&Donna		As a business man and landowner in McCone County, I would like to see the Keystone Pipeline Co. through our county. We need the additional tax base and the jobs it would create.	Comment acknowledged.
1022	1	Larson	Wayne&Janet		As to our previous comments, we continue to be VERY concerned about this pipeline, a leak be a complete disaster for our state. Oil companies statements about safety should be accepted with the highest skepticism.	Issues related to the Northern High Plains Aquifer System are addressed in Consolidated Responses AQF-1 through AQF-4. Consolidated Response AQF-3 provides information on hypothetical spills from the Project over two areas of the Northern High Plains Aquifer System.
1513	1	Larson	Carol		I write in support of TransCanada's Keystone XL crude oil	Comment acknowledged.

					<p>pipeline project and urge the department to grant a permit for the pipeline. This project is a vital link to secure energy supplies for the United States. According to the U.S. Energy Information Administration, oil and natural gas will continue to supply over 50 percent of U.S. energy needs in 2030. Canada is a valued trading partner and our most reliable supplier of foreign-based crude oil. The Keystone project will have the added benefit of potential links to growing domestic supplies of crude oil in Montana and North and South Dakota. The environmental benefits of Keystone XI should not be overlooked. The current tragedy in the Gulf underscores the importance of a diverse portfolio of energy supplies. Within the spectrum of viable options, it is appropriate to seek a growing role for oil resources that are: Land based; North American; and, Transported by pipeline. This project meets each of these criteria. Securing stable and affordable energy from our North American allies through projects such as the Keystone pipeline is in the national interest. Considering the economic and energy security benefits of these vital resources, we should continue to expand America's access to safe, affordable energy to help ensure improved domestic and global energy security and stable prices for consumers. Pipelines are the safest, most reliable, economical and environmentally favorable way to transport oil and petroleum products, as well as other energy liquids, throughout the U.S. America depends on the more than 168,000 miles of liquid pipelines to move energy and raw materials our country relies on. Additional pipeline capacity will help consumers and businesses throughout the United States. This project also stands to provide a powerful private sector economic stimulus. During construction, Keystone XL will create more than 13,000 jobs funded with private investment. In addition, local governments will have a steady source of income from economic activity associated with construction and from property taxes the pipeline company will pay. Rejection of the permit or suspension of the review would sacrifice the significant economic benefits this project stands to deliver and force U.S. consumers to rely on other sources of crude oil not economically and politically allied with U.S. interests. This would be a mistake. I urge the granting of the permit. Thank you for the opportunity to comment.</p>	
1243	1	LaSeur	Carrie	Plains Justice, et al	<p>As residents of the states that will bear all the risk of the Pipeline, Biodiversity Conservation Alliance, Friends of the Niobrara, Honor the Earth, Intertribal Council on Utility Policy, Nebraska Environmental Action Coalition, Nebraska Chapter of the Sierra Club, Nebraska Sustainable Agriculture Society, Northern Plains Resource Council, Plains Justice, Prairie Hills Audubon Society, Wachiska Audubon Society Western Nebraska Resources Council, and Western Organization of Resource Council believe that the risks associated with the current proposal are too great.</p>	The commenter's opinion is noted.
1243	2	LaSeur	Carrie	Plains Justice, et al	<p>The impacts when pipelines fail are too devastating to leave any element to chance. In the last four years alone, pipeline incidents have killed 56 people, injured 209 people, and caused over \$900 million in property damage.</p>	Consolidated Response OIL-1 addresses the likelihood of spills from the Project. Consolidated Response OIL-2 addresses maximum-sized releases from the Project. Consolidated Response SAF-1 describes the regulatory

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
						requirements and Project-specific Special Conditions that Keystone would comply with to construct, operate, maintain, inspect, and monitor the proposed Project. It also describes the monitoring, inspections, and reviews of the proposed Project that the Pipeline and Hazardous Materials Safety Administration would conduct to ensure compliance with those regulatory requirements.
1243	3	LaSeur	Carrie	Plains Justice, et al	The proposed Keystone XL DEIS is particularly troublesome in light of the many recent oil spill disasters.	Consolidated Response OIL-1 addresses the likelihood of spills from the Project. Consolidated Response OIL-2 addresses maximum-sized releases from the Project. Consolidated Response SAF-1 describes the regulatory requirements and Project-specific Special Conditions that Keystone would comply with to construct, operate, maintain, inspect, and monitor the proposed Project. It also describes the monitoring, inspections, and reviews of the proposed Project that the Pipeline and Hazardous Materials Safety Administration would conduct to ensure compliance with those regulatory requirements. As described in Consolidated Response GLF-1, the risks associated with the proposed Project are substantially different from those associated with the BP Deepwater Horizon Project.
1243	5	LaSeur	Carrie	Plains Justice, et al	A string of recent oil pipeline accidents have exposed a lack of government oversight of the pipeline industry and a lack of spill detection and response plans. In January of 2010, an Enbridge pipeline spilled over 3,000 barrels of crude oil in North Dakota. In late April, another Enbridge pipeline ruptured and leaked over 210 gallons of tar sands crude oil into Minnesota wetlands. The exact date of the Minnesota spill is unknown because the accident went completely undiscovered until firefighters working in the area happened to notice crude oil covering the ground while investigating a wildfire. In May of 2010, the Trans-Alaska Pipeline, owned partly by BP, had a "series of mishaps" that resulted in a power outage that opened relief valves and spilled several thousand barrels of crude oil. Luckily, this spill was mostly contained in "backup containers." On June 12, 2010, a massive spill from a Chevron crude oil pipeline was discovered in Salt Lake City, Utah. The reason for the breach is unknown, and crews are continuing to try to stop the giant oil slick from reaching the Great Salt Lake.	Consolidated Response OIL-1 addresses the likelihood of spills from the Project. Consolidated Response OIL-2 addresses maximum-sized releases from the Project. Consolidated Response SAF-1 describes the regulatory requirements and Project-specific Special Conditions that Keystone would comply with to construct, operate, maintain, inspect, and monitor the proposed Project. It also describes the monitoring, inspections, and reviews of the proposed Project that the Pipeline and Hazardous Materials Safety Administration would conduct to ensure compliance with those regulatory requirements.
1243	6	LaSeur	Carrie	Plains Justice, et al	The DEIS for the Keystone XL project is legally and technically flawed because the U.S. Department of State ("State") failed to provide an adequate analysis all of the direct, indirect and cumulative impacts of the project, including risks of leaks and spills, emergency response planning, and abandonment standards.	Consolidated Response RES-1 addresses issues related to preparation and review of the emergency response plans for the proposed Project. Section 3.13 of the EIS has been revised and addresses reliability and safety issues, including calculations of the probability of a spill from the proposed Project and the potential environmental impacts associated with spills. Issues related to taking the Project out of service at the end of the life of the Project are presented in Consolidated Response DEC-1.
1243	7	LaSeur	Carrie	Plains Justice, et al	The DEIS improperly defines the project's purpose and need and fails to ensure the scientific integrity of its analysis.	Consolidated Response P&N-7 addresses commentor concerns regarding the stated purpose of the proposed Project in the EIS. Consolidated Response P&N-1 addresses the need that the Project has been proposed to meet.
1243	8	LaSeur	Carrie	Plains Justice, et al	We request that State fully and completely address our concerns and re-issue the DEIS for further public comment.	Consolidated Response P&N-6 addresses requests for a supplemental draft EIS.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
1243	12	LaSeur	Carrie	Plains Justice, et al	The EIS must analyze the environmental impacts of increased capacity that will result from additional inputs of petroleum in Montana. The Pipeline is projected to have an ultimate capacity of 900,000 bpd, but the capacity may rise significantly when and if the MPSC orders TransCanada to allow additional inputs, or the ultimate capacity may be reached sooner.	The maximum capacity of the proposed Project at the time the draft EIS was issued was 900,000 bpd. The impacts associated with construction, operation, monitoring, maintenance, and inspection of the proposed Project have been addressed for that maximum throughput. However, Keystone withdrew its application for a special permit and the maximum nominal throughput would be 830,000 bpd. The proposed Project cannot be expanded beyond that capacity with adding an additional pipeline. If Keystone is interested in adding a pipeline to the Project in the future, it would have to submit a new application for a Presidential Permit and apply for all of the relevant environmental permits (see Table 1.10.1-1).
1243	13	LaSeur	Carrie	Plains Justice, et al	An increase in Pipeline capacity would amplify the environmental impacts from refining and end use of the petroleum, and may heighten the risk of spills and the severity of environmental impact if a spill were to occur. It would also drastically increase the physical footprint of the project, due to increased infrastructure, access roads, pumping stations, and electric transmission lines. These impacts are reasonably foreseeable indirect, cumulative and/or connected actions that must be considered in the EIS.	As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries. Section 3.13 addresses the reliability and safety of the pipeline, irrespective of maximum throughput, although the maximum spill volume was calculated for a throughput of 900,000 bpd (also see Consolidated Response OIL-2). That estimate is considered conservative since the maximum nominal throughput for the proposed Project would be 830,000 bpd. As noted in Sections 1.1 and 2.1 of the EIS, increasing throughput from the initial rate of 700,000 bpd to the maximum rate of 830,000 would require increasing pumping capacity. That increase would be installed within the boundaries of the proposed pump stations and increasing to maximum capacity would not increase the footprint of the Project or increase the number of access roads or electric transmission lines.
1243	14	LaSeur	Carrie	Plains Justice, et al	The EIS must analyze how these additional sources of conventional crude oil will interact with the tar sands crude oil being transported from Alberta and whether any operational or design changes will be necessary. For example, the EIS should examine whether the currently-planned pumping stations will be sufficient to accommodate the additional sources and additional capacity; whether the amount of diluent or heating that is required to move the crude through the pipeline will change; what additional facilities, operational plans, or emergency response plans will be necessary, and what the potential impacts to the environment and local communities will be.	As is common with crude oil and petroleum product pipelines, crude oil would be shipped in batches through the proposed Project. Different sources of crude would be "batched" through the pipeline from Canada. If the connected actions described in Sections 2.5.3 and 2.5.4 of the EIS are implemented, the U.S. crude oil would also be batched in the pipeline. Heating is not required for transport of the crude oil that would be shipped through the proposed Project. Consolidated Response OIL-4 addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils. If crude oil from U.S. sources is transported by the proposed Project and the nominal capacity of 700,000 bpd is not exceeded, no additional facilities or actions would be required. If there is sufficient transportation demand, Keystone could increase the maximum nominal throughput to 830,000 bpd by adding pumping capacity at the existing pump stations.
1243	15	LaSeur	Carrie	Plains Justice, et al	If granted common carrier status, the Pipeline will likely increase the amount of oil development in Montana due to the availability of additional pipeline capacity. This increase in domestic oil development is an indirect, connected, and/or cumulative action. As such, its environmental impacts must be	Connected actions are address in Section 2.5 of the EIS and in the resource portions of Section 3.0.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					evaluated, including but not limited to the increased use of hydraulic fracturing, increase in greenhouse gas (GHG) emissions, and the displacement effect it will have on the renewable energy market, including biofuels.	
1243	16	LaSeur	Carrie	Plains Justice, et al	The EIS must examine the environmental impacts of the spur lines that will transport the Montana oil to their connections with the main Pipeline. Specifically, the EIS should contain an analysis of several alternatives for the spur lines, including analyses of their respective water crossings and proximity to sensitive areas.	Consolidated Response ALT-3 addresses issues related to transportation of crude oil from the Williston Basin.
1243	18	LaSeur	Carrie	Plains Justice, et al	Throughout the EIS scoping and public hearing process, there has been short notice before public meetings and remote locations that hindered meaningful public participation. Many affected entities and individuals have had no notice or very short notice of public hearing opportunities.	DOS notified the public of the scoping meetings and the comment meetings on the draft EIS at least 2 weeks prior to the meeting dates. The meetings were held in the vicinity of the proposed route to provide affected landowners with the opportunity to participate in the meetings.
1243	19	LaSeur	Carrie	Plains Justice, et al	Hard copies of the DEIS have been made available only in a very limited manner, which is not consistent with the goal of NEPA to enable public participation. The online version is inaccessible, as a practical matter, to many rural residents with slow dialup internet connections. Accordingly, we ask State to hold open the public notice and comment period and hold public hearings and make hard copies of the DEIS more widely available, prior to any final decision on the DEIS.	As noted in Consolidated Response CMT-6, DOS provided libraries in the vicinity of the proposed route with paper copies of the draft EIS. As noted in Consolidated Response CMT-2, DOS also held 19 comment meetings on the draft EIS at locations in the vicinity of the proposed route and the comment period remained open until July 2, 2010.
1243	21	LaSeur	Carrie	Plains Justice, et al	The draft EIS attempts to cover alternatives dealing with no action, system, and major route alternatives. However, the Pipeline is being proposed in order to fill a perceived future gap in fuel and energy in the United States. The Pipeline is not the only alternative for filling this gap: other alternatives include fuel efficiency, alternative fuels, electric vehicles, other clean transport technologies, and public transportation. The draft EIS does not adequately address alternatives to expanding U.S. capacity to import tar sands oil or the opportunity costs involved in this decision.	Consolidated Response ALT-2 addresses the use of alternative technologies and alternative energy sources.
1243	23	LaSeur	Carrie	Plains Justice, et al	The purpose of this EIS is to provide an assessment of the environmental impacts if a Presidential Permit for the proposed project is approved. Presidential Permits, unlike NEPA analyses, have the burden of looking at not only the narrow field of traditional NEPA factors, but whether the "issuance would serve the national interest." Therefore, the DEIS's determination that a "no action alternative" is not preferable cites to supply and demand components.	Consolidated Responses ENR-1 and P&N-9 provide information on the DOS environmental review process, the National Interest Determination process, and the need to complete those reviews before approving or denying the Presidential permit for the proposed Project. As noted in that response, the determination of national interest is a separate process from the NEPA environmental assessment.
1243	24	LaSeur	Carrie	Plains Justice, et al	According to Section 4.1 of the draft, a "no action alternative" is not considered preferable because it would not meet the purpose and need of the project which involves both supply and demand components. Section 4.1 argues that it is because of the demand in the U.S., the supply available in WCSB, the WCSB as a "relatively stable and secure source of North American crude oil for Midwest and Gulf Coast markets" and the desire to reduce our dependence on Middle Eastern oil supplies that makes this alternative not preferable. The analysis of national interest only looks at one aspect of how to meet our energy needs. It does not consider that unconventional oil is not the only alternative for our energy	Consolidated Response ALT-2 addresses the use of alternative technologies and alternative energy sources.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					future.	
1243	25	LaSeur	Carrie	Plains Justice, et al	The draft EIS does not consider the alternative of biofuels and their domestic economic advantages.	Consolidated Response ALT-2 addresses the use of alternative technologies and alternative energy sources.
1243	26	LaSeur	Carrie	Plains Justice, et al	The DEIS does not consider the significant risk of leaks and spills and how damage to water sources, soil and other natural resources in our nation's breadbasket would compromise the national interest.	Section 3.13 of the EIS addresses reliability and safety issues, including calculations of the probability of a spill from the Project and the potential environmental impacts associated with spills, including discussions of surface water and groundwater. Consolidated Response OIL-2 describes the maximum size of a spill from the Project. As described in Section 1.3 of the EIS and in Consolidated Response P&N-9, the process for the determination of national interest is a separate process that will include consideration findings presented in the final EIS.
1243	28	LaSeur	Carrie	Plains Justice, et al	The central problem with the draft EIS analysis of alternate routes is that no U.S. agency at the state or federal level actually has the authority to change the full pipeline route in response to the draft EIS. There is some jurisdiction within agencies such as the Montana Department of Environmental Quality to guide route decisions, but even that authority was abdicated during the application review process because the applicants had already chosen a route without reference to Montana standards. Other states along the route have no routing authority, except some de minimis discretion at the county level. Performing an analysis of alternative routes for the purely theoretical purpose of NEPA review, when no agency has authority to act on the conclusions, is a sham and an abuse of the NEPA process that gives participants an entirely false impression that their participation might somehow influence the outcome.	Section 4.3 of the EIS presents assessments of alternative routes. DOS has the authority to condition the Presidential Permit through conditions in the Record of Decision and will include a route requirement condition the ROD. The public, including federal and state agencies, reviewed the draft EIS and provided comments on it, including comments on the proposed route and alternative routes. DOS considered those comments in identifying the preferred route in the final EIS. As a result, the agencies and the general public had the opportunity to provide input that could change the full pipeline route. As noted in Section I-2.3 of Appendix I of the EIS, the Montana Department of Environmental Quality (MDEQ) required that Keystone develop two additional alternatives in Montana after it reviewed Keystone's proposed route in detail. Since that time, MDEQ reviewed nearly 100 variations and minor route realignments prior to selecting its preferred route, which is not the route proposed by Keystone. Keystone would be required to construct the Project along MDEQ's preferred route since that would be the route identified in the Certificate of Compliance under the Montana Facility Siting Act.
1243	29	LaSeur	Carrie	Plains Justice, et al	In one instance of sham review of alternate routes, Montana DEQ collaborated with the Applicant to invent alternate routes after the proposed route had already been chosen. To comply with the requirements of the Montana Major Facilities Siting Act (MFSA) and Montana Environmental Policy Act (MEPA), at Section 4.3 the EIS considers five alternate routes in Montana. According to the EIS, Keystone did not appear to examine the preferred Montana routine criteria and preference for the use of public land until after it had selected Alternative SCS-B as its proposed route.... Thus, MDEQ worked with Keystone and the third-party EIS contractor to develop two new alternatives (the CND and CSD alternatives) in a manner that provided clear documentation of the steps taken and factors considered, as indicated in Sections I-2.1 and I-2.3.17. Conveniently, these two after-the-fact alternate routes were rejected.	After reviewing the applicant's proposed route, the Montana DEQ (MDEQ) required Keystone to develop two additional alternatives that would meet the criteria of the state Major Facility Siting Act as described in Section I-2.3 of Appendix I of the EIS. MDEQ reviewed the CND and CSD alternatives and did not consider them preferable to the proposed route, as described in Section 4.3.7.1 and Appendix I of the EIS. However, portions of the CSD were considered environmentally preferable to portions of the preferred route (termed variations in the EIS) and were incorporated into MDEQ's tentative preferred route identified in Section I-2.6 of Appendix I of the draft EIS.
1243	30	LaSeur	Carrie	Plains Justice, et al	Development and review of alternate routes that takes place after the proposed route is chosen can hardly provide the meaningful consideration of alternatives required by state and federal law. To the contrary, it is another sham with no	At the time the draft EIS was issued, neither the Department of State (DOS) nor the Montana DEQ (MDEQ) had selected a route for the proposed Project. The applicant submitted its preferred route for review and consideration. Alternatives

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					purpose other than to paper over the NEPA, MEPA and MFSA processes.	were developed after the applicant identified its preferred route, not after the proposed route was "chosen." After the draft EIS was issued, MDEQ considered additional variations in Montana to further reduce impacts of construction of the Project. Pipeline routing in Montana is addressed in Consolidated Response EAS-1. DOS and MDEQ followed the requirements of NEPA, MFSA, and MEPA in conducting the assessments of the proposed Project.
1243	31	LaSeur	Carrie	Plains Justice, et al	The EIS fails to consider existing pipeline routes, including the route of the recently completed Keystone pipeline, which begins in Alberta and would require only a relatively short additional section to reach the Gulf coast. At no point does the draft EIS attempt to justify the additional disruption, destruction and risk of an entirely new pipeline route.	Consolidated Response ALT-1 and Section 4.3 of the EIS address potential alternative routes, including following the existing Keystone Oil Pipeline System. Paralleling an existing corridor does not mean that a pipeline is installed within an existing right-of-way. Typically a new pipeline is installed parallel and adjacent to an existing corridor rather than within the same, previously disturbed corridor. That generally results in impacts that are similar to those resulting from construction through an area without an existing pipeline. In addition, even if a new pipeline is installed within an existing corridor, the risk of a spill is the same as that of a new pipeline outside of an existing corridor; there is not an additional risk as suggested by the commenter. These issues are further addressed in the revision to Section 4.3 of the EIS.
1243	32	LaSeur	Carrie	Plains Justice, et al	The draft EIS gives insufficient consideration to alternate routes that would have less impact on water resources. The "Western Alternative" is one such alternative that may be both practicable and less damaging to water resources. The draft EIS admits that "[p]otential positive attributes to this alternative include the avoidance of the Missouri River crossing just to the east of the Fort Peck Reservoir and the avoidance of crossings of reaches of the Niobrara River that have been included with the federal Wild and Scenic River program." However, the route still crosses the Niobrara, one of Nebraska's most treasured natural resources. Not mentioned, but also a potential reduction in impacts to water resources of this more westerly route, is the avoidance of vital and sensitive prairie potholes generally located in the more eastern portions of Montana and South Dakota.	The proposed Missouri River crossing would be accomplished using the horizontal directional drilling method and would not result in a significant impact. The reach of the proposed crossing site of the Niobrara River is not part of the Wild and Scenic River program. As noted in the EIS, the proposed Project would not have a significant impact on prairie potholes.
1243	33	LaSeur	Carrie	Plains Justice, et al	The DEIS fails to consider environmental impacts associated with new power lines and power generation sources that will be required to provide the large amounts of electricity required by the project. In light of the probability that interconnection for domestic oil producers will be required as part of the Montana siting process, the infrastructure necessary for that interconnection must also be evaluated as part of the EIS process. These impacts are part of the project impacts and must be considered as part of a single EIS to avoid illegal segmentation.	Section 3 of the EIS addresses the impacts of construction and operation of the proposed Project, as well as impacts from connected actions, including electrical distribution lines. Consolidated Response ELE-1 addresses issues regarding the potential need for additional energy sources to provide electrical power for the pump stations and mainline valves.
1243	34	LaSeur	Carrie	Plains Justice, et al	The DEIS does not adequately address impacts on water and wildlife under the federal Clean Water Act (CWA), discharges of pollutants, including dredged and fill material, are prohibited unless permitted pursuant to CWA. In order for discharges of dredged and fill to be permitted under the CWA by the U.S. Army Corps of Engineers (Corps or USACE), a "sequencing"	Keystone has consulted with U.S. Army Corps of Engineers to avoid, minimize, and mitigate impacts for proposed Project construction as is described in Section 3.4. The EIS presents a summary of this process that will culminate with the USACE granting the permit for construction. The development of compensatory mitigation is tied to the permitting process

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					analysis must occur. First, impacts to wetlands must be avoided; then minimized; and finally, to the extent impacts are unavoidable, compensated. For non-water dependent projects, CWA regulations do not allow for a permit to be issued if a practicable alternative to the discharge exists that would have a lesser impact on water resources. Mitigation is a last resort to be used only to compensate for impacts that could not be avoided or minimized.	which is outside of the National Environmental Policy Act analysis.
1243	35	LaSeur	Carrie	Plains Justice, et al	The DEIS relies almost solely on mitigation measures in its analysis of impacts to wetlands and streams. The DEIS fails to adequately demonstrate that efforts were properly made to avoid or minimize wetland, stream and river impacts.	Keystone has provided various versions of alignments to regulatory agencies for review and comment during the development of the proposed Project alignment. The alignment presented in the EIS is the result of their review and input. Impacts to many wetland areas were avoided through this process. Construction techniques for pipeline installation are designed to minimize impacts to wetland, stream and river crossings. Keystone has committed to follow the same construction, mitigation, and reclamation plan for all wetland crossings regardless of whether the wetland qualifies as jurisdictional under the U.S. Army Corps of Engineer Section 404 permits.
1243	36	LaSeur	Carrie	Plains Justice, et al	The DEIS fails to quantify the extent to which CWA mitigation requirements will even apply to wetlands and streams that will be impacted, leaving a very open-ended statement that "requirements for compensatory mitigation would depend on final USACE decisions on jurisdictional determinations."	Keystone has committed to follow the same construction, mitigation, and reclamation plan for all wetland crossings regardless of whether the wetland qualifies as jurisdictional under the U.S. Army Corps of Engineer Section 404 permits. The only difference would be the requirement for compensatory mitigation for permanent wetland losses. Keystone is currently consulting with the State of Nebraska concerning permanent wetland impacts at Pump Station 22. Most wetlands would be restored after pipeline construction. See Section 3.4 of the EIS for further information on wetland impacts and mitigation.
1243	37	LaSeur	Carrie	Plains Justice, et al	The pipeline will cross vital water resources the Corps has not been protecting under the CWA, meaning that no CWA permitting or mitigation requirements would apply.	Section 3.3 of the EIS addresses stream crossings, including permitting requirements and potential impacts. As noted in Consolidated Response WAT-1, prior to commencing any stream crossing construction activities, Keystone would be required to obtain a permit under Section 404 of the Clean Water Act (CWA) and, in some cases, under Section 10 of the Rivers and Harbors Act of 1899 administered by the USACE and a CWA Section 401 water quality certification as per state regulations. These federal and state agencies would require measures to limit unnecessary impacts to aquatic and riparian species and their habitat during construction as a condition of the crossing permits. In Montana each crossing of a perennial stream would be reviewed in the field by personnel from the Montana Department of Environmental Quality and specific requirements for stream crossings would be determined upon completion of that review. The potential impacts to water quality associated with waterbody crossings are addressed in Section 3.3.2.2 of the EIS.
1243	38	LaSeur	Carrie	Plains Justice, et al	The purpose and need of this project is unlawfully narrow and not substantiated.	Consolidated Response P&N-7 addresses commentor concerns that the stated purpose of the proposed Project in the EIS is "too narrow."
1243	39	LaSeur	Carrie	Plains Justice, et al	A proper purpose and need would reveal that this project is not necessary to meet energy needs. As such, the No-Action	Consolidated Response P&N-7 addresses commentor concerns regarding the stated purpose of the proposed Project

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					Alternative is the practicable alternative with the least damage to the aquatic environment. Thus, the currently proposed impacts to hundreds of rivers and streams and several hundred acres of wetlands should not be permitted under Section 404 and should not be allowed. System alternatives would also have less impact on water resources and be practicable. As the DEIS states: "A system alternative would render construction of the pipeline unnecessary, although some modifications or additions to other existing pipeline systems would be required to increase the current capacity of those systems." The DEIS projected demand well exceeds what EIA has demonstrated future demand to be. Although existing pipelines like the ExxonMobile Pegasus may not be able to accommodate the 900,000 bpd that the Keystone pipeline can carry, demand does not show such carrying capacity is needed.	in the EIS. Consolidated Response P&N-1 addresses the need that the Project has been proposed to meet, and as noted in that response, uses EIA data as the basis for the assessment of need. System alternatives would not meet the heavy crude oil needs of Gulf Coast refineries as described in Section 4.2 of the EIS.
1243	40	LaSeur	Carrie	Plains Justice, et al	It is possible use of existing pipelines could meet the need of this project, thus being practicable, and would avoid and minimize impacts to water resources as required by law. This practicable alternative would almost certainly result in far less impact to aquatic resources and should demand that CWA permits not be issued for the impacts associated with the preferred alternative.	Consolidated Response P&N-1 addresses the need that the Project has been proposed to meet. As noted in that response, the Project has been proposed to meet the heavy crude oil needs of refineries in the Gulf Coast area, not for the U.S. in general. In addition, the Alberta Clipper and existing Keystone pipeline projects serve other markets and do not meet the demands of the Gulf Coast refineries.
1243	41	LaSeur	Carrie	Plains Justice, et al	The draft EIS dismisses use of other planned pipelines (such as the Altex, Chinook-Maple Leaf, Trailbreaker, and Enbridge-BP Delivery System pipelines) as alternatives to building the Keystone XL on the basis that "[p]art of the purpose and need of the Project is to provide up to 900,000 bpd of crude oil to PADD III in as short a timeframe as possible." The assumptions about the amount of capacity needed are baseless. A proper assessment based on an appropriate purpose and need would likely demonstrate that the project is not needed at all, and that any carrying capacity needed could be accommodated by other proposed pipelines with overall minimization of impacts to water resources. This again leads to a conclusion that impacts for this project cannot be permitted under the CWA.	DOS considered System Alternatives in Section 4.2 of the EIS and determined that there were no such alternatives that would meet the purpose of the proposed Project or the crude oil needs of PADD III refineries as described in Consolidated Response P&N-1 and Section 1.4.2 of the EIS. They were not "dismissed" based on maximum Project throughput. As described in Consolidated Response P&N-1, the assessment of need was a thorough and independent study using information from government agencies tasked with projecting energy needs and from independent experts on energy use and projections.
1243	45	LaSeur	Carrie	Plains Justice, et al	The preferred Gulf Coast Section alternative (GCS-A) has considerable more impacts to wetlands than the rejected alternative (GCS-B), which is only 6 miles longer. GCS-A has 280 more acres of impacts than GCS-B (853.3 compared to 573.3). The cited reason for rejected GCS-B is its "greater length" and "associated greater area of impact and [stream/river] crossings." Yet, while this alternative does have more waterway crossings, the difference in wetland impacts (280 less acres of impacts for the rejected alternative) dwarfs the difference in stream crossings (13.2 more acres of impacts). The added six miles of length hardly makes this alternative impracticable, especially when almost 98% of this rejected alternative would parallel existing ROWs of other linear facilities.	Alternative GCS-B would cross more agricultural land, rangeland and grassland, developed land, more open water and rivers and streams than the proposed route. In addition, Alternative GCS-B would be in close proximity to more developed areas along its route than the proposed route. K108
1243	46	LaSeur	Carrie	Plains Justice, et al	The preferred route for the Houston Lateral section (Houston Lateral Alternative A) has significantly more wetland impacts (236.5 acres to 165.5 acres) than the rejected alternative	In addition to the reasons for rejecting Alternative HL-B stated by the commenter, the alternative would also extend through heavily developed urban areas at the beginning and end of the

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					(Houston Lateral Alternative B). While the rejected alternative is longer, has more stream crossings, and may have more difficulty in terms of meeting compliance with the Coastal Zone Management Act, there is still an inadequate showing that the route is not practicable and does not have less overall impact on aquatic resources than the alternative route chosen.	proposed route (see Section 4.3.6). Alternative HL-B would also require a marine crossing of an arm of Galveston Bay in the vicinity of the Houston Ship Channel. The crossing distance would be approximately 1.8 miles, and would produce impacts to benthic communities and nearshore environment along the proposed route. In comparison, the proposed Project route would not cross any portion of Galveston Bay. DOS considers the reasons stated for rejecting Alternative HL-B to be reasonable and adequate.
1243	47	LaSeur	Carrie	Plains Justice, et al	Crossing methods do not appropriately seek to avoid and minimize impacts to water resources. Rather than ensuring the least environmentally damaging practicable alternative is used, convenience seems to be the overriding concern in regards to which crossing methods are used. This fails to comply with the law.	Consolidated Response WAT-1 addresses stream crossing methods and the associated potential water quality impacts. Section 3.3 of the EIS addresses permitting requirements and potential impacts. Section 3.3 of the EIS addresses stream crossings, including permitting requirements and potential impacts. As noted in Consolidated Response WAT-1, prior to commencing any stream crossing construction activities, Keystone would be required to obtain a permit under Section 404 of the Clean Water Act (CWA) and, in some cases, under Section 10 of the Rivers and Harbors Act of 1899 administered by the USACE and a CWA Section 401 water quality certification as per state regulations. These federal and state agencies would require measures to limit unnecessary impacts to aquatic and riparian species and their habitat during construction as a condition of the crossing permits. In Montana each crossing of a perennial stream would be reviewed in the field by personnel from the Montana Department of Environmental Quality and specific requirements for stream crossings would be determined upon completion of that review. The potential impacts to water quality associated with waterbody crossings are addressed in Section 3.3.2.2 of the EIS.
1243	48	LaSeur	Carrie	Plains Justice, et al	The DEIS states that approximately 621 intermittent waterbodies would be crossed by the proposed Project (Appendix E). In the event that these intermittent waterbodies are dry or stagnant at the time of crossing, conventional upland cross-country construction techniques would be used. The pipeline would be installed with the open-cut wet crossing method if water is flowing at the time of installation. The specific method used for each crossing would be based on site-specific analyses of conditions at the time of installation so that the method selected would result in lower levels of environmental impact. However, the DEIS does not indicate that efforts will be made to ensure that the timing of the crossing will result in the least amount of damage to water resources.	Keystone would prefer to construct stream crossings during low flow periods, or for intermittent streams, when there is no flow. However, the timing of stream crossing will be determined by the limitations imposed in environmental permits, weather conditions, and other variables.
1243	49	LaSeur	Carrie	Plains Justice, et al	Given relatively predictable changes in flow rates throughout the year, achieving the lowest level of environmental impact may depend greatly on when crossings occur, allowing crossing to happen at times of low or no flow when impacts would be reduced and less environmentally damaging methods could be used. It is practicable to time crossings in such a manner as to reduce impacts.	Keystone would prefer to construct stream crossings during low flow periods, or for intermittent streams, when there is no flow. However, the timing of stream crossing will be determined by the limitations imposed in environmental permits, weather conditions, and other variables.
1243	50	LaSeur	Carrie	Plains Justice, et al	Crossing methods for many streams seem to improperly be allowed to occur at the whim of land owners and managers.	All stream crossing methods used must meet the requirements of federal and state permits obtained for those crossings. If

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					"The actual crossing method employed at an individual perennial stream would depend on permit conditions from USACE and other relevant regulatory agencies, as well as additional conditions that may be imposed by landowners or land managers at crossing locations."	landowners have specific requests in addition to those requirements that are consistent with environmental permits and regulations, Keystone would consider accommodating the landowner.
1243	51	LaSeur	Carrie	Plains Justice, et al	The DEIS does not address the fact that the Corps may decline to find jurisdiction over certain stream crossings (see below), meaning that for some streams no CWA permit conditions may apply. In order to truly assess possible impacts from stream crossings, the DEIS must analyze the possible impacts from the Corps not asserting jurisdiction over certain water resources.	Consolidated Response WAT-1 addresses stream crossing methods and the associated potential water quality impacts. Section 3.3 of the EIS addresses permitting requirements and potential impacts. As noted in Consolidated Response WAT-1, prior to commencing any stream crossing construction activities, Keystone would be required to obtain a permit under Section 404 of the Clean Water Act (CWA) and, in some cases, under Section 10 of the Rivers and Harbors Act of 1899 administered by the USACE and a CWA Section 401 water quality certification as per state regulations. These federal and state agencies would require measures to limit unnecessary impacts to aquatic and riparian species and their habitat during construction as a condition of the crossing permits. In Montana each crossing of a perennial stream would be reviewed in the field by personnel from the Montana Department of Environmental Quality and specific requirements for stream crossings would be determined upon completion of that review. The potential impacts to water quality associated with waterbody crossings are addressed in Section 3.3.2.2 of the EIS.
1243	52	LaSeur	Carrie	Plains Justice, et al	Plans for wetlands crossings seem to be more concerned with convenience than ensuring crossings are timed to reduce impacts. The DEIS states that, "Pipeline construction across wetlands would be similar to typical conventional upland cross-country construction procedures, with modifications to reduce the potential for affects to wetland hydrology and soil structure. The wetland crossing methods used would depend largely on the stability of the soils at the location at time of construction." As with streams, there is no attempt to ensure crossings are timed during periods of lower water or other times to ensure an avoidance or minimization of impacts.	The description of wetland impacts in Section 3.4 of the EIS does not make this statement. Wetland crossing methods are described in Keystone's Construction, Mitigation, and Reclamation Plan (Appendix B of the EIS). Pipeline construction across wetlands that are dry during the construction period would be similar to upland crossing methods. Construction across wetlands are timed to avoid high water periods to the extent practicable.
1243	53	LaSeur	Carrie	Plains Justice, et al	In general, State should require that dry crossings should occur unless TransCanada can demonstrate that such crossings are impracticable or not possible. Other than the 38 streams that would be crossed using the Horizontal Directional Drilling (HDD) method, the "preferred crossing method" is the open-cut crossing method, which is the method with the most environmental impacts. An open cut allows substantial downstream sedimentation, since excavation, pipeline placement, and back fill all occur in flowing water. There are a total of 341 perennial waterbodies and 621 intermittent waterbodies. Aside from the 38 that will be crossed by the HDD method, there is no requirement that less damaging alternatives to open-cut will be used and only a statement that dam-and-pump and flume crossings will be used "where technically feasible" or "where practicable" on unspecified "environmentally sensitive waterbodies."	Consolidated Response WAT-1 addresses stream crossing methods and the associated potential water quality impacts. Section 3.3 of the EIS addresses permitting requirements and potential impacts. As noted in Consolidated Response WAT-1, prior to commencing any stream crossing construction activities, Keystone would be required to obtain a permit under Section 404 of the Clean Water Act (CWA) and, in some cases, under Section 10 of the Rivers and Harbors Act of 1899 administered by the USACE and a CWA Section 401 water quality certification as per state regulations. These federal and state agencies would require measures to limit unnecessary impacts to aquatic and riparian species and their habitat during construction as a condition of the crossing permits. In Montana each crossing of a perennial stream would be reviewed in the field by personnel from the Montana Department of Environmental Quality and specific requirements for stream crossings would be determined upon completion of that review. The potential impacts to water

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
						quality associated with waterbody crossings are addressed in Section 3.3.2.2 of the EIS.
1243	54	LaSeur	Carrie	Plains Justice, et al	Dam-and-pump and flume crossings are standard techniques in the pipeline industry for achieving a dry crossing. DOS should discuss a mitigation measure indicating that dry crossings of waterbodies are the preferred method unless Keystone provides information that such a crossing is infeasible or impractical.	The U.S. Army Corps of Engineers is responsible for stipulating stream crossing requirements in its permitting process.
1243	55	LaSeur	Carrie	Plains Justice, et al	The DEIS does not require that stream banks be properly restored. The DEIS allows that "[a]fter pipeline installation, stream banks would be restored to preconstruction contours or to a stable configuration." Stable configuration could mean the use of "rock riprap, gabion baskets (rock enclosed in wire bins), log walls, geogrids, willow cuttings, or alternative wood-based structured where required by regulatory authorities." Stabilization methods like riprap, log walls and other methods, can often have severe deleterious impacts on streams. They can alter or negatively impact important functions such as stream evolution processes, riparian succession, sedimentation processes, habitat, and biological community interactions, with resulting adverse impacts to aquatic wildlife. This means that once functional banks could be made stable, but have important functions permanently degraded. These impacts are not assessed by the DEIS.	The EIS is a document developed by the Department of State to disclose potential impacts of the proposed Project to resources and does not "allow" actions. Keystone would follow state regulations and recommended best management practices for reclamation of riparian habitats at river and stream crossings. Stream crossings and typical reclamation are discussed in Section 2.3.3.5 of the EIS and in the Construction Mitigation, and Reclamation Plan which is included as Appendix B of the EIS.
1243	56	LaSeur	Carrie	Plains Justice, et al	The DEIS further notes several impacts to water resources that could potentially be severe, but fails to quantify or describe them in a manner that provides meaningful information regarding the severity of the impacts. For instance, the DEIS states that the project will result in "temporary increase in turbidity and changes in wetland hydrology and water quality." However, how long is temporary? And when will the impacts occur? During times when, for instance, certain aquatic life may be breeding or foraging and could be dramatically impacted by turbidity? And will the turbidity and sedimentation cause long term problems such as destruction or degradation or fish or amphibian breeding habitat? The DEIS leaves these important issues unaddressed.	The information on the potential impacts of waterbody crossings in Section 3.7.3 was revised. As noted in Section 3.0, Temporary impacts would generally occur during construction, with the resources returning to pre-construction conditions almost immediately afterward. Short-term impacts would continue for approximately 3 years following construction. Impacts to aquatic life, including sensitive life stages, are discussed in Section 3.7.3.1 of the EIS. In-stream crossing time periods would be limited (typically between 24 and 48 hours for waterbodies up to 100 feet in width) and the resultant elevated suspended sediment levels in the water column would generally be temporary. The duration of elevated suspended sediment levels as a result of direct disturbance to waterbodies would depend upon site-specific waterbody conditions. Keystone has initiated and will continue consultation with relevant regulatory agencies, including the USFWS and state fishery agencies, to minimize potential Project-related impacts to sensitive aquatic species.
1243	57	LaSeur	Carrie	Plains Justice, et al	Impacts to wildlife are not properly analyzed.	Project-related impacts to wildlife are addressed in Sections 3.5, 3.6, 3.7, and 3.8 of the EIS. Additional discussion concerning the adequacy of the EIS are provided in Consolidated ResponseP&N-6.
1243	58	LaSeur	Carrie	Plains Justice, et al	The project will result in immense impacts along the project route due largely to habitat loss and fragmentation. Overall, the project will result in significant habitat modification.	Impacts to wildlife habitats including loss and alteration are addressed in Section 3.5, 3.6, 3.7, and 3.8 of the EIS.
1243	59	LaSeur	Carrie	Plains Justice, et al	Construction of the proposed Project would result in loss and alteration of about 22,493 acres of wildlife habitat, including 11,533 acres of grasslands and rangelands, 2,523 acres of forested habitat, and 554 acres of wetland habitats (including	Impacts to wildlife and wildlife habitats including loss and alteration are addressed in Section 3.5, 3.6, 3.7, and 3.8 of the EIS. Habitat loss and fragmentation or sage brush and forest habitats are discussed in Section 3.6 and 3.8.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					271 acres of forested wetlands)." This loss and fragmentation has the potential to be especially harmful in areas, such as forests and shrubland, that will recover over a longer period time.	
1243	60	LaSeur	Carrie	Plains Justice, et al	The impacts of habitat fragmentation are documented and well-known. Studies have shown that the fragmentation of a species' habitat can threaten that species survival for a variety of reasons. These include: reduction of total habitat area; vulnerability during dispersal to other patches (increased risk of predation to species during movement); isolation of a species population; edge effects (more "edge" habitat that changes the type and distribution of species); edge effects-changes in microclimate (e.g. forested areas tend to be shadier, more humid and less windy, but more edge can alter these micro climates).	Habitat fragmentation issues are identified and discussed in Section 3.6.2 of the EIS.
1243	61	LaSeur	Carrie	Plains Justice, et al	The DEIS acknowledges impacts of habitat fragmentation, stating that predator movement will be facilitated by the existence of a right of way (right-of-way) for the pipeline; predator opportunities will be increased by fragmentation as more "edge" habitat is created for predation and parasitism (like cowbird nesting invasions); and fragmentation will impact movement of amphibians, reptiles, small mammals and some bird species.	Consolidated Response WIL-1 addresses concerns relative to the approach to assessing potential impacts to wildlife described in the EIS.
1243	62	LaSeur	Carrie	Plains Justice, et al	Another major impact of the project that is inadequately analyzed is the introduction of invasive species.	Keystone would implement measures to prevent the spread of noxious weeds and invasive aquatic animals as described in Sections 3.5.5.4 and 3.7.3.1 of the EIS. Section 3.7.3.1 of the EIS was revised to include additional measures Keystone would implement to prevent the spread of aquatic invasive species. The measures described were recommended by federal and state management agencies.
1243	63	LaSeur	Carrie	Plains Justice, et al	The pipeline right-of-way will cut through native grassland, shrub, and forest communities and would remove vegetation including sagebrush and native grasses, creating an unvegetated strip over the pipeline trench and adjacent construction areas. Subsequent revegetation may not provide habitat features comparable to pre-project conditions.	These impacts are addressed in Sections 3.5 and 3.6 of the EIS. Additional discussions on impacts to sagebrush habitats specific to Montana are also presented in Appendix I of the EIS.
1243	64	LaSeur	Carrie	Plains Justice, et al	The potential impacts of invasive species, particularly in light of climate change, are not properly analyzed.	Keystone would implement measures to prevent the spread of noxious weeds and invasive aquatic animals as described in Sections 3.5.5.4 and 3.7.3.1 of the EIS. Section 3.7.3.1 of the EIS was revised to include additional measures Keystone would implement to prevent the spread of aquatic invasive species. The measures described were recommended by federal and state management agencies.
1243	65	LaSeur	Carrie	Plains Justice, et al	Because many invasive species are fast-growing, highly opportunistic ecological generalists, land use change and alteration generally favors biological invasion. Non-native aquatic species can compete with native species and transmit diseases. As protection against invasives, the DEIS provides that, "During construction, the Contractor shall clean the tracks, tires, and blades of equipment by hand (track shovel) or compressed air to remove excess soil prior to movement of equipment out of weed or soil-borne pest infested areas or utilize cleaning stations to remove vegetative materials using	Keystone would implement measures to prevent the spread of noxious weeds and invasive aquatic animals as described in Sections 3.5.5.4 and 3.7.3.1 of the EIS. Section 3.7.3.1 of the EIS was revised to include additional measures Keystone would implement to prevent the spread of aquatic invasive species. The measures described were recommended by federal and state management agencies.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					water under high pressure.” This is insufficient to protect sensitive ecosystems from the spread of invasive species. Small organisms may be hidden in crevices and other dangers, such as disease-spreading parasites, bacteria and viruses, are completely invisible to the naked eye. Additionally, the DEIS only states that such cleaning/decontamination will occur “before entering areas either identified as sensitive habitats or new ROW.”	
1243	66	LaSeur	Carrie	Plains Justice, et al	The DEIS does not explain why measures would not be used in existing right of ways, construction areas, or other locations where invasives could easily be introduced, become established and negatively impact native species.	Keystone would implement measures to prevent the spread of noxious weeds and invasive aquatic animals as described in Sections 3.5.5.4 and 3.7.3.1 of the EIS. Section 3.7.3.1 of the EIS was revised to include additional measures Keystone would implement to prevent the spread of aquatic invasive species. The measures described were recommended by federal and state management agencies.
1243	67	LaSeur	Carrie	Plains Justice, et al	Plans for preventing the spread of invasive species from hydrostatic testing equipment are inadequate. Measures apply only in areas “where zebra mussels are known to occur” and the measures only call for a “thorough cleaning” of equipment. The project will apparently not take preventive measures to stop invasives spreading where zebra mussels are not present. This is a wholly unacceptable risk that must be examined.	Keystone would implement measures to prevent the spread of noxious weeds and invasive aquatic animals as described in Sections 3.5.5.4 and 3.7.3.1 of the EIS. Section 3.7.3.1 of the EIS was revised to include additional measures Keystone would implement to prevent the spread of aquatic invasive species. The measures described were recommended by federal and state management agencies.
1243	68	LaSeur	Carrie	Plains Justice, et al	A “thorough cleaning” may not remove all invasives that could be contained in equipment and subsequently spread to other waterbodies. The utmost precaution should be taken in preventing the spread of invasive species, since they are a pollutant that spreads exponentially over time, and once established, are nearly impossible to eradicate and incredibly costly to manage. Climate change will make it ever easier for such invasives to spread, and ever harder to control such invasives. These impacts are not examined by the DEIS and must be given a hard look.	Keystone would implement measures to prevent the spread of noxious weeds and invasive aquatic animals as described in Sections 3.5.5.4 and 3.7.3.1 of the EIS. Section 3.7.3.1 of the EIS was revised to include additional measures Keystone would implement to prevent the spread of aquatic invasive species. The measures described were recommended by federal and state management agencies.
1243	70	LaSeur	Carrie	Plains Justice, et al	The DEIS fails to detail the full impacts to wildlife caused by the construction of the Pipeline. Many potentially harmful activities will be associated with the construction of the Pipeline.	The EIS describes the mechanisms for Project-related construction and operation impacts to wildlife, including activities that may result in direct mortality to wildlife.
1243	71	LaSeur	Carrie	Plains Justice, et al	The DEIS does not address this construction in detail or provide mitigation measures for the construction of some temporary roads would be required in addition to upgrading of existing roads. Approximately 400 temporary access roads are needed to provide adequate access to the construction sites.	Consolidated Response RDS-1 addresses concerns about the condition of roadways and roadway structures associated with construction and operation of the proposed Project.
1243	72	LaSeur	Carrie	Plains Justice, et al	The DEIS does not properly address impacts from driving fuel trucks – such as collisions – which would be transported daily by fuel trucks from the yards to the construction area for equipment fueling	Section 3.13.3.2 of the EIS addresses the potential for fuel to be released from fuel trucks due to accidents.
1243	73	LaSeur	Carrie	Plains Justice, et al	The DEIS does not properly address impacts from building “temporary bridges (e.g., subsoil fill over culverts, timber mats supported by flumes, railcar flatbeds, flexi-float apparatus)” which “would be installed across all perennial water bodies to allow construction equipment to cross with reduced disturbance.”	Section 3.3.2 of the EIS was revised to address the potential impacts of temporary bridges.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
1243	74	LaSeur	Carrie	Plains Justice, et al	The methods proposed in the DEIS for water body and wetland crossings are unnecessarily destructive in many instances. Approximately 621 intermittent waterbodies would be crossed by the Pipeline. In the event that these intermittent waterbodies are dry or stagnant at the time of crossing, conventional upland cross-country construction techniques would be used. However, the pipeline would be installed with the open-cut wet crossing method if water is flowing at the time of installation. The open-cut wet crossing method is potentially more harmful to wildlife and wildlife habitat than other methods by causing the discharge of suspended solids and other pollutants into waters, many of which are already impaired. There is inadequate explanation as to both the number of waters that might be impacted by this method, or why efforts are not made to ensure crossings at times when a less harmful method can be used.	Consolidated Response WAT-1 addresses stream crossing methods and the associated potential water quality impacts. Section 3.3 of the EIS addresses permitting requirements and potential impacts. As noted in Consolidated Response WAT-1, prior to commencing any stream crossing construction activities, Keystone would be required to obtain a permit under Section 404 of the Clean Water Act (CWA) and, in some cases, under Section 10 of the Rivers and Harbors Act of 1899 administered by the USACE and a CWA Section 401 water quality certification as per state regulations. These federal and state agencies would require measures to limit unnecessary impacts to aquatic and riparian species and their habitat during construction as a condition of the crossing permits. In Montana each crossing of a perennial stream would be reviewed in the field by personnel from the Montana Department of Environmental Quality and specific requirements for stream crossings would be determined upon completion of that review. The potential impacts to water quality associated with waterbody crossings are addressed in Section 3.3.2.2 of the EIS.
1244	1	LaSeur	Carrie	Plains Justice, et al	The DEIS does not properly account for the fact that many impacted wetlands and water bodies are not being regulated under CWA and therefore may not receive mitigation.	All wetlands will receive construction mitigations as described in Keystone's Construction, Mitigation, and Reclamation Plan (Appendix B of the EIS). Keystone has committed to follow the same construction, mitigation, and reclamation plan for all wetland crossings regardless of whether the wetland qualifies as jurisdictional under the U.S. Army Corps of Engineer Section 404 permits. The only difference would be the requirement for compensatory mitigation for permanent wetland losses. Most wetlands would be restored after pipeline construction. Most wetlands would be restored after pipeline construction. See additional discussion of this issue in Consolidated Response WAT-2.
1244	2	LaSeur	Carrie	Plains Justice, et al	The DEIS relies on CWA protections to conclude that mitigation measures will protect waters from the impacts of the pipeline. However, due to two Supreme Court decisions, Solid Waste Agency of Northern Cook County v. U.S. Army Corps of Engineers, 531 U.S. 159 (2001) and Rapanos v. United States, 547 U.S. 715 (2006) and subsequent Corps and EPA guidance documents interpreting those decisions, the status of CWA protections for many important waters that will be impacted by the project, such as intermittent streams and so-called "isolated" wetlands, is in doubt.	Keystone has committed to follow the same construction, mitigation, and reclamation plan for all wetland crossings regardless of whether the wetland qualifies as jurisdictional under the U.S. Army Corps of Engineer Section 404 permits. The only difference would be the requirement for compensatory mitigation for permanent wetland losses. Most wetlands would be restored after pipeline construction. See additional discussion of this issue in Consolidated Response WAT-2.
1244	3	LaSeur	Carrie	Plains Justice, et al	The overwhelming majority of streams impacted are intermittent or ephemeral (350 in MT; 331 in SD; 127 in NE; 273 in OK; 415 in TX). In terms of the wetlands, the pipeline crosses the interior of the country, where a great number of depressional, geographically isolated wetlands exist. While the DEIS never quantifies the number of "isolated" waters that will be impacted, the DEIS acknowledges that "[w]etlands throughout Montana, South Dakota, Nebraska, Kansas, Oklahoma, and Texas include isolated depressional wetlands, glaciated kettle-hole wetlands, and sinkhole wetlands, as well as isolated floodplain wetlands such as oxbows." Due to a 2003 guidance document interpreting the SWANCC decision,	All wetlands will receive construction mitigations as described in Keystone's Construction, Mitigation, and Reclamation Plan (Appendix B of the EIS) and any other applicable guidance from the U.S. Army Corps of Engineers. Keystone has committed to follow the same construction, mitigation, and reclamation plan for all wetland crossings regardless of whether the wetland qualifies as jurisdictional under the U.S. Army Corps of Engineer Section 404 permits. The only difference would be the requirement for compensatory mitigation for permanent wetland losses. Most wetlands would be restored after pipeline construction. See additional discussion of this issue in Consolidated Response WAT-2.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					the Corps is not protecting geographically isolated wetlands such as prairie potholes under the CWA meaning that developers have been free to impact and destroy these valuable resources without any federal safeguards under the CWA.	
1244	4	LaSeur	Carrie	Plains Justice, et al	The DEIS never examines the extent to which jurisdictional uncertainty and Corps implementation of the SWANCC and Rapanos decisions effects its conclusions regarding impacts to water resources. While acknowledging that “[w]etland impacts that affect non-jurisdictional wetlands under Section 404 would not require mitigation,” the DEIS never even roughly quantifies these impacts and does not discuss possible impacts to streams due to possible questions of CWA jurisdiction.	All wetlands and stream crossing will receive construction mitigations as described in Keystone’s Construction, Mitigation, and Reclamation Plan (Appendix B of the EIS) and any other applicable guidance from the U.S. Army Corps of Engineers. Keystone has committed to follow the same construction, mitigation, and reclamation plan for all wetland crossings regardless of whether the wetland qualifies as jurisdictional under the U.S. Army Corps of Engineer Section 404 permits. The only difference would be the requirement for compensatory mitigation for permanent wetland losses. Most wetlands would be restored after pipeline construction. See additional discussion of this issue in Consolidated Response WAT-2.
1244	5	LaSeur	Carrie	Plains Justice, et al	The DEIS relies heavily on the existence of CWA protections to conclude impacts will be accounted for when this may not be the case. The DEIS fails to mention the possibility that in many instances both Section 404 and 401 safeguards would not be invoked.	All wetlands and stream crossings will receive construction mitigations as described in Keystone’s Construction, Mitigation, and Reclamation Plan (Appendix B of the EIS) and any other applicable guidance from the U.S. Army Corps of Engineers. Keystone has committed to follow the same construction, mitigation, and reclamation plan for all wetland crossings regardless of whether the wetland qualifies as jurisdictional under the U.S. Army Corps of Engineer Section 404 permits. The only difference would be the requirement for compensatory mitigation for permanent wetland losses. Most wetlands would be restored after pipeline construction. See additional discussion of this issue in Consolidated Response WAT-2.
1244	7	LaSeur	Carrie	Plains Justice, et al	For the hundreds of intermittent and ephemeral streams the Corps may determine are not jurisdictional, similar protections may also not be applied. Yet, the DEIS seems oblivious to this risk, stating that, “Prior to any stream crossing construction activities, Keystone would obtain a permit under Section 404 [of the CWA] through the USACE and Section 401 water quality certification as per state regulations.” DOS is in no position to require such permits to be issued and it is ultimate the Corps and EPA, or a court, that will determine whether or not certain crossings require permits.	All wetlands and stream crossings will receive construction mitigations as described in Keystone’s Construction, Mitigation, and Reclamation Plan (Appendix B of the EIS) and any other applicable guidance from the U.S. Army Corps of Engineers. Keystone has committed to follow the same construction, mitigation, and reclamation plan for all wetland crossings regardless of whether the wetland qualifies as jurisdictional under the U.S. Army Corps of Engineer Section 404 permits. The only difference would be the requirement for compensatory mitigation for permanent wetland losses. Keystone is currently consulting with the State of Nebraska concerning permanent wetland impacts at Pump Station 22. Most wetlands would be restored after pipeline construction. See additional discussion of this issue in Consolidated Response WAT-2.
1244	8	LaSeur	Carrie	Plains Justice, et al	DOS is in no position to assume that stream crossing will necessarily be subject to CWA protections. The DEIS must take this serious risk to waters into account, and cannot rely on assumptions about CWA protections ameliorating water impacts without assessing the extent to which those protections are assured.	Section 3.3 of the EIS addresses stream crossings, including permitting requirements and potential impacts. As noted in Consolidated Response WAT-1, prior to commencing any stream crossing construction activities, Keystone would be required to obtain a permit under Section 404 of the Clean Water Act (CWA) and, in some cases, under Section 10 of the Rivers and Harbors Act of 1899 administered by the USACE and a CWA Section 401 water quality certification as per state

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
						regulations. These federal and state agencies would require measures to limit unnecessary impacts to aquatic and riparian species and their habitat during construction as a condition of the crossing permits. In Montana each crossing of a perennial stream would be reviewed in the field by personnel from the Montana Department of Environmental Quality and specific requirements for stream crossings would be determined upon completion of that review. The potential impacts to water quality and associated mitigation measures associated with waterbody crossings are addressed in Section 3.3.2.2 of the EIS.
1244	9	LaSeur	Carrie	Plains Justice, et al	The DEIS Fails to Assess Impacts to Water from Pump Stations, Mainline Valves, Roads and Other Associated Developments	Potential impacts associated with construction of the proposed Project described in Section 3.3.2.2 of the EIS include the impacts of constructing the pump stations and valve stations within the construction right-of-way. No access roads would be constructed at or across streams and there would be essentially no impacts to water quality due to construction of the access roads. The EIS has been revised to address potential impacts of pump stations, valve stations, and ancillary facilities during operation.
1244	10	LaSeur	Carrie	Plains Justice, et al	The project will impact, in addition to the route, wetlands and water resources associated with 30 new pump stations, 74 intermediate mainline valves of which 24 are check valves located downstream of major river crossings, approximately 50 new access roads and approximately 400 temporary access roads. However, the DEIS did not assess the associated developments: "The Project would disturb a total of 554 acres of wetlands (not including pipe storage yards, rail sidings, contractor's yards, access roads, or construction camps)." These impacts could potentially be enormous, as roads, storage yards and similar developments can disturb or destroy water resources by directly impacting them by crossing through them, or by causing stormwater discharges, erosion, changes in water temperature by removing shading vegetation, and other similar impacts. These impacts are not quantified or analyzed in a manner that could be characterized as a "hard look."	Most proposed pump stations, intermediate mainline valves, and new permanent access roads would not be located within wetlands. Information on wetland impacts for permanent facilities and temporary access roads has been added to the description of wetland impacts in Section 3.4. Most wetland impacts from the Keystone XL proposed Project occur during construction of the pipeline, not from construction of new permanent facilities. Keystone is currently consulting with the State of Nebraska concerning permanent wetland impacts at Pump Station 22.
1244	11	LaSeur	Carrie	Plains Justice, et al	The DEIS hints at the scale of the potential impacts it fails to examine, acknowledging that "[e]xtra workspace areas away from the construction ROW would be required during construction of the Project for use as pipe storage sites, railroad sidings and contractor yards. Pipe storage sites would be required at 30-mile to 80-mile intervals and contractor yards would be required at approximately 60-mile intervals. It is estimated that 40 pipe storage yards and 19 contractor yards would be required for the proposed Project."	After the DEIS was issued, Keystone submitted additional information regarding the proposed locations of construction yards and pipe storage sites. The EIS has been revised to describe those facilities and the potential impacts of establishing and using them. As noted in the EIS, there would not be significant impacts associated with those facilities.
1244	12	LaSeur	Carrie	Plains Justice, et al	Extension road construction would be large in scale as well.	Impacts due to construction and use of temporary and permanent access roads are addressed in the relevant resource portions of Section 3.0 of the EIS.
1244	13	LaSeur	Carrie	Plains Justice, et al	The impacts of building 40 pipe storage yards, 19 contractor yards, 400 temporary access roads, and 50 permanent roads on wetlands, streams, rivers and other waters are not analyzed. This is a blatant and illegal oversight.	Most pipe storage yards, contractor yards, temporary access roads, and permanent access roads would not be located within wetlands. Information on wetland impacts for permanent facilities and temporary access roads has been added to the description of wetland impacts in Section 3.4.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
						Most wetland impacts from the Keystone XL proposed Project occur during construction of the pipeline, not from storage or contractor yards which are normally located in uplands.
1244	15	LaSeur	Carrie	Plains Justice, et al	The DEIS states that the use of herbicides or pesticides will be prohibited within 100 feet of any wetland, unless allowed by the appropriate land management or state agency. This requirement is not even mitigation: it allows herbicide and pesticide use where it currently would be allowed and appears to add no additional protection. Beyond that there is no explanation as to whether 100 feet will properly reduce impacts, or how that number was chosen. It appears to be a completely arbitrary number.	Keystone has followed the typical Federal Energy Regulatory Commission guidelines for planned construction activities, including the buffer zones described in the EIS and in Keystone's Construction, Mitigation, and Remediation Plan. As stated in Section 3.3.2.2 of the EIS, prior to commencing any stream crossing construction activities, Keystone would be required to obtain a permit under Section 404 of the Clean Water Act (CWA), and in some cases, under Section 10 of the Rivers and Harbors Act of 1899 administered by the USACE and a CWA Section 401 water quality certification in accordance with state regulations. The USACE and the state agencies would require measures to limit unnecessary impacts to aquatic and riparian species and their habitat during construction as a condition of the crossing permits.
1244	17	LaSeur	Carrie	Plains Justice, et al	There is no explanation as to why the 85 foot wide corridor construction zone mitigation measure is either protective or the least damaging width practicable. Nor is there any guidance about what sort of "soil conditions" would permit TransCanada to ignore this width requirement and impact a wider corridor.	As described in Section 2.1 of the EIS, the pipeline would typically require a 110-foot-wide construction right-of-way. In certain sensitive areas, which may include wetlands, cultural sites, shelterbelts, residential areas, or commercial/industrial areas, the construction right-of-way would be reduced to 85 feet.
1244	18	LaSeur	Carrie	Plains Justice, et al	The DEIS does not adequately address the destruction of irreplaceable native grassland ecosystems and impacts on the Sand Hills. Although the DEIS acknowledges that "conservation of native prairie remnants is a high priority throughout the project area" and that the Sand Hills are "one of the few remaining examples of a functioning prairie ecosystem," the Pipeline route will cross over 336 miles of native grasslands that may take a century or more to recover from the excavation. These are irreplaceable resources of national and international value that cannot simply be replanted.	The EIS was revised to include additional information on Keystone's construction and restoration techniques within the Sand Hills in Section 3.5. Additional information on Keystone's process for development of construction and restoration methods within the Sand Hills and other issues are discussed in Consolidated Response ENV-1. Issues related to the Sand Hills area are addressed in Consolidated Response ERO-1.
1244	19	LaSeur	Carrie	Plains Justice, et al	In recent years increasing amounts of scarce remaining native grasslands have been plowed under to meet agricultural needs. The native prairie remnants on the High Plains and Great Plains are biologically unique, contain high biological diversity, and provide critical ecosystem services to the region, including carbon sequestration. Pipeline construction and operation will permanently alter this ecosystem by causing increased soil erosion, introduction and expansion of noxious weed populations, long-term damage to delicate soils, alteration of vegetation due to increased soil temperatures, and a risk of minor to catastrophic spills along the full Pipeline route.	The EIS was revised to include additional information on Keystone's construction and restoration techniques within the Sand Hills in Section 3.5. Additional information on Keystone's process for identifying and mitigating impacts to native grasslands are discussed in ENV-3.
1244	22	LaSeur	Carrie	Plains Justice, et al	The DEIS underestimates the significance of native grassland excavation.	These impacts are addressed in Sections 3.5 and 3.6 of the EIS. Additional discussions on impacts to sagebrush habitats specific to Montana are also presented in Appendix I of the EIS. Additional information on Keystone's process for identifying and mitigating impacts to native grasslands is presented in Consolidated Response ENV-3.
1244	23	LaSeur	Carrie	Plains Justice,	In Section 3.5.2 (under Terrestrial Vegetation), the first	The commenter has mis-read the opening sentence. The

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
				et al	sentence is inaccurate with regard to the degree of alteration “by agriculture, urban, industrial development...prairie dogs”. It is inaccurate to say that native vegetation communities “throughout” the project area have been so altered. Some of these areas have been altered very little. Their excavation would represent, in some cases, the first alteration by human hands.	sentence lists the anthropogenic (agriculture, urban and industrial) and natural processes (fire, bison grazing, prairie dogs) through which native vegetation communities are “altered”. There is no degree of anthropogenic alteration stated or implied.
1244	24	LaSeur	Carrie	Plains Justice, et al	Section 3.5.2 includes factual errors. For example, grasses are either bunch grasses or sodforming, not both.	The EIS was revised in response to this comment.
1244	25	LaSeur	Carrie	Plains Justice, et al	The discussion of “Traditionally Used Native Plants” at Section 3.5.2.4 requires updating and/or additions to scientific names.	The EIS was revised to include “purple (or prairie) coneflower (<i>Echinacea</i> spp.).” All other traditionally used native plants include scientific names.
1244	26	LaSeur	Carrie	Plains Justice, et al	Most of the lakes in the Sand Hills region represent the water table. The risk of aquifer contamination is therefore exceptionally high in this area.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
1244	27	LaSeur	Carrie	Plains Justice, et al	The DEIS fails to consider fully the risk of noxious weed introduction.	Keystone would implement measures to prevent the spread of noxious weeds and invasive aquatic animals as described in Sections 3.5.5.4 and 3.7.3.1 of the EIS. Section 3.7.3.1 of the EIS was revised to include additional measures Keystone would implement to prevent the spread of aquatic invasive species. The measures described were recommended by federal and state management agencies.
1244	28	LaSeur	Carrie	Plains Justice, et al	Table 3.5.5-4 (Noxious Weed Sources Occurring Along the Steele City Segment of the Project) underestimates the noxious weed species active in Nebraska. The DEIS does not reflect the fact that noxious weeds ‘ <i>Sericea</i> [Chinese] <i>lespedeza</i> ’ and Johnsongrass grow in Nebraska.	Table 3.5.5-4 was compiled from weed surveys completed by Keystone across the proposed Project ROW. It is not intended to represent a comprehensive list of weeds in Nebraska. The noxious weeds identified as occurring within counties crossed by the proposed Project is included in Table 3.5.4-1. Neither <i>Sericea</i> [Chinese] <i>lespedeza</i> (<i>Lespedeza cuneata</i>) or Johnsongrass (<i>Sorghum halepense</i>) are considered noxious weeds in Nebraska (see http://www.agr.state.ne.us/division/bpi/nwp/nwp1.htm).
1244	29	LaSeur	Carrie	Plains Justice, et al	Table 3.5.4-1 (Federal, State, or Local Noxious Weeds Potentially Occurring Along the Project Route) has omissions and should be revised with the assistance of a specialist in affected prairie ecosystems.	Table 3.5.4-1 was prepared based on reported occurrences of noxious weeds within counties crossed by the proposed Project. As noted above, different states include different plants on their noxious weed lists. This listing is specific for counties and states crossed by the proposed Project. Keystone has worked with experts in restoration of native prairie habitats as noted in the document entitled Sand Hills Construction/Reclamation Unit included in Appendix H of the EIS.
1244	30	LaSeur	Carrie	Plains Justice, et al	Section 3.5.5.1 does not address the fact that increasing soil temperature might allow for southern plants to move northward. An additional concern is that the newly created microclimate may allow invasion of new noxious weeds.	Disturbed soils would be revegetated as quickly as possible and equipment would be cleaned after use within infected areas. These are the primary deterrents to establishment and expansion of noxious weeds. Small changes in soil temperature would have local scale, not regional scale impacts and would likely be indistinguishable from exposure to local noxious weed sources.
1244	31	LaSeur	Carrie	Plains Justice, et al	Research on soil temperatures increases (Appendix L) extensively cites an article, Dunn et al that is unpublished. Since it has not gone through a scientific peer review process, the Dunn article should neither be used nor cited in the document. Other cited research is primarily related to crops,	Consolidated Response ENV-2 addresses concerns related to pipeline temperature effects. Keystone acknowledged in Appendix L that the article prepared by Dunn et al. is a pre-published draft.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					and the only article on the impact of native grass species involves a natural gas pipeline installed 17 years ago. Further research needs to be done to determine if more relevant and newer peer-reviewed research exists that can provide a stronger basis for decision-making.	
1244	32	LaSeur	Carrie	Plains Justice, et al	The small section regarding revegetation monitoring (Appendix L, section v.) discusses a CRP field reestablished after a crude oil pipeline was installed, but the research is not in a peer reviewed journal and was conducted by a paid environmental service firm. The 20-50% increase in temperature they quote from the Knapp article is not a correct conclusion from the article. It is an overstatement.	This resport in Appendix L was provided by Keystone, and information specific to modeled pipeline temperatures was used in the EIS. The 20 to 50 percent increase in temperature was not used in the EIS.
1244	33	LaSeur	Carrie	Plains Justice, et al	The DEIS plans inadequately for revegetation.	Revegetation plans are generally specific to location along a pipeline corridor, and specific plans would be prepared for the proposed route based on the Keystone Construction, Mitigation, Reclamation Plan in Appendix B of the EIS. Reclamation would be monitored for 2 to 3 years until adequate cover by vegetation has been achieved. The EIS was revised to provide additional information on reclamation of the Sand Hills in Section 3.5. In addition, sagebrush restoration specific to Montana is discussed in more detail in Appendix I of the EIS. Additional discussion on reclamation in the Sand Hills of Nebraska is provided in Appendix H of the EIS and in Consolidated Response ENV-1. Issues related to the Sand Hills area are also addressed in Consolidated Response ERO-1.
1244	34	LaSeur	Carrie	Plains Justice, et al	At several points, the DEIS makes faulty assumptions, proposes insufficient measures, or is unclear about revegetation planning for highly sensitive areas. For example, one growing season of discouraging livestock grazing will be inadequate for establishment. Establishment will likely take five to ten years.	Revegetation plans are generally specific to location along a pipeline corridor, and specific plans would be prepared for the proposed route based on the Keystone Construction, Mitigation, Reclamation Plan in Appendix B of the EIS. Reclamation would be monitored for 2 to 3 years until adequate cover by vegetation has been achieved. Additional information on reclamation of the Sand Hills has been added to Section 3.5. In addition, sagebrush restoration specific to Montana is discussed in more detail in Appendix I of the EIS. Additional discussion on reclamation in the Sand Hills of Nebraska is provided in Appendix H of the EIS and in Consolidated Response ENV-1. Issues related to the Sand Hills area are also addressed in Consolidated Response ERO-1.
1244	35	LaSeur	Carrie	Plains Justice, et al	The recommendation by regulatory agencies on prohibiting burning is not clear.	Agency recommendations are presented in the EIS as submitted to DOS.
1244	36	LaSeur	Carrie	Plains Justice, et al	The DEIS is unclear on whether local ecotypes will be used for seed mixes in replanting and offers no supporting evidence for the assertion that the reseeding plan will restore the biodiversity that will be destroyed by the construction process. Dr. James Stubbendieck, Director of the Center for Great Plains Studies at the University of Nebraska at Lincoln believes it will not.	Reclamation of Sand Hills vegetation and recommended seed mixes were discussed with regional experts, including: Dr. Jerry Volesky, Dr. Dave Wedin, Dr. David Loope, Dr. Alexander Smart, and Dr. Eric Mousel. Native grass species will be used in the seed mix, including those recorded during pedestrian surveys of the proposed Project and have been recommended by the NRCS, university scientists, and the Nebraska Department of Roads. The EIS was revised to include additional information on Sand Hills construction and reclamation in Appendix H.
1244	37	LaSeur	Carrie	Plains Justice,	Recovery time projected for "Vegetation Communities of	Recovery times are estimates and vary with the type of

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
				et al	Concern" is inadequate.	vegetation community, precipitation, livestock and wildlife grazing. In many instances estimated recovery periods were suggested by resource management agencies. Section 3.5.5 of the EIS discusses vegetation mitigation.
1244	38	LaSeur	Carrie	Plains Justice, et al	It is not clear if prairie dog burrows will be encouraged or even allowed on the right-of-way post construction.	Prairie dog burrows would be neither encouraged or discouraged within the right-of-way after construction.
1244	39	LaSeur	Carrie	Plains Justice, et al	The DEIS does not clarify whether the predicted sagebrush re-establishment time is related to re-planting or natural colonizing. Monitoring in the recovery phase must last longer than just one year, and evaluation of revegetation success by "visual survey" is inadequate. A sampling technique should be developed that requires more quantitative figures versus the proposed qualitative method. For example, a system evaluating percent cover or botanical composition of each species should be employed.	Resource management agencies would specify monitoring protocols and time periods. In general Keystone would monitor vegetation re-establishment for 2 to 3 years or until sufficient vegetation cover is achieved. Information on sagebrush restoration specific to Montana is presented in Appendix I of the EIS.
1244	40	LaSeur	Carrie	Plains Justice, et al	For the Sand Hills region, certain specifics are lacking or inappropriate to the unique soil conditions. There is little topsoil development in this area, so stockpiling it would be of little value on the uplands.	The EIS has been revised in response to this comment. Issues related to the Sand Hills area are addressed in Consolidated Response ERO-1.
1244	41	LaSeur	Carrie	Plains Justice, et al	Revegetation methods specific to the Sand Hills are inadequate. Some are untested in the region (such as imprinting the soil).	Keystone has consulted with the U.S. Natural Resources Conservation Services and the U.S. Department of Fish and Wildlife regarding revegetation and would continue to do so. Continued monitoring of revegetated areas is described in Section 2.3.2.9 of the EIS.
1244	42	LaSeur	Carrie	Plains Justice, et al	Wind erosion in the Sand Hills region is a major concern that remains unaddressed.	Identification of sensitive environments crossed by the proposed Project is discussed in Consolidated Response ENV-1 and ENV-3. Issues related to the Sand Hills area are addressed in Consolidated Response ERO-1.
1244	43	LaSeur	Carrie	Plains Justice, et al	Fencing in Sand Hills region would be needed to remove animal traffic in revegetated areas.	Reclamation of Sand Hills vegetation is discussed in Consolidated Responses ENV-1 and ERO-1 and the Appendix H of the EIS was revised to include additional information on construction and restoration in the Sand Hills area. Use of fencing to limit livestock access of the reclamation area is included as a special consideration in the Sand Hills reclamation plan.
1244	44	LaSeur	Carrie	Plains Justice, et al	The sixth bullet point in Section 3.5.5 fails to discuss the impact of increased soil temperatures on the soil microbial community or the impact on native vegetation.	Consolidated Response ENV-2 addresses concerns related to pipeline temperature effects.
1244	45	LaSeur	Carrie	Plains Justice, et al	Section 3.5.5.1 (General Vegetation Resources paragraph) misrepresents the length of time it will take for vegetation to establish to preconstruction conditions. Studies have shown a much longer re-establishment period, for example, 20-40 years in the shortgrass prairie, but less time for Sand Hills or tallgrass prairies.	Recovery times are estimates and vary with the type of vegetation community, precipitation, livestock and wildlife grazing. In many instances estimated recovery periods were suggested by resource management agencies. Section 3.5.5 of the EIS discusses vegetation mitigation.
1244	46	LaSeur	Carrie	Plains Justice, et al	In Section 3.5.5.1, it is unclear whether the time period for shrubland re-establishment would be if the shrubs were re-introduced or natural colonization was allowed to occur.	The estimates in the EIS were developed assuming natural colonization would take place.
1244	47	LaSeur	Carrie	Plains Justice, et al	Section 3.8 (Threatened and Endangered Species) omits consideration of the federally endangered Blowout Penstemon (Penstemon haydenii) population in Rock County, Nebraska.	The proposed Project would not cross known populations or suitable habitat for the blowout penstemon (Penstemon haydenii) in Rock County, Nebraska, and no associated facilities would be constructed in this county. The blowout penstemon was not identified as occurring near the proposed

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
						Project during Section 7 Endangered Species Act consultations with either the U.S. Fish and Wildlife Service or the Nebraska Game and Parks Commission. Further discussion about the blowout penstemon is presented in Section 3.8.1.7 of the EIS.
1244	49	LaSeur	Carrie	Plains Justice, et al	We request that DOS condition the grant of the Permit on a requirement that the fifty-one special permit conditions imposed on the original Keystone pipeline by PHMSA be imposed on the full length of the Keystone XL project as well.	As described in Consolidated Response SAF-1, the Pipeline and Hazardous Materials Safety Administration (PHMSA) has regulatory requirements that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project. In addition, PHMSA developed 57 Project-specific Special Conditions that Keystone has agreed to implement. Incorporation of those conditions would result in a Project that would have a degree of safety over any other typically constructed domestic oil pipeline system under current code and a degree of safety along the entire length of the pipeline system similar to that which is required in HCAs as defined in 49 CFR 195.450.
1244	51	LaSeur	Carrie	Plains Justice, et al	Because of the higher temperature at which this pipeline will operate, internal and external corrosion will be a major risk. Given the advanced state of various corrosion mitigation technologies such as recent developments in fusion bonded epoxy ("FBE") coatings, improvements in cathodic protection design and operation, and requirements for cleaning pigs and corrosion inspection with high resolution smart pigs, we request that DOS expand its conditions for corrosion mitigation to include all of the above.	<p>As described in Consolidated Response SAF-1, the Pipeline and Hazardous Materials Safety Administration (PHMSA) has regulatory requirements that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project. In addition, PHMSA developed 57 Project-specific Special Conditions that Keystone has agreed to implement. Incorporation of those conditions would result in a Project that would have a degree of safety over any other typically constructed domestic oil pipeline system under current code and a degree of safety along the entire length of the pipeline system similar to that which is required in HCAs as defined in 49 CFR 195.450.</p> <p>The temperature of the crude oil in the pipeline would be similar to that of crude oil transported by many other pipelines and would have the same potential for corrosion as those existing pipelines. The Special Conditions address temperature of the oil, corrosion monitoring, and corrosion mitigation. Corrosion prevention and reduction measures are also described in Section 2.3 of the EIS.</p> <p>All issues related to design specifics and operation of the proposed pipeline system are under the jurisdiction of PHMSA, as explained in Sections 2.3, 2.3.1, and 3.13.1. As such, PHMSA would be responsible for considering recommendations such as those of the commenter and implementing them if they are considered appropriate.</p>
1244	56	LaSeur	Carrie	Plains Justice, et al	Federal regulations identify certain areas, such as populated areas, that can be affected by pipeline releases as HCAs. Keystone XL has asked to increase design factors to 0.8, allowing thinner pipe, in special permit rural areas that are not located in HCAs. The approximate location of HCAs and special permit areas along the pipeline should be identified in a pipeline route map that should be included in the EIS. It is very important that the public knows and understands that the HCAs and special permit areas designated are proper and this understanding can best be conveyed with a map showing the	Keystone has withdrawn its application for a Special Permit as described in Consolidated Response REG-1. As described in Consolidated Response SAF-1, the Pipeline and Hazardous Materials Safety Administration (PHMSA) has regulatory requirements that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project. In addition, PHMSA developed 57 Project-specific Special Conditions that Keystone has agreed to implement. Incorporation of those conditions would result in a Project that would have a degree of safety over any other typically

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					approximate locations of these areas along a pipeline.	constructed domestic oil pipeline system under current code and a degree of safety along the entire length of the pipeline system similar to that which is required in HCAs as defined in 49 CFR 195.450.
1244	58	LaSeur	Carrie	Plains Justice, et al	Table 3.1.4-2 identifies areas of the proposed pipeline route that are "Areas with High Landslide Potential Crossed by the Project." The impression that this table gives is that there are over 360 miles of pipeline routed in areas with high landslide potential. No pipeline is capable of withstanding the forces of many tons associated with a massive landslide.	Consolidated Response GEO-1 addresses landslide potential along the proposed route.
1244	59	LaSeur	Carrie	Plains Justice, et al	The DEIS states that "Keystone has considered landslide potential in its routing work and has selected crossings of these areas where the landslide potential is considered minimal." Further detail is warranted to put this concern to rest given that landslide related failures usually end up as pipeline ruptures, with very large, high rate releases.	Consolidated Response GEO-1 addresses landslide potential along the proposed route.
1244	60	LaSeur	Carrie	Plains Justice, et al	Table 3.1.4-2 needs to be expanded in further detail to identify those areas of the pipeline route where steep landslide would be of the "breakaway" type rather than slight or limited earth movement or settlement. Pipelines are usually designed to handle slight earth movement or settlement. A pipeline elevation profile should quickly help in determining breakaway landslide potential in those areas identified as steep unstable slopes. Breakaway landslides place rapid and excessive abnormal loading forces on the pipeline. Pipelines placed in breakaway landslide areas need to be routed out of these landslide areas.	Consolidated Response GEO-1 addresses landslide potential along the proposed route.
1244	61	LaSeur	Carrie	Plains Justice, et al	The analysis of seismic activity at 3.1.4.1 discounts almost entirely any risk from earthquakes along the route. These claims seem ignorant to local residents who have experienced repeated seismic activity along much of the route, including in some of the most biologically sensitive areas such as the Nebraska Sand Hills.	Consolidated Response GEO-2 addresses potential seismic hazards. Issues related to the Sand Hills area are addressed in Consolidated Response ERO-1.
1244	62	LaSeur	Carrie	Plains Justice, et al	Table 3.1.4-1 finds no "High Seismic Hazard" along the route, defined as "peak ground acceleration with 2 percent probability of exceedance in 50 years >0.5 g." The studies cited are compilations of faults, not seismological analyses or projections of seismic risk in the area. A more thorough analysis should be performed in light of the grave risk to pipeline safety posed by active geologic faults.	Consolidated Response GEO-2 addresses potential seismic hazards.
1244	67	LaSeur	Carrie	Plains Justice, et al	The U.S., in recent years, has undergone an unusual expansion/construction phase in the number of miles of transmission pipeline constructed, and both the Keystone and Keystone XL projects are contributing to a serious demand on experienced pipeline construction and inspection resources.	The commenter is correct in that there were many natural gas pipeline and oil pipeline projects constructed in the past several years. However, most of those projects have been completed, and many others will be completed before construction begins on the proposed Project, if it is approved. DOS does not anticipate that the proposed Project-related demand for experienced construction and inspection resources would exceed the supply available for the proposed Project.
1244	70	LaSeur	Carrie	Plains Justice, et al	It is also unclear if girth weld non-destructive testing means inspection by radiograph or ultrasonic testing, and if such inspection will also occur in non special permit areas (i.e., HCAs). Many companies and other countries (including	All welds would be inspected using non-destructive radiographic, ultrasonic, or other PHMSA-approved methods. All aspects of welding, including reporting, would be conducted in compliance with the requirements of 49 CFR

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					<p>Canada) now incorporate this important construction quality inspection on all their transmission pipeline girth welds and require such important records to be maintained for the life of the pipeline. It is also unclear from the DEIS if all girth weld radiological or ultrasonic inspection records are to be maintained for the life of the pipeline. This should be a simple matter to clarify.</p> <p>For example, federal pipeline safety regulations do not require that all girth welds that join pipeline segments be radiologically or ultrasonically inspected, even segments in HCAs. Prudent pipeline operators constructing new pipeline exceed current federal safety minimums, and provide such high tech inspections to assure the quality of all girth welds. Smart pigging currently cannot inspect girth welds to the level of detail or quality as that of radiologically or ultrasonically inspection. Such girth weld radiologically or ultrasonically inspection records should be maintained for the life of the pipeline as is required in many other countries.</p>	195.228 and PHMSA Special Conditions 4, 5, 6, 12, 18, and 20 (see Appendix U).
1244	72	LaSeur	Carrie	Plains Justice, et al	Given the amount of energy driving the electric pumps and the viscosity of the oil, the oil temperature in the pipeline will increase and range from approximately 100°F to 140°F, depending on the pipeline's throughput and the season of the year. PHMSA has placed a 150°F maximum temperature limit on the Keystone pipeline for various technical reasons, and this restriction should also be placed on the Keystone XL pipeline.	PHMSA Special Condition 15 includes temperature limitations and related requirements similar to those requested by the commenter (see Appendix U).
1244	73	LaSeur	Carrie	Plains Justice, et al	The increase in temperature as the crude oil flows down the pipeline increases the energy efficiency of the pipeline as the oil thins with higher temperature, making it easier to flow down the pipeline. Temperature increase, however, markedly raises the risks of corrosion attack (both internal and external) to the pipeline. Corrosion will be a bona fide risk of concern for this system, well beyond that for a normal liquid pipeline operating at much lower temperatures.	PHMSA Special Condition 15 includes temperature limitations and related requirements similar to those requested by the commenter (see Appendix U). The temperature of the crude oil in the pipeline would be similar to that of crude oil transported by other pipelines and there is no evidence that the oil that would be transported by the proposed Project would be more corrosive than other heavy crude oils transported by pipeline. Corrosion prevention and reduction measures are described in Section 2.3 of the EIS.
1244	75	LaSeur	Carrie	Plains Justice, et al	Cleaning pigs and prudent runs of high resolution smart pigs provide an important safety net in monitoring various forms of corrosion.	Consolidated Response SAF-1 describes the regulatory requirements and Project-specific Special Conditions that Keystone would comply with to construct, operate, maintain, inspect, and monitor the proposed Project. It also describes the monitoring, inspections, and reviews of the proposed Project that the Pipeline and Hazardous Materials Safety Administration would conduct to ensure compliance with those regulatory requirements.
1244	76	LaSeur	Carrie	Plains Justice, et al	It is important to note that PHMSA has required an import safety net for special permit areas in requiring that general corrosion with predicted metal loss greater than 40% wall thickness be repaired within 180 days. Pipe in HCAs only has to be repaired within 180 days if general corrosion loss exceeds 50% of nominal wall.	Keystone has withdrawn its application for a Special Permit as described in Consolidated Response REG-1. As described in Consolidated Response SAF-1, the Pipeline and Hazardous Materials Safety Administration (PHMSA) has regulatory requirements that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project in a manner that protects the health and safety of the public and the environment. In addition, PHMSA developed 57 Project-specific Special Conditions that Keystone has agreed to implement. Incorporation of those conditions would result in

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
						a Project that would have a degree of safety over any other typically constructed domestic oil pipeline system under current code and a degree of safety along the entire length of the pipeline system similar to that which is required in HCAs as defined in 49 CFR 195.450. The Special Conditions, presented in Appendix U of the EIS, include many requirements associated with corrosion, including pipe repair if corrosion is detected.
1244	78	LaSeur	Carrie	Plains Justice, et al	Overpressure protection design and effectiveness should be taken very seriously, especially for this liquid pipeline system, given several unique characteristics associated with this pipeline such as bitumen, horsepower, and batching operation.	The proposed Project would not have the unique characteristics suggested by the commenter. The proposed Project would transport crude oil, not raw bitumen. As noted in Consolidated Response OIL-4, the crude oil that would be transported by the proposed proposed Project is similar to other heavy crude oils refined in the U.S. and transported by other pipeline systems. Prior to shipment, the materials obtained from the oil sands are processed to remove many impurities such as sand. The horsepower used to pump oil and the batching operations would be essentially the same as on other crude oil pipeline systems.
1244	82	LaSeur	Carrie	Plains Justice, et al	From the DEIS there is no backup power to the mainline electric motors and this is not necessarily a problem. There appears to be a backup system of the SCADA operation and certain MLVs. The DEIS is not clear if other safety related equipment, such as critical core communication or tank level monitoring, has an adequate and independent electric power supply that will assure safe pipeline operation is maintained, especially during an upset associated with an electric power loss.	All issues related to design specifics and operation of the proposed pipeline system are under the jurisdiction of the Pipeline and Hazardous Materials Safety Administration (PHMSA), as explained in Sections 2.3 and 3.13.1 and in Consolidated Response SAF-1. The EIS describes the basic elements of design, construction, and operation that need to be considered in assessments of the potential impacts of construction and normal operation. As a result, not all equipment that would be installed if the proposed Project is approved is listed and not all operating conditions are listed. The probability of a spill presented in Sections 3.13.3 and 3.13.4 are based on PHMSA incident data, and the impacts of a spill presented in Sections 3.13.5 and 3.13.6 describe what would likely occur if oil were to be released, irrespective of the reason for the release. In essence this section answers the question "what if" and does not rely on specific causes. Pump stations would have battery backup systems.
1244	83	LaSeur	Carrie	Plains Justice, et al	Because of the ability for PHMSA to impose additional requirements as a result of the special permit request, PHMSA had added requirements on the Keystone pipeline system incorporating additional SCADA requirements related to National Transportation Safety Board ("NTSB") pipeline safety investigations and recommendations that have recently been codified into federal pipeline safety regulations. These improvements increase the effectiveness of the SCADA, its presentation and alarm system, and incorporate control room management practices that increase the proficiency and the efficiency of the important control room operators remotely overseeing and operating the pipeline system.	Keystone has withdrawn its application for a Special Permit as described in Consolidated Response REG-1. As described in Consolidated Response SAF-1, the Pipeline and Hazardous Materials Safety Administration (PHMSA) has regulatory requirements that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project in a manner that protects the health and safety of the public and the environment. In addition, PHMSA developed 57 Project-specific Special Conditions that include many conditions for SCADA (see Appendix U of the EIS).
1244	85	LaSeur	Carrie	Plains Justice, et al	While the DEIS is moot about the number of contract employees that will assist the pipeline operator in certain operation, maintenance, and oil spill response activities, 20 employees sounds like a very small number to cover a 24/7 pipeline operation of approx. 1,700 miles of 36-inch pipe, 32 pump stations with multiple pumps (even though electric	Pipeline maintenance and monitoring would be conducted in compliance with PHMSA regulatory requirements and the applicable Special Conditions presented in Appendix U of the EIS.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					drivers simplify the pump station complexity), 74 main line valves, a tank farm, metering equipment, cathodic protection systems, and assorted telecommunication and monitoring as well as safety equipment, that have to be periodically inspected, calibrated and tested, as well as cover round the clock 24/7 response to operating needs or demands.	
1244	86	LaSeur	Carrie	Plains Justice, et al	In fairness to the operator, this low number of employees may reflect a reliance on contract personnel to perform many less critical operational and maintenance activities associated with maintaining the safety of the pipeline. A more detailed review of the work tasks, work load, and requirements, while under the discretion of the pipeline operator, is warranted to assure adequate coverage of maintenance and operational core activities.	DOS agrees that a detailed review of operational procedures is appropriate, and PHMSA will be responsible for conducting that review, including reviews of the Keystone Operations and Maintenance Manual for the proposed Project.
1244	87	LaSeur	Carrie	Plains Justice, et al	PHMSA's approval of the Keystone XL Pipeline Emergency Response Plan is a major federal action subject to NEPA. Although many of the pipeline safety standards in federal law are written as performance standards, PHMSA has discretion to determine whether the means of compliance chosen by a pipeline company satisfies federal law given the size, location, and type of the specific pipeline at issue.	Consolidated Response RES-1 addresses issues related to preparation and review of emergency response plans for the proposed Project.
1244	89	LaSeur	Carrie	Plains Justice, et al	Since federal law requires only that emergency response plans be approved before operation, without specifying how long before operation approval is required and without prohibiting or specifying any particular review procedures, it is entirely possible for PHMSA to comply with both the requirements of federal pipeline law and NEPA.	Consolidated Response RES-1 addresses issues related to preparation and review of emergency response plans for the proposed Project, including NEPA compliance by PHMSA.
1244	90	LaSeur	Carrie	Plains Justice, et al	DOS's failure to include a draft Emergency Response Plan means that Draft EIS provides no opportunity to comment on this critical issue. Instead, the Draft EIS presents merely a general description of federal emergency response planning law, with no details about how the federal government will protect citizen and the environment from the Keystone XL Pipeline.	Consolidated Response RES-1 addresses issues related to preparation and review of emergency response plans for the proposed Project.
1244	91	LaSeur	Carrie	Plains Justice, et al	PHMSA actions under federal pipeline law are subject to NEPA in part because federal pipeline law preempts state and local pipeline safety requirements, with the result that PHMSA actions are the exclusive form of mitigation for impacts related to oil spills from this pipeline. Absent full review of Emergency Response Plan alternatives related to, for example, amount of spill response equipment, number of spill response personnel, location of spill response personnel and equipment, alternative spill response strategies, time for response, worst-case spill scenarios, and mitigation options, the Draft EIS will not consider meaningful alternatives and mitigation related to the primary risk posed by the pipeline to citizens and the environment, namely oil spills.	Consolidated Response RES-1 addresses issues related to preparation and review of emergency response plans for the proposed Project+K52
1244	92	LaSeur	Carrie	Plains Justice, et al	Absent consideration of a Keystone XL Pipeline Emergency Response Plan through this NEPA review, citizens will have no opportunity to comment on the sufficiency of federal actions intended to protect them from oil spills from this pipeline.	Consolidated Response RES-1 addresses issues related to preparation and review of emergency response plans for the proposed Project.
1244	93	LaSeur	Carrie	Plains Justice,	Given several references in the DEIS, this author must caution	Consolidated Response RES-1 addresses issues related to

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
				et al	that additional details are warranted because of the unusual properties of blended bitumen and the temperatures at which the pipeline will be operating that can make oil recovery process and equipment needs substantially different than that for more conventional lighter crude oil blends.	preparation and review of emergency response plans for the proposed Project. As noted in Consolidated Response OIL-4, the Canadian crude oil that would be transported by the proposed Project would be similar to other heavy crude oil transported by pipeline in the U.S. In addition, the temperature of the oil transported would not be different from that of other heavy crudes transported as noted in Special Condition 15 (see Section 3.13.1.1 and Appendix U of the EIS). As discussed in Section 3.13.5.1 of the EIS, if a spill occurs, the behavior of the released Canadian crude oil would be the same as that of other heavy crude oils. Therefore, the recovery process and the equipment needed would be the same as those applicable to other heavy crude oils.
1244	94	LaSeur	Carrie	Plains Justice, et al	An oil spill plan should categorize and address releases as small rate leak releases, both those that reach the surface and those that flow underground, especially those that can threaten aquifers, and then address the oil spill recovery and mitigation plans, including mitigation/recovery techniques for such smaller releases.	Consolidated Response RES-1 addresses issues related to preparation and review of emergency response plans for the proposed Project. As noted in that response, the specific requirements of the plan are the responsibility of PHMSA.
1244	95	LaSeur	Carrie	Plains Justice, et al	A separate section within the oil spill plan related to releases that can enter aquifers is a must as the response and mitigation will be entirely different than that for surface releases.	Consolidated Response RES-1 addresses issues related to preparation and review of emergency response plans for the proposed Project. As noted in that response, the specific requirements of the plan are the responsibility of PHMSA.
1244	98	LaSeur	Carrie	Plains Justice, et al	Certain core information related to oil spill response plans must be made public to assure that such plans can be implemented in a timely manner and be effective for this unique material.	Consolidated Response RES-1 addresses issues related to preparation and review of emergency response plans for the proposed Project. As noted in Consolidated Response OIL-4, the Canadian crude oil that would be transported by the proposed Project would be similar to other heavy crude oil transported by pipeline in the U.S. As discussed in Section 3.13.5.1 of the EIS, if a spill occurs, the behavior of the released Canadian crude oil would be the same as that of other heavy crude oils. Therefore, the recovery process and the equipment needed would be the same as those applicable to other heavy crude oils.
1244	99	LaSeur	Carrie	Plains Justice, et al	One core document that is important in evaluating whether an ERP will be effective on a particular pipeline, is an elevation profile of the pipeline showing the approximate location of mainline valves including check valves. An elevation profile is especially important in judging the soundness of an ERP when it comes to a large high rate release associated with pipeline ruptures. The elevation profile is much less effective in evaluating the ERP when it comes to leaks. An elevation profile indicating the location of the mainline valves, including check valves, and their mode of operation will also help determine and confirm if the placement of such valves, especially check valves, is appropriate. Some highly sensitive areas warrant remote operated mainline valves, other than check valves, given the possible severe consequences in the event of a release.	Consolidated Response RES-1 addresses issues related to preparation and review of emergency response plans for the proposed Project. As noted in that response, the specific requirements of the plan are the responsibility of PHMSA. All issues related to design specifics and operation of the proposed pipeline system, including valve placement, are under the jurisdiction of the Pipeline and Hazardous Materials Safety Administration (PHMSA), as explained in Sections 2.3, 2.3.1, and 3.13.1 and in Consolidated Response SAF-1. PHMSA regulations in 49 CFR 195 and Project-specific Special Condition 32 include requirements for the placement of valves.
1244	100	LaSeur	Carrie	Plains Justice, et al	According to Section 3.3.1.1 of the draft EIS, the proposed route for the Keystone Pipeline Project passes directly over a number of shallow aquifers in the eastern Dakotas and	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					Nebraska. Many of these shallow aquifers along the proposed pipeline route are close enough to the surface to be directly replenished by rainfall and hydraulically connected to surface waters. This means that any leak or spill from the pipeline has the potential to contaminate these underlying aquifers, and unlike surface waters, they cannot be directly accessed for the purpose of clean-up and mitigation measures.	
1244	101	LaSeur	Carrie	Plains Justice, et al	Many rural residents and rural communities rely on both private and public wells that draw potable water from shallow aquifers the eastern Dakotas and Nebraska. In addition, rural residents actively engaged in production agriculture are likely to have irrigation systems and livestock that also depend on these shallow aquifers as a primary water source. The draft EIS does not adequately address the full range of consequences that would result from a catastrophic leak or spill along the pipeline that occurs over an underlying shallow aquifer.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
1244	102	LaSeur	Carrie	Plains Justice, et al	At Section 5.3.1, the draft EIS concludes that “[m]any of the aquifers present beneath, or in the vicinity of, the proposed route are isolated by the presence of glacial till,” which would offer a measure of protection from contamination. For those near-surface aquifers that do not have this overlying layer of protection, the draft EIS notes that “measures have been proposed ... to reduce the potential impact of leaks and spills during construction.” The draft EIS does not address what measures would be implemented to protect these aquifers during the operation lifetime of the pipeline.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. In addition, the EIS no longer includes Section 5.0 since the same summary information is presented in the Executive Summary.
1244	104	LaSeur	Carrie	Plains Justice, et al	What contaminants would be released into the groundwater in the event of such a spill? What would be the likely duration of such contamination?	Section 3.13 of the EIS addresses the potential environmental impacts associated with spills, including duration which would vary with habitat and environmental conditions. Consolidated Response OIL-4 and Sections 3.13.5 and 3.13.6 provide a summary of the composition of the transported crude oils.
1244	105	LaSeur	Carrie	Plains Justice, et al	If a spill from the pipeline could permanently contaminate a shallow aquifer that rural residents rely on for their potable water, is it appropriate to route the pipeline over such aquifers, or are there viable alternatives?	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. Consolidated Response ALT-1 addresses potential alternative routes, including routes that would avoid much of the Northern High Plains Aquifer system.
1244	106	LaSeur	Carrie	Plains Justice, et al	The final EIS should more thoroughly examine the risk to shallow aquifers posed by the Keystone Pipeline Project. The draft EIS does not address these issues, which are vital to the health and livelihood of the rural residents who depend on these aquifers as their sole source of potable water.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
1244	107	LaSeur	Carrie	Plains Justice, et al	Water is a priceless resource in the region to be traversed by the pipeline. The DEIS indicates in many segments of the report that the pipeline will not cross any sole-source aquifers. We question the correctness of these statements and request further documentation of affected aquifers.	Consolidated Response AQF-2 addresses pipeline routing through shallow aquifers. In addition, there are no sole source aquifers crossed by the pipeline as designated by EPA Region 6, 7, and 8.
1244	109	LaSeur	Carrie	Plains Justice, et al	Oil spill response plans (or ERPs) should identify how a specific aquifer will be protected and how contamination will be addressed. This is especially important to avoid serious contamination of critical aquifers such as the Ogallala Aquifer that plays a very important water supply role along parts of the Pipeline route. Remediation could include actually digging up	Consolidated Response RES-1 addresses issues related to preparation and review of emergency response plans for the proposed Project. As noted in that response, the specific requirements of the plan are the responsibility of PHMSA. Consolidated Response AQF-3 addresses potential accidental

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					soil contaminated with the very thick bitumen blends in the event various other remediation approaches are ineffective.	releases of oil into the High Plains Aquifer System and the associated response procedures. As noted in Consolidated Response OIL-4, the Canadian crude oil that would be transported by the proposed Project would be similar to other heavy crude oil transported by pipeline in the U.S. As discussed in Section 3.13.5.1 of the EIS, if a spill occurs, the behavior of the released Canadian crude oil would be the same as that of other heavy crude oils. Therefore, the recovery process and the equipment needed would be the same as those applicable to other heavy crude oils.
1244	110	LaSeur	Carrie	Plains Justice, et al	There is a specific type of aquifer, called a karst aquifer that usually merits special attention given its unique characteristics. Considerable discussion is presented in the DEIS related to the pipeline and the exposure to subsidence to the pipeline in karsts. While federal pipeline safety regulations require the pipeline operator to consider abnormal load threats such as that from subsidence, the more critical issue is the threat that the pipeline has to the karst aquifer as a water source.	See Consolidated Response AQF-3 for a discussion on the potential for groundwater resources (aquifers) to be impacted by the proposed Project. As described in the EIS, potential karst features are present in the Niobrara Formation in Nebraska. This formation is typically covered by 50 feet of sediment, so impacts to these karst features (if filled with water), would be limited. In southeastern Oklahoma and Texas, karst features may be present in flat-lying carbonate rock. However, the proposed Project route does not cross any principal karst aquifers. The nearest principal karst aquifers are the Arbuckle-Simpson aquifer, located approximately 12 miles to the west and Ozark Plateau Karst Aquifer, located approximately 90 miles to the east in northeastern Oklahoma.
1244	111	LaSeur	Carrie	Plains Justice, et al	Karst aquifers consist mainly of water flow structures that can cause released oil in such an environment to more rapidly move through the aquifer. The fracture structure of a karst aquifer makes oil removal, especially the heavier oil moved by the pipeline, extremely difficult, if not impossible, to remove.	See Consolidated Response AQF-3 for a discussion on the potential for groundwater resources (aquifers) to be impacted by the proposed Project. As described in the EIS, potential karst features are present in the Niobrara Formation in Nebraska. This formation is typically covered by 50 feet of sediment, so impacts to these karst features (if filled with water), would be limited. In southeastern Oklahoma and Texas, karst features may be present in flat-lying carbonate rock. However, the proposed Project route does not cross any principal karst aquifers. The nearest principal karst aquifers are the Arbuckle-Simpson aquifer, located approximately 12 miles to the west and Ozark Plateau Karst Aquifer, located approximately 90 miles to the east in northeastern Oklahoma.
1244	112	LaSeur	Carrie	Plains Justice, et al	Regarding pipeline routing, special precautions should be exercised in karst aquifers and any aquifers that may have rapid migration phenomena in the event a pipeline oil release can reach such structures, especially if these aquifers are sole sources of water.	See Consolidated Response AQF-3 for a discussion on the potential for groundwater resources (aquifers) to be impacted by the proposed Project. As described in the EIS, potential karst features are present in the Niobrara Formation in Nebraska. This formation is typically covered by 50 feet of sediment, so impacts to these karst features (if filled with water), would be limited. In southeastern Oklahoma and Texas, karst features may be present in flat-lying carbonate rock. However, the proposed Project route does not cross any principal karst aquifers. The nearest principal karst aquifers are the Arbuckle-Simpson aquifer, located approximately 12 miles to the west and Ozark Plateau Karst Aquifer, located approximately 90 miles to the east in northeastern Oklahoma.
1244	113	LaSeur	Carrie	Plains Justice, et al	Pipelines that can affect sole source aquifers, especially karst-like aquifers, are identified as unusually sensitive areas marked for special pipeline integrity management protocols in federal pipeline safety regulation covering HCAs.	See Consolidated Response AQF-3 for a discussion on the potential for groundwater resources (aquifers) to be impacted by the proposed Project. As described in the EIS, potential karst features are present in the Niobrara Formation in Nebraska. This formation is typically covered by 50 feet of

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
						sediment, so impacts to these karst features (if filled with water), would be limited. In southeastern Oklahoma and Texas, karst features may be present in flat-lying carbonate rock. However, the proposed Project route does not cross any principal karst aquifers. The nearest principal karst aquifers are the Arbuckle-Simpson aquifer, located approximately 12 miles to the west and Ozark Plateau Karst Aquifer, located approximately 90 miles to the east in northeastern Oklahoma.
1244	114	LaSeur	Carrie	Plains Justice, et al	Table 3.1.4-3 in the DEIS lists approximately fifty miles of the pipeline that cross karst aquifers as identified by national scale karst maps. The DEIS goes on to state "Keystone would consult with the respective state geological survey departments to identify the most up-to-date sources of data on karst-related subsidence hazards along the proposed route." We request that such karst aquifers be screened as to their potential to be impacted by an oil spill (leak or rupture) from the pipeline. If such an analysis finds the pipeline to be a serious threat, the pipeline should be routed out of the karst risk area, or effective pipeline mitigation efforts incurred to prevent contamination from the pipeline.	See Consolidated Response AQF-3 for a discussion on the potential for ground water resources (aquifers) to be impacted by the proposed Project. As described in the EIS, potential karst features are present in the Niobrara Formation in Nebraska. This formation is typically covered by 50 feet of sediment, so impacts to these karst features (if filled with water), would be limited. In southeastern Oklahoma and Texas, karst features may be present in flat-lying carbonate rock. However, the proposed Project route does not cross any principal karst aquifers. The nearest principal karst aquifers are the Arbuckle-Simpson aquifer, located approximately 12 miles to the west and Ozark Plateau Karst Aquifer, located approximately 90 miles to the east in northeastern Oklahoma.
1244	115	LaSeur	Carrie	Plains Justice, et al	We request a separate analysis of risks and impacts to agricultural and native soils, native biota, and productive capacity.	Impacts related to native soils, native biota, and agriculture are addressed in Sections 3.2, 3.5, and 3.9 of the EIS. Productive capacity is not addressed since Keystone would compensate landowners for lost productivity as described in its Construction, Mitigation, and Reclamation Plan in Appendix B.
1245	12	LaSeur	Carrie	Plains Justice, et al	NEPA does not limit assessment of impacts to only those impacts that are subject to federal regulation, in part because Congress intended that NEPA review act to inform Congress and agencies of significant impacts that have not yet been addressed through federal programs.	The EIS for the proposed Project addresses potential impacts associated with construction, operation, maintenance, and monitoring of the Project and considers alternatives to the proposed Project. It does not limit the impact assessments to "impacts that are subject to federal regulation."
1245	16	LaSeur	Carrie	Plains Justice, et al	The draft EIS does not adequately address the potential adverse impacts of the Pipeline on historic cultural resources of Native American nations along the route.	Consolidated Response CUL-1 and Section 3.11 of the EIS address protection of historic properties and the consultations conducted in compliance with Section 106 of the National Historic Preservation Act, including consultation with Indian tribes. DOS considers this assessment to be in compliance with NEPA environmental review requirements.
1245	17	LaSeur	Carrie	Plains Justice, et al	According to the EIS, many of the traditional cultural properties studies are still "currently underway," and some nations and tribes have not formally responded to communications from State. Although the proposed pipeline route does not currently cross any lands owned by the various Native American nations and tribes consulted with as a part of this process, federal regulations require a process of formal consultation for any properties of "historic significance" to Native American nations and tribes. These same regulations further require that the relevant federal agency "must, except where appropriate to protect confidentiality concerns of affected parties, provide the public with information about an undertaking and its effects on historic properties and seek public comment and input."	Consolidated Response CUL-1 and Sections 3.11.1.2 and 3.11.4.3 of the EIS address properties of religious and cultural significance to Indian tribes, including Traditional Cultural Properties, and the consultation process between DOS and Indian tribes.
1245	18	LaSeur	Carrie	Plains Justice, et al	To date, the public has been provided with no information about the potential adverse impacts of the Pipeline on cultural	Consolidated Response CUL-1 and Section 3.11 of the EIS address protection of historic properties and the consultations

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					resources of Native American nations and tribes along the proposed pipeline route. Indeed, it would be impossible for the Department of State to have done so, because formal consultations with affected Native American nations and tribes were incomplete at the time the draft EIS was published. In order for all affected parties, including members of the general public, to adequately comment in this important issue, it is vital that State complete the required process of consultation with affected Native American nations and tribes prior to publishing a final EIS.	conducted in compliance with Section 106 of the National Historic Preservation Act, including consultation with Indian tribes. Potential impacts of the proposed Project on cultural resources are discussed in Sections 3.11.1 and 3.11.3.1 of the EIS. The DEIS was made available to the public for review and comment. The Traditional Cultural Property (TCP) reports (noted in 3.11.4-3) may not be disclosed due to concerns regarding confidentiality.
1245	19	LaSeur	Carrie	Plains Justice, et al	It is vital that the results of tribal consultations be made available for public comment, as required by federal regulation. Without gathering this information through a rigorous process of formal consultation and subjecting the findings and conclusions to public comment, the impacts of the Pipeline on important Native American cultural resources cannot be properly predicted or adequate mitigation plans drafted in a final EIS.	Consolidated Response CUL-1 and Section 3.11 of the EIS address protection of historic properties and the consultations conducted in compliance with Section 106 of the National Historic Preservation Act, including consultation with Indian tribes. The Programmatic Agreement (PA) provides the process by which cultural resources adversely affected by the project are mitigated and how the associated consultation process is conducted between the DOS and other federal agencies, tribes, SHPOs, and other consulting parties. The DEIS was made available to the public for review and comment. The Traditional Cultural Property (TCP) reports and (noted in 3.11.4-3) as well as specific aspects of tribal consultation may not be disclosed due to concerns regarding confidentiality.
1245	20	LaSeur	Carrie	Plains Justice, et al	We believe that the Draft EIS does not provide a full and fair discussion of significant environmental impacts of the Keystone XL project.	The impacts associated with implementation of the proposed Project are addressed in Section 3.0 of the EIS. As noted in that section, construction and normal operation the proposed Project would not result in significant environmental impacts. As noted in Consolidated Response ENR-1, the environmental review, including preparation of this EIS, has been conducted consistent with the DOS regulations pertaining to NEPA (22 CFR Part 161) as well as the Council on Environmental Quality (CEQ) regulations for implementing NEPA (40 CFR Part 1500). As a result, DOS considers the EIS to be consistent with the requirements of a NEPA environmental review.
1245	21	LaSeur	Carrie	Plains Justice, et al	Commenters request that State issue a subsequent DEIS that addresses these shortcomings and allows for further review and comment. Commenters have demonstrated at length that major portions of the DEIS are inadequate. In such circumstances, NEPA regulations require re-issuance of a revised draft.	Consolidated Response P&N-6 addresses requests for a supplemental draft EIS.
1245	22	LaSeur	Carrie	Plains Justice, et al	Failing significant improvement of the draft EIS, the no action alternative will be the only responsible action based on the inadequate demonstration of need for the Pipeline and the significant impacts that the project is likely to have on human health and the environment.	Consolidated Response P&N-1 addresses the need for the proposed Project. As described in the EIS, construction and operation would not result in significant impacts and the commenter has not identified any specific impacts she considers significant.
1245	23	LaSeur	Carrie	Plains Justice, et al	The hundreds of Americans whose land will be condemned for a foreign corporation's private development project deserve the highest level of agency scrutiny on every detail of this misguided endeavor.	As described in Section 1.0 of the EIS and in Consolidated Response RES-2, TransCanada-Keystone Pipeline LP (Keystone) is not a foreign corporation. It is a limited partnership organized under the laws of the state of Delaware. Keystone has the same rights as other pipeline companies in the U.S. to propose projects. Consolidated Response EAS-2 addresses issues related to easement negotiations. As noted

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
						in that response, DOS has no legal authority in the easement negotiation process. Consolidated Response ENR-1 provides information on the Department of State's environmental review process, the National Interest Determination process, and the need to complete those reviews before approving or denying the Presidential permit for the proposed Project.
1243	16	LaSeur	Carrie	Plains Justice, et al	The EIS must examine the environmental impacts of the spur lines that will transport the Montana oil to their connections with the main Pipeline. Specifically, the EIS should contain an analysis of several alternatives for the spur lines, including analyses of their respective water crossings and proximity to sensitive areas.	Consolidated Response ALT-3 addresses issues related to transportation of crude oil from the Williston Basin.
1243	33	LaSeur	Carrie	Plains Justice, et al	The DEIS fails to consider environmental impacts associated with new power lines and power generation sources that will be required to provide the large amounts of electricity required by the project. In light of the probability that interconnection for domestic oil producers will be required as part of the Montana siting process, the infrastructure necessary for that interconnection must also be evaluated as part of the EIS process. These impacts are part of the project impacts and must be considered as part of a single EIS to avoid illegal segmentation.	Consolidated Response ALT-3 addresses issues related to transportation of crude oil from the Williston Basin. Consolidated Response ELE-1 addresses issues regarding the potential need for additional energy sources to provide electrical power for the pump stations and mainline valves. During operation, the pump stations would consume at least as much electrical power as other customers currently use in the area. That could result in long-term stability of the usage rates of electricity and increased profits to local electric co-ops.
546	1	Latham	Darwin		I urge you to allow the permit for the Keystone XL pipeline. This pipeline will provide a substantial boost to the economy of the cities, counties, and States that the pipeline will go through. There will be short term jobs created during the construction phase, and some long term jobs associated with the pumping stations when the pipeline is operational. The local tax revenue that will be generated for the counties and school districts in the rural areas will be a huge benefit.	Comment acknowledged.
546	2	Latham	Darwin		In my home county, Harding County, SD, it is estimated that the valuation of the 2 pumping stations located within the county will equal the entire current tax base in the county. This will increase available revenues for local government, and at the same time lower the tax burden on residents. I again urge you to allow the permit for the Keystone XL Pipeline.	Comment acknowledged.
1110	1	Latta	Janet		As a lifelong Nebraskan, I understand what a hidden treasure the United States has beneath the Midwest Plains in the form of the Ogallala Aquifer. This vast reservoir of fresh water must be protected from foreign entrepreneurs who see nothing but treeless miles to cross for their own profit.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
1110	2	Latta	Janet		The Keystone XL oil pipeline project must be stopped before an unregulated accident again threatens the precious natural resources of our country.	Consolidated Response ENR-1 provides information on the Department of State's environmental review process, the National Interest Determination process, and the need to complete those reviews before approving or denying the Presidential permit for the proposed Project.
1110	5	Latta	Janet		We "small people" must join together to say no to companies who would use our country's thirst for energy as a motivator for reckless disregard for our irreplaceable land and water... Tell our Canadian neighbors that pumping tar sand oil under high pressure over a thousand miles through our country's heartland is a bad idea. Please, do not allow the Keystone XL pipeline to be built.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information on current and future production. As noted in that Consolidated Response, without the proposed Project, oil sands development would continue at or above the current level until at least 2020, with or without the proposed Project. Consolidated Response OIL-4 addresses the composition of

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
						the Canadian crude oil that would be transported by the proposed Project, including concerns relative to the corrosivity and erosivity of the crude oil. As noted in that Consolidated Response, that crude oil is similar in composition and properties to other heavy crude oils that are currently transported within the U.S. pipeline system and similar in composition and properties to other heavy crude oils that are currently refined in PADD III.
1500	1	Laudeman	Chuck	Newfield Exploration Company	On behalf of Newfield Exploration Company, I am writing to express my support for TransCanada's Keystone XL (KXL) crude oil pipeline, and to urge that the Department of State continue its permitting process for this important energy infrastructure project. KXL is important for America's domestic energy security, not only because it will deliver crude to U.S. markets from our closest ally and neighbor, Canada, but because it will also facilitate the ongoing development of the Bakken formation within the Williston Basin in the United States of America. Energy independence is a national priority. The Bakken formation is the only land-based region of the continental United States where oil production has been increasing in recent years. The U.S. Geological Survey estimates there are between 3 billion and 4 billion barrels of technically recoverable oil in the Bakken formation. This is a tremendous national resource that can displace imports from unfriendly or unstable nations. This resource will not be developed to its full potential without maximizing access to markets and additional pipeline capacity. Standing alone, KXL would alleviate some of the existing congestion in regional pipeline systems and therefore benefit domestic oil production. More importantly, TransCanada is actively working with Bakken producers in Montana and North Dakota to determine if there is sufficient interest and commercial support to provide a connection to KXL for Bakken producers. Such a connection would not only provide access to additional U.S. markets but increase domestic oil production, reduce dependence on foreign oil, increase jobs, and increase tax revenues. I strongly encourage the Department of State to reject calls to halt its rigorous permitting process for this vital national energy infrastructure project. This process, fully compliant with the National Environmental Policy Act and under the auspices not only of the Department of State but an additional eleven cooperating agencies, is fully sufficient to determine whether or not this vital national energy infrastructure project will meet our rigorous environmental standards, and therefore believe the process should continue.	Comment acknowledged.
1559	32	Lauman	Jeff		U.S. oil production has declined since 1970.	Consolidated Response P&N-1 addresses the need that the Project has been proposed to meet, including information on crude oil supply and demand from an analysis specific to the proposed Project.
1559	35	Lauman	Jeff		Agrees with the comment about the need for this pipeline for national security.	Comment acknowledged.
1559	65	Lauman	Jeff		First aquifer below land surface is anywhere from 8-25 feet. So if bury pipe deeper it would be subject to more corrosion over time.	The pipe would be buried deeper than required by the regulations of the Pipeline and Hazardous Materials Administration (PHMSA) as described in Section 2.3.2.3 and

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
						<p>in Speical Condition 19 (see Appendix U of the EIS). Along most of the proposed route, the top of the pipe would be 4 feet below the surface of the land.</p> <p>As described in Section 2.3.1 of the EIS, to avoid or minimize external corrosion, the entire pipeline would be coated pipe with a corrosion-protectant bond and the proposed Project would include a cathodic protection system. Keystone would conduct internal monitoring of the pipeline as a part of its Integrity Management Program and would replace sections of pipe that have unacceptable corrosion levels as defined by PHMSA. In addition, PHMSA regulations include requirements to address corrosion (see 49 CFR 195, Subpart H -- Corrosion Control) and PHMSA Special Conditions 9, 34, 37, 39, 49, and 52 address corrosion monitoring, repair, and reporting (see Appendix U).</p>
1435	1	Laut	Steve	Canadian Natural Resources Limited	This project is a vital link to secure energy supplies for the United States from Canada. Canada is a valued trading partner and the most reliable supplier of foreign-based crude oil.	Comment acknowledged.
1435	2	Laut	Steve	Canadian Natural Resources Limited	The environmental benefits of Keystone XL should not be overlooked. The current tragedy in the Gulf underscores the importance of a diverse portfolio of energy supplies. Within the spectrum of viable options, it is appropriate to seek a growing role for oil resources that are: Land-based; North American; and, Transported by pipeline. TransCanada's Keystone XL project meets each of these criteria.	As described in Consolidated Response GLF-1, the risks associated with the proposed Project are substantially different from those associated with the BP Deepwater Horizon Project.
1435	3	Laut	Steve	Canadian Natural Resources Limited	Securing stable and affordable energy from Canada through projects such as the Keystone pipeline will offer more stable prices for consumers as significant interruptions of pipeline operations are few and easily resolved. Pipelines are the safest, most reliable, economical and environmentally favorable way to transport oil and petroleum products, as well as other energy liquids, throughout the U.S. Canada and the U.S. depend on more than 175,000 miles of liquid pipelines to move energy and draw materials safely and reliably. Additional pipeline capacity will help consumers and businesses throughout the United States by providing the means to a dependable source of energy.	Comment acknowledged.
1435	4	Laut	Steve	Canadian Natural Resources Limited	This project also stands to provide a powerful private sector economic stimulus. During construction, Keystone XL will create more than 13,000 jobs funded with private investment. In addition, local governments will have a steady source of income from economic activity associated with construction and from property tax revenues paid by the pipeline company.	Consolidated Response ECO-1 addresses potential socioeconomic impacts, and Consolidated Response TAX-1 addresses concerns regarding taxes.
98	1	Lawrence	Barbara		Surely you realize that Texas is a state running amok, energy wise. We experience a proliferation of dirty power plants, with very little regulation. With the country trying to improve our air quality I see no reason to allow the Keystone XL pipeline to go through and cause further dirty air.	The proposed Project does not include any regulated sources of emissions in Texas. Based on the nonattainment status of Texas counties in which the pipeline will pass, a General Conformity analysis was prepared (see Section 3.12.1.3 of the EIS). It was determined that construction emissions for the Project would be accounted for in the SIP emissions budget and the proposed activity within the Houston-Galveston-Brazoria nonattainment area was presumed to conform to the SIP.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
						As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries.
842	1	Lechner	Joel		I would like to voice my concern over the keystone XL pipeline running through my state. I'm sure there are plenty of other comments that deal with fears of contamination of the vast underground water resources that are underneath the pipeline routing pathway, so I will be brief. As valuable as oil is in the current world, water is even more valuable. Oil will never be as important to existence as oil. There has to be another way. Perhaps above ground piping, or a different route would be a better compromise to both move what is undoubtedly an important resource, but still protect our most important resource. Thank you for your attention. Please do not let this pipeline go forward in the current configuration.	Consolidated Response ALT-1 and Section 4.3 address potential alternative routes, including following the existing Keystone Oil Pipeline System route to minimize the distance the proposed Project would extend across the Northern High Plains Aquifer system. Issues related to an aboveground pipeline are addressed in Consolidated Response CST-1.
391	1	Leclerc	John		I am concerned about the oversight, safety, reliability and maintenance of this pipeline, it's impact on wildlife, and the ecological impact of supporting operations in Canada.	Consolidated Response SAF-1 describes the regulatory requirements that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project. It also describes the inspections and reviews of the proposed Project that the Pipeline and Hazardous Materials Safety Administration would conduct to ensure compliance with those regulatory requirements. The impacts associated with implementation of the proposed Project are addressed in Section 3.0 of the EIS. As noted in that section, construction and normal operation the proposed Project would not result in significant environmental impacts. Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project.
631	1	Lee	April		Please keep this pipeline away from the Nebraska Sand Hills.	Identification of sensitive environments crossed by the proposed Project is discussed in Consolidated Response ENV-1 and ENV-3. Issues related to the Sand Hills area are addressed in Consolidated Response ERO-1.
711	1	Lee	Justin		I urge the US government to not approve the the Keystone XL pipeline. Once this pipeline is built it will be politically impossible to shut it down, even if all parties agree that tar sands are not the energy source we need. It is far simpler, and cheaper, to not build it in the first place.	The commenter's opinion is noted.
711	2	Lee	Justin		...but neither the US nor Canada can accept the environmental degradation that Tar Sands cause. Long before the Deepwater Horizon disaster in the Gulf tar sands projects have been shown to cause massive damage to local ecosystems, and entire watersheds...	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project.
711	3	Lee	Justin		...It does not make fiscal sense for the US to allow this massive project that quickly turn into a financial boondoggle as soon as energy/carbon legislation is passed, and it will only make it harder for us to meet our domestic and international commitments. ...	The commenter's opinion is noted.
711	5	Lee	Justin		...Not only is Obama Administration setting a new path to ...	The commenter's opinion is noted.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					mitigate the worst effects of climate change, which this project does neither, ...	
1541	27	Lee	Chuck		Will a disaster plan be made available to the local county coordinators and the State of Montana? If something is to happen, we're going to be one of the people called on. I want to make sure that the disaster emergency services are in the loop.	Consolidated Response RES-1 addresses issues related to preparation and review of emergency response plans for the proposed Project.
1541	28	Lee	Chuck		We have a lot of concerns about the camps. We're not against it, but we do have concerns. In 2000 the population of Fallon County was 2,837. In Baker there was 1,695 people. If we have an influx of 600 people, maybe more, we're talking a 33 percent increase in population. No offense to the people that do the work, but that's going to be a lot of young, fired-up men. From a law enforcement standpoint, traffic, road conditions, etc, we have concerns.	Potential socioeconomic impacts due to the use of construction camps are addressed in Section 3.10.2.2 of the EIS. As noted in that Section, DOS understands that Keystone would work with local law enforcement, fire departments, and emergency service providers, including medical aid facilities, to establish appropriate and effective emergency response measures.
1541	29	Lee	Chuck		If we have a thousand new people in this community, how are we going to deal with that and the effects, whether it's law enforcement, shopping, whatever. This is going to affect the community. What efforts are being made to assist with that?	Potential socioeconomic impacts due to the use of construction camps are addressed in Section 3.10.2.2 of the EIS. As noted in that Section, DOS understands that Keystone would work with local law enforcement, fire departments, and emergency service providers, including medical aid facilities, to establish appropriate and effective emergency response measures.
1550	12	Lee	Anita		I hope you have not signed yet for three reasons. One of them is, as you've learned in the last couple weeks, they're still changing the rules. They went to the PUC. They had some things changed. Those changes were granted. This is a permanent easement they want you to sign. I mean when they change the rules on a permanent easement we're talking like a marriage contract when they haven't decided who the wife is going to be yet, only there's no annulment.	Consolidated Response EAS-2 addresses issues related to easement negotiations and eminent domain. DOS has no legal authority in the easement negotiations or in eminent domain proceedings.
1550	14	Lee	Anita		Asking landowners to question why the crude has to be piped all they way across the US if its actually going to be used in the US.	As noted Consolidated Response P&N-1, the project has been proposed to meet a need for heavy crude oil in the Gulf Coast area and will replace declining supplies of heavy crude oil from Mexico and Venezuela. That need cannot be met by existing sources of oil in the U.S. Consolidated Response P&N-2 addresses exports of refined product from the U.S. Gulf Coast.
1550	15	Lee	Anita		Discussion about an ordinance in Meade County and asking to hold off approving pipeline until after the next County Commissioners election in Meade Co.	Consolidated Response ENR-1 provides information on the Department of State's (DOS's) environmental review process, the National Interest Determination (NID) process, and the need to complete those reviews before approving or denying the Presidential permit for the proposed Project. DOS will make a decision on the Presidential Permit application and the NID 90 days after the final EIS is issued.
412	1	Leeker	Mark		For the sake of all future generations please do not sign off on this FOOLISH proposal. We can survive and live well without oil, not so without clean water. Please consider the future of mankind!	The commenter's opinion is noted.
1557	26	Leeper	Kevin		Real problem is that we are all consumers of oil and cannot switch to alternative energy sources overnight. TransCanada is the strictest company in regards to safety and the environment. Believes that TransCanada will make sure that the people that build the pipeline are competent and will do it in a trustworthy manner. Would feel safer if he knew the job	Consolidated Response ALT-2 addresses the use of alternative technologies, alternative energy sources, and conservation of energy.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					was being done right.	
904	1	Leitz	Curt	Minnesota Division, Izaak Walton League of America	The Minnesota Division of the Izaak Walton League of America (IWLA) primary concern is that the proposed project's DEIS does not adequately address several issues raised during the scoping process. The "United States Department of State Scoping Summary for the Keystone XL Project Environmental Impact Statement," published May 2009, reflects comments that urge a full analysis of the cumulative impacts of producing and refining Western Canadian Sedimentary Basin (WCSB) crude oil (p. 11, p. 14), including GHG emissions that will result directly and indirectly if the proposed project is developed. We feel this analysis is abridged or absent in the DEIS.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information on current and future production. As noted in that response, without the proposed Project, oil sands development would continue at or above the current level until at least 2020, with or without the proposed Project. Consolidated Response GHG-1 addresses the greenhouse gas life-cycle analyses presented in the EIS. As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries.
904	2	Leitz	Curt	Minnesota Division, Izaak Walton League of America	The analysis of need for the proposed project in DEIS section 1.2.2 acknowledges the many sources of uncertainty in projections of crude oil supply, demand, prices, government regulations, costs and availability of alternative energy sources, etc. (p. 1-4). Nonetheless, this section proceeds with the assumption that domestic consumption of crude oil will not decrease over the next thirty years, and that consumption of heavy crude will increase (p. 1-4). This assumption, paired with the assumption that sources of light, sweet crude will decline or become unstable, is used to argue for the necessity of the proposed project. However, the most recent U.S. Energy Information Administration (EIA) forecasts project a significant decline (3 million barrels/day) in U.S. imports of crude oil by 2030 (http://www.eia.doe.gov). The EIA analysis shows that the current pipeline system can handle the projected volumes of imported heavy crude.	Consolidated Response P&N-1 addresses the need that the Project has been proposed to meet. As noted in that response, the Project has been proposed to meet the heavy crude oil needs of refineries in the Gulf Coast area, not for the U.S. in general.
904	3	Leitz	Curt	Minnesota Division, Izaak Walton League of America	By law, the EIA cannot factor expected (indeed, certain) future laws and regulations limiting greenhouse gas (GHG) emissions. Numerous regional and state initiatives, including the Western Climate Initiative, the Midwest Greenhouse Gas Reduction Accord, and Minnesota's Next Generation Energy Act, are working to reduce GHG emissions in the coming decades. Federal policies are following suit. As the DEIS recognizes, in 2007 the Supreme Court found that GHGs are pollutants covered by the Clean Air Act (Massachusetts v. EPA, 549 U.S. 497). The Environmental Protection Agency is now required to regulate GHG emissions as a pollutant that endangers the health and welfare of current and future generations, including GHG emissions from motor vehicles (DEIS 3.14-38). One result of this regulation and other expected federal regulations is that GHG emissions will be required to decline, causing a further decline in demand for imported crude oil. The DEIS fails recognize and analyze such factors in assessing the need for the proposed project.	The CEQ regulations for implementing NEPA do not require that environmental review consider the potential impacts of proposed projects in relation to speculative policies and goals, only existing plans, regulations, and policies. However, the analysis of need for the proposed Project did include consideration of the EPA low-demand scenario as well as consideration of the effect of the use of alternative technologies and energy conservation. Consolidated Response P&N-1 addresses the need that the Project has been proposed to meet.
904	4	Leitz	Curt	Minnesota Division, Izaak Walton League of America	Section 3.0 of the DEIS discusses numerous environmental impacts and procedures to mitigate those impacts. The Minnesota Division IWLA has significant concerns that the DEIS does not adequately analyze the cumulative and indirect impacts that would result from development of the proposed project. Section 3.14, "Cumulative Impacts," asserts that the	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information on current and future production. As noted in that response, without the proposed Project, oil sands development would continue at or above the current level until at least 2020, with or without the proposed Project. Section

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					DEIS “employs the definition of cumulative impacts found in the Council on Environmental Quality’s (CEQ) regulations implementing NEPA: “the impact on the environment which results from the incremental impact of the action when added to other past, present, and reasonably foreseeable future actions regardless of what agency (federal or non-federal) or person undertakes such actions” (40 CFR 1508.7).” However, the DEIS fails to consider cumulative impacts that will result from further exploitation of WCSB reserves that are the source of heavy crude to be transported by the proposed project. Ostensibly, this omission is due to the assumption that U.S. demand for imported heavy crude will increase in the coming decades and due to the assumption that the WCSB reserves will be exploited regardless of whether the proposed project is developed. We dispute these assumptions. Because the DEIS proceeds on these two assumptions, parts of Section 3.0, “Environmental Analysis,” are incomplete or inadequate.	3.13.4 of the EIS has been revised to expand discussions of extraterritorial concerns.
904	7	Leitz	Curt	Minnesota Division, Izaak Walton League of America	Section 3.14.3.14, “Air Quality, Greenhouse Gasses, and Climate Change” of the DEIS considers the proposed projects effects on refinery emissions to be “speculative” and thus “not required” as part of the environmental review process (p. 30). Because some refineries have already been retooled to process heavy, sour crude instead of sweet, light crude, the resulting effects on refinery emissions are not speculative. While the pipeline infrastructure and system of contracts between suppliers and consumers (refineries) may preclude predicting changes to emissions at a specific refinery, systemwide predictions can be made based on the increased processing of heavy, sour crude that would result from development of the proposed project.	As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries. Consolidated Response OIL-4 also addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils.
904	8	Leitz	Curt	Minnesota Division, Izaak Walton League of America	Section 3.14.3.14 fails to consider the cumulative GHG emissions, and the resulting effects of climate change on those emissions, that will result from increased exploitation of WCSB reserves. Tar sands are a notoriously carbon-intensive source of petroleum products. The DEIS analyzes GHG emissions based on the assumption that refining one barrel of heavy, sour crude emits 47.4 kilograms of carbon dioxide (p. 41). From this figure, the DEIS extrapolates that refining the oil transported by the proposed project will result in additional emissions of from 1.3 to 17.2 million tons of carbon dioxide annually (p. 41). What these figures omit, however, is the increased emissions caused by production of the heavy, sour crude in the first place. Canada’s National Energy Board (NEB) estimates that production of crude from WCSB reserves emits approximately 75 kilograms/barrel of carbon dioxide (“Canada’s Oil Sands: Opportunities and Challenges to 2015, An Update,” 2006, Cat. No. NE23-116/2006E, p. 39). The cumulative effects analysis, and especially the analysis of GHG emissions, is woefully inadequate without considering the impacts of developing the tar sands and producing the crude oil. The DEIS disregards these impacts on the basis of faulty assumptions regarding U.S. demand for heavy crude and whether WCSB reserves would be developed independently of the development of the proposed project. We dispute the latter assumption.	Consolidated Response GHG-2 addresses the potential causal connection of implementation of the proposed Project and expanded oil sands production in Canada and increases in refining. Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project. Consolidated Response GHG-1 addresses the greenhouse gas life-cycle analyses presented in the revised EIS. Climate change is addressed in Section 3.14.3.14. As noted in that Section, implementation of the proposed Project is unlikely to result in a measureable climate change.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
904	10	Leitz	Curt	Minnesota Division, Izaak Walton League of America	Section 4.1.3, "Potential WCSB Markets Under the No Action Alternative," accepts blindly Canadian producers' assertions that WCSB reserves will be developed regardless of whether the proposed project is developed (p. 4). However, this same section points out that under the No Action Alternative, significantly greater costs and GHG emissions will be required to develop and operate infrastructures that can move WCSB heavy crude to non-U.S. markets, particularly Japan, China, and India (p. 4). The DEIS fails to consider that these increased costs will make WCSB reserves more expensive, and thus less developable, than other sources of crude oil. The net effect of the No Action Alternative would thus be to delay or prevent a degree of the development of WCSB reserves. Thus, it is entirely appropriate to use the total cumulative impacts of producing, developing, and refining WCSB reserves in an analysis of the proposed project's expected impacts.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including updated information on development of oil sands projects with and without the proposed Keystone XL Project.
1388	1	Leone	W.A.	Delta Gulf Corp.	As a union pipeline contractor from Louisiana, we strongly encourage the U.S. Department of State to approve an energy infrastructure project [that not only will strengthen long-term energy security in the United States, but also will provide a powerful private sector economic stimulus to the communities along the pipeline route during its construction, at a time when our economy continues to struggle...] We enthusiastically support the Keystone XL Pipeline Project [and encourage the Department of State to confirm the findings of the Draft Environmental Impact Statement, which found that the proposed Keystone XL Pipeline would have "limited adverse environmental impact during construction and operation."] We look forward to the issuance of a Final Environmental Impact Statement followed by a Presidential Permit that allows the construction of Keystone XL [and enables our counties, the State of Texas, and the United States to collect the substantial economic benefits Keystone XL would create.]	Comment acknowledged.
1388	2	Leone	W.A.	Delta Gulf Corp.	As a union pipeline contractor from Louisiana, we strongly encourage the U.S. Department of State to approve an energy infrastructure project that not only will strengthen long-term energy security in the United States, but also will provide a powerful private sector economic stimulus to the communities along the pipeline route during its construction, at a time when our economy continues to struggle. We enthusiastically support the Keystone XL Pipeline Project and encourage the Department of State to confirm the findings of the Draft Environmental Impact Statement, which found that the proposed Keystone XL Pipeline would have "Limited adverse environmental impact during construction and operation." We look forward to the issuance of a Final Environmental Impact Statement followed by a Presidential Permit that allows the construction of Keystone XL and enables our counties, the State of Texas, and the United States to collect the substantial economic benefits Keystone XL would create... As a pipeline contractor we understand Keystone XL will directly create more than 13,000 high wage construction jobs during the project's 2011-2012 construction schedule. Many of those jobs will be created in Texas and falloff work will come into	Consolidated Response ECO-1 addresses potential socioeconomic impacts, and Consolidated Response TAX-1 addresses concerns regarding taxes.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					Louisiana, where too many of our residents continue to find it difficult to find good jobs. With Keystone XL, they will have an opportunity to work on the project or for businesses that provide supplies, goods and services for its construction and operation. In addition to the jobs Keystone XL will create, the project will generate substantial economic benefits for the United States and in states and communities along the proposed route. Like our parishes, in many cases these are areas where economic performance has stagnated or is shrinking. It is our understanding that TransCanada commissioned a study to measure the project's economic stimulus to the U.S. and the states along the route. The study found that in the U.S., Keystone XL would generate \$20.9 billion in total expenditures, \$9.6 billion in output (gross product), personal income of \$6.5 billion, and 118,935 person years of employment (jobs). In addition, the report concluded that during construction, Keystone XL would generate \$486.36 million in tax revenue for state governments along the route, and \$99.1 million for local taxing entities where the pipeline is located. Moreover, in addition to the construction and manufacturing jobs Keystone XL will create during construction, the economic stimulus provided by the pipeline's construction and development will lead to the creation of more than 100,000 additional jobs in the economy... This is permanent jobs to the U.S. economy, and add \$29 billion to the nation's gross annual product, conservatively estimated.	
1388	4	Leone	W.A.	Delta Gulf Corp.	Furthermore, the delivery of secure and affordable supplies of Canadian energy to American consumers would have minimal impacts on the environment.	Comment acknowledged.
1388	6	Leone	W.A.	Delta Gulf Corp.	Oil sands account for more than 97 percent of that vast reserve: 170 billion barrels of oil with the potential for more than 100 years of production.	Comment acknowledged.
1241	3	Leopold	Bruce	THE WILDLIFE SOCIETY	The Wildlife Society (TWS) are more specifically concerned by the lack of consideration of the upcoming CEQ guidance on climate change, and by the lack of basic compliance with U.S. environmental regulations, such as the National Environmental Protection Act (NEPA).	Consolidated Response GHG-5 explains that the DOS assessment of GHG emissions was conducted in accordance with CEQ guidance. As noted in Consolidated Response ENR-1, the environmental review, including preparation of this EIS, has been conducted consistent with the DOS regulations pertaining to NEPA (22 CFR Part 161) as well as the Council on Environmental Quality (CEQ) regulations for implementing NEPA (40 CFR Part 1500). As a result, DOS considers the EIS to be consistent with the requirements of a NEPA environmental review.
1241	4	Leopold	Bruce	THE WILDLIFE SOCIETY	The refinement of oil sands is an environmentally destructive process. In this process, sands containing oil, or bitumen, are strip-mined or collected using underground heating techniques, and the heavy oil is extracted and separated during a subsequent refining process. Over two tons of sand are required to produce just one barrel of oil.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information on current and future production. As noted in that Consolidated Response, without the proposed Project, oil sands development would continue at or above the current level until at least 2020, with or without the proposed Project.
1241	5	Leopold	Bruce	THE WILDLIFE SOCIETY	This process of mining and extraction not only strips away features of the natural environment, uprooting trees, filling ponds, draining groundwater, and displacing wildlife, but also generates a number of toxic chemicals, including naphthenic acids, mercury, arsenic salts, and polycyclic aromatic hydrocarbons (PAHs), all of which have been shown to be	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					rising in concentration in the atmosphere.	
1241	6	Leopold	Bruce	THE WILDLIFE SOCIETY	The toxic pollution that is created from the refinement of oil sands has been described as “what amounts to a slow motion oil spill in the region’s river systems...worse in many respects than the Exxon Valdez oil spill.”	As noted in Consolidated Response OIL-4, the composition of crude oil that would be transported by the proposed Project would be essentially the same as that of other heavy crude oils refined in the U.S. Also see Consolidated Responses CAN-1 and P&N-3.
1241	7	Leopold	Bruce	THE WILDLIFE SOCIETY	Scientific and anecdotal reports from the locales in Alberta where oil sands are refined have noted deformed pickerel in Lake Athabasca, moose meat with 453 times the acceptable level of arsenic, and unusually high levels of cancer in local communities.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information on current and future production. As noted in that Consolidated Response, without the proposed Project, oil sands development would continue at or above the current level until at least 2020, with or without the proposed Project.
1241	8	Leopold	Bruce	THE WILDLIFE SOCIETY	This pollution enters the environment largely through massive toxic tailings ponds filled with acutely toxic chemicals. These chemicals are very concentrated and birds have been observed to die simply by landing on the ponds, necessitating that some companies hire workers to rake dead birds from the surface. These ponds are often built on the banks of the Athabasca River and are held in place only by earthen dikes; it has been predicted that if an earthquake or severe weather event were ever to cause the breach of a dike, the impacts on the downstream environment would be far-reaching and fatal. Because these ponds are built in the water-dominated boreal forest environment, the main environmental threats are a result of the migration of pollutants through the groundwater system and into neighboring surface water sources.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information on current and future production. As noted in that Consolidated Response, without the proposed Project, oil sands development would continue at or above the current level until at least 2020, with or without the proposed Project. Consolidated Response GHG-4 addresses concerns regarding the loss of boreal forest and peat bogs.
1241	9	Leopold	Bruce	THE WILDLIFE SOCIETY	The pollution coming into the Athabasca River from the oil sands refineries is already being found far downstream in the Peace-Athabasca Delta, one of the largest freshwater deltas in the world, and a region of great biodiversity. More than 1/6 of Canada drains into this watershed, which is also one of the world’s most important migratory bird and animal habitats, with more than half of America’s birds migrating to the Canadian boreal forest region to nest every spring.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information on current and future production. As noted in that Consolidated Response, without the proposed Project, oil sands development would continue at or above the current level until at least 2020, with or without the proposed Project. Consolidated Response ENV-4 addresses issues related to oil sands production and migratory birds.
1241	12	Leopold	Bruce	THE WILDLIFE SOCIETY	Acid rain effects are not confined to Canada and could cause similar deleterious consequences in the northern United States.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information on current and future production. As noted in that Consolidated Response, without the proposed Project, oil sands development would continue at or above the current level until at least 2020, with or without the proposed Project.
1241	13	Leopold	Bruce	THE WILDLIFE SOCIETY	The Wildlife Society (TWS) is particularly concerned with the effect that oil sands refinement and the Keystone XL Pipeline project may have on wildlife within the United States.	Potential impacts associated with construction and normal operation of the proposed Project are presented in Section 3.5 of the EIS. Section 3.13 of the EIS addresses reliability and safety issues, including calculations of the probability of a spill from the proposed Project and the potential environmental impacts associated with spills, including potential impacts to wildlife. As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries.
1241	16	Leopold	Bruce	THE WILDLIFE SOCIETY	The pipeline itself may also have more substantial effects on	Potential Project-related impacts to black-footed ferrets and

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
				SOCIETY	U.S. wildlife than the DEIS suggests. As noted in the DEIS, the proposed project would cross two counties in Montana and four counties in South Dakota that may contain black-footed ferret (<i>Mustela nigripes</i>) habitat, fragmenting prairie dog (food source) colonies, altering habitat, and leading to a possible increase of direct mortalities due to collisions and other disturbance. The DEIS notes that the populations it is likely to affect are non-essential experimental populations. However, with a population estimated to be as low as 750, each population is important to the survival of the species and should be treated with due caution.	black-tailed prairie dogs are discussed in Section 3.8.1 of the EIS. After construction and reclamation are completed, the buried pipeline would not create a barrier to movements of either black-tailed prairie dogs or black-footed ferrets. The comments concerning non-essential experimental populations refer to the level of protection afforded to these populations through federal Endangered Species Act protections.
1241	17	Leopold	Bruce	THE WILDLIFE SOCIETY	The whooping crane (<i>Grus Americana</i>) is another endangered species that will be threatened by the Keystone XL Pipeline proposed Project. The DEIS notes that the pipeline crosses some of the migratory route, however, it fails to note that the complete expanse of the Keystone XL proposed Project in fact falls within the whooping crane migration route, from Texas, to North Dakota, up to Alberta. We believe this is a critical omission, and we believe that not only the pipeline, but the larger development that it supports must be considered when reviewing the adverse impacts this proposed Project will have upon a species.	The potential impacts to whooping cranes from construction of the proposed Project and associated aboveground facilities, including the electrical distribution lines to pump stations, are discussed in Section 3.8 and in the Biological Assessment presented in Appendix T of the EIS, including recommended conservation measures. Section 3.14.4.4 of the EIS was revised to add information on potential impacts of the proposed Project the whooping crane for the Canadian portion of the proposed Project. Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information on current and future production. As noted in that response, without the proposed Project, oil sands development would continue at or above the current level until at least 2020, with or without the proposed Project.
1241	18	Leopold	Bruce	THE WILDLIFE SOCIETY	The DEIS concludes that the Proposed Project will not adversely affect whooping cranes, in part because of the "rarity of the species." Citing this as a reason that the Proposed Project will not harm the species shows questionable logic; additionally, given that the Proposed Project is crossing the migratory route, and contributing to the destruction of whooping crane nesting grounds, it is difficult to see how the species will not be adversely affected. We urge a re-evaluation of the effects of the entire Keystone proposed Project on the entire life history of the whooping crane.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information on current and future production. As noted in that response, without the proposed Project, oil sands development would continue at or above the current level until at least 2020, with or without the proposed Project. As a result, the proposed Project would not affect whooping crane nesting habitat. The potential impacts to whooping cranes from construction of the pipeline and associated aboveground facilities, including the electrical distribution lines to pump stations, are discussed in Section 3.8 and in the Biological Assessment presented in Appendix T of the EIS, including recommended conservation measures. Section 3.14.4.4 of the EIS has been revised to add information on potential impacts of the proposed Project the whooping crane for the Canadian portion of the proposed Project. Section 3.14.4 of the EIS has been revised to add a discussion of the environmental impacts due to oil sands development.
1241	19	Leopold	Bruce	THE WILDLIFE SOCIETY	In February 2010 the Council on Environmental Quality (CEQ) released a draft of "Guidance on Consideration of the Effects of Climate Change and Greenhouse Gases under NEPA" document. The document, while still in draft form, does discuss several critical components that CEQ may expect to have in future NEPA reviews. These include consideration of the cumulative effects of greenhouse gas (GHG) emissions, the impacts of projects on climate change, and a longer-term consideration of effects than have been used in past NEPA assessments. While this document is not yet final, the	Consolidated Response GHG-5 explains that the DOS assessment of GHG emissions was conducted in accordance with CEQ guidance.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					Department of the State would be wise to act in accordance with impending changes that protect the health and environment of the nation.	
1241	20	Leopold	Bruce	THE WILDLIFE SOCIETY	As measured by the National Oceanic and Atmospheric Administration in May 2010, the atmospheric concentration of carbon dioxide, the leading GHG, is 392 parts per million, which is greater than any time in the last 650,000 years. The Carbon Dioxide Information Analysis Center lists 207 nations by order of carbon emissions. The oil sands of Canada have greater emissions than 145 of them and are the single largest contributor to emissions growth in Canada. This figure, it is also worth noting, is only the result of the development of oil sands and does not include all the associated activities, including the movement of oil using trucks and tankers, energy that goes into the refinery process, and the burning of the oil and their resulting GHG emissions. These cumulative effects, most of which will occur in the United States, should be considered in any NEPA assessment.	Section 3.14.3.14 addresses the cumulative effects of greenhouse gases. Consolidated Response GHG-1 addresses the greenhouse gas life-cycle analyses presented in the revised EIS. As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries.
1241	21	Leopold	Bruce	THE WILDLIFE SOCIETY	The science of climate change clearly shows that GHG emissions need to be lowered immediately and rapidly if we are to prevent further drastic climatic impacts, conserve wildlife habitats, and protect human health. President Obama and Secretary Clinton already have national policies to address climate change and have said that combating climate change should be a national priority. Further, the UN Framework convention on Climate Change, to which we are a party, calls for all parties to "take precautionary measures to anticipate, prevent, or minimize the causes of climate change and mitigate its adverse effects." By supporting the development of a pipeline that will increase GHG emissions in many ways, in the US and beyond, we are violating the spirit of international agreements and national commitments.	Consolidated Response GHG-1 addresses the greenhouse gas life-cycle analyses presented in the revised EIS.
1241	23	Leopold	Bruce	THE WILDLIFE SOCIETY	While the DEIS does make some mention of connected actions, those that it references are inadequate. The DEIS does not address the connected actions from the impacts of additional refinery needs in the Gulf Coast. It also does not examine connected actions of how the expansion of oil sands mining activities will have adverse effects on human and wildlife health, environmental quality, and water quality in Canada and downstream. These "connected actions" will undoubtedly have significant impacts upon the environment and must be considered in preparation of the EIS.	As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries.
1241	24	Leopold	Bruce	THE WILDLIFE SOCIETY	The DEIS does not adequately address the "cumulative" effects upon surrounding wildlife habitats and the larger, more distant environment.	As a matter of policy, DOS has included within Section 3.14 of the EIS a discussion of trans-boundary cumulative impacts.
1241	25	Leopold	Bruce	THE WILDLIFE SOCIETY	The DEIS limits its discussion of cumulative effects to relatively minor effects from noise, habitat fragmentation, vegetative resources, and viewshed degradation from disruption by pumping stations and increases in the width of right-of-way areas.	As noted in Consolidated Response ENR-1, the environmental review, including preparation of this EIS, has been conducted consistent with the DOS regulations pertaining to NEPA (22 CFR Part 161) as well as the Council on Environmental Quality (CEQ) regulations for implementing NEPA (40 CFR Part 1500). As a result, DOS considers the EIS to be consistent with the requirements of a NEPA environmental review.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
1241	26	Leopold	Bruce	THE WILDLIFE SOCIETY	As for the cumulative effects from GHG emissions, the DEIS notes that while crude oil does contribute to the release of CO2 into the atmosphere, "the crude oil delivered by the Project would be replacing similar crude oils from other sources, [and] the incremental impact of these emissions would be minor." We believe this treatment of the cumulative effects to be woefully inadequate.	Section 3.14.3.14 addresses the cumulative effects of greenhouse gases. Consolidated Response GHG-1 addresses the greenhouse gas life-cycle analyses presented in the revised EIS.
1241	27	Leopold	Bruce	THE WILDLIFE SOCIETY	The reach of this pipeline's effects go far beyond the actual physical bounds of the pipeline. The pipeline also has the potential to generate spills, will necessitate further refinery and pumping station upgrades, and will be using a significant amount of clean water and natural gas to create a pollution-heavy, difficult to process, carbon-emitting form of energy. While neither the Department of State regulations nor Executive Order 12114 may require the DEIS to analyze impacts on environmental activities outside of international borders, we believe that both in the spirit of supporting international accords on climate change and in the best interest of a nation that is downstream and downwind from the toxic effects of oil sands production, cumulative effects must be more carefully considered.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information on current and future production. As noted in that response, without the proposed Project, oil sands development would continue at or above the current level until at least 2020, with or without the proposed Project. In addition, Section 3.13.4 of the EIS has been revised to expand discussions of extraterritorial concerns.
1241	29	Leopold	Bruce	THE WILDLIFE SOCIETY	How much habitat can be damaged before a species is lost forever?	The thresholds for cumulative habitat loss are largely unknown for most plants and animals. The goal is to minimize impacts to habitats identified as important or critical for the species in question. Project-related impacts to wildlife are addressed in Sections 3.5, 3.6, 3.7, and 3.8 of the EIS.
1241	30	Leopold	Bruce	THE WILDLIFE SOCIETY	What will be the estimated loss of migratory birds due to the toxic ponds and tailings?	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project. Consolidated Response ENV-4 addresses issues related to oil sands production and migratory birds.
1241	31	Leopold	Bruce	THE WILDLIFE SOCIETY	What will be the potential near and downstream (as far as the U.S.) impacts of a breach in the dikes supporting these tailing ponds?	The oil sands development projects are hundreds of miles from the U.S. border and it is highly unlikely that a breach in the dikes supporting oil sands tailings ponds would reach the U.S. Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project.
1241	32	Leopold	Bruce	THE WILDLIFE SOCIETY	What will be the cumulative impacts of the GHG emissions produced during the actual refining of the crude, esp. in respect to cleaner fuel sources?	Consolidated Response GHG-1 addresses the greenhouse gas life-cycle analyses presented in the revised EIS. As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries.
1241	33	Leopold	Bruce	THE WILDLIFE SOCIETY	What will be the cumulative effects of the resulting GHG emissions from the use of fossil fuels?	Consolidated Response GHG-1 addresses the greenhouse gas life-cycle analyses presented in the revised EIS.
1241	34	Leopold	Bruce	THE WILDLIFE SOCIETY	Given that better, cleaner energy technologies are being developed every day, it seems insincere for the Department of State to argue that this pipeline is being built with our nation's best interests in mind.	Consolidated Response P&N-1 addresses the need that the Project has been proposed to meet. Consolidated Response ALT-2 addresses the use of alternative technologies and alternative energy sources. Consolidated Responses ENR-1 and P&N-9 provide information on the Department of State

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
						(DOS) environmental review process, the National Interest Determination process, and the need to complete those reviews before approving or denying the Presidential permit for the proposed Project. As noted in that response, DOS is neither a proponent nor an opponent of the proposed Project.
1241	23	Leopold	Bruce	THE WILDLIFE SOCIETY	While the DEIS does make some mention of connected actions, those that it references are inadequate. The DEIS does not address the connected actions from the impacts of additional refinery needs in the Gulf Coast. It also does not examine connected actions of how the expansion of oil sands mining activities will have adverse effects on human and wildlife health, environmental quality, and water quality in Canada and downstream. These "connected actions" will undoubtedly have significant impacts upon the environment and must be considered in preparation of the EIS.	As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries. Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1.
330	1	Ler	Patty		As a farm/ranch and private land owner this pipeline Keystone XL will directly impact our lively hood and our way of life. It will affect the fields and grazing pastures for years not just 1 or 2.	Consolidated Response FRM-1 describes potential impacts to farmland and ranches and Keystone's responsibilities to compensate for damage to these crops. The EIS was revised to reflect that the potential impacts to agricultural land from construction and from an oil spill and subsequent response actions may last for one to a few years, depending upon the amount of oil, area impacted, and the type of cleanup actions taken by Keystone. In general, oil on and/or in the soils is weathered through biodegradation by micro-organisms, photodegradation by sunlight, and physical-chemical degradation. These basic processes generally reduce or eliminate the lighter fractions of oil that may be harmful to plants and/or animals and do so in a few months to a year or two. The heavier fractions of the oil (commonly called tar or asphalt) may persist for longer periods of time but are not toxic to organisms. The response actions may disturb the soils and provide habitat for weeds, reduce or remove the native or agricultural vegetation, and otherwise have impacts that may persist for a year or more.
330	2	Ler	Patty		Some of my concerns are the emergency response plan. The DEIS does not contain a plan. I live in a rural area the closet towns are 30 to 40 miles away, we have no mail route or bus route for our kids to go to school. Neighbors are far and few. A plan on how or who to call would be important. Also these small communities would need some training on how to respond to an oil spill. An oil spill would be a big deal to us who make a living off the land. Look what has happened in the gulf. It will take years to fix that mess. A plan would have been a good thing.	Consolidated Response RES-1 addresses issues related to preparation and review of emergency response plans for the proposed Project.
330	3	Ler	Patty		Pressure waiver; "low consequence" we live in a "low consequence" area. I find this term insulting. This is where we make our living. I happen to believe this land is a vital and important in the fact that we make our living here and we also produce food for our country.	The Pipeline and Hazardous Materials Administration (PHMSA) identifies high consequence areas (HCAs) for the purposes of pipeline design requirements and integrity management plans. In general, HCAs are commercially navigable waterways, high population areas (urbanized areas that contain 50,000 or more people with population densities of at least 1,000 people per square mile), other populated areas (places that contain a concentrated population, such as an incorporated or unincorporated city, town, or village); and unusually sensitive areas, as defined in 49 CFR 195.6. All

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
						<p>other areas are defined as low consequence areas. There is no intent in the PHMSA definitions to devalue agricultural land or the people who work the land.K28</p> <p>Keystone has withdrawn its application for a Special Permit as described in Consolidated Response REG-1.</p>
330	5	Ler	Patty		Do we really need this pipeline, as there is already a tar sand pipeline completed.	Consolidated Response P&N-1 addresses the need that the Project has been proposed to meet. The Alberta Clipper and existing Keystone pipeline projects serve other markets and do not meet the demands of the Gulf Coast refineries.
330	6	Ler	Patty		Keystone XL should pay private land owners a fee to cross there land for surveying and trespassing. I think Keystone would find the land owners easier to get along with if they treated us with some respect. After all, we to have to make a living.	<p>Consolidated Response EAS-2 addresses issues related to easement negotiations. As noted in that response, DOS has no legal authority in the easement negotiation process.</p> <p>State or local trespass and access laws are applicable along the entire route and therefore along each landowner's property Keystone seeks permission to use. DOS has no legal authority over negotiating temporary use agreements or easement agreements, no legal status to enforce the conditions of an easement agreement, and no legal authority over Keystone representatives who gain access to private property. The commentor has the option to take up the matter with Keystone or local law enforcement officials, or initiate legal consultation.</p>
1552	8	Ler	Lewis		Concern about being misled by the land agent in reference to the location and the number of times the easements of the old pipeline would cross his crops, particularly the wheat fields. After having told the land agent that he did not want him crossing the wheat field, he found numerous tracks across that wheat field all running parallel to the original pipeline.	State or local trespass and access laws are applicable along the entire route and therefore along each easement negotiated by Keystone. DOS has no legal authority over negotiating easement agreements, no legal status to enforce the conditions of an easement agreement, and no legal authority over Keystone representatives who gain access to private property. The commentor has the option to take up the matter with Keystone or local law enforcement officials, or initiate legal consultation.
1552	9	Ler	Lewis		After hearing about the new pipeline, I tried to contact the DEQ for information and was told to wait until they completed a survey. I'm still waiting to hear where the pipeline runs.	Consolidated Response REQ-1 addresses requests for additional information, including detailed maps of the proposed route.
1552	10	Ler	Lewis		I feel like we've been thrown under the bus by the State of Montana. We don't know anything about the pipeline, and we haven't had enough time or help from the organizations involved to learn about the situation.	Appendix I of the EIS addresses the requirements of the Montana Department of Environmental Quality (MDEQ) in their assessment of the proposed Project consistent with the requirements of MEPA and MFSA.
1552	12	Ler	Lewis		Concern about the lack of information provided to the landowners.	Consolidated Response REQ-1 addresses requests for additional information, including detailed maps of the proposed route.
1552	13	Ler	Lewis		I think that to do this right, we should start over and get all the affected landowners involved and discuss what's being done.	Consolidated Response EAS-2 addresses issues related to easement negotiations and eminent domain. DOS has no legal authority in the easement negotiations or in eminent domain proceedings.
1552	10	Ler	Lewis		I feel like we've been thrown under the bus by the State of Montana. We don't know anything about the pipeline, and we haven't had enough time or help from the organizations involved to learn about the situation.	Consolidated Response INT-1 addresses concerns related to the Notice of Intent (NOI) to prepare an EIS for the proposed Project. Consolidated Response CMT-3 addresses the level of information provided to the public regarding the proposed Project and the draft EIS scoping meeting locations and

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
						schedules. Appendix I of the EIS addresses the consideration of the proposed Project under the Montana Major Facility Siting Act (MFSA) and the Montana Environmental Protection Act (MEPA).
1552	13	Ler	Lewis		I think that to do this right, we should start over and get all the affected landowners involved and discuss what's being done.	Consolidated Response EAS-2 addresses issues related to easement negotiations and eminent domain. DOS has no legal authority in the easement negotiations or in eminent domain proceedings.
1552	14	Ler	Lewis		Landowners should be treated as people and land of importance instead of as low consequence.	Consolidated Response EAS-2 addresses issues related to easement negotiations and eminent domain. DOS has no legal authority in the easement negotiations or in eminent domain proceedings.
898	1	Leveillee	Daniel		Since a stable & steady energy supply is pertinent to our National security, & our economy, there's no question in my mind that this pipeline should move forward. The Politicizing of environmental issues seems to have become an epidemic in the U.S. in the last few years, & it is to the detriment of our country & our economy. Oil pipelines are NOT new technology, & have been operating safely for many decades. Please do the right thing, & continue to allow necessary sources of fossil energy (like crude oil) to be transported to, & processed in the U.S.	Comment acknowledged.
387	1	Levine	Ruby		Please keep tar sands out of the United States. This dirty, dangerous fuel is the last thing we need	Consolidated Response OIL-4 addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils. Consolidated Response P&N-1 addresses the need that the Project has been proposed to meet. Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project.
1003	1	Liebers	Margo		I oppose the pipeline being planned to transport oil 2000 miles from Canada to the U.S. We cannot afford any more environmental catastrophes and must start now to reject dangerous efforts to wring the last drop of oil from the earth and instead turn to learning how to restructure our lives, our work, our communities to do without fossil fuels.	Comment acknowledged.
785	1	Lierz	Albert	Sierra Club - Nebraska Chapter	[I am opposed to the Keystone XL Pipeline for the following reasons:] • It would go from Canada to Texas, across thousands of miles of agricultural heartland. ...	The impacts associated with implementation of the proposed Project are addressed in Section 3.0 of the EIS. As noted in that section, construction and normal operation the proposed Project would not result in significant environmental impacts. Consolidated Response FRM-1 addresses potential ranch of farmland impacts.
785	3	Lierz	Albert	Sierra Club - Nebraska Chapter	[I am opposed to the Keystone XL Pipeline for the following reasons:] This pipeline would cross many miles of Nebraska's Sandhills, a unique environmental area with soils and plant life that are easily damaged and difficult to restore.	Identification of sensitive environments crossed by the proposed Project is discussed in Consolidated Response ENV-1 and ENV-3. Issues related to the Sand Hills area are addressed in Consolidated Response ERO-1.
785	4	Lierz	Albert	Sierra Club - Nebraska Chapter	[I am opposed to the Keystone XL Pipeline for the following reasons:] It would go through an area where the Ogallala Aquifer is largest and deepest. Once an aquifer is polluted it is difficult and expensive to clean up, and environmental cleanup	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					funds are very limited (thanks to George W. Bush).	
785	6	Lierz	Albert	Sierra Club - Nebraska Chapter	[I am opposed to the Keystone XL Pipeline for the following reasons:]... • It will be used to transport tar sands oil from Canada. The process to obtain tar sands is very environmentally damaging. If they build the pipeline they will have more reasons to further develop the tar sands and expand the environmental damage.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information on current and future production. As noted in that Consolidated Response, without the proposed Project, oil sands development would continue at or above the current level until at least 2020, with or without the proposed Project. Consolidated Responses GHG-1 through GHG-5 address concerns related to greenhouse gas, climate change, alternative energy considerations, and approach to assessment of GHG emissions.
1200	1	Liess	Paul&Sue		Please don't overact on the pipeline. Nebraska has many pipelines in the ground, none with the technology the new line will have. We need to support it. Paul and Sue Liess	Comment acknowledged.
149	1	Liles	Kent		My comment will address existing landowner water pipelines that will be crossed by the Keystone XL Pipeline. I have found nowhere to my knowledge that it is addressed in the EIS; except for that Trans Canada will compensate. As a landowner I want the issue addressed first. Our water pipelines are buried at a minimum of six feet in depth because of frost. I am asking that these pipelines be sleeved for the width of the determined easement plus at least 50 feet each side of the easement. The sleeving material to be used should be adequate to with stand crushing, corrosion and accommodate the required maintenance of the water pipeline by the landowner. Asking for at least 50 feet each side of the pipeline is based on the information that most pipeline leaks or spills are caused by the landowner (by digging to close to the easement). Therefore I am asking that you implement this measure for the safety of the landowner and the pipeline. This needs addressing before construction; because of the possibility of crushing pipelines buried at depths less than six feet, due to the heavy equipment and traffic on the work side of the construction area. If the Keystone XL Pipeline would lay parallel to an existing landowner's water pipeline; we ask that there be at least a 100 foot offset from the easement. I am also asking that you implement a safety measure that requires a baseline water test of the water source that provides the water that flows through the landowner's pipeline. A copy of this test should be submitted to the landowner and the DEQ....If Trans Canada has to drill a well for stock water or for water for construction use, that the water right be conveyed to the landowners when the well is finished being drilled. This would be instead of at the time of decommissioning.	Consolidated Response PVT-2 addresses concerns related to the proximity of the proposed Project to existing structures and facilities. Section 2.3.3.2 of the EIS addresses construction in areas with buried water lines. Landowners may also include requests such as those of the commenter during the easement negotiation process. All issues related to design specifics and operation of the proposed pipeline system are under the jurisdiction of Pipeline and Hazardous Materials Safety Administration (PHMSA), as explained in Sections 2.3, 2.3.1, and 3.13.1 and in Consolidated Response SAF-1. DOS does not have the authority to establish safety regulations for pipelines.
701	3	Liles	Kent&Christie		We are currently mounting a 4 1/2 to 5 lb. trout that was caught through the ice on one of these reservoirs. This makes this land a lot more valuable; because we all know that this type of recreation in eastern Montana is an asset to any land.	Comment acknowledged.
752	2	Liles	Kent&Christie		...Within the Construction, Mitigation, Reclamation Plan, Keystone addresses a complaint process to resolve complaints that a landowner might have in reference to issues with the Keystone XL Pipeline. One area referenced to in Appendix B of the (CMRP) is: 4.14.3 Landowner Complaint Resolution Procedure Keystone shall implement a landowner	DOS has submitted the request by the commenter to the Montana Department of Environmental Quality for consideration in its Environmental Specifications for the proposed Project. Those specifications are presented in Attachment 1 to Appendix I of the EIS.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					<p>complaint procedure as follows: • Landowners should first contact the construction spread office to express their concern over restoration or mitigation of environmental damages on their property. The Construction Manager or his designated representative shall respond to the landowner within 24 hours of receipt of the phone call. CONSTRUCTION MITIGATION AND RECLAMATION PLAN TRANSCANADA KEYSTONE PIPELINE, L.P. 40 November, 2008 Rev. 1 • If the landowner has not received a response or is not satisfied with the response, he can contact Keystone's representative at 1-877-880-4881. The landowner should expect a response within 48 hours. Section: 3.2. 11 under Restoration, Reclamation, and Revegetation in the MEPA section of EIS it reads as follows: 3.2.11 The OWNER shall develop and implement an environmental complaint resolution procedure. The procedure shall provide LANDOWNERS with clear and simple directions for identifying and resolving their environmental mitigation problems/concerns during construction and operation of the Project. Prior to construction, the OWNER shall mail the environmental complaint resolution procedure to each LANDOWNER whose property would be crossed by the Project: a) In the complaint resolution procedure, the OWNER shall: (i) Provide a local contact that LANDOWNERS shall call first with their concerns and indicate how soon to expect a response; (ii) Instruct LANDOWNERS that if they are not satisfied with the response, they should call the OWNER, provide a phone number for the OWNER and indicate how soon to expect a response; and b) In addition, during construction and reclamation the OWNER shall include in its weekly status report a table that contains the following information for each problem/concern: (i) The identity of the caller and the date of the call; (ii) The identification number from the certificated alignment sheet(s) of the affected property and appropriate location by milepost; (iii) A description of the problem/concern; and (iv) An explanation of how and when the problem was resolved or will be resolved, or why it has not been resolved. Neither of the above addresses this question; what happens if the problem isn't resolved? Our proposal: Is that you add 4.6.3 to read as follows: DEQ require the OWNER to fund additional efforts to resolve problems which develop that aren't resolved through a complaint process that would be in place for the lifetime of the pipeline. The additional efforts could be a third party independent contractor or consultant; that would review the complaint; and make a proposal to resolve the complaint. This proposal would then be accepted by both parties involved...</p>	
755	1	Liles	Kent&Christie		<p>My comment addresses section 3.10.2.2 Operation Impacts in the NEPA part of the EIS. It reads as follows: Tax Revenue and Fiscal Resources Once the Project is constructed, it would generate long-term property tax revenues for the states and counties traversed by the pipeline, in accordance with applicable tax structures. Keystone has developed estimates of property taxes by state based on the value and/or length of pipe in the ground and quantity of aboveground facilities (see Table 3.10.2-3). The estimated tax data for Montana was</p>	<p>Consolidated Response TAX-1 and revisions to Section 3.10.2.4 of the EIS address concerns regarding taxes associated with implementation of the proposed Project.</p>

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					<p>developed by the Montana Department of Revenue (e-mail correspondence with Vern Fogle). Keystone estimates that \$138.4 million in annual property tax revenues would be generated by the Project in the region of influence. This estimate is based on 2006 tax rates and an estimated \$7.0 billion of capital costs. The estimate implies an average 2.0 percent effective tax rate on \$7.0 billion. Most of these revenues, about \$98.2 million, are attributed to the Steele City Segment. The Pump Stations in Kansas would generate \$2.0 million. The Gulf Coast Segment would generate \$37.3 million. The remaining \$1.1 million would be generated on the Houston Lateral. The incremental property tax revenues for the Project area would be an increase of 9.0 percent over the 2006 taxes reported by each State as levied in the counties within the proposed Project area. The greatest percent increase over 2006 taxes, 42.0 percent, would occur along the Steele City Segment. Keystone estimates that in Montana the increase over 2006 taxes would be 145.9 percent. The Keystone estimate implies an effective tax rate of 4.3 percent on the estimated capital costs. This tax rate is twice that of the Project average and may cause an overstatement of the taxes that would be paid to Montana counties. Without regard to magnitude, the impact of the property taxes is a benefit to the counties. The percent increase of taxes over 2006 levels in Kansas is 2.7 percent. Along the Gulf Coast Segment the Project property taxes represent an 11.9 percent increase over 2006 levels. The increase in property taxes along the Houston Lateral is 2.1 percent above 2006 levels. Local counties would be the primary beneficiaries of estimated property tax benefits. Given the size of the existing tax base of affected jurisdictions and assuming that the 2006 tax rates would remain in effect once the Project is built, these revenues represent a minor to major long-term Project fiscal benefit. 3.10-54 Draft EIS Keystone XL Pipeline Project As a landowner I would like an explanation to the statement in the above paragraph that is stated as follows: "The Keystone estimate implies an effective tax rate of 4.3 percent on the estimated capital costs. This tax rate is twice that of the Project average and may cause an overstatement of the taxes that would be paid to Montana counties.</p>	
773	1	Liles	Kent&Christie		<p>United State Department of State Montana Department of Environmental Quality Keystone XL Oil Pipeline Project This comment is in reference to 5.0: Decommissioning number 5.1.4 which reads "All water wells developed by the owner shall be conveyed or transferred to the LANDOWNER upon decommissioning of the pipeline." If the water well was drilled to compensate a Landowner for loss of a water source; then the water well and all items necessary to put it into operation should be conveyed or transferred immediately to landowner impacted. Usually, the landowner will be the property owner and /or water right holder. If the water well is needed for any other purpose than to compensate; an agreement should be reached between the Owner and the Landowner on whose land the well is drilled.</p>	<p>The commentator is quoting from the Montana Department of Environmental Quality's (MDEQ's) Environmental Specifications for the Keystone XL Project (presented as Attachment 1 to Appendix I of the EIS). MDEQ would be responsible for considering this request, and we have forwarded it to them.</p>
858	1	Liles	Kent&Christie		<p>United States Department of State Montana Department of</p>	<p>The Montana Department of Environmental Quality (MDEQ)</p>

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					Environmental Quality Keystone XL Oil Pipeline Project This comment is in reference to Appendix B (CMRP) of the Draft EIS: 2.5 Damages to Private Property. We understand that the Montana Department of Environmental Quality can adopt this (CMRP) plan with additional conditions or stipulations. We ask that you include this condition or stipulation: Keystone XL Pipeline or Owner shall pay commercially reasonable costs and indemnify and hold the landowner harmless for any loss, damage, claim or action resulting from Keystone's or the OWNER use of the easement, including any resulting from any release of regulated substances or from abandonment of the facility, except to the extent such loss, damage claim or action results from the gross negligence or willful misconduct of the landowner or its agents. This is a condition that the South Dakota Public Utilities Commission stipulated in their Order Granting ; Notice of Entry to Construct The Keystone XL Project Docket (HP09-001) at: http://puc.sd.gov/dockets/hydrocarbonpipeline/2009/hp09-001.aspx . It is under EXHIBIT A: PERMIT CONDITIONS under VII: ENFORCEMENT AND LIABILITY FOR DAMAGE: NUMBER 49. This need for such indemnification of the landowners is apparent. Without these protections, individual landowners could or would be held responsible for the costs incurred to correct the loss, damage, claim or actions taken against the cause and effect of the problem that occurred on the easement. Please protect the Landowners and the State of Montana in the same manner that the South Dakota Public Utilities Commission protected their State and Landowners.	has established its Environmental Specifications for the proposed Project (presented as Attachment 1 to Appendix I of the EIS). MDEQ would be responsible for considering this request, and we have forwarded it to them.
1552	54	Liles	Christie		As a landowner, I would like to see you implement 3.2.11 under Restoration, Reclamation, and Revegetation in the MEPA section of the EIS with some additional stipulations.	The Montana Department of Environmental Quality (MDEQ) developed a list of environmental specifications for the proposed Project. Those specifications are included in Attachment 1 to Appendix I. Any requests for revisions to those specifications should be directed to MDEQ.
1552	55	Liles	Christie		As a landowner, I'm asking you to implement these changes to section 3.2.11 of the DEIS: The owner shall develop and implement an environmental complaint resolution procedure. The procedure shall provide landowners with clear and simple directions for identifying and resolving their environmental mitigation problems and concerns during construction, reclamation, operation and maintenance activities for the life of the project.	The Construction, Mitigation, and Reclamation (CRM) Plan, which is Appendix B of the EIS, addresses these concerns.
1552	58	Liles	Christie		I would like to know what thickness of pipe was used to determine the tax tables that are used in the NEPA part of the EIS. Whichever one was used, it will make a difference in regards to the property taxes and the value that TransCanada puts as the cap at \$7 billion in regards to the overall capital expenses incurred on this pipeline project. That will make a difference in our counties as far as what they're going to get in taxes.	Keystone has withdrawn its application for a Special Permit as described in Consolidated Response REG-1. The pipe wall thickness will be as required by the Pipeline and Hazardous Materials Safety Administration. The estimate of taxes was based on the cost of pipe provided by Keystone.
1558	9	Liles	Kent		I am concerned with existing water pipelines that will be crossed by Keystone XL. I have found nothing in the EIS addressing this issue except that TransCanada will compensate. As a landowner, I want this issue addressed.	Consolidated Response PVT-2 addresses concerns related to the proximity of the proposed Project to existing structures and facilities. Section 2.3.3.2 of the EIS addresses construction in areas with buried water lines. Landowners may also include requests such as those of the commenter during the easement

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
						negotiation process. All issues related to design specifics and operation of the proposed pipeline system are under the jurisdiction of Pipeline and Hazardous Materials Safety Administration (PHMSA), as explained in Sections 2.3, 2.3.1, and 3.13.1 and in Consolidated Response SAF-1. DOS does not have the authority to establish safety regulations for pipelines.
1558	10	Liles	Kent		Our water pipelines are buried at a minimum of six feet due to frost. I am asking that these pipelines be sleeved for the width of the determined easement plus at least 50 feet each side of the easement. The sleeving material should be adequate to withstand crushing, corrosion, and accommodate the required maintenance of the water pipeline by the landowner. Asking for the 50 feet on each side of the pipeline is based on the information that most pipeline leaks or spills are caused by the landowner, by digging too close to the easement. Therefore I am asking that you implement this measure for the safety of the landowner and the pipeline.	Specific requests such as this should be directed to Keystone and included in the easement agreement (see Consolidated Response EAS-2).
1558	12	Liles	Kent		If the Keystone XL pipeline would lay parallel to an existing landowner's water pipeline, we ask that it be at least 100 feet away from the easement.	Consolidated Response PVT-2 addresses concerns related to the proximity of the proposed Project to existing structures and facilities. Section 2.3.3.2 of the EIS addresses construction in areas with buried water lines. Landowners may also include requests such as those of the commenter during the easement negotiation process. All issues related to design specifics and operation of the proposed pipeline system are under the jurisdiction of Pipeline and Hazardous Materials Safety Administration (PHMSA), as explained in Sections 2.3, 2.3.1, and 3.13.1 and in Consolidated Response SAF-1. DOS does not have the authority to establish safety regulations for pipelines.
1558	13	Liles	Kent		I ask that you implement a safety measure that requires a baseline water test of the water source that provides the water that flows through the landowner's pipeline. A copy of this test should be submitted to the landowner and the DEQ. This issue was addressed in the EIS, under the NEPA 5.0 Decommissioning and down to 2.54, but not completely the way I would like it.	DOS has followed the typical Federal Energy Regulatory Commission (FERC) approach to documenting private water wells that could potentially be impacted by proposed Project construction and operation. As explained in Consolidated Responses SAF-1 and AQF-3, there is minimal risk to private water wells distant from the pipeline centerline due to the high level of safety imposed on the proposed Project and due to the low likelihood of long-distance crude oil migration in the unlikely event of a major oil spill. In addition, well testing is not required around every petroleum storage tank or gasoline storage tank. Such testing is conducted only after a leak occurs. If there is a spill from the proposed Project state, federal agencies will require sampling as appropriate.
1558	14	Liles	Kent		If TransCanada has to drill a well for stock water or for water used in construction, we would like that water right to be conveyed to the landowner when the well is finished being drilled. This would be instead of at the time of decommissioning. That way it will belong to the landowner to use from the start.	Keystone has stated that it would not drill wells as a part of construction of the proposed Project.
54	1	Limpert	Jacki		I live on a ranch south of Buffalo, South Dakota, on one of the ranches being directly impacted by the TransCanada Keystone XL pipeline. When we read the proposed modifications to the siting permit we have some serious concerns regarding the property owners affected by this	The permitting process in South Dakota is separate from the consideration of a Presidential permit by the Department of State. As noted in Consolidated Response REG-2, Keystone would have to obtain and comply with federal, state, and local permits to construct, operate, maintain, monitor, and inspect

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					pipeline. David Niemi has sent the Public Utilities Commission, Commissioners Dustin Johnson, Steve Kolbeck, and Gary Hanson a letter for the reconsideration of the TransCanada Permit. This letter has been extremely well thought out and highlights our concerns with the changes that TransCanada is trying to make. We realize how much time, thought and consideration that the commissioners have put into this permit. We are asking that you do not alter them in anyway.	the Project, including the South Dakota siting permit.
1147	1	Lind	Carol&Mike		We are writing to protest the continuation of the Keystone XL pipeline through Nebraska... We oppose the pipeline.	Comment acknowledged.
1147	2	Lind	Carol&Mike		It will be placed two miles west of our acreage.	Comment acknowledged.
1147	3	Lind	Carol&Mike		After the recent tragedy of the BP debacle, we fear what can happen to the pristine Ogallala Aquifer.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. As described in Consolidated Response GLF-1, the risks associated with the proposed Project are substantially different from those associated with the BP Deepwater Horizon Project.
1147	4	Lind	Carol&Mike		We also don't believe there can ever be a guarantee that this pipeline will not leak; even with fail-safe measures in place. Nebraska and the other states have too much to lose should there ever be a leak, no matter how small it may be.	Section 3.13 of the EIS addresses reliability and safety issues, including calculations of the probability of a spill from the Project and the potential environmental impacts associated with spills, including discussions of surface water and groundwater. As noted in that section, the likelihood of a spill from the Project is low, but it is not zero. Issues related to the Northern High Plains Aquifer System are addressed in Consolidated Responses AQF-1 through AQF-4. Consolidated Response AQF-3 provides information on hypothetical spills from the Project over two areas of the Northern High Plains Aquifer System.
847	1	Lindley	Vina		I am disgusted that the State Department would even consider the Alberta /Texas Pipeline. In lieu of the current BP disaster and the public focus on dirty oil the only possibly answer to Canada is NO. Please don't sell out our safety, the environment or the security of future generations of Americans.	Consolidated Response ENR-1 provides information on the Department of State's environmental review process, the National Interest Determination process, and the need to complete those reviews before approving or denying the Presidential permit for the proposed Project.
1354	1	Lindsay	Elinor&Byron		As a resident of St. Marie in Valley County, Montana, I support the Keystone XLPipeline project, which also incorporates the transmission line to be built by Big Flat Electric Cooperative to serve this load.	Comment acknowledged.
1544	131	Lindsey	Carl		Concern about the increase in availability of poor quality tar sands oil that will be created by this project.	Consolidated Response OIL-4 addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils. As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries.
1544	132	Lindsey	Carl		Concern about the long history of polluting refineries with abysmal safety records in Houston.	Consolidated Response Oil-3 and Sections 3.14.3.12 and 3.14.3.14 of the EIS address issues related to refinery emissions.
1544	134	Lindsey	Carl		I recommend that you look at the history of Texas refineries and implement higher standards for air quality.	DOS is not involved in regulation under the Clean Air Act. Regulation of air quality in Texas is under the jurisdiction of

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
						the Texas Commission on Environmental Quality and the U.S. Environmental Protection Agency.
1544	136	Lindsey	Carl		If you're going to count employment created by this project, also count all those doctors, scientists, specialists, nurses, and all the other people who will gain employment as a consequence of increased pollution.	As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries.
134	1	Lingle	Mary		I am concerned about the small spring fed branch that the pipeline is crossing on my parents' property. It is bad enough that the pipeline is crossing the best part of the property and they are going to have to use more right-of-way for drill pits. I just don't want the natural springs and branch to be damaged. I don't see how this process is going to work without messing up the branch.	Consolidated Response PVT-2 addresses concerns related to the proximity of the proposed Project to existing structures and facilities.
1043	1	Linke	Linda&Melvin		Our main concern is the effect this pipeline might have on the Ogallala Aquifer.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
1043	2	Linke	Linda&Melvin		We are also concerned with the State Dept. being the lead agency in the permitting process.	The Department of State (DOS) is not the lead agency in the overall permitting process. As described in Consolidated Response REG-2, DOS is the lead federal agency for the NEPA environmental review and is responsible for the review of Keystone's application for a Presidential permit, and is responsible for Project compliance with the Endangered Species Act and the National Historic Preservation Act. Many other federal, state, and local permits would be required for proposed Project authorization as noted in Table 1.8.1-1 of the EIS. DOS has no involvement in those permitting processes.
580	1	Lish	Christopher		Subject: Keystone XL is not in America's national interest Dear Elizabeth Orlando, I am writing to submit my concerns about the impacts the proposed Keystone XL pipeline would have on the climate and communities--and to urge you to deny a permit for this pipeline. The Department of State should not give permits for pipelines importing the world's dirtiest fuel while the rest of the country fights to prevent catastrophic climate change. "It is horrifying that we have to fight our own government to save the environment." -- Ansel Adams Tar sands will increase our transportation emissions, counteract existing efforts to fight global warming, and undermine U.S. energy independence by continuing our dependence on foreign oil. By expanding the U.S. market for tar sands oil, this pipeline will increase air pollution at American refineries and spur further expansion of the tar sands industry in Canada--an industry that has caused severe water and air contamination and destroyed hundreds of square miles of wetlands and forest. "These temple destroyers, devotees of ravaging commercialism, seem to have a perfect contempt for nature, and, instead of lifting their eyes to the God of the Mountains, lift them to the almighty dollar." -- John Muir Allowing more tar sands oil into the U.S. would be a disaster for the climate because it is dirtier than conventional oil at every step of the production process, causing three times more greenhouse gas emissions than regular gasoline. The 900,000 barrels of dirty oil that would be pumped through this pipeline every day would add 38 million tons of carbon dioxide to the atmosphere annually, which is equal to adding six million new cars to the	Consolidated Response OIL-4 addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils. Consolidated Response P&N-1 addresses the need that the Project has been proposed to meet, including information on crude oil supply and demand from an analysis specific to the proposed Project. Consolidated Response GHG-2 addresses the potential causal connection of implementation of the proposed Project and expanded oil sands production in Canada and increases in refining. Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project. As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries. Consolidated Response GHG-1 addresses the greenhouse gas life-cycle analyses presented in the revised EIS. Climate change is addressed in Section 3.14.3.14. As noted in that Section, implementation of the proposed Project is unlikely to result in a measureable climate change.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					<p>road. Your draft environmental impact statement ignores how this pipeline would make global warming worse, a serious oversight that must be amended. "Our government is like a rich and foolish spendthrift who has inherited a magnificent estate in perfect order, and then has left his fields and meadows, forests and parks to be sold and plundered and wasted." -- John Muir The expanded production of tar sands oil enabled by this pipeline would also result in more destructive strip mining and drilling in Canada and bring more air pollution to refinery communities in Texas. In Canada, ground zero for tar sands extraction, oil corporations are strip mining huge tracts of forest, and the waste is causing cancer hot spots in indigenous communities living downstream from the toxic byproducts. In the plains states along the Keystone XL pipeline's proposed path, communities face the risk of spills, as the company building the pipeline plans to pump oil at higher than typical pressures through farmland and key natural resources like the Missouri River. And, at the pipeline's end, the health of people living near Texas refineries would suffer, as tar sands oil spews higher levels of dangerous pollutants into the air when processed. "As we peer into society's future, we--you and I, and our government--must avoid the impulse to live only for today, plundering for our own ease and convenience the precious resources of tomorrow. We cannot mortgage the material assets of our grandchildren without risking the loss also of their political and spiritual heritage. We want democracy to survive for all generations to come, not to become the insolvent phantom of tomorrow." -- Dwight D. Eisenhower Tar sands oil production is incredibly toxic and puts American communities and wildlife populations at risk, while setting us back from our goal of transitioning to clean renewable energy sources. Tying our future to toxic tar sands will never be in our national interest. Increasing our reliance on more of the dirtiest oil on Earth and the steep social costs that come with it would be a dangerous step in the wrong direction. It's beyond time to ramp up investments in low-carbon alternatives to oil, such as better fuel economy requirements, plug-in electric cars fueled by solar power, and smart growth and public transportation infrastructure that give Americans choices other than cars. America cannot afford to let big oil and their cronies get rich while we're left with another disaster to clean up.</p>	<p>Keystone has withdrawn its application for a Special Permit as described in Consolidated Response REG-1. Section 3.13 of the EIS has been revised and addresses reliability and safety issues, including calculations of the probability of a spill from the proposed Project and the potential environmental impacts associated with spills.</p>
580	3	Lish	Christopher		<p>Please consider the true impact of this pipeline by including the devastating effects of mining, refining, and burning this fuel when you make your decision. "Our duty to the whole, including to the unborn generations, bids us to restrain an unprincipled present-day minority from wasting the heritage of these unborn generations. The movement for the conservation of wildlife and the larger movement for the conservation of all our natural resources are essentially democratic in spirit, purpose and method." -- Theodore Roosevelt</p>	<p>Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information on current and future production. As noted in that response, without the proposed Project, oil sands development would continue at or above the current level until at least 2020, with or without the proposed Project. Consolidated Response GHG-1 addresses the greenhouse gas life-cycle analyses presented in the EIS. As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries.</p>

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
762	1	Loberg	Kimberly		Please put our needs, the American people who would be directly affected by the Keystone XL pipeline, before the monetary needs of a foreign corporation.	The commenter's opinion is noted.
762	2	Loberg	Kimberly		I am against the TransCanada Keystone XL pipeline project going through the Nebraska Sand Hills as I believe it is a danger to the Ogallala Aquifer system that lies below the Sand Hills. Imagine what a leak like that would do, seeping through the sand in Nebraska's Pan Handle and into the Ogallala Aquifer below, the drinking water of most of Nebraska? Sparing the Ogallala Aquifer is what would be most beneficial to the Midwest people who rely on the aquifer as their sole means of drinking water.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
762	5	Loberg	Kimberly		Sparing the Nebraska Sand Hills is what would be most beneficial to the Midwest people.	Identification of sensitive environments crossed by the proposed Project is discussed in Consolidated Response ENV-1 and ENV-3. Issues related to the Sand Hills area are addressed in Consolidated Response ERO-1. Consolidated Response ALT-1 addresses potential alternative routes, including routes that would avoid much of the Northern High Plains Aquifer system and the Sand Hills area.
397	1	Long	Ash	peaceful Uprising	I oppose tar sands and the Keystone Pipeline. This project would essentially import the dirtiest fuel possible into this country, leaving us to store all of the waste that is refined out of the tar.	Consolidated Response OIL-4 addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils. Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project. As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in substantial changes to operations in Gulf Coast refineries.
397	3	Long	Ash	peaceful Uprising	Utah is too beautiful Why is money so Important? It's more important that preserving nature, which is necessary for life. What good is a tar pit when you're dead!. Please don't bring tar sands to Utah	The proposed Project does not extend through Utah.
710	1	Long	Nancy		Even the very rare possibility of leakage into the aquifer is too much. Please do not put the pipeline in the Sand Hills.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
450	1	Longsine	Marguerite		I greatly oppose the Keystone pipeline going through any of Nebraska let alone our water supply.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
450	3	Longsine	Marguerite		Big oil and big money HAVE to be stopped and alternative energy is a must for our future. It would be a tragedy if this were allowed. I am tired of corporations, legislatures, senators and congressmen who allow such outdated tragedies to continue.	Consolidated Response ALT-2 addresses the use of alternative technologies, alternative energy sources, and conservation of energy.
707	2	Lott	S		Please require Texas to meet Clean Air Act standards.	The U.S. Environmental Protection Agency, not the Department of State, is responsible for delegating the authority to states to issue and monitor permits under the Clean Air Act (CAA) and to ensure that the actions of the states are in compliance with the requirements of the CAA.
973	1	Lowery	Rich		As a registered Nebraskan voter I am very concerned about the long-term impact of the Keystone XL pipeline and its path	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					through the Ogallala Aquifer. The Ogallala Aquifer water resource is priceless. The aquifer is the source of drinking water and irrigation water critical to the economy and population in the state of Nebraska.	
973	2	Lowery	Rich		Industry best practices are not good enough on this project, it needs to redefine safety. Piping leakage calculations need to be continuously performed based on flowrates on the pipe. These need to be independently monitored, reported, and have mandatory thresholds to drive prompt shutdown and piping inspections. These are not burdens, they are prudent risk-mitigation requirements similar to regulations currently imposed on other high-risk industries such as nuclear power. If the regulatory burdens and safety requirements make this piping cost-prohibitive then it is simply not cost-effective to begin with.	As described in Consolidated Response SAF-1, the Pipeline and Hazardous Materials Safety Administration (PHMSA) has regulatory requirements that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project in a manner that protects the health and safety of the public and the environment. In addition, PHMSA developed 57 Project-specific Special Conditions that Keystone has agreed to implement. Incorporation of those conditions would result in a Project that would have a degree of safety over any other typically constructed domestic oil pipeline system under current code and a degree of safety along the entire length of the pipeline system similar to that which is required in HCAs as defined in 49 CFR 195.450. Sections 2.4.2 and 3.13.4.5 provide information on the monitoring and leak detection systems that would be incorporated into the Project.
973	3	Lowery	Rich		The pipeline needs to be routinely inspected and repaired on a preventative and predictive basis not after a piping failure.	As described in Consolidated Response SAF-1, the Pipeline and Hazardous Materials Safety Administration (PHMSA) has regulatory requirements that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project. In addition, PHMSA developed 57 Project-specific Special Conditions that Keystone has agreed to implement (see Appendix U). Both the existing regulations and the Special Conditions require regular pipeline monitoring and inspection, repair procedures, and reporting on those activities.
674	1	Lowndes	Connie		Do not allow the pipeline to cross the Nebraska Sandhills.	Identification of sensitive environments crossed by the proposed Project is discussed in Consolidated Response ENV-1 and ENV-3. Issues related to the Sand Hills area are addressed in Consolidated Response ERO-1.
644	1	Lubman	Stephen		Concerning the proposed Keystone XL Pipeline Project: I am not at all interested in industry assurances; they have too often been false, from the petroleum industry in particular. I am only slightly impressed by "insurances", even escrow accounts, because no amount of money is adequate to compensate for irreparable harm done to irreplaceable water and habitat. I am interested only in "ENSURRENCES" against damage. So long as industry is allowed to proceed without them, they are avoidable expenses, and 'accidents' are just part of the cost of doing business. My background is in computers, so for me to be assured, I would require detection, alarm, and suppression systems for ANY leak, out or in. I would require those systems to be virtually instantaneous and '99 and 44/100%' reliable. I would need that speed and reliability to be regularly tested and certified by a third party. And any attempt to cause or conceal safety defects would result in jail time, not just a fine. So what systems do I suggest? I was a software engineer, not a pipeline engineer, and I'm about to suggest something very expensive. But if it's not worth the money, it is NOT worth doing. I suggest a pipe	Consolidated Response SAF-1 describes the regulatory requirements that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project in a manner that protects the health and safety of the public and the environment. Those requirements do not include installation of a line under or around the pipe or the use of double-walled pipe. Consolidated Response AQF-6 also addresses the potential for using double-walled or triple-walled pipe. Pipelines extending through sensitive areas require thicker walled pipe than through other areas as noted in Section 2.3.1 of the EIS (see Table 2.3.1-1).

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					within a pipe, a la double-hulled tankers. The inner pipe would carry the cargo. The outer pipe would contain only sensors (for moisture, fumes, something else?) and could temporarily contain any leak from the inner pipe. Every sensor would be continuously monitored from a (remote) facility that would expeditiously investigate any problem. The inner pipe would be shutdown ahead of the leak before compromising the outer pipe. Too expensive? Than just say NO! to the pipeline. I do not want oil in my water unless it is unsaturated and I'm cooking pasta.	
1304	1	Lucas	Frank	US Congress	As a member of Congress whose constituents would be positively impacted by Keystone XL I strongly encourage the U.S. Department of State to approve an energy infrastructure project that not only will strengthen long-term energy security in the United States,	Comment acknowledged.
1304	2	Lucas	Frank	US Congress	but also will provide a powerful private sector economic stimulus to the mostly rural communities along the pipeline route during its construction at a time when our economy continues to struggle. I am deeply concerned about the unintended negative economic consequences that could possibly arise by not allowing TransCanada to continue with the pipeline building process. It is my understanding that Keystone XL will create over 13,000 jobs during a time when unemployment is bordering towards double-digits. A study by TransCanada found that in the U.S., Keystone XL would generate \$20.9 billion in total expenditures, \$9.6 billion in output, and \$6.5 billion of personal income. Also, the economic impact toward state governments would be \$486.36 million and \$99.1 million for local taxing entities along the pipeline route.	Consolidated Response ECO-1 addresses potential socioeconomic impacts, and Consolidated Response TAX-1 addresses concerns regarding taxes.
1304	3	Lucas	Frank	US Congress	Canada is already the largest supplier of energy to the United States, meeting 12 percent of current U.S. petroleum consumption needs and representing 18 percent of U.S. petroleum imports. This reserve is a growing source of reliable crude oil to our domestic markets that will strengthen U.S. energy security and reduce our dependence on unstable foreign oil sources. Therefore, turning to Canada for a secure oil supply alternative is a logical step.	Comment acknowledged.
1304	4	Lucas	Frank	US Congress	Also from an economic standpoint, it is critical that additional pipeline facilities be constructed, such as the Keystone XL Project, to transport oil sands production to the vitally important Gulf Coast. Their refineries in this region have excess capacity due to reduced production in Mexico and Venezuela shifting towards other markets.	Comment acknowledged.
1304	5	Lucas	Frank	US Congress	Therefore, I greatly support the Keystone XL Pipeline Project and strongly encourage the U.S. Department of State to confirm the findings of the Draft Environmental Impact Statement, which found that the proposed Keystone XL Pipeline would have "limited adverse environmental impact during construction and operation." I appreciate your consideration into this matter and look forward to the issue of a Final Environmental Impact Statement followed by a Presidential Permit that allows the construction of Keystone XL. This would enable the region and the United States to	Comment acknowledged.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					collect the substantial economic benefits Keystone XL would create ..	
273	1	Ludden	Jim	TIC-The Industrial Company Wyoming, Inc.	Recently a number of advocacy groups sent a letter seeking suspension of the permitting of the Keystone XL pipeline. TIC respectfully requests that you to reject the request and to continue to review the proposed project.	Comment acknowledged.
273	5	Ludden	Jim	TIC-The Industrial Company Wyoming, Inc.	The permitting processes in place are appropriate and should proceed so that a final determination can be made about the impacts of the project and whether it is in the national interest.	Comment acknowledged.
273	6	Ludden	Jim	TIC-The Industrial Company Wyoming, Inc.	Over and above the various comments going forward, TIC as a whole, urges the department to grant a permit for the pipeline.	Comment acknowledged.
273	8	Ludden	Jim	TIC-The Industrial Company Wyoming, Inc.	The environmental benefits of Keystone XL should not be overlooked.	Comment acknowledged.
273	10	Ludden	Jim	TIC-The Industrial Company Wyoming, Inc.	Pipelines are the safest, most reliable, economical and environmentally favorable way to transport oil and petroleum products, as well as other energy liquids, throughout the U.S. America depends on the more than 168,000 miles of liquid pipelines to move energy and raw materials our country relies on.	Comment acknowledged.
273	11	Ludden	Jim	TIC-The Industrial Company Wyoming, Inc.	Additional pipeline capacity will help consumers and businesses throughout the United States.	Comment acknowledged.
273	12	Ludden	Jim	TIC-The Industrial Company Wyoming, Inc.	This project also stands to provide a powerful private sector economic stimulus. During construction, the initial Keystone pipeline project created more than 500 full time jobs in the sectors that TIC worked on. In addition, a number of other contractors employed a like number of full time craftsmen and laborers throughout the length of the project. These are projects and employment that is funded by the private sector.	Comment acknowledged.
521	1	Ludes	Amanda		This project is far too great a risk to be allowed to go on. If any leak were to occur, this valuable water supply would be polluted -- and we all know how difficult it is to remove oil from water! The fact that this is underground means that any leaks would be even more difficult to deal with and repair. Please, make sure this project is rerouted somewhere else and recognize the value of the Ogallala Aquifer as a water source that needs to be kept safe.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. ALT-1.
217	1	Luetkemeyer	Blaine	Member of Congress	Rejection of the permit or suspension of the review would sacrifice the significant economic benefits this project stands to deliver and force U.S. consumers to rely on foreign sources of crude oil not economically and politically aligned with U.S. interests. I urge you to grant this permit should it meet necessary environmental and safety standards.	Comment acknowledged.
271	1	Luetkemeyer	Blaine	State Representative MO District 9	I write in support of TransCanada's Keystone XL crude oil pipeline project and urge the department to grant a permit for the pipeline.	Comment acknowledged.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
271	7	Luetkemeyer	Blaine	State Representative MO District 9	This project also stands to provide a powerful private sector economic stimulus. During construction, the initial Keystone pipeline project created more than 13,000 jobs funded with private investment.	Consolidated Response ECO-1 and Section 3.10.2.2 of the EIS address the potential socioeconomic impacts of the proposed Project.
271	8	Luetkemeyer	Blaine	State Representative MO District 9	Local governments will have a steady source of income from economic activity associated with construction and from property taxes.	Comment acknowledged.
271	9	Luetkemeyer	Blaine	State Representative MO District 9	Pipelines are a reliable, economical and environmentally favorable way to transport oil and petroleum products, as well as other energy liquids, throughout the U.S. America depends on the more than 168,000 miles of liquid pipelines to move energy and raw materials our country relies on	Comment acknowledged.
271	10	Luetkemeyer	Blaine	State Representative MO District 9	Additional pipeline capacity will help consumers and businesses throughout the United States.	Comment acknowledged.
181	1	Lund	Sherian		I wish to express my opposition to the proposed pipeline through Nebraska. I have been reading about it and think it is a bad idea to go near or through the aquifer. They say they have safeguards in place, but look what happened in the gulf oil spill and the pipeline rupture Friday in Utah. We cannot endanger our great source of water for drinking and agriculture.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. As described in Consolidated Response GLF-1, the risks associated with the proposed Project are substantially different from those associated with the BP Deepwater Horizon Project.
673	1	Lunsford	Kristen		Please deny approval to the Keystone Pipeline. It is in no conceivable way a project for the "greater good" of Americans. It is harmful to livelihoods and the environment of rural America.	Consolidated Response RUR-1 addresses concerns regarding potential changes to rural lifestyles.
106	1	Luscher	Diana		I do not believe this is a good idea since the pipeline traverses the migratory bird route for Sandhill Cranes, Whooping Cranes and many aquatic birds who migrate through the central part of Nebraska.	Potential Project-related impacts to whooping cranes are described in Section 3.8 and in the Biological Assessment (presented in Appendix T of the EIS). Additional discussion concerning sensitive resources potentially affected by the proposed Project are addressed in Consolidated Response ENV-1.
106	3	Luscher	Diana		Any damage to the Ogallala Aquifer by a pipeline rupture could be devastating to the populations in 8 states. Consider a safer route and or alternative.	Consolidated Response ALT-1 addresses potential alternative routes, including routes that would avoid much of the Northern High Plains Aquifer system.
41	1	Luton	Susan		The potential destruction of forests and potential pollution of water in no way equals the benefits of the Keystone XL Pipeline Project. The only people who will benefit for certain are a small group who will collect short-term financial profits. Many thousands of other people (including those of future generations) stand to lose from this insane proposed project.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information on current and future production. As noted in that Consolidated Response, without the proposed Project, oil sands development would continue at or above the current level until at least 2020, with or without the proposed Project.
111	5	Luttich	S.N.		Regulatory assurances have been become meaningless assurances, due to regulatory agencies having become pawns of the industries that they are instructed and mandated to regulate. The regulators and over-sight inspectors and examiners are not allowed to operate in an environment that is free from political and industrial nuance and interference. The regulators and inspectors are not free to conduct impartial examinations to assure critical standards are being met. Furthermore, the standards alone are often compromised to better serve the profitable interests of industry.	Consolidated Response SAF-1 describes the regulatory requirements and Project-specific Special Conditions that Keystone would comply with to construct, operate, maintain, inspect, and monitor the proposed Project. It also describes the monitoring, inspections, and reviews of the proposed Project that the Pipeline and Hazardous Materials Safety Administration would conduct to ensure compliance with those regulatory requirements.
111	6	Luttich	S.N.		The proposed Keystone XL Pipeline (KSXLP) should not be	Consolidated Response ALT-1 addresses potential alternative

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					constructed where it is being proposed to be constructed, nor how it is being proposed to be constructed.	routes and system alternatives, including rail and barge networks. Consolidated Response SAF-1 describes the regulatory requirements and Project-specific Special Conditions that Keystone would comply with to construct, operate, maintain, inspect, and monitor the proposed Project. It also describes the monitoring, inspections, and reviews of the proposed Project that the Pipeline and Hazardous Materials Safety Administration would conduct to ensure compliance with those regulatory requirements.
111	7	Luttich	S.N.		The oil to be piped through the proposed KSXLP to Gulf (of Mexico) Coast refineries from the Alberta Tar Sands (Canada) is not only dirty oil, but, also employs a variety of social-economic-political-ecological implications, which should inherently imply need for caution, if not conservative rejection.	Consolidated Response OIL-4 addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils. Consolidated Response ECO-1 addresses potential socioeconomic impacts associated with construction and normal operation of the proposed Project.
111	9	Luttich	S.N.		The final destination for the Keystone XL Pipeline tar-sands crude is the Gulf Coast refineries; and, no oil is being extracted en-route between the Alberta source and refineries; therefore, follow the pre-existing corridor, which will avoid prejudicing the Sandhill grasslands, east-west surface drainage watersheds, and most of the underlying High Plains water aquifer. It will cost more money; but, it will also avoid the risks, costs and environmental ramifications associated with the construction of the pipeline, and, operation of the pipeline, including potential ruptures of and leaks from the pipeline, when crossing through the Sandhills ecosystem and within and above the Ogallala and High Plains Aquifers and surface rivers, streams and drainage systems.	Consolidated Response ALT-1 and Section 4.3 of the EIS address potential alternative routes, including use of the existing Keystone Oil Pipeline System route. Consolidated Response ALT-1 and Section 4.3 of the EIS also address potential alternative routes that would avoid much of the Northern High Plains Aquifer System. Issues related to the High Plains Aquifer System are addressed in Consolidated Responses AQF-1 and AQF-2, and issues related to the Sand Hills area are addressed in Consolidated Response ERO-1.
111	12	Luttich	S.N.		Provisions need to be established to guarantee inspectors and examiners are both fully funded and positioned to comprehensively assure compliance standards and oversight reviews are both being met and thoroughly addressed, and, any rectifications completed. Employ only inspectors and engineers who are dedicated to assure the best job is being done and being done safely, without interference or objection from either the politicians or oil and pipeline industry. No short-changing the regulatory environment!	Consolidated Response SAF-1 describes the regulatory requirements and Project-specific Special Conditions that Keystone would comply with to construct, operate, maintain, inspect, and monitor the proposed Project. It also describes the monitoring, inspections, and reviews of the proposed Project that the Pipeline and Hazardous Materials Safety Administration would conduct to ensure compliance with those regulatory requirements.
111	13	Luttich	S.N.		Keystone XL Pipeline should be bonded for being financially obligated to compensate, mitigate and rectify any damages to people and/or the environment resulting from the operation of the pipeline, including spills and leakages. The value of that bond needs to be annually reviewed and structured to be commensurate with inflationary or deflationary changes in the economy. There are no free lunches! They built the pipeline; they are responsible for what they built! Yes, there will be costs; and, we the people will pay those costs either directly or indirectly. We can either pay by avoiding or insuring against the prospects of an accident or after the accident occurs! The cost of insurance is usually less if an accident is avoided an ounce of prevention is worth a pound of cure!	Consolidated Response LIA-2 addresses the issue of bonding for the proposed Project.
111	14	Luttich	S.N.		Preferably, the Keystone XL Pipeline would not be constructed; and, all refining would be on-site; but, if built to accommodate crude oil flow, than the building should avoid all	Consolidated Response P&N-8 addresses issues related to shipping Canadian crude oil to refineries that are closer to the source of oil. As described in Consolidated Response SAF-1,

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					risks, and, no costs spared to diminish risk.	the Pipeline and Hazardous Materials Safety Administration (PHMSA) has regulatory requirements that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project in a manner that protects the health and safety of the public and the environment. In addition, PHMSA developed 57 Project-specific Special Conditions that Keystone has agreed to implement. Incorporation of those conditions would result in a Project that would have a degree of safety over any other typically constructed domestic oil pipeline system under current code and a degree of safety along the entire length of the pipeline system similar to that which is required in HCAs as defined in 49 CFR 195.450.
293	3	Luttich	Stuart		The crude oil flowing through the pipeline will be a relatively highly corrosive oil in need of further refinement.	Consolidated Response OIL-4 addresses the composition of the Canadian crude oil that would be transported by the proposed Project, including concerns relative to the corrosivity and erosivity of the crude oil. As noted in that Consolidated Response, that crude oil is similar in composition and properties to other heavy crude oils that are currently transported within the U.S. pipeline system and similar in composition and properties to other heavy crude oils that are currently refined in PADD III.
293	4	Luttich	Stuart		The proposed pipeline is being routed through an aquifer and ecosystem that should a leak and spill develop will never be repaired or restored to its original state, i.e. the consequences will be, in the context of contemporary time, relatively permanent and not much different from that currently transpiring from the BP Deepwater Horizon well blow-out in the Gulf of Mexico.	As described in Consolidated Response GLF-1, the risks associated with the proposed Project are substantially different from those associated with the BP Deepwater Horizon Project. Issues related to the Northern High Plains Aquifer System are addressed in Consolidated Responses AQF-1 through AQF-4. Consolidated Response AQF-3 provides information on hypothetical spills from the Project over two areas of the Northern High Plains Aquifer System.
293	5	Luttich	Stuart		The native grasslands of the Sandhills and Great Plains that are being destroyed within the route of the proposed pipeline and resulting from the construction process will never be restored to the original status within the context of contemporary time. Native grasslands once plowed require centuries to recover or be restored. For those living today, this is a one time deal.	The EIS was revised to include additional information on Keystone's construction and restoration techniques within the Sand Hills in Section 3.5. Additional information on Keystone's process for development of construction and restoration methods within the Sand Hills and other issues are discussed in Consolidated Responses ENV-1 and ERO-1 and additional construction and reclamation information specifics to the Sand Hills was added to Appendix H of the EIS.
293	7	Luttich	Stuart		The proposed pipeline is transporting crude oil to refineries on the Gulf of Mexico shores of Louisiana and Texas, with no guarantees that the resulting products will remain to improve serving the public interests of the United States (or Canada).	Although there are no guarantees, as noted in Consolidated Response P&N-1, the Project has been proposed to replace dwindling crude oil supplies from Mexico and Venezuela. We anticipate that the refineries using the replacement oil would continue to ship refined product to current consumers along the East Coast of the U.S. and the Midwest.
293	8	Luttich	Stuart		The United States (and Canada) is assuming all of the environmental and ecological risks and damages along with resulting costs to serve the self-serving pleasures of the oil industries. This is fundamentally wrong!!	Consolidated Response P&N-1 addresses the need that the Project has been proposed to meet. The impacts associated with implementation of the proposed Project are addressed in Section 3.0 of the EIS. As noted in that response, the proposed Project would not result in any significant environmental impacts.
293	9	Luttich	Stuart		Reroute the pipeline to follow existing common corridors.	Consolidated Response ALT-1 and Section 4.3 address

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
						potential alternative routes, including use of the existing Keystone Oil Pipeline System route and other existing pipeline routes.
293	10	Luttich	Stuart		Do not build the pipeline, and, instead, refine the oil on-site.	Consolidated Response P&N-8 addresses issues related to shipping Canadian crude oil to refineries that are closer to the source of oil.
255	2	Luttrell	Ken	State Representative MO District 9	As I understand it, Keystone XL will create more than 13,000 high-wage construction and manufacturing jobs during the project's 2011-2012 construction schedule. Many of those jobs will be created in our rural districts, where too many residents continue to have difficulties finding good jobs. With Keystone XL, they will have an opportunity to work on the project or for businesses that provide supplies, goods and services for its construction and operation.	Consolidated Response ECO-1 and Section 3.10.2.2 of the EIS address the potential socioeconomic impacts of the proposed Project.
255	3	Luttrell	Ken	State Representative MO District 9	In addition to the jobs Keystone XL will create, the project will generate substantial economic benefits for the United States and our states and communities along the proposed route. It is our understanding that TransCanada commissioned a study to measure the project's economic stimulus to the U.S. and the states along the route. The study found that in the U.S., Keystone XL would generate \$20.9 billion in total expenditures, \$9.6 billion in output (gross product), personal income of \$6.5 billion and 118,935 person years of employment (jobs).	Consolidated Response ECO-1 addresses potential socioeconomic impacts, and Consolidated Response TAX-1 addresses concerns regarding taxes.
255	4	Luttrell	Ken	State Representative MO District 9	In addition, the report concluded that during construction, Keystone XL would generate \$486.36 million in tax revenue for state governments along the route and \$99.1 million for local taxing entities where the pipeline is located. In Oklahoma, the study found Keystone XL expenditures during construction would total \$1.2 billion and generate an economic gross product of nearly \$1.1 billion. Keystone XL construction also would generate more than \$7.7 million in tax revenue for local government and \$31.4 million for state government.	Consolidated Responses TAX-1 and ECO-1 address the estimated increases in the tax base and the jobs generated by the proposed Project. Also see the revisions to Sections 3.10.2.3 and 3.10.2.4 of the EIS.
255	8	Luttrell	Ken	State Representative MO District 9	I enthusiastically support the Keystone XL Pipeline Project and encourage the U.S. Department of State to confirm the findings of the Draft Environmental Impact Statement, which found that the proposed Keystone XL Pipeline would have "limited adverse environmental impact during construction and operation. I look forward to the issuance of a Final Environmental Impact Statement followed by a Presidential Permit that allows the construction of Keystone XL and enables our districts, the State of Oklahoma, and the United States to collect the substantial economic benefits Keystone XL would create.	Comment acknowledged.
1477	1	Luty	Dale		Please help slow global warming by denying the permit for the Keystone XL Project. Tar sands are probably the dirtiest form of fossil fuels, in terms of total carbon footprint and global warming potential. I urge you to use your influence at the Department of State to disallow this project. We need to devote our infrastructure spending to more sustainable energy sources. My grandsons deserve better options, for a better future.	Consolidated Response GHG-1 addresses GHG life-cycle analyses. Consolidated Response P&N-5 addresses issues related to investments in other technologies.
1203	1	LYMAN	MARVIN		I feel there are additional protective measures that should be	As described in Consolidated Response SAF-1, the Pipeline

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					required and implemented if there is ever to be approval for this project. Some to be considered would be above ground location with crossing possibilities provided to accommodate private and public ready access for crossing. Double strength casing of the pipe itself could be required to further prevent any possible leakage. A remedial (proven) plan in effect in the event of the "impossible". Etc. Otherwise - "just say no" to the pipeline within 100 miles of the ogallala aquifer.	and Hazardous Materials Safety Administration (PHMSA) has regulatory requirements that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project in a manner that protects the health and safety of the public and the environment. In addition, PHMSA developed 57 Project-specific Special Conditions that Keystone has agreed to implement. Incorporation of those conditions would result in a Project that would have a degree of safety over any other typically constructed domestic oil pipeline system under current code and a degree of safety along the entire length of the pipeline system similar to that which is required in HCAs as defined in 49 CFR 195.450. Issues related to an above-ground pipeline are addressed in Consolidated Response CST-1. Consolidated Responses AQF-1 through AQF-4 address issues related to the Northern High Plains Aquifer system, which includes the Ogallala aquifer. Consolidated Response AQF-6 addresses the suggestion that Keystone use double-walled pipe for the Project. Consolidated Response RES-1 addresses issues related to preparation and review of the emergency response plan for the proposed Project.
1556	4	Lyman	Lon		TransCanada proposes to run right down the middle of me, right straight through the middle of the ranch..And as we rode up there that morning thinking we were minding our own business, here came a helicopter come up out of that creek.... They said they were going to fly the line that day, 300 to 500 feet. They weren't...any time that I've dealt with TransCanada they have not been truthful, not been truthful at all.	Consolidated Response ALT-1 addresses potential alternative routes and system alternatives, including rail and barge networks. Consolidated Response EAS-2 addresses issues related to easement negotiations and eminent domain. DOS has no legal authority in the easement negotiations or in eminent domain proceedings.
1556	5	Lyman	Lon		But the problem is now we've discovered that they were looking for migratory birds with that chopper. I called FAA. They checked it out. PUC has checked it out. We have migratory hawks in that creek, a lot of them. And if this comes down through there, and this is their plan, that they're going to run over us, which they've tried to do on everything in the world, and people from all over testified up there at PUC at Pierre, Harding County especially. And they've had trouble with this, and we do not want our wildlife disturbed. Those birds have been in there for years, and this is a way of life for us. It isn't money. Be sure you know that. It's not money. You can't buy it. We want those birds protected and we want our wildlife protected.	Pre-construction surveys to find locations with eagle or other raptor nests are generally completed using a helicopter flying at low level. While some disturbance to nesting birds occurs from the surveys, disturbance is generally limited to a single overflight. Surveys are necessary to identify areas that may need to be avoided or where construction may be limited to specific times of the year when nesting or roosting birds may be present. Raptors are protected by the Migratory Bird Treaty Act which is enforced by the U.S. Fish and Wildlife Service. Nest trees would not be removed when nests are active. While there may be some disturbance to nesting raptors during construction; disturbance would generally be limited to one nesting season. Habitats would be restored, although loss of any nest trees due to construction would be long-term.
1542	74	Lynden	Donita		I oppose the tar sands Keystone XL pipeline.	Comment acknowledged.
1542	75	Lynden	Donita		The tar sands directly compete with a number of jobs in clean energy. They take away opportunities in the area to transition to an independent energy sector.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information on current and future production. As noted in that Consolidated Response, without the proposed Project, oil sands development would continue at or above the current level until at least 2020, with or without the proposed Project.
1542	78	Lynden	Donita		Oil is not the answer, tar sand oil is certainly not the answer.	Consolidated Response ALT-2 addresses the use of alternative technologies, alternative energy sources, and conservation of energy.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
1544	214	Lyneigye	Ms.	U.S. Pipeline	Building a pipeline will bring economic growth.	Comment acknowledged.
1544	215	Lyneigye	Ms.	U.S. Pipeline	Pipelines are the safest way to transport liquids with respect to the environment.	Comment acknowledged.
1544	216	Lyneigye	Ms.	U.S. Pipeline	All pipelines are strictly inspected by the highest governmental standards, all impacted wetlands restored, construction limited to times that will have the least impact on wildlife.	Consolidated Response WAT-2 addresses concerns regarding a compensatory mitigation plan for jurisdictional wetlands and potential impacts to non-jurisdictional wetlands.
1297	1	Lyon	Jim	National Wildlife Federation	National Wildlife Federation's mission is to inspire Americans to protect wildlife for future generations. We are here today because we believe the proposed Keystone Pipeline Project is in direct conflict with our mission.	Comment acknowledged.
1297	3	Lyon	Jim	National Wildlife Federation	Over 2,000 miles long, this pipeline would traverse rivers and carve across prairies, flow on top of vital aquifers, and threaten farmers, ranchers and wildlife when it leaks or breaks, as we believe it undoubtedly will.	The Project being evaluated by the Department of State and the cooperating agencies includes a pipeline in the U.S. that is approximately 1,384. The EIS addresses the potential impacts of normal operation and the potential impacts that would result from spills from the Project.
1297	5	Lyon	Jim	National Wildlife Federation	The sludge-like tar sands oil delivered by the pipeline would release vast amounts of toxic chemicals into our air when it is refined in the U.S., and emit much more global warming pollution into the atmosphere than fuels made from conventional oil.	Consolidated Response OIL-4 also addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils being processed in Gulf Coast refineries. As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries.
1297	12	Lyon	Jim	National Wildlife Federation	Oil production and OIL-related disasters have devastating impacts.	The commenter's opinion is noted.
1297	13	Lyon	Jim	National Wildlife Federation	If we do not stop the expansion of major infrastructure projects like Keystone XL, we run a huge risk of only further increasing our addiction to oil-at a moment in history when an alternative course is desperately needed-and expected -by the American public.	Consolidated Response P&N-1 addresses the need that the Project has been proposed to meet. Consolidated Response ALT-2 addresses the use of alternative technologies and alternative energy sources.
1297	14	Lyon	Jim	National Wildlife Federation	Keystone XL would have substantial impacts on North America's migratory wildlife species.	Proposed Project-related effects on animal movements are discussed in Section 3.6. After construction, the pipeline right-of-way would have little effect on movements of most animals that migrate through flight or movements of large mammals. Some impediment to movements of amphibians and reptiles may result from construction of the pipeline, permanent access roads and other associated facilities as described in Section 3.6.
1297	15	Lyon	Jim	National Wildlife Federation	Canada's boreal forest, lakes and wetlands, which are being destroyed and polluted at an alarming rate by the expansion of tar sands oil production, provide critical breeding habitat for 30% of America's songbirds and 40% of its waterfowl.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information on current and future production. As noted in that Consolidated Response, without the proposed Project, oil sands development would continue at or above the current level until at least 2020, with or without the proposed Project. Consolidated Response ENV-4 addresses issues related to oil sands production and migratory birds.
1297	16	Lyon	Jim	National Wildlife Federation	Among the many sportsmen and women represented by our organization, there is a growing concern over the threat that tar sands pose to America's conservation, and hunting and fishing legacy.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
1297	17	Lyon	Jim	National Wildlife Federation	The full impacts of tar sands development on wildlife remain largely unknown because the Canadian government, provincial authorities, and energy companies have not conducted adequate monitoring and testing. However, it is becoming clear that the impacts are substantial.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information on current and future production. As noted in that Consolidated Response, without the proposed Project, oil sands development would continue at or above the current level until at least 2020, with or without the proposed Project.
1297	19	Lyon	Jim	National Wildlife Federation	Bird mortalities associated with tar sands mining are woefully under-reported and mostly undocumented. In an article published in the Open Conservation Biology Journal, Dr. Kevin Timoney laid out a disturbing case that tar sands development has led to a permanent loss of at least 58,000 birds-and possibly as many as 400,000. The Syncrude tailings pond deaths were the result of the birds becoming mired in oil, (a painfully familiar sight these days) when companies' efforts to deter the birds with noise cannons and scarecrows failed.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information on current and future production. As noted in that Consolidated Response, without the proposed Project, oil sands development would continue at or above the current level until at least 2020, with or without the proposed Project.
1297	22	Lyon	Jim	National Wildlife Federation	Despite pipeline safety claims by TransCanada, the reality is that pipeline leaks and oil spills are more commonplace than most people realize. The BP oil spill is just starting to bring this reality under greater public scrutiny.	Section 3.13 of the EIS addresses reliability and safety issues, including calculations of the probability of a spill from the proposed Project. That section substantiates the comment regarding the potential for a spill from the Project.
1297	23	Lyon	Jim	National Wildlife Federation	Keystone XL would be pumping up to 900,000 barrels per day of tar sands oil at approximately 50 times the pressure of the air in a car tire over its 2,000 mile route-any leak could cause a disastrous oil spill. This would spell serious trouble for local waters and wildlife.	Section 3.13 of the EIS addresses reliability and safety issues, including calculations of the probability of a spill from the Project and the potential environmental impacts associated with spills.
1297	24	Lyon	Jim	National Wildlife Federation	The pipeline's construction, additional roads, power lines, and pumping stations would fragment the landscape and important wildlife habitat. Keystone XL will be bring these two threats-the risk of oil spills and landscape and habitat fragmentation-right through America's Heartland.	Habitat fragmentation is addressed in Section 3.6 of the EIS. Section 3.13 of the EIS has been revised and addresses reliability and safety issues, including calculations of the probability of a spill from the proposed Project and the potential environmental impacts associated with spills.
1297	25	Lyon	Jim	National Wildlife Federation	In Montana, the pipeline would cross some of the best pronghorn antelope habitat in North America and the Yellowstone River, which is the longest of the Missouri Headwaters and is still undammed. The river is vitally important to anglers in the region.	Additional discussions of pronghorn antelope range and the Yellowstone River crossing are presented in Appendix I of the EIS. The Yellowstone River would be crossed using the horizontal directional drilling method. The pipeline would be at least 25 feet below the streambed to avoid impacts to water quality and fisheries resources.
1297	26	Lyon	Jim	National Wildlife Federation	In South Dakota, the pipeline would cut through short-grass prairie habitat for the mountain plover, a rare species that has been proposed for listing as an endangered species.	In the final EIS, the discussion of potential Project-related impacts to the mountain plover has been moved to Section 3.8.1.2 of the EIS in consideration of its Proposed Threatened listing. The discussion of mountain plover includes Keystone's proposed minimization measures, which could include nesting season surveys and construction delays in areas where nests or broods are identified.
1297	28	Lyon	Jim	National Wildlife Federation	In Nebraska, Keystone XL would cross the Ogallala Aquifer, which underlies the entire state and extends into areas of South Dakota, Wyoming, Colorado, Kansas, Oklahoma, New Mexico and Texas. This aquifer provides drinking water for two million people and waters more than a 3 quarter of the irrigated land in the U.S. The water table is so close to the surface in some areas that local farmers and ranchers create artesian wells simply by putting a pipe in the ground. Landowners are concerned that any spill could immediately contaminate a large portion of their groundwater.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
1297	29	Lyon	Jim	National Wildlife Federation	The pipeline would also cross the Platte River, which is a critically important, if not sacred, migration stop for migratory whooping and sandhill cranes.	The proposed Project would cross the Platte River using the horizontal directional drilling (HDD) method which would avoid any direct impacts to instream river habitats for migration stopover for whooping and sandhill cranes. An assessment of potential Project-related impacts to whooping cranes is described in Section 3.8.1 of the EIS, and sandhill cranes are described in Section 3.6.2.
1297	30	Lyon	Jim	National Wildlife Federation	In Oklahoma, the pipeline would cross the Red River and many other river systems that provide an abundance of small fish and breeding habitat for the highly endangered least tern.	Habitats crossed by the proposed route that could be suitable for least tern nesting were identified and surveyed for presence/absence of this species in 2008, 2009, and 2010. Evaluation of potential Project-related impacts and conservation measures for this species are described in Section 3.8.1.2 of the EIS. The Red River would be crossed using the horizontal directional drilling (HDD) method which would avoid any direct impacts to instream river habitats for nesting interior least terns.
1297	31	Lyon	Jim	National Wildlife Federation	It would also cut through the Deep Fork Wildlife Management Area, a haven for game and non-game species including bobwhite quail, turkey, bobcat and bald eagles. And this area is one of the few public hunting areas in the state.	Proposed Project-related effect on wildlife are described in Section 3.6 to the EIS. The proposed Project would cross less than 1 mile of the Deep Fork Wildlife Management Area in Oklahoma. The proposed Project would cross Deep Fork Creek using the horizontal directional drilling method and would be parallel to an existing right-of-way through the crossing of the Deep Fork Wildlife Management Area minimizing impacts to wildlife and wildlife habitats.
1297	32	Lyon	Jim	National Wildlife Federation	In Texas, the pipeline would cross the Neches River, which is the last river with its natural values still relatively intact, including abundant wildlife, clean water, scenic river vistas, and forests.	The proposed Project would cross the Neches River using a the horizontal directional drilling method which avoids and minimizes impacts to riparian vegetation, river banks, benthic substrates, stream channel stability, and water quality.
1297	34	Lyon	Jim	National Wildlife Federation	While President Obama has shown real international leadership on climate change, if his Administration were to approve Keystone XL, his leadership would be undermined.	The commenter's opinion is noted.
1297	35	Lyon	Jim	National Wildlife Federation	James Hansen, one of the most well-respected climate scientists in the world, recently wrote in the British publication, The Guardian, "the tar sands of Canada constitute one of our planet's greatest threats." Hansen points out that tar sands are a "double-barreled threat" to our planet's climate systems. The first problem is that burning carbon-based fuels emits carbon dioxide into the atmosphere. Burning gasoline made from conventional oil has long been seen as a major culprit 4 in this process, but as Hansen points out, "producing oil from tar sands emits two-to-three times the global warming pollution of conventional oil." That's just one part of the problem.	Consolidated Response GHG-1 addresses the greenhouse gas life-cycle analyses presented in the revised EIS.
1546	36	Lyon	Jim	National Wildlife Federation	Believes that the pipeline is in direct conflict with NWF's mission to protect wildlife for future generations.	Comment acknowledged.
1546	37	Lyon	Jim	National Wildlife Federation	If project is approved, every day we will import 900,000 barrels of the world's dirtiest fuel (tar sand oil) over 2,000 miles, traversing rivers, carving across prairies and vital aquifers and threatening natural systems.	As noted in Consolidated Responses OIL-4, the crude oil that the Project would transport is similar to much of the heavy crude oil currently being transported to and used in the same refineries that Keystone would supply. The impacts associated with construction and normal operation of the proposed Project are addressed in Section 3.0 of the EIS. As noted in that section, the proposed Project would not result in significant environmental impacts.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
1546	40	Lyon	Jim	National Wildlife Federation	So despite the pipeline safety claims from TransCanada, the reality is pipeline leaks and oil spills are commonplace, and the BP spill brings that home.	Consolidated Response OIL-1 provides a summary of the range of spill frequency estimates addressed in the EIS. Consolidated Response OIL-2 addresses maximum-sized releases from the Project and addresses concerns about corrosion rate comparisons between the Alberta transmission pipeline system and the U.S. transmission pipeline system. As described in Consolidated Response GLF-1, the risks associated with the proposed Project are substantially different from those associated with the BP Deepwater Horizon Project.
1546	41	Lyon	Jim	National Wildlife Federation	Keystone will be pumping 900,000 barrels of tar sands oils at approximately 50 times the pressure of air in a car time over a 2,000 mile route. Any leak could cause a disastrous oil spill.	Section 3.13 of the EIS addresses reliability and safety issues, including calculations of the probability of a spill from the Project and the potential environmental impacts associated with spills.
1546	42	Lyon	Jim	National Wildlife Federation	Pipeline spells serious trouble for local water.	Consolidated Response WAT-1 addresses concerns regarding potential water quality impacts.
1546	43	Lyon	Jim	National Wildlife Federation	Pipeline spells serious trouble for local wildlife.	The impacts associated with implementation of the proposed Project, including the potential impacts to wildlife, are addressed in Section 3.0 of the EIS. As noted in that section, construction and normal operation the proposed Project would not result in significant environmental impacts.
1546	44	Lyon	Jim	National Wildlife Federation	In addition to the construction, the additional roads and the power lines and the pumping stations will fragment the landscapes and important wildlife habitat.	An assessment of potential habitat fragmentation is presented in Section 3.6 of the EIS. Additional information for potential fragmentation due to power distribution lines has been added to the EIS.
1546	45	Lyon	Jim	National Wildlife Federation	In Montana, the pipeline would cut across some of the best Prong horned Antelope habitat in North America, and of course the Yellowstone River...	Rangeland habitats used by the pronghorn would be restored and no permanent fencing that could impede movements would be constructed. The Yellowstone River would be crossed using the horizontal directional drilling method (HDD) and banks and river bed would be undisturbed by this crossing method. Further information on HDD is presented in Section 2.3.3.5 of the EIS.
1546	46	Lyon	Jim	National Wildlife Federation	In South Dakota, the pipeline would cut across a short grass prairie habitat of the Mountain Plover, a rare species [that] has been proposed for listing as an endangered species. And it would cut across the Mississippi and central flyways of the Prairie Pot Hole Regions, which are critical nesting areas for ducks of all sorts.	Agency-identified habitats suitable for mountain plover nesting would be surveyed for the presence prior to construction. Disturbance to nesting mountain plovers would be avoided. Unavoidable crossings of wetland habitats would employ construction methods that would minimized damage to the wetlands. Most wetlands would be restored after construction. Further information about wetlands is presented in Consolidated Response WAT-2
1546	47	Lyon	Jim	National Wildlife Federation	In Oklahoma, the pipeline would cut across the Red River, and many of the river systems that provide an abundance of small fish and breeding habitat for the highly endangered Lee's Tern. The Platte River it crosses [is a] critically important, if not sacred[,] migration stop for migratory whooping and Sand Hill Cranes.	Both the Red River and Platte River would be crossed using the horizontal directional drilling method (HDD). Any nesting habitat available for the interior least tern or migration stopover habitat for whooping cranes at these locations would not be damaged by construction. In addition, pre-construction surveys would be completed to ensure that no active least tern nests are present within the crossing area. If active least tern nests are located within the construction area, construction would be stopped until the nests have hatched and young are fledged. Further information on HDD is presented in Section 2.3.3.5 of the EIS.
1546	50	Lyon	Jim	National Wildlife Federation	While President Obama has shown real international leadership on climate change, if this administration were to	The commenter's opinion is noted.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					approve KXL, his leadership would be undermined.	
1546	52	Lyon	Jim	National Wildlife Federation	The burning of carbon fuels emitted carbon dioxide into the atmosphere at 2 to 3 times the rate of standard fossil fuels.	Consolidated Response GHG-1 addresses the greenhouse gas life-cycle analyses presented in the revised EIS.
1546	54	Lyon	Jim	National Wildlife Federation	Building the Keystone XL will import billions of barrels of dirty fuels from Canada, and its taking the wrong path into increasingly hazardous terrain.	Consolidated Response OIL-4 addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils.
	27	Lyon	Jim	National Wildlife Federation	The pipeline route tracks the Central and Mississippi Flyways, and cuts through the prairie potholes, which provide critical nesting habitat for many ducks, including pintails and mallards.	Proposed Project-related effect on prairie pothole and Rainwater Basin wetlands are discussed in Section 3.4. Additional discussion of sensitive habitats crossed by the proposed Project is provided in Consolidated Response ENV-1.
207	1	M.	Francis		Please work to prevent any oil pipelines from crossing NE. Spills would harm our underground waters. We believe it would be better if Canada and oil company would build a refinery up there. Here in the Grand Island the gov. is spending large amounts of money to clean the water under our town from toxic chemicals over several years.	Section 4.3 of the EIS and Consolidated Response ALT-1 address potential alternative routes, including routes that avoid Nebraska. Issues related to the Northern High Plains Aquifer System are addressed in Consolidated Responses AQF-1 through AQF-4. Consolidated Response P&N-8 addresses issues related to shipping Canadian crude oil to refineries that are closer to the source of oil.
526	1	Maas	Ronald		I am writing this message to express my opposition to routing the Keystone XL Pipeline through the Sandhill region of Nebraska. It would be much better to route it only a hundred miles or more to the east and avoid crossing the fragile soils and near surface water table that are a part of this area. There are numerous examples of how much damage can be done when the native grass is disturbed and the resultant huge blow outs can never be repaired. The soils are a light sand structure about the same as on beaches around the ocean. The grass that Mother Nature has put in place is the only thing that holds it in place and when it is removed the winds and rains can create blow outs that only increase in size. The loss to grazing in the area will be enormous and can be prevented by moving the route to more stable soils just to the east. There is no way that grass can be reseeded in area that will be dug up or damaged by the construction of the pipeline. The prevailing wind in that part of the world is from the Northwest to the Southeast and that would be the same direction as the planned pipeline. The result will be substantial additional damage to a fragile natural environment and no way to restore it to the condition it is now. Thank you for considering my request. Ron Maas	Identification of sensitive environments crossed by the proposed Project is discussed in Consolidated Response ENV-1 and ENV-3. Issues related to the Sand Hills area are addressed in Consolidated Response ERO-1. Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. Consolidated Response ALT-1 addresses potential alternative routes, including routes that would avoid much of the Northern High Plains Aquifer system and the Sand Hills area.
1094	1	Maas	Marian		Dear Sir, I strongly oppose the Keystone Pipeline which is proposed to be built across the Sandhills and the Ogallala Aquifer here in Nebraska. The Ogallala holds ancient water and once any kind of contamination enters this amazing geological formation, it will be there to continue to contaminate for centuries. There is no clean up potential, no artificial means of flushing it out. This is a water source for many towns, ranchers, livestock and wildlife of the Great Plains. The groundwater table can be high in certain places in the Sandhills □ the Ogallala seeps and creates wet meadows and lush hayfields for livestock on the range □ and the construction of a pipeline will damage this sensitive land,	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
1094	2	Maas	Marian		not to mention the danger from potential oil leaks and other accidents. Buried in the ground, leaks in the pipeline could go undetected or unfound for days. The company's plan to use thinner metal for the pipeline and run the oil under higher pressure □ let's see, that's a thinner pipe with more pressure going through it than previous pipelines actually borders on irresponsibility. Is it because this is out where "no one lives" that the builders of this pipeline think they can get away with less cost by building it more cheaply and at the same time expecting to transport more oil per second than possibly it was designed? Further, I have talked with an engineer who works with the Alaskan pipeline and he strongly believes that no pipeline of this size should be buried. Integrity loss will be too difficult to correct expediently. Lastly, my graduate work focused on endangered and threatened fish species of the Sandhills and the geological fragility of the ecosystems, vegetation, and the streams of this area. Even slight mechanized transport through this area creates vegetation loss and "blowouts" in which vegetative cover is lost and sandy, barren ground takes over.	Keystone has withdrawn its application for a Special Permit as described in Consolidated Response REG-1. As described in Consolidated Response SAF-1, the Pipeline and Hazardous Materials Safety Administration (PHMSA) has regulatory requirements that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project. In addition, PHMSA developed 57 Project-specific Special Conditions (see Appendix U of the EIS) that Keystone has agreed to implement. Incorporation of those conditions would result in a Project that would have a degree of safety over any other typically constructed domestic oil pipeline system under current code and a degree of safety along the entire length of the pipeline system similar to that which is required in high consequence areas (HCAs) as defined in 49 CFR 195.450. Consolidated Response CST-1 describes the reasons that Keystone designed a buried rather than above-ground pipeline. Issues related to the Sand Hills area are addressed in Consolidated Response ERO-1.
1094	3	Maas	Marian		The area is geologically young, and Phoxinus neogaus and Phoxinus eos are relic Cyprinid populations of the last glacial period, and depend on clear, un□impacted prairie streams. These are examples of the exceptional nature of the Sandhills, a geological formation unlike nearly anything else in the world.	Occurrence surveys were completed in Nebraska as directed by the Nebraska Game and Parks Commission for finescale dace (Phoxinus neogaeus) and northern redbelly dace (Phoxinus eos). These minnows were not found in streams crossed by the proposed Project in Nebraska. An evaluation for suitable habitat along the proposed Project route did not identify any additional suitable habitat for these species that would be crossed by the proposed Project. This information has been added to Section 3.8.3.4 of the EIS.
1561	1	Macholan	Daniel	Caterpillar, Inc	I write to you in support of TransCanada's Keystone XL crude oil pipeline project, and urge the department to grant a permit for the pipeline.	Comment acknowledged.
1561	2	Macholan	Daniel	Caterpillar, Inc	Rejection of the permit, or suspension of the review, would sacrifice the significant economic and energy benefits this project stands to deliver.	Comment acknowledged.
1561	7	Macholan	Daniel	Caterpillar, Inc	Again, I urge support for TransCanada's Keystone XL crude oil pipeline project, and urge the department to grant a permit for the pipeline without delay.	Comment acknowledged.
995	1	MacInnis	Ronald	Cal Performances/I. A.T.S.E. local 107	Considering the enormous length of the pipeline and the shoddy maintenance that we've come to expect from oil extractors, it is too much to imagine that this project will not end up with a series of disasters.	Keystone is an oil transporter, not an oil extractor. As described in Consolidated Response SAF-1, the Pipeline and Hazardous Materials Safety Administration (PHMSA) has regulatory requirements that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project in a manner that protects the health and safety of the public and the environment. In addition, PHMSA developed 57 Project-specific Special Conditions that Keystone has agreed to implement. Incorporation of those conditions would result in a Project that would have a degree of safety over any other typically constructed domestic oil pipeline system under current code and a degree of safety along the entire length of the pipeline system similar to that which is required in HCAs as defined in 49 CFR 195.450.
995	2	MacInnis	Ronald	Cal	To place the refining in a state that does not adhere to Clean	As described in Consolidated Responses P&N-1, P&N-3, and

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
				Performances/l. A.T.S.E. local 107	Air standards should be the final nail in its coffin.	OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries. Consolidated Response OIL-4 also addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils.
911	1	Madrone	Serenity		I am writing today to urge you to halt any further development of the Keystone XL pipeline.	Consolidated Response ENR-1 provides information on the Department of State's environmental review process, the National Interest Determination process, and the need to complete those reviews before approving or denying the Presidential permit for the proposed Project.
911	2	Madrone	Serenity		Like many Americans I have struggled through the current recession. Jobs are important, and a strong economy benefits us all. Nonetheless, "job creation" and "boosting the economy" must not be promoted at any costs, regardless of the price current and future generations will pay for short-term gains.	Comment acknowledged.
481	1	Maguire	Joan		In light of current events it would seem to be complete madness to run a pipeline across Nebraska and risk poisoning the Ogallala aquifer. There is no such thing as absolutely safe.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
566	1	Mainelli	Margaret		I am completely and utterly opposed to any pipeline coming through the Sandhills of Nebraska. Putting a pipeline in this fragile area is asking for trouble. Keep it out!	Identification of sensitive environments crossed by the proposed Project is discussed in Consolidated Response ENV-1 and ENV-3. Issues related to the Sand Hills area are addressed in Consolidated Response ERO-1.
533	1	Majors	Dalienne		I am a native Nebraska and am horrified about the plan to put an oil pipeline through the Nebraskan Sandhills. Routing the oil pipeline over the Nebraskan Sandhills above the Ogallala Aquifer MUST be stopped! There has already been a leak in Montana and fracking is affecting the water supply in New York State (See Gasland, a recent and illuminating film documentary by Josh Fox). We will still need our water supply in 30 years. Think about the next generation. Please find alternatives. This needs to be rerouted over safer land.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. Consolidated Response ALT-1 addresses potential alternative routes, including routes that would avoid much of the Northern High Plains Aquifer system.
367	1	Mangan	Maria		I ask that you reconsider and do not send the Keystone pipeline route through any part of the Ogallala Aquifer area. Pure water is much more important to the people of the country, in fact all countries than any oil production. Contaminated water cannot be undone. I hope that this will be a "red flag" for your committees.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
1175	1	Mann	Curtis		The proposed pipeline across the state of Nebraska is a HUGE mistake...Please do not allow it to happen!	Consolidated Response ALT-1 addresses potential alternative routes, including routes that would avoid much of the Northern High Plains Aquifer system.
1175	2	Mann	Curtis		[In light of the oil spill in the Gulf of Mexico,] can we afford taking a chance with the aquifer in Nebraska? I don't think so.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. As described in Consolidated Response GLF-1, the risks associated with the proposed Project are substantially different from those associated with the BP Deepwater Horizon Project.
1175	4	Mann	Curtis		[In light of the oil spill in the Gulf of Mexico, can we afford taking a chance with the aquifer in Nebraska? I don't think so.] We treasure our water in Nebraska and cannot afford to risk our future.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
150	1	Mannchen	Brandt	Sierra Club	Need for the Proposal - Why should the citizens of Texas and Houston become a dumping ground for Canada? Why not let Canada refine its own dirty tar sands oil? TransCanada has not been able to do this because Canadians have fought the construction of a refinery to process dirty tar sands oil.	Consolidated Response P&N-1 addresses the need that the Project has been proposed to meet. Products refined from the Canadian crude oil would be used by consumers in the U.S. Consolidated Response P&N-4 provides information on investments by Chinese companies in Canadian oil sands project.
150	2	Mannchen	Brandt	Sierra Club	Canadians don't want to breathe polluted air. Neither do Texans and Houstonians. Don't foist air pollution off on Texas and Houston. We are not a sacrifice zone.	As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries.
150	3	Mannchen	Brandt	Sierra Club	Chapter request a 60-day extension to the public comment period for the DEIS and a public hearing in Houston, Texas. Since Houston air will be affected by dirty tar sands oil Houstonian deserve a public hearing. The Houston Group and Lone Star Chapter were not directly notified about this proposal by the DS and as a result we found out about the TCK last week. The DEIS is 100's of pages in length and filled with technical information that requires extensive analysis, assessment, and evaluation.	Consolidated Response CMT-1 addresses issues related to the length of the comment period for the draft EIS and supplemental draft EIS.
150	4	Mannchen	Brandt	Sierra Club	The Houston Group and Lone Star Chapter are concerned that very few members of the public have been notified about this proposal. We were not aware of the three scoping notices in 2009. The Houston Group and Lone Star Chapter believe that the DS has not implemented the Council on Environmental Quality regulations for the National Environmental Policy Act (NEPA). Under these regulations, 1503.1(a)(4), the CEQ states "Request comments from the public, affirmatively soliciting comments from those persons or organizations who may be interested or affected." This is a broad and comprehensive responsibility and the DS has not fulfilled its duty to notify "persons or organizations who may be interested or affected." In addition, the Houston Group and Lone Star Chapter have found it difficult to find accurate, site specific maps of the TCK. The DS webpage where the DEIS is located has only a general map of the entire project. Since much depends on site specific information this general map does us no good in assessing what the potential environmental impacts may be so that we can provide comments to the DS. The public needs this information so it can review, comment on, and understand the proposal. TransCanada's TCK website for community outreach and consultation states "We recognize the importance of incorporating public input into our project plans... Input from stakeholders will be sought through the regulatory process, as well as through our public outreach program." TransCanada should heed its own TCK website and ensure that the public is notified of this proposal.	Consolidated Response CMT-3 addresses the level of information provided to the public regarding the proposed Project and the scoping meeting locations and schedules. The entire DEIS is available on the Department of State Project website that includes a general map of the entire Project, state-by-state maps, as well as many other maps and figures. Furthermore, photoalignment sheets of the entire route are available on the DOS website for the Project at http://www.keystonepipeline-xl.state.gov/clientsite/keystonexl.nsf?Open . Click on "Project Documents" and the maps are accessible under "Supplemental Filing."
150	5	Mannchen	Brandt	Sierra Club	Climate Change - Climate change will alter existing ecosystems and make it more difficult for plants and animals to adapt successfully to these changed ecosystems. The DS must address questions like: 1. How will TCK affect and be affected by climate change? 2. What can be done to create more resilient and resistant habitats and ecosystems along the	The impacts associated with implementation of the proposed Project are addressed in Section 3.0 of the EIS. That section addresses reclamation and restoration after construction is completed and mitigation measures to avoid or minimize impacts. Consolidated Response ENV-6 addresses concerns regarding the influence of climate change on the potential

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					<p>TCK route? 3. What can DS do to reduce CO2 or other greenhouse gas emissions that are emitted directly, indirectly, or cumulatively due to TCK? 4. What can DS do to assist plants and animals so they can adapt to climate change caused by TCK? Because dirty tar sands oil emits directly at least 20% more greenhouse gases as normal petroleum oil the OS should prepare and include in this DEIS a climate change ecological resilience and resistance plan (CCERRP) as part of the mitigation for the release of greenhouse gases from the TCK directly, indirectly, and cumulatively. The CCERRP would assess the biological and ecological elements within the TCK area and the effects that climate change has had and will have on them. The CCERRP would also assist plants, animals, and ecosystems to adapt to climate change and would require monitoring of changes and mitigation measure effectiveness. The CCERRP would be based on: 1. Protection of existing functioning ecosystems in the TCK area. 2. Reduction of stressors on the ecosystems in the TCK area. 3. Restoration of natural functioning ecological processes in the TCK area. 4. Use of natural recovery in the TCK area, in most instances. 5. Acquire buffers and corridors to expand and ensure connectivity of ecosystems in the TCK area. 6. Intervene to manipulate (manage) ecosystems in the TCK area only as a last resort. 7. Reduce greenhouse gas emissions that are emitted directly, indirectly, or cumulatively due to the TCK. In addition, a life cycle analysis is needed to determine the greenhouse gas emission contribution from the TCK due to direct, indirect, and cumulative impacts. This means that greenhouse gas emissions that occur from construction, operation, repair, and maintenance of the pipeline must be quantified and analyzed as well as the production, delivery, and consumption of dirty tar sands oil from mining to use as gasoline in vehicles. This has not been done in the DEIS. The public needs this information so it can review, comment on, and understand the proposal.</p>	<p>impacts of the proposed Project. As noted in Section 3.0, construction and normal operation of the proposed Project would not result in significant environmental impacts.</p> <p>Consolidated Response GHG-1 addresses the greenhouse gas life-cycle analyses presented in the revised EIS. Section 3.14.3.14 of the EIS includes potential mitigation measures to reduce GHG, and Consolidated Response GHG-3 addresses the decreased rate of GHG gas emissions from oil sands production in Canada. Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project. As noted in that section, production in the Canadian oil sands would not be increased by implementation of the proposed Project. Climate change is addressed in Section 3.14.3.14. As noted in that Section, implementation of the proposed Project is unlikely to result in a measureable climate change. As a result of these considerations, a climate change ecological resilience and resistance plan was not developed for the proposed Project.</p> <p>Finally, Consolidated Response OIL-4 addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils.</p>
150	6	Mannchen	Brandt	Sierra Club	<p>Air Pollutants Other than Greenhouse Gases - The TCK will emit directly and indirectly from dirty tar sands oil more nitrogen oxides (NOx), carbon monoxide (CO), volatile organic compounds (VOC), sulfur dioxide (SO2), mercury (Hg), lead (Pb), other air toxics (like benzene, toluene, xylene, etc.), and ozone (O3) than normal petroleum oil. Fence-line communities and the entire Houston O3 Non-Attainment Area will be negatively impacted by the TCK. The Houston area is non-attainment for O3. A more stringent O3 standard will soon be finalized by the U.S. Environmental Protection Agency. That standard will be set somewhere between 0.060 ppm and 0.070 ppm of O3. The Houston O3 Non-attainment Area will have a very difficult time achieving the new O3 standard due to greater NOx and VOC emissions that come from the refining and use of dirty tar sands oil.</p>	<p>As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries. Consolidated Response OIL-4 addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils.</p> <p>Based on the nonattainment status of Texas counties in which the pipeline will pass, Section 3.12.1.3 of the EIS describes the General Conformity analysis prepared. It was determined that construction emissions for the Project would be accounted for in the SIP emissions budget and the proposed activity within the Houston-Galveston-Brazoria nonattainment area was presumed to conform to the SIP.</p>
150	7	Mannchen	Brandt	Sierra Club	<p>The electricity used to operate the TCK will generate additional air pollutant emissions in Texas from dirty lignite coal-fired power plants. The use of 700,000 barrels/day and</p>	<p>As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III</p>

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					ultimately 900,000 barrels/day of dirty tar sands oil will ensure that the citizens of Houston breathe dirtier air than should be allowed. In the DEIS the DS completely ignores the cumulative air quality impacts that will come from refining dirty tar sands oil at refineries in Houston and Beaumont areas due to the TCK. This refining or dirtier tar sands oil rather than normal petroleum oil will result in more air pollution and health problems for the citizens of these areas and areas where this air pollution is transported in Texas or other states. Other 3 Texas 03 non-attainment areas may also be negatively affected by polluted air from the refining and use of dirty tar sands oil.	and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries. Consolidated Response OIL-4 addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils.
150	8	Mannchen	Brandt	Sierra Club	In addition, because some air pollution from the Houston area blows to and affects Big Bend and Guadalupe Mountains National Parks the regional haze that diminishes visibility in these two national parks will be increased. Regional haze standards will be negatively affected so that there will be a delay in attaining visibility standards in America's Cright-of-way Jewels, its national parks.	As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries. As discussed in Section 3.12.1.2 of the EIS, if a new source or major modification to an existing source is subject to the PSD program requirements and is within 62 miles (100 kilometers) of a Class I area, the facility is required to notify the appropriate federal officials and assess the impacts of the proposed Project on the Class I area. There are Class I areas within 62 miles of the proposed Project right-of-way in North Dakota, South Dakota, and Montana. However, the proposed proposed Project does not include construction or operation of significant stationary sources of air pollutants subject to the PSD program requirements. Based on these distances, it is not expected that the proposed Project would affect haze at the national parks.
150	9	Mannchen	Brandt	Sierra Club	Sensitive Areas - The TCK would take dirty tar sands oil to Moore Road Junction (Harris County Key Map 458N) and Nederland. The TCK will cross the San Jacinto River, Cedar Bayou, Hildebrandt Bayou, Neches River, Trinity River, Red River, Bois D'Arc Creek, North Sulphur Creek, South Sulphur Creek, Sabine River, Angelina River and streams and their associated floodplains and wetlands. The TCK may cross the Trinity River National Wildlife Refuge (TRNWR) or lands that the U.S. Fish and Wildlife Service would like to purchase and add to the TRNWR. As the TCK turns east for Port Arthur it will pass near Batson, Texas and Mary See Prairie (owned by the Texas Land Conservancy), the only protected prairie in the Big Thicket. The Houston Group and Lone Star Chapter are very concerned that the TCK will cross the Menard Creek Corridor Unit of Big Thicket National Preserve and damage this Man and Biosphere Reserve.	Construction and operation of the proposed Project are not anticipated to alter either the rate or extent of oil sands development in Canada as discussed in Consolidated Responses CAN-1 and GHG-2. The river crossing mentioned by the commenter would be completed using the horizontal directional drilling method as described in Section 2.3.3.5 of the EIS. The Houston Lateral Segment of the proposed Project would cross the Trinity River National Wildlife Refuge in the Champion Lake Unit; Keystone would coordinate with the U.S. Fish and Wildlife Service to evaluate this crossing. The proposed Project does not cross the Big Thicket National Preserve on federal lands but crosses the portion of the Menard Creek unit along a roadway and existing utility corridor.
150	10	Mannchen	Brandt	Sierra Club	At a minimum, the DS must require that the TCK use the horizontal directional drilling method (HDD) so that all wetlands and ephemeral, intermittent, and perennial streams will be drilled under and be minimally impacted by this proposal. Requiring the use of HDD would ensure that environmental damage to water quality, aquatic habitats, stream-side vegetation, and wildlife is minimized.	Crossing all wetlands and waters using the horizontal directional drilling method is not practicable or without impact as discussed in Consolidated Response ENV-5. The river crossing mentioned would be completed using the horizontal directional drilling method as described in Section 2.3.3.5 of the EIS.
150	12	Mannchen	Brandt	Sierra Club	Safety - It is of great concern that TransCanada has applied	Keystone has withdrawn its application for a Special Permit as

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					for a permit from the U.S. Department of Transportation to use of thinner steel pipes and seeks a waiver of safety regulations so that it can save money. This will allow in the pumping of dirty tar sands oil at very high pressures which could increase the risk of an oil spill. After the TransOcean oil spill disaster in the Gulf of Mexico there is no reason to reduce safety requirements for oil pipelines. Due to the problems enumerated in this comment letter and others the Houston Group and Lone Star Chapter oppose the TCK and urge that the request for a presidential permit be denied.	described in Consolidated Response REG-1. As described in Consolidated Response SAF-1, the Pipeline and Hazardous Materials Safety Administration (PHMSA) has regulatory requirements that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project in a manner that protects the health and safety of the public and the environment. In addition, PHMSA developed 57 Project-specific Special Conditions that Keystone has agreed to implement. Incorporation of those conditions would result in a Project that would have a degree of safety over any other typically constructed domestic oil pipeline system under current code and a degree of safety along the entire length of the pipeline system similar to that which is required in HCAs as defined in 49 CFR 195.450.
1544	10	Mannchen	Brandt	Sierra Club Houston Regional Group & Lone Star Chapter	One of the Sierra Club's concerns is that we have no real programmatic Environmental Impact Statement to look at tar sands policy in the United States.	The Department of State (DOS) is reviewing the application for a Presidential Permit for a specific project to import crude oil from Canada into the U.S. DOS is not aware of a programmatic EIS regarding the use of crude oil derived from oil sands projects and would not be responsible for preparing such a document.
1544	11	Mannchen	Brandt	Sierra Club Houston Regional Group & Lone Star Chapter	Already the Keystone and the Alberta Clipper pipelines either have been built or are being built right now and the Environmental Impact Statement mentions a large number of other pipelines that are being considered in addition to the Keystone XL. There should be a regional or national assessment evaluation and analysis about the environmental impacts of choosing the use of tar sands oil in the US as a major source of oil for transportation, commercial residential, institutional and industrial purposes.	Consolidated Response OIL-4 addresses the composition of the Canadian crude oil that would be transported by the proposed Project, including concerns relative to the corrosivity and erosivity of the crude oil. As noted in that Consolidated Response, that crude oil is similar in composition and properties to other heavy crude oils that are currently transported within the U.S. pipeline system and similar in composition and properties to other heavy crude oils that are currently refined in PADD III.
1544	15	Mannchen	Brandt	Sierra Club Houston Regional Group & Lone Star Chapter	We must ask why are large, international corporations, in essence, being allowed to set the United States national policy on tar sands? We need to have public input on any national policy for the use of tar sands oil. We need a national debate about our proposed national use of tar sands oil.	Consolidated Response ENR-1 provides information on the Department of State's environmental review process, the National Interest Determination process, and the need to complete those reviews before approving or denying the Presidential permit for the proposed Project.
1553	7	Mannchen	Brandt	Sierra Club Houston Regional Group, Lone Star Chapter	the first that I heard of this project was just last week. As far as I've been able to tell within our leadership and within the Houston Regional Group, we were never notified last year or this year by the Department of State. So apparently we're not on your list, and we would sure like to be on your list. I am submitting written comments tonight, so you'll have, you can contact me. I also contacted the Lonestar Chapter, which is the state Sierra Club, and they apparently have never received either scoping notice or the notice of the April 30th federal register notice for this year. So somehow the local and state Sierra Clubs were not notified, and so that gives us cause for concern, and we'd like to request a 60 day extension to the public comment period, so that we have a chance to read, you know, 6 or 8 inches of material.	Consolidated Response INT-1 addresses concerns related to the Notice of Intent (NOI) to prepare an EIS for the proposed Project. Consolidated Response CMT-2 addresses issues related to comment meetings on the draft EIS and requests for additional public involvement.
1553	10	Mannchen	Brandt	Sierra Club Houston Regional Group, Lone Star Chapter	We also have found difficulty in looking at the Department of State's website, as well as TransCanada's website, with finding really accurate maps, site-specific maps. In fact the map on TransCanada's website, the Trinity River disappears and you can't follow it down and see where this pipeline crosses the Trinity River, which is obviously going to be a	Photoalignment sheets of the entire route are available on the Department of State web site for the Project at http://www.keystonepipeline-xl.state.gov/clientsite/keystonexl.nsf?Open . Click on "Project Documents" and the maps are accessible under "Supplemental Filing." Maps are also available in the EIS.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					potential impact with extensive wild land, hardwood forests along the Trinity River.	
1553	11	Mannchen	Brandt	Sierra Club Houston Regional Group, Lone Star Chapter	We also have concerns about climate change. We believe a life cycle analysis needs to be done, looking at climate change, greenhouse gases, and what that's going to mean for our area. And we think that should be in the environmental impact statement.	Consolidated Response GHG-1 addresses the greenhouse gas life-cycle analyses presented in the revised EIS.
1553	12	Mannchen	Brandt	Sierra Club Houston Regional Group, Lone Star Chapter	Concerning other air pollutants, tar sands are dirty, and they have much more in air pollution than the petroleum we're used to. Generally more volatile organic compounds, sulphur dioxide, and lead, mercury and other air toxins like Benzene. So we're going to probably get more of those in our ambient air as well as it's going to contribute to our problem that we have with smog or ozone, because we are a non-attainment area. So we're real concerned about that. We're talking 700,000 to 900,000 barrels per day, refining of this heavy, sour crude.	As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries. Consolidated Response OIL-4 also addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils.
150	4	Mannchen	Brandt	Sierra Club	The Houston Group and Lone Star Chapter are concerned that very few members of the public have been notified about this proposal. We were not aware of the three scoping notices in 2009. The Houston Group and Lone Star Chapter believe that the DS has not implemented the Council on Environmental Quality regulations for the National Environmental Policy Act (NEPA). Under these regulations, 1503.1(a)(4), the CEQ states "Request comments from the public, affirmatively soliciting comments from those persons or organizations who may be interested or affected." This is a broad and comprehensive responsibility and the DS has not fulfilled its duty to notify "persons or organizations who may be interested or affected." In addition, the Houston Group and Lone Star Chapter have found it difficult to find accurate, site specific maps of the TCK. The DS webpage where the DEIS is located has only a general map of the entire project. Since much depends on site specific information this general map does us no good in assessing what the potential environmental impacts may be so that we can provide comments to the DS. The public needs this information so it can review, comment on, and understand the proposal. TransCanada's TCK website for community outreach and consultation states "We recognize the importance of incorporating public input into our project plans... Input from stakeholders will be sought through the regulatory process, as well as through our public outreach program." TransCanada should heed its own TCK website and ensure that the public is notified of this proposal.	Consolidated Response INT-1 addresses concerns related to the Notice of Intent (NOI) to prepare an EIS for the proposed Project. Consolidated Response CMT-3 addresses the level of information provided to the public regarding the proposed Project and the scoping meeting locations and schedules. The entire DEIS is available on the Department of State Project website that includes a general map of the entire Project, state-by-state maps, as well as many other maps and figures. Furthermore, photoalignment sheets of the entire route are available on the DOS website for the Project at http://www.keystonepipeline-xl.state.gov/clientsite/keystonexl.nsf?Open . Click on "Project Documents" and the maps are accessible under "Supplemental Filing."
1553	7	Mannchen	Brandt	Sierra Club Houston Regional Group, Lone Star Chapter	the first that I heard of this project was just last week. Click on "Project Documents" and the maps are accessible under "Supplemental Filing." Maps are also available in the EIS.
283	1	Manning/Warren	Ann	Manning Ranch Co.	You absolutely cannot put a pipe line in the aquifer--You start messing with the life line of the center of the United States and one thing goes wrong, you will destroy this country! What are you thinking! Have you not heard about the Gulf oil spill! The aquifer has the purest water there is and agriculture is the life line of this country and can't exist without it! Don't think for a minute you are smarter than Mother Nature!	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. Consolidated Response ALT-1 addresses potential alternative routes, including routes that would avoid much of the Northern High Plains Aquifer system. As described in Consolidated Response GLF-1, the risks associated with the proposed Project are substantially different from those associated with the BP Deepwater Horizon Project.
1026	1	manogod_1999@yahoo.com			I would have to say that to allow any drilling in the Ogallala Aquifer would be a major mistake for millions of people's safe drinking water and ag operations who depend on it. I say no, Senator, and you should vehemently say so as well! You can't drink money! But you can sure damn well choke on it!	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
1026	2	manogod_1999@yahoo.com			I am opposed to allowing the State Dept. to have control over the Nebraska State properties. As WE the PEOPLE are not in favor of gov't oversight and mounds of unfunded mandate regulations being piled on our already broken backs of debt loads in this state just to maintain a pipeline that will not be watched for as carefully or be as responsible for as a local municipality can be to respond to any situation that can arise with a flawed system.	The Department of State (DOS) does not have control over property in the state. As described in Consolidated Response ENR-1, DOS is responsible for the review of Keystone's application of a Presidential permit and is the lead federal agency for the NEPA review of the proposed Project. The proposed Project would be under the regulatory jurisdiction of the Pipeline and Hazardous Materials Safety Administration (PHMSA). Consolidated Response SAF-1 provides information on the PHMSA regulatory requirements, including monitoring and inspection requirements.
665	1	Mantz	Julie	Nationwide Transportation	Unfortunately, I am not an expert on the environment nor on oil refineries nor on the economic impact of a pipeline, but I am extremely concerned about the proposed pipeline that will be crossing one of the largest freshwater underground bodies of water in the world. The Ogallala Aquifer should be protected from any unnecessary risks.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
665	5	Mantz	Julie	Nationwide Transportation	What safety precautions are going to be taken?	As described in Consolidated Response SAF-1, the Pipeline and Hazardous Materials Safety Administration (PHMSA) has regulatory requirements that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project in a manner that protects the health and safety of the public and the environment. In addition, PHMSA developed 57 Project-specific Special Conditions that

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
						Keystone has agreed to implement. Incorporation of those conditions would result in a Project that would have a degree of safety over any other typically constructed domestic oil pipeline system under current code and a degree of safety along the entire length of the pipeline system similar to that which is required in HCAs as defined in 49 CFR 195.450.
665	6	Mantz	Julie	Nationwide Transportation	Will it be built to withstand the impacts of flooding, tornadoes, and earthquakes (all of which are very real possibilities in the Midwest)?	Consolidated Response GEO-3 addresses potential geologic hazards. Consolidated Response GEO-2 addresses potential seismic hazards. Tornadoes would not affect the buried pipeline.
1210	1	Mantz	Julie	Nationwide Transportation	Unfortunately, I am not an expert on the environment nor on oil refineries nor on the economic impact of a pipeline, but I am extremely concerned about the proposed pipeline that will be crossing one of the largest freshwater underground bodies of water in the world. The Ogallala Aquifer should be protected from any unnecessary risks.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
1210	3	Mantz	Julie	Nationwide Transportation	The pipeline is going to funnel crude oil across the United States to refineries in Texas and Louisiana (Can refineries only be built in the South? Why not build refineries closer to the source?)	Consolidated Response P&N-8 addresses issues related to shipping Canadian crude oil to refineries that are closer to the source of oil. Consolidated Response P&N-1 addresses the need that the Project has been proposed to meet; transporting Canadian crude oil in the Keystone XL Project to refineries outside of the Gulf Coast region would not meet the current and near-term crude oil needs of those refineries.
1210	4	Mantz	Julie	Nationwide Transportation	The pipeline is going to be buried 4 feet underground. (How are leaks to be detected? How much additional time will be required to dig up an area that needs to be repaired if the leak is discovered during the winter when the ground is frozen? How long will it take for the oil to leak into the Aquifer (the well in the Gulf is still spewing)?)	Consolidated Response OIL-3 and Sections 2.4.2 and 3.13.5 of the EIS describe the leak detection system for the Project. Response and pipeline repair times will vary according to environmental, logistics, and other operational variables. Consolidated Response RES-1 addresses issues related to preparation and review of the Emergency Response Plan for the proposed Project. Issues related to the Northern High Plains Aquifer System are addressed in Consolidated Responses AQF-1 through AQF-4. Consolidated Response AQF-3 provides information on hypothetical spills from the Project over two areas of the Northern High Plains Aquifer System. As described in Consolidated Response GLF-1, the risks associated with the proposed Project are substantially different from those associated with the BP Deepwater Horizon Project.
1210	5	Mantz	Julie	Nationwide Transportation	What safety precautions are going to be taken? Will it be built to withstand the impacts of flooding, tornadoes, and earthquakes (all of which are very real possibilities in the Midwest)?	As described in Consolidated Response SAF-1, the Pipeline and Hazardous Materials Safety Administration (PHMSA) has regulatory requirements that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project. In addition, PHMSA developed 57 Project-specific Special Conditions that Keystone has agreed to implement. Incorporation of those conditions would result in a Project that would have a degree of safety over any other typically constructed domestic oil pipeline system under current code and a degree of safety along the entire length of the pipeline system similar to that which is required in HCAs as defined in 49 CFR 195.450. Issues related to earthquakes and flooding are addressed in Sections 3.1 and 3.3 of the EIS. The heavy gauge steel pipe filled with oil would not be expected to be affected by flooding,

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
						and the integrity of aboveground facilities would not be affected by flooding. Buildings enclosing the equipment at pump station sites may be affected by tornadoes, but tornadoes are not expected to affect the underground pipeline, the mainline valves, or the transportation-related equipment of the pump stations.
1210	6	Mantz	Julie	Nationwide Transportation	Who REALLY benefits from this and is it REALLY WORTH IT? (I think we should ask the people living along the Gulf Coast what they would say.)	Consolidated Response P&N-1 addresses the need that the Project has been proposed to meet.
1556	11	Margadant	Jim	Black Hills Group of the Sierra Club	This DEIS may be adequate for a border crossing, but what happens to this environmental impact statement after that is that it is used by every agency and every permitting organization that addresses an application by the pipeline as it proceeds south. It's called tiering, and this document will be cited over and over and over again. Therefore, I want to point out to you that I think the wildlife section is relatively inadequate.	The adequacy of the wildlife analysis and the EIS are addressed in Consolidated Response WIL-1 and ENR-1.
1556	12	Margadant	Jim	Black Hills Group of the Sierra Club	U.S. Fish and Wildlife Service, in my estimation, certainly hasn't been a heavy contributor to this process. It's cursory, from what I can tell, at best. The section I'm referring to in the Environmental Impact Statement is Section 3.6.1. That covers the wildlife.	The adequacy of the wildlife assessment and EIS are addressed in Consolidated Responses WIL-1. The U.S. Fish and Wildlife Service (USFWS) is a cooperating agency in the environmental review of the proposed Project and has contributed to scoping and review during all stages of the NEPA process. In addition, DOS was in formal consultation with USFWS regarding Section 7 of the Endangered Species Act (ESA) and a Biological Assessment was prepared regarding the proposed Project (see Appendix T of the EIS). Assessments of sensitive wildlife, including species covered by the ESA, are addressed in Section 3.8.
1556	13	Margadant	Jim	Black Hills Group of the Sierra Club	The U.S. Fish and Wildlife Services, as I can see, has provided no biological assessment yet and there's questions about whether the surveys that are referenced in that are adequate. For example, you have a reference here on page 3.6.21. It says there was a survey that found 297 large stick nests in the survey area which covered or were within a quarter to a mile of the project center line. And I read that I understood that to be from Canada to probably the Nebraska south state line there.	Appendix T of the EIS presents the Biological Assessment. Stick nest surveys were completed for the entire proposed route.
1556	14	Margadant	Jim	Black Hills Group of the Sierra Club	Did a quick survey of his range, and particularly this creek, spent an afternoon looking at about I suppose 6 miles of creek maybe. And I'm going to provide to you tonight, for the record, a set of photographs of six raptor nests and we found hawks sitting on two of them. We saw a number of other hawks in the area. And I have another picture of a rose tree. I didn't include that. But there's six to seven definite hawk nests in this creek bottom.	DOS thanks the commenter for the information he provided. For consistency in the assessment, however, standardized aerial surveys were completed for the entire proposed route to identify eagle and other raptor nests. While these surveys may have missed some nests, consistent data were available for the assessment of impacts to raptor nests for the entire proposed route.
1556	15	Margadant	Jim	Black Hills Group of the Sierra Club	the only migratory bird of prey that's really referenced in -- well, there's two I guess, is the peregrine falcon and the red tail hawk. But out here in the prairie we have bald eagles. We have golden eagles. There is in addition to red tails there are swansons. There are ferruginous hawks. There are kestrels, prairie falcons. All of these are migratory birds. None of them really are referenced or dealt with at all. Instead, the EIS seems to think it's sufficient that at some point in time there's	Keystone is consulting with USFWS concerning compliance with both the Endangered Species Act, and the Migratory Bird Treaty Act. Sensitive species are covered in Section 3.8 including bald and golden eagles. The information presented in Section 3.6 is not intended to identify every species that may be present in the vicinity of the proposed Project. Additional discussion of Migratory Bird Treaty Act and Endangered Species Act-related issues are included in

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					going to be a migratory bird conservation plan developed through the U.S. Fish and Wildlife Service, and I don't think that's adequate. You've got an EIS that is very candid about direct and indirect impacts to the wildlife just from the construction and operation of this pipeline, and that's at 3.6.2. It's stunning the things that can happen. And I've gone through it, and it's accurate. These things can happen. But knowing that they can happen I think requires certainly immediate consultation in depth with the U.S. Fish and Wildlife Service.	Consolidated Response WIL-2.
1556	16	Margadant	Jim	Black Hills Group of the Sierra Club	Certainly, TransCanada or Fish and Wildlife should be conducting I guess what I would term mortality assessments.	Keystone is consulting with USFWS concerning compliance with both the Endangered Species Act, and the Migratory Bird Treaty Act (MBTA). Incidental mortality to ESA and MBTA protected species will be addressed during these consultations.
1556	17	Margadant	Jim	Black Hills Group of the Sierra Club	I did some swift fox litigation 10, 12 years ago. And just as a lawyer working that case I learned more about swift fox than I found in the EIS. It's much more detailed and complicated. It's a well-written document, but it essentially constitutes just a literature search. It's not adequate to protect wildlife or to do any environmental assessment or analysis with respect to what needs to be done when you build and maintain this thing.	The adequacy of the wildlife assessment is discussed in Consolidated Response WIL-1. Additional discussions concerning impacts to swift fox are found in Section 3.8.3.1 and Appendix I of the EIS. Conservation measures included in Section 3.8.3.1 are those identified by resource management agencies.
969	1	Margrave	Mark		I am opposed to any oil pipeline that would be buried in the vicinity of the Ogallala Aquifer. The aquifer is an extremely precious resource which cannot be repaired or replaced should oil spill into it.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
1100	1	Marsh	Mitch		I am writing to OPPOSE the Keystone Oil Pipeline that will run through Nebraska across the Ogallala Aquifer. I think this is simply too great a risk. When an oil spill occurs, it will poison the water, and it will never be the same again, it will not be able to be repaired. For these reasons, the pipeline should not run over the Aquifer.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
1467	1	Marshall	Rod	Int'l Union of Operating Engineers Local 571	The Keystone XL Project will provide thousands of U.S. jobs and a source of transport for reliable fuel from Canada. We, the International Union of Operating Engineers Local 571, appeal for Secretary of State Hillary Clinton to allow the Keystone XL Project to proceed. Pipelines are constructed to strict standards and are the safest, most reliable, and most efficient method of crude oil transport. Annually, billions of gallons of petroleum travel through our country's pipelines, pipelines built by hard working men and women like those of Local 571.	Comment acknowledged.
1467	2	Marshall	Rod	Int'l Union of Operating Engineers Local 572	Keystone XL would provide transport for oil from the plentiful Canadian Oil Sands, The Canadian Oil Sands reserves are second only to Saudi Arabia; the Sands potentially offers billions of barrels of oil from a friendly, democratic country to help meet the United States' growing energy needs. Please provide the necessary approvals for the Keystone XL Pipeline Project.	Comment acknowledged.
1493	1	Marshall	Rod	Int'l Union of Operating Engineers Local 571	The Interactional Union of Operating Engineers Local 571 respectfully asks that Secretary of State Hillary Clinton grant the needed approvals for the Keystone XL Project. This pipeline will provide 13,000 jobs and foster a positive	Consolidated Response ECO-1 addresses potential socioeconomic impacts, and Consolidated Response TAX-1 addresses concerns regarding taxes.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					economic relationship between the United States and the democratic nation of Canada. We, at Local 571, look forward to opportunities such as Keystone XL to demonstrate our training and ability to produce high-quality work done safely, correctly, and on time. This pipeline expansion will create jobs for skilled workers, such as our members, providing them with family-supporting wages. Plus, the Keystone XL Project is a step forward in increasing fuel supply from a democratic nation that frequently makes investments in meeting stringent environmental and regulatory standards. Please proceed with Keystone XL for the sake of jobs with family supporting wages and an energy relationship with democratic Canada.	
1092	2	Martin	Sandy		Second, the Keystone Pipeline was news to me. The idea that the people who brought the Gulf disaster (this country's policies and Oil Company GREED and IRRESPONSIBILITY) is now digging an oil trench through Nebraska is downright willy-nilly giving.	As described in Consolidated Response GLF-1, the risks associated with the proposed Project are substantially different from those associated with the BP Deepwater Horizon Project.
49	1	Martinez	Arthur		I am opposed to the development of the Keystone XL DEIS pipeline.	The commenter's opinion is noted.
1316	1	Mas	Jose	MasTec, Inc.	Dear Ms. Orlando:I write in support of TransCanada's Keystone XI crude oil pipeline project and urge the department to grant a permit for the pipeline.	Comment acknowledged.
1316	3	Mas	Jose	MasTec, Inc.	The environmental benefits of Keystone XI should not be overlooked, The current tragedy in the Gulf underscores the importance of a diverse portfolio of energy supplies, Within the spectrum of viable options, it is appropriate to seek a growing role for O11 resources that are:• land-based;• North American; and,• Transported by pipeline, This project meets each of these criteria, Securing stable and affordable energy from our North American allies through projects such as the Keystone pipeline is in the national interest, Considering the economic and energy security benefits of these vital resources, we should continue to expand America's access to safe, affordable energy to help ensure improved domestic and global energy security and stable prices for consumers.	Comment acknowledged.
1316	4	Mas	Jose	MasTec, Inc.	Pipelines are the safest, most reliable, economical and environmentally favorable way to transport oil and petroleum products, as well as other energy liquids, throughout the U.S. America depends on the more than 168,000 miles of liquid pipelines to move energy and raw materials our country relies on.	Comment acknowledged.
1316	5	Mas	Jose	MasTec, Inc.	Additional pipeline capacity will help consumers and businesses throughout the United States. This project also stands to provide a powerful private sector economic stimulus. During construction, Keystone XL will create more than 13,000 jobs funded with private investment. In addition, local governments will have a steady source of income from economic activity associated with construction	Consolidated Response ECO-1 and Section 3.10.2.2 of the EIS address the potential socioeconomic impacts of the proposed Project.
1316	6	Mas	Jose	MasTec, Inc.	and from property taxes the pipeline company will pay.	Comment acknowledged.
1316	7	Mas	Jose	MasTec, Inc.	Rejection of the permit or suspension of the review would sacrifice the significant economic benefits this project stands to deliver and force U.S. consumers to rely on other sources	Comment acknowledged.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					of crude oil not economically and politically allied with U.S. interests. This would be a mistake. I urge the granting of the permit. Thank you for the opportunity to comment.	
1316	8	Mas	Jose	MasTec, Inc.	Dear Ms. Orlando: Recently a number of advocacy groups sent a letter seeking suspension of the permitting of theKeystone XL pipeline. I encourage you to reject the request and to continue to review the proposedproject.	Comment acknowledged.
1316	9	Mas	Jose	MasTec, Inc.	The project has the potential to deliver significant energy security benefits to the United States,increasing access to significant land-based sources of oil from a trading partner with whom we are closely allied.	Comment acknowledged.
1316	10	Mas	Jose	MasTec, Inc.	At the same time as a minority contractor with close to 10,000 employees, we are certain that this project will bring significant economic benefits and well paying jobs to the residents of the local area where this job will be built.	Comment acknowledged.
1316	11	Mas	Jose	MasTec, Inc.	Provided it has limited impact on the environment, this project could be an important part of thesolution to our energy supplies. The permitting processes in place are appropriate and should proceed so that a final determination can be made about the impacts of the project and whether it is in the national interest.Please reject the request to suspend the process and continue with the review .	Comment acknowledged.
1351	2	Mason	Amber		Tar Sands oil is one of the dirtiest fuels in the world, and I don't want leakage, or dangerous emissions from its refinery killing our earth and all its inhabitants. Lastly, indigenous populations are under attack in N. Alberta where the tar sands oil is being extracted. The peoples homes, livelihood and cultural traditions are being threatened. Cancer, renal failure, lupus, and hyperthyroidism rates have dramatically spiked for the communities living down stream from tailing ponds and these problems will only get worse unless tar sands production is halted.	Consolidated Response OIL-4 addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils. Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project.
1490	1	Mass	Ken	Nebraska State AFL-CIO	On behalf of the Nebraska State AFL-CIO, I am writing in reference to the Keystone XL Project and what Keystone XL means to the Nebraska Labor Movement, the state of Nebraska and the United States. The Keystone XL Project means thousands of jobs - approximately 10,000 construction jobs alone, many of which will be union jobs with family supporting wages. In addition, over 340,000 additional U. S. jobs will be generated in related manufacturing and service industries as a result of the pipeline. With nearly 15 million Americans out of work, these are jobs Nebraska and America need now! The Keystone XL Project will enhance our energy independence - Canada is already the largest supplier of energy to the United States and has oil reserves second only to Saudi Arabia. While this energy is badly needed to help our nation's economic recovery, the draft environmental impact statement recently issued in connection with the project states that the pipeline will have limited adverse impact during construction. With so much at stake, the Nebraska State AFL-CIO asks Secretary of State Hilary Clinton to approve the Keystone XL Project. If you have any questions, please do not hesitate to contact me.	Consolidated Response ECO-1 addresses potential socioeconomic impacts, and Consolidated Response TAX-1 addresses concerns regarding taxes.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
1397	1	Massenbuge	Morine		I am 500 yards from the pipeline crossing. What I am wondering is why everyone else was payed, received a check and I haven't. I received a letter some time ago that I would.	Easement agreements are established for the use of land that a pipeline crosses, and it is not clear whether or not the proposed route crosses the commentor's property. Consolidated Response EAS-2 addresses issues related to easement negotiations and eminent domain, and as noted in that response, the Department of State does not have legal authority to intervene in those processes.
1397	2	Massenbuge	Morine		I do not mind the pipeline in my area.	Comment acknowledged.
421	1	Massey	Virginia		the science supports the description of tar sands oil as the dirtiest on the planet ...the pollution from processing it is horrendous ...why would anyone support its use ??? could be like the "judge" in LA with filthy hands and filthy pockets ...THINK ALTERNATIVE GREEN	Consolidated Response OIL-4 addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils. As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries. Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project.
1207	1	Masterson	LJ		I am a lifelong Nebraskan who wants to insure the protection and purity of one of our area's greatest natural resources, the Ogallala Aquifer. Please make that a priority for ourselves and future generations of Nebraskans when setting safety standards and government oversight for the Keystone pipeline.	As described in Consolidated Response GLF-1, the risks associated with the proposed Project are substantially different from those associated with the BP Deepwater Horizon Project.
1207	2	Masterson	LJ		Causing damage to the aquifer would prove unbelievably costly and devastating to our ag-based economy and our healthy lifestyle.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
357	1	Mattes	Martha		I am writing in opposition to the pending permit for the Keystone XL pipeline.	Comment acknowledged.
357	2	Mattes	Martha		Oil produced from tar sands is the most harmful type of oil for the atmosphere emitting high volumes of greenhouse gases during production. It also leaves behind toxic sludge ponds so big they can be viewed from space.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project. Consolidated Response GHG-1 addresses GHG life-cycle analyses.
357	3	Mattes	Martha		The Keystone XL pipeline would devastate over 2,000 miles across the western United States by clear-cutting ancient forests, contaminating water supplies and leaving behind toxic lakes. I urge you to drop plans to issue permits to Keystone XL or other pipelines.	The impacts associated with implementation of the proposed Project are addressed in Section 3.0 of the EIS. As noted in that section, construction and normal operation the proposed Project would not result in significant environmental impacts. An evaluation of the potential for the proposed Project to affect old-growth cross-timbers forest in Oklahoma was added to the EIS in Section 3.5.5.2. The toxic lakes referred to by the commenter are a part of the extraction process in Canada and would not be created by construction and operation of the proposed Project. Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project.
1373	1	McCall	Mickey	Eastern Plains RC&D Area, Inc	I write in support of TransCanada's Keystone XL crude oil pipeline project and urge the department to grant a permit for	Comment acknowledged.

1552	24	McCormick	Chantel	Representative for Governor Brian Schweitzer	I support TransCanada's Keystone XL crude oil pipeline.	Comment acknowledged.
1552	25	McCormick	Chantel	Representative for Governor Brian Schweitzer	This project will create a significant number of jobs in Montana, including approximately 790 construction and 10 permanent jobs.	Consolidated Response ECO-1 and Section 3.10.2.2 of the EIS address potential socioeconomic impacts.
1552	26	McCormick	Chantel	Representative for Governor Brian Schweitzer	This project will generate more than \$62 million annually in property tax revenue.	Consolidated Response TAX-1 and revisions to Section 3.10.2.4 of the EIS address concerns regarding taxes associated with implementation of the proposed Project.
1552	27	McCormick	Chantel	Representative for Governor Brian Schweitzer	The project is estimated to generate approximately \$1 billion of investment in Montana.	Consolidated Response ECO-1 and Section 3.10.2.2 of the EIS address potential socioeconomic impacts.
1552	28	McCormick	Chantel	Representative for Governor Brian Schweitzer	This economic development is welcome news for those counties that have suffered from years of economic dislocation and decline.	Comment acknowledged.
1552	35	McCormick	Chantel	Representative for Governor Brian Schweitzer	I believe that the Keystone project is good for Montana and it's good for the nation. I wholeheartedly support and stand behind the rigorous permitting process that is being administered jointly by the State Department and Montana DEQ. I trust in these permitting processes and I believe they are thoroughly sufficient to gauge whether or not the project will meet environmental standards. I urge the approval of this project provided it can comply with all environmental regulations.	Comment acknowledged.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
840	1	Mccoy	Billie		I am very concerned about the Canadian company, Keystone XL building a pipeline across Nebraska's Sand Hills regions. I do not believe the company spokesman who says that there is a small chance of an oil leak or an oil spill. There have been several spills in the United States, with each one being accidentally discovered by others who are not employed by the company. The pipeline is going through a environmentally sensitive area. Please keep this pipeline out of the Sand Hills, or for that matter out of Nebraska.	Section 3.13 of the EIS addresses reliability and safety issues, including calculations of the probability of a spill from the Project and the potential environmental impacts associated with spills. Issues related to the Sand Hills area are addressed in Consolidated Response ERO-1. Consolidated Response ALT-1 addresses potential alternative routes, including routes that would avoid much of the Northern High Plains Aquifer System and the Sand Hills area.
1529	3	McCurry	Julene		The US military bombed pumping stations, not the pipeline in Iraq even though the pipeline is above ground. From a national security aspect – protect the stations, not the line!	Consolidated Response TER-1 addresses potential terrorism associated with the proposed Project.
91	1	Mcdonald	Virgil		My first problem is with Eminent Domain. Why does someone have the right to take my land just because they want to make money. Not because it will be good for the country. Because they are GREEDY. We have had nothing but trouble the last year w/domestic companies taking over our property without consideration for our rights or our land. Keystone is the only one who has considered environmental issues, as it appears to us at this time. We believe it will be good for the country but we expect to be treated w/consideration for the impact it is going to have on our property and us as individuals.	As noted in Consolidated Response EAS-2, state laws dictate under what circumstances eminent domain may be used and define the eminent domain process within the state. DOS has no legal authority in the easement negotiations or in eminent domain proceedings.
44	1	Mcgahey	Barbara		The ecological and environmental risks/costs are prohibitive. Producing the oil for this pipeline will emit 11 million tons of carbon dioxide into the atmosphere annually, even before it gets to the U.S. for refining.	Consolidated Response GHG-2 addresses the potential causal connection of implementation of the proposed Project and expanded oil sands production in Canada and increases in refining. Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information on current and future production. K17
44	2	Mcgahey	Barbara		It also requires clear-cutting vast old forests and will suck up water supplies and leave behind massive toxic tailing ponds that'll eventually cause more land & water pollution.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project.
44	3	Mcgahey	Barbara		The pipeline is supposed to be laid through 1,700 miles of farmland and fragile ecosystems, such as the Missouri River. Pipeline breaks are not uncommon, as seen in January 2010, when a pipeline in North Dakota spilled 126,000 gallons of oil into the surrounding area. Not only that, but TransCanada plans to use thin pipe and pump oil at pressures that exceed the normal allowable limits. The company is seeking a special permit to operate at this pressure from the Pipeline and Hazardous Materials Safety Administration. Having spent almost 30 yrs. in pipeline electrical & electronic design and construction, we can tell you it would be suicide to issue a permit given these criteria. Let's stick with our cleaner La. crude, et al., and draw a line in the dirt when it comes to compromising our clean energy economy goals.	<p>Keystone has withdrawn its application for a Special Permit as described in Consolidated Response REG-1. As described in Consolidated Response SAF-1, the Pipeline and Hazardous Materials Safety Administration (PHMSA) has regulatory requirements that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project. In addition, PHMSA developed 57 Project-specific Special Conditions (see Appendix U of the EIS) that Keystone has agreed to implement. Incorporation of those conditions would result in a proposed Project that would have a degree of safety over any other typically constructed domestic oil pipeline system under current code and a degree of safety along the entire length of the pipeline system similar to that which is required in high consequence areas (HCAs) as defined in 49 CFR 195.450.</p> <p>Consolidated Response P&N-1 addresses the need that the Project has been proposed to meet, and Consolidated Response OIL-4 addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils.</p>

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
						Section 3.13 of the EIS addresses reliability and safety issues, including calculations of the probability of a spill from the proposed Project and the potential environmental impacts associated with spills.
165	1	McGinn	Joellen		There had better be a backup plan in effect before this goes through. If the Ogallala Aquifer is contaminated it will be a worse crisis than we now have in the Gulf.	Consolidated Response AQF-3 provides information on hypothetical spills from the Project over two areas of the Northern High Plains Aquifer System and also addresses response actions. As described in Consolidated Response GLF-1, the risks associated with the proposed Project are substantially different from those associated with the BP Deepwater Horizon Project.
863	1	McGinn	Joellen		Please do not let this insane idea come to fruition. The Ogallala Aquifer is too important and precious to allow even the possibility of contamination to take place. The porosity of the soil would make clean-up of a spill more difficult than the problem we already have in the Gulf.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. As described in Consolidated Response GLF-1, the risks associated with the proposed Project are substantially different from those associated with the BP Deepwater Horizon Project.
1185	1	McGrath	Anne		Is it not obvious by now that when we transport, dig for and store oil, it does leak and pollute the environment eventually? One only needs to look to the gulf, or google oil and environment to pull up all kinds of terrible events. This is a disaster waiting to happen.	As described in Consolidated Response GLF-1, the risks associated with the proposed Project are substantially different from those associated with the BP Deepwater Horizon Project.
166	1	McIntosh	Dale		I am writing in protest of the XL pipeline project. The thought of running a pipeline over the biggest aquifer in the states is unthinkable. We can live without oil, we cannot live without water. This past week alone the headlines are on the Gulf leak and several hundred gallons of oil leaking into a creek from a pipeline in Utah. We cannot allow contamination of our water supply, not for any amount of money. Do the right thing. Do not allow this to happen. We cannot allow contamination of our water supply, not for any amount of money. Do the right thing. Do not allow this to happen.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. As described in Consolidated Response GLF-1, the risks associated with the proposed Project are substantially different from those associated with the BP Deepwater Horizon Project.
289	1	McIntosh	Lloyd		We do Not need a pipline thru our Main source of water stream to ruin our grass to feed our cows as we are RANCHERS. Please do not do this. Thanks you!!!!!!!!!!!!	The impacts associated with implementation of the proposed Project are addressed in Section 3.0 of the EIS. As noted in that section, construction and normal operation the proposed Project would not result in significant environmental impacts. Consolidated Response FRM-1 addresses potential ranch of farmland impacts. If there is a spill from the proposed Project, Keystone or the incident response team would inform all landowners in the vicinity of the spill that the release had occurred and advise the landowners of the appropriate precautions. Keystone would be liable for all costs associated with cleanup and restoration as well as other compensations, as noted in Consolidated Response LIA-1. If a stockpond or a well used as a source of water is affected, Keystone would provide water until the affected water is proven to be acceptable for use.
222	1	McIntyre	George		Greetings from Montana. I live in Valley Co. 7-29-40. Alt. B is too close to my house. Alt. B goes through Ken Sonsteny and my place and then through a housing subdivision. It should go north of all the housing. If the route was north of all this housing it would then cross 2 additional parcels of state land. I have enclosed a map. Thank you for your consideration.	Pipeline routing in Montana is addressed in Consolidated Response EAS-1. Consolidated Response PVT-2 addresses concerns regarding the proximity of the proposed project to existing structures and facilities and routing concerns across private property.

1374	1	McKeehan	Patrick	Leadership Council Southwestern Illinois	I write in support of TransCanada's Keystone XL crude oil pipeline project and urge your Department to grant the project permit... It is for these reasons and many more that we support the continued investment by TransCanada in this vital energy-related project. I urge you to give this permit request your full consideration and move quick with the review process.	Comment acknowledged.
1374	4	McKeehan	Patrick	Leadership Council Southwestern Illinois	Benefits include reducing environmental risk to our [land and] water sources because of the greater reliability in oil piped from its source directly into the refineries;	Comment acknowledged.
1374	5	McKeehan	Patrick	Leadership Council Southwestern Illinois	benefits include ... and • increasing the level of economic activity, family-supporting jobs and tax revenues in local communities through the significant capital investment in pipeline projects.	Comment acknowledged.
817	1	McKeever	Mike		We are very much in favor of the pipeline and hope it goes on the proposed route through McCone County, MT. It will pass close to the ranch we operate on in the area---also close to the proposed coal mine on Nelson Creek. We feel the economic benefits far outweigh the potential problems that may arise. It also has potential to open up the development of other oil, gas and coal reserves in the area. We're for it!	Comment acknowledged.
824	1	Mckinley	Gary	Wood Co. Industrial Commission	The Wood County Industrial Commission (WCIC) strongly encourages the U.S. Department of State to approve the Keystone XL Project which represents an infrastructure project that not only will strengthen long-term energy security for the United States, but also will provide a powerful private sector economic stimulus to Wood County. ...We believe that increased economic benefits that the Keystone-XL Project represents are extremely important for the future development and prosperity of our County and the communities we serve. As we understand it, Keystone XL will create more than 3,087 Wood County high-wage construction and manufacturing jobs during the 2011-2012 construction schedule...TransCanada recently commissioned a study to measure the project's economic stimulus to the U.S. and the states along the route. The study found that, in Wood County, Keystone XL would generate significant increases in total expenditures, output, personal income and new jobs. In addition, the report concluded that during construction Keystone XL would generate \$447,840 in tax revenue for our local communities along the route and generate \$26,771,594 for property taxes over the operational life for the pipeline in Wood County. These are substantial figures for our county. The Wood County Industrial Commission enthusiastically supports the Keystone XL Pipeline Project.	Consolidated Response ECO-1 addresses potential socioeconomic impacts, and Consolidated Response TAX-1 addresses concerns regarding taxes.
824	2	Mckinley	Gary	Wood Co. Industrial Commission	The delivery of secure and affordable supplies of Canadian energy to American consumers would have minimal impacts on the Wood County environment and we believe this is a vital project that will strengthen U.S. energy security and reduce our dependence on unstable foreign sources of oil.	Comment acknowledged.
613	1	Mclaughlin	Barbara		I grew up in the Sand Hills of Nebraska. It is very unique and beautiful land. I urge you to keep the pipeline away from the	Consolidated Response ALT-1 addresses potential alternative routes, including routes that would avoid much of the Northern

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					Nebraska Sand Hills.	High Plains Aquifer system and the Sand Hills area.
684	1	McLaughlin	Stanley		Do not permit an oil pipeline to be constructed through the Nebraska Sandhills and over the largest water aquifer in North America.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
1120	2	McMahon	Jean		[Much more has been written about the problems with tearing down the Boreal Forests in Canada and] using so much dirty energy to produce the dirty oil. This is a huge National security issue for American citizens.	Consolidated Response GHG-4 addresses concerns regarding the loss of boreal forest and peat bogs. Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project. OIL-4 addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils. Consolidated Response P&N-9 describes the National Interest Determination process.
1557	14	McMahon	Jean		Poor communication, heard about this meeting by chance.	Consolidated Response CMT-2 addresses issues related to comment meetings on the draft EIS and requests for additional public involvement. Consolidated Response INT-1 addresses concerns related to the Notice of Intent (NOI) to prepare an EIS for the proposed Project.
1557	15	McMahon	Jean		Concerned about greenhouse gasses. Tar sands produce too much carbon dioxide and cutting down the boreal forests cuts down a carbon source.	Consolidated Response GHG-1 addresses the greenhouse gas life-cycle analyses presented in the revised EIS. Consolidated Response GHG-4 addresses potential loss of boreal forests and peat bogs.
1557	14	McMahon	Jean		Poor communication, heard about this meeting by chance.	Consolidated Response INT-1 addresses concerns related to the Notice of Intent (NOI) to prepare an EIS for the proposed Project. Consolidated Response CMT-3 addresses the level of information provided to the public regarding the proposed Project and the draft EIS scoping meeting locations and schedules.
1272	1	McNabb	Marilyn		My comment is that I do not understand why the State Department, presumably full of people educated in such places as the School of Foreign Service at Georgetown, are being asked to assess a pipeline project that calls for expert knowledge far outside the field of international relations. I hope you will spend the money to hire independent, knowledgeable experts on subjects such as steel pipeline strength and durability (see attachments) and the risk of slow, undetected leaks into the source of Nebraska's prosperity, now and future, the Ogallala Aquifer.	As described in Section 1.0 of the EIS, DOS is responsible for reviewing applications for Presidential permits for oil pipelines that cross the border of the United States and is the lead federal agency for the environmental review of the proposed proposed Project. As described in Consolidated Response SAF-1, the Pipeline and Hazardous Materials Safety Administration (PHMSA) has regulatory requirements that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project. In addition, PHMSA developed 57 Project-specific Special Conditions that Keystone has agreed to implement. Consolidated Response OIL-3 and Section 3.13.2.1 addresses small releases from the proposed Project. Consolidated Response AQF-3 provides information on hypothetical accidental releases from the proposed Project over two areas of the Northern High Plains Aquifer System and also addresses response actions. Issues related to the Northern High Plains Aquifer System are addressed in Consolidated Responses AQF-1 through AQF-4. The attachments to the comment letter were related to previously constructed pipeline projects and are not germane to the environmental review of the proposed proposed Project.
1544	182	McPherson	Kathleen	U.S. Pipeline	Pipeline produces temporary jobs. They have received letters	Comment acknowledged.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					of thanks from several communities for helping to bring jobs and stimulate local economies.	
1544	183	McPherson	Kathleen	U.S. Pipeline	If the oil was brought by semi trucks instead of through a pipeline, it would take thousands and thousands of trucks. The emissions would go directly into the air and cause a lot more damage.	Comment acknowledged.
1544	184	McPherson	Kathleen	U.S. Pipeline	Project should be approved.	Comment acknowledged.
1157	1	McQuistan	Karen		I object to this pipeline running through Nebraska.	Comment acknowledged.
1157	2	McQuistan	Karen		Please consider carefully what this could mean to this State if something went wrong. And no matter what the pipeline company says about how safe it is and how careful they are being, it is impossible to know what could unexpectedly happen.	Section 3.13 of the EIS addresses reliability and safety issues, including calculations of the probability of a spill from the Project and the potential environmental impacts associated with spills. Consolidated Responses AQF-1 through AQF-4 address issues related to the Northern High Plains Aquifer system, which includes the Ogallala aquifer.
176	1	Medina	Susan	Susan K. Medina Communication Strategies, LLC	I write in support of TransCanada's Keystone XL crude oil pipeline project and urge the department to grant a permit for the pipeline. I have been working with TransCanada now for more than two years as a U.S. consultant and have been extremely impressed with their commitment to community and stakeholder outreach. They have continually gotten out "in front of" the issues to make sure all stakeholder groups are kept informed and up to date every step of the way, be it a landowner, business or civic leader, elected official or the general public.	Comment acknowledged.
176	4	Medina	Susan	Susan K. Medina Communication Strategies, LLC	The Keystone project will have the added benefit of potential links to growing domestic supplies of crude oil in Montana and North and South Dakota.	Consolidated Response ALT-3 addresses issues related to transportation of crude oil from the Williston Basin.
176	5	Medina	Susan	Susan K. Medina Communication Strategies, LLC	The environmental benefits of Keystone XL should not be overlooked. The current tragedy in the Gulf underscores the importance of a diverse portfolio of energy supplies. Within the spectrum of viable options, it is appropriate to seek a growing role for oil resources that are:. Land-based;. North American; and,. Transported by pipeline. This project meets each of these criteria.	As described in Consolidated Response GLF-1, the risks associated with the proposed Project are substantially different from those associated with the BP Deepwater Horizon Project.
176	7	Medina	Susan	Susan K. Medina Communication Strategies, LLC	Pipelines are the safest, most reliable, economical and environmentally favorable way to transport oil and petroleum products, as well as other energy liquids, throughout the U.S. America depends on the more than 168,000 miles of liquid pipelines to move energy and raw materials our country relies on. Additional pipeline capacity will help consumers and businesses throughout the United States.	Consolidated Response SAF-1 describes the regulatory requirements and Project-specific Special Conditions that Keystone would comply with to construct, operate, maintain, inspect, and monitor the proposed Project. It also describes the monitoring, inspections, and reviews of the proposed Project that the Pipeline and Hazardous Materials Safety Administration would conduct to ensure compliance with those regulatory requirements.
176	8	Medina	Susan	Susan K. Medina Communication Strategies, LLC	This project also stands to provide a powerful private sector economic stimulus. During construction, Keystone XL will create more than 13,000 jobs funded with private investment. In addition, local governments will have a steady source of income from economic activity associated with construction and from property taxes the pipeline company will pay. Rejection of the permit or suspension of the review would sacrifice the significant economic benefits this project stands to deliver and force U.S. consumers to rely on other sources	Consolidated Response ECO-1 addresses potential socioeconomic impacts associated with construction and normal operation of the proposed Project.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					of crude oil not economically and politically allied with U.S. interests. This would be a mistake. I urge the granting of the permit. Thank you for the opportunity to comment.	
176	4	Medina	Susan	Susan K. Medina Communication Strategies, LLC	The Keystone project will have the added benefit of potential links to growing domestic supplies of crude oil in Montana and North and South Dakota.	Consolidated Response ALT-3 addresses issues related to transportation of crude oil from the Williston Basin.
1381	1	Meier	Glen	Valley County Sheriff's Office	Recently a number of advocacy groups sent a letter seeking suspension of the permitting of the Keystone XL pipeline. I encourage you to reject the request and to continue to review the proposed project. Please reject the request to suspend the process and continue with the review. The permitting processes in place are appropriate and should proceed so that a final determination can be made about the impacts of the project and whether it is in the national interest.	Comment acknowledged.
1381	3	Meier	Glen	Valley County Sheriff's Office	At the same time, construction of this project stands to bring significant economic benefits to the areas where it will be built.	Comment acknowledged.
1382	1	Meier	Glen	Valley County Sheriff's Office	I write in support of TransCanada's Keystone XL crude oil pipeline project and urge the department to grant a permit for the pipeline... I urge the granting of the permit. Thank you for the opportunity to comment.	Comment acknowledged.
1382	4	Meier	Glen	Valley County Sheriff's Office	Considering the economic [and energy security] benefits of these vital resources, we should continue to expand America's access to safe, affordable energy to help ensure [improved domestic and global energy security and] stable prices for consumers... This project also stands to provide a powerful private sector economic stimulus. During construction, Keystone XL will create more than 13,000 jobs funded with private investment. In addition, local governments will have a steady source of income from economic activity associated with construction and from property taxes the pipeline company will pay. Rejection of the permit or suspension of the review would sacrifice the significant economic benefits this project stands to deliver and force U.S. consumers to rely on other sources of crude oil not economically and politically allied with U.S. interests. This would be a mistake.	Consolidated Response ECO-1 addresses potential socioeconomic impacts, and Consolidated Response TAX-1 addresses concerns regarding taxes.
1382	5	Meier	Glen	Valley County Sheriff's Office	Pipelines are the safest, most reliable, economical and environmentally favorable way to transport oil and petroleum products, as well as other energy liquids, throughout the U.S.	Comment acknowledged.
279	1	Melander	Karla		Please do not put the pipeline through the Ogallala Aquifer. This would be total devastating to the area if there was ever leak in the pipe line. It would be a gulf disaster all over again.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. As described in Consolidated Response GLF-1, the risks associated with the proposed Project are substantially different from those associated with the BP Deepwater Horizon Project.
1044	2	Mendyk	David		Safety of our environment is also important. One thing I will always remember Senator Nelson of Nebraska for is fighting the proposed Radiactive Dump that would have endangered the Ogallalla Aquifer beneath the 'Bread-basket' of our Country. Please allow the State of Nebraska to oversee the safety issues surrounding this oil pipeline.	The state of Nebraska does not have any regulatory requirements for the siting or construction of crude oil pipelines. As described in Consolidated Response SAF-1, the Pipeline and Hazardous Materials Safety Administration (PHMSA) has regulatory requirements that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project in a manner that protects the health and safety of the public and the environment. In

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
						addition, PHMSA developed 57 Project-specific Special Conditions that Keystone has agreed to implement. Incorporation of those conditions would result in a Project that would have a degree of safety over any other typically constructed domestic oil pipeline system under current code and a degree of safety along the entire length of the pipeline system similar to that which is required in HCAs as defined in 49 CFR 195.450.
1044	3	Mendyk	David		Should we lose our water resource we would also have to import food?	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
788	1	Merrill	Hillary		As a resident of Utah, I've been researching the effects and efficiency of the tar sands process thoroughly and with great interest. It should be obvious to all that this is a bad idea. The EROEI (Energy Return On Energy Invested) is settled right around 2 or 3, which is extremely low when compared to other forms of energy...	The commenter's opinion is noted.
788	3	Merrill	Hillary		...The fact that we, as a state, would be duped into such an economical and environmental mistake is not only embarrassing but extremely irresponsible. I am 100% against developing the Keystone XL Pipeline Project. As an active, responsible, and legitimate citizen of this Country and the State of Utah, I strongly implore you to not go forward with this.	The proposed Project does not extend through Utah. Consolidated Response ENR-1 provides information on the Department of State's environmental review process, the National Interest Determination process, and the need to complete those reviews before approving or denying the Presidential permit for the proposed Project.
794	1	Merrill	Steve		This "fuel" that comes from tar sands is very inefficient and very dirty...	Consolidated Response OIL-4 addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils.
794	2	Merrill	Steve		...Please do not approve this pipeline project...	Comment acknowledged.
808	1	Merrill	Colette		This consideration for energy development is in line with rejecting electricity and promoting coal and wood burning as the energy of the future. Why is this even being considered? The concept is RIDICULOUS when compared to solar and wind sustainable energy. This concept only can attract those drawn pollution and mass suicide. Let go of the CODE and promote positive change.	Consolidated Response P&N-1 addresses the need that the Project has been proposed to meet. Consolidated Response ALT-2 addresses the use of alternative technologies and alternative energy sources.
934	1	Merrill	Jon	The State of Utah	Esteemed Representatives- I am a very busy person, but I am taking the time to demand that you deny the permit for the pipeline. Utah is not the country's testing ground, landfill, or hazmat lab. It's the state with the most varied terrain of any, making every natural environment found here as unique and rare as any endangered species. It is a literal treasure chest, and a center for all sorts of valuable tourism and business, arts and sciences- far beyond the normal proportion in an area. For our size we weigh in very heavily, and we don't like people treating us like we are primitive inhabitants of a harvest area- like disposable casualties of big business and big government. We will only choose to trip you, successfully- and the bigger you are, the harder you will fall. It seems like because Utahns are too often misrepresented and slandered throughout the country- being called everything from religious nuts to rednecks- that people forget that most of us are very normal; these misinformed groups of outsiders always seem to think that they can use our state as their diaper. But the fact	The propose Project does not extend through Utah.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					<p>is that Utahns are highly educated, they represent a wide spectrum of philosophy and thought, and are extremely savvy- a.k.a. we're not stupid, and we won't be sacrificed to someone's white-collar, dinosaur mentality. We're also known for our outdoorsy lifestyles and our love for nature- so it's hilarious that people think that 'this is the place' to dump on the environment, as if no one's going to care. Utahns are sick of Utah Government entertaining what is nothing less than a non-stop onslaught of lame attempts to misuse and exploit our land- of which this pipeline is just the latest. You look ignorant, as though you had failed to inform yourselves on the laughably low energy return and incredibly high carbon impact of milking oil from tar sands</p> <p>(http://en.wikipedia.org/wiki/Oil_sands)- which has only recently been even considered an oil resource, surely because of the higher oil prices set by by criminal-minded people. So it's not any secret that this is pure exploitation, making hay while the Oil Barons' sun shines- and being associated with it is not good for the reputation of Utah or it's government. Rather than being the idiots that people make us out to be, Utahns are starting to see that some of its governmental leaders that are among those who make Utahns look that way; and since we aren't weak or unintelligent, and have such a large base of activists, as well, per capita- we will simply continue to remove and replace those who do not truly represent us, and who cause us to be misunderstood. Just focus on the fact that the whole idea of using Tar Sands for oil is an embarrassment, as is your consideration of it. It is clearly backwards thinking. I would think that Utah would want to instead try to help lead the path into alternative energy- as Utah has shown that it easily has the inventiveness and capacity to make historic strides in that more intelligent pursuit. So please listen to me, as your friend I would tell you- not as a threat, but as a warning about the future of your careers- protect our land or you will, in fact, be replaced. Think long-term, remove what dangerous programs you have running- and in essence, do your jobs by protecting our state and it's people. Our local economy doesn't need this, and our national economy needs to remove itself from the Oil Man's teet, and everybody knows it. America is dependent upon people who largely despise and envy us- and if that isn't a formula for catastrophe, I don't know what is. Show some faith in Utah- and instead of trying to sell us out, believe that we could provide improvements in clean energy that are as valuable as any other contributor. Instead of making a wasteland, let's make an oasis- instead of killing our children's future, let's make history.</p>	
1281	8	Merz	Evelyn	Sierra Club Lone Star Chapter and Houston Group	Thank you for holding the public meeting in Channelview and for your assistance in this matter.	Comment acknowledged.
1544	74	Merz	Evelyn	Sierra Club Lone Star Chapter	Expressing appreciation for Congressman Gene Green and Mayor Annise Parker for requesting that the Department of State hold a meeting in Houston, despite the DOS trying to save money and be efficient.	Consolidated Response CMT-2 addresses issues related to comment meetings on the draft EIS and requests for additional public involvement.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
1544	76	Merz	Evelyn	Sierra Club Lone Star Chapter	The DEIS assumes that the refining of heavy tar sands crude is no different from the average feedstock in the Texas Gulf Coast.	As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries. Consolidated Response OIL-4 also addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils.
1544	77	Merz	Evelyn	Sierra Club Lone Star Chapter	The DEIS assumes that the plants will be responsible for handling their emissions and that the emissions will not change. I think this is false. If you look at the recent record at the Whiting Refinery in Indiana, which is a major refinery facility owned by BP in Sierra Lake, Michigan, the EPA had to step in because BP was consistently underestimating the emissions that would result from the revamping of this plant to handle a 90 percent increase in Canadian tar sand crude. I think the experience in Indiana should inform what may happen here and in the Draft EIS.	As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries. Consolidated Response OIL-4 also addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils.
1544	78	Merz	Evelyn	Sierra Club Lone Star Chapter	The EIS does not adequately address the emission impacts in the east Houston and Port Arthur areas. Both of these areas are challenged to meet air quality standards as it is.	As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries. Consolidated Response OIL-4 also addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils.
1544	79	Merz	Evelyn	Sierra Club Lone Star Chapter	The cumulative impacts should also consider the overall impacts of increasing the percentage of tar sands crude in the United States fuel supply.	As stated in Table 3.14.3-1, "While much of the oil transported by the Project could be replacing dwindling supplies, there could be an incremental increase in emissions from the processing of heavy crude oil at refineries. However, all refining would be required to adhere to refinery-specific air permits designed to avoid significant cumulative impacts to air quality. Future electricity sources in the region would likely include renewable energy sources (e.g., wind power)."
1544	81	Merz	Evelyn	Sierra Club Lone Star Chapter	The oil sands crude is a dirty fuel source. It is heavy, high in sulfur, nitrous oxides, metals and particulates.	Consolidated Response OIL-4 addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils.
1544	86	Merz	Evelyn	Sierra Club Lone Star Chapter	Comparing the DEIS with the incident report from the Department of Transportation Public Pipeline Safety Site, the DEIS description of cleanup in the event of a spill, particularly the cleanup of benzene contaminated soil, would vary according to where the spill occurred. It says that the level of cleanup would vary according to the state. To me, that is not good environmental policy.	Required emergency response plans for the proposed Project are discussed in Consolidated Response RES-1. As discussed in Section 3.13 of the EIS, federal, state, and local agencies would participate in response activities and soil, surface water, and groundwater cleanup consistent with their authorities and duties under applicable regulations and consistent with the requirements of the Emergency Response Plan and the Pipeline Spill Response Plan. A list of applicable regulations relative to remediation of crude oil spill contamination at the federal and state level is provided in Table 3.13.5-10. Required mitigation for crude oil or oil products spill impacts would be determined by these agencies.
1544	87	Merz	Evelyn	Sierra Club	The DEIS stated that the benzene contaminated soil cleanup	Required emergency response plans for the proposed Project

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
				Lone Star Chapter	standards would range from .04 parts per million in Montana all the way to no standard in Oklahoma, to 38 parts per million in Texas. That is a huge range of what is considered acceptable. If we are concerned with maintaining a healthy environment, then certainly the standards should be equal across the United States as to what is considered an acceptable amount of benzene in the soil after a cleanup.	are discussed in Consolidated Response RES-1. As discussed in Section 3.13 of the EIS, federal, state, and local agencies would participate in response activities and soil, surface water, and groundwater cleanup consistent with their authorities and duties under applicable regulations and consistent with the requirements of the Emergency Response Plan and the Pipeline Spill Response Plan. A list of applicable regulations relative to remediation of crude oil spill contamination at the federal and state level is provided in Table 3.13.5-10. Required mitigation for crude oil or oil products spill impacts would be determined by these agencies.
1554	15	Merz	Evelyn	Lonestar Chapter of the Sierra Club	The Department of State has violated the sense and the spirit of the National Environmental Policy Act. As best I can determine no advance publicity of the public hearings in any of the 4 cities in Texas has been done. ...We should not all be expected to read the Federal Register every morning to learn about meetings that affect the quality of the air we breathe and the welfare of our streams and our wetlands.	As noted in Consolidated Response ENR-1, the environmental review, including preparation of this EIS, has been conducted consistent with the DOS regulations pertaining to NEPA (22 CFR Part 161) as well as the Council on Environmental Quality (CEQ) regulations for implementing NEPA (40 CFR Part 1500). As a result, DOS considers the EIS to be consistent with the requirements of a NEPA environmental review. Consolidated Response INT-1 addresses concerns related to the Notice of Intent (NOI) to prepare an EIS for the proposed Project.
1554	16	Merz	Evelyn	Lonestar Chapter of the Sierra Club	the nearest library to Houston that had a copy was in Bay Town. That is quite a drive if you don't live there.	Consolidated Response CMT-6 addresses issues related to the availability of paper copies of the draft EIS.
1554	18	Merz	Evelyn	Lonestar Chapter of the Sierra Club	The Canadian tar sands crude is heavy, high sulfur crude, higher in heavy metals and a lower quality than current average feedstock. Refining tar sands produces higher levels of pollutants, which will further complicate efforts to meet air quality goals in Texas Gulf Coast cities, including Houston.	As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries. Consolidated Response OIL-4 also addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils.
1554	19	Merz	Evelyn	Lonestar Chapter of the Sierra Club	Today tar sands comprise about 4% of the U.S. fuel supply, if Keystone XL Pipeline is added to Keystone and Alberta Clipper pipelines, and they all are at capacity, the tar sands will comprise about 15% of U.S. fuel supply....The proposed pipeline would provide a market for very dirty crude from Canada, with the effects of contrary to U.S. efforts to utilize clean energy sources.	Consolidated Response Oil-4 addresses the composition of the Canadian crude oils that would be transported by the proposed Project. As noted in that response, the Canadian crude oil that would be transported is similar in composition to other heavy crude oils.
1554	20	Merz	Evelyn	Lonestar Chapter of the Sierra Club	...increased risks of pipeline spills. The proposed pipeline would cross the Ogallala Aquifer in the central United States. This aquifer is a vital water supply source for high plains region of Texas. Although the pipeline route does not cross the Northern High Plains of Texas per se, the actual aquifer extends beneath the Northern High Plains of Texas.	Consolidated Responses AQF-1 through AQF-3 discuss the Northern High Plains Aquifer system and potential impacts of a spill to this system.
1554	21	Merz	Evelyn	Lonestar Chapter of the Sierra Club	The proposed pipeline is going to cross 91 streams that support recreational, or commercial fisheries, which are in Texas. And I have not had sufficient time to look more closely at the information in the appendices that deal with water crossings. However, I do note that it does cross the Menard Creek. As best as I can tell, it includes the Menard Creek unit of the Big Thicket National Preserve, which is 1 of the	Consolidated Response WAT-1 addresses concerns regarding potential water quality impacts. Section 3.3 of the EIS addresses water crossings along the proposed Project route.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					precious natural resources of east Texas.	
1554	22	Merz	Evelyn	Lonestar Chapter of the Sierra Club	Based upon the appendix for forested lands affected by the proposed pipeline, the route would cross 136 miles of forested uplands and forested streams and wetlands in Texas alone.	Total miles and acres of forested lands within the proposed Project construction and operation footprints are identified in Table 3.5.5-1 and revised totals include 155.2 miles of upland and wetland forests resulting in 2,121 acres of effected forested habitats during construction, and 937 acres of previously forested habitats where trees would not be allowed to re-establish because of pipeline monitoring and integrity concerns.
1554	24	Merz	Evelyn	Lonestar Chapter of the Sierra Club	The draft environmental impact statement does not accurately address global warming impacts as a result of the increase of the tar sands crude in the U.S. fuel supply.	Consolidated Response GHG-1 addresses the greenhouse gas life-cycle analyses presented in the revised EIS. Climate change is addressed in Section 3.14.3.14. As noted in that Section, implementation of the proposed Project is unlikely to result in a measureable climate change.
1554	44	Merz	Evelyn		I just wanted to make a comment about 2 things. One is that all crude is the same, that is absolutely, positively incorrect. One does not use the same refining techniques for light sweet crude as you do for heavy crude or crude from tar sands. The price of crude is not the same. It varies according to the quality of the crude. Light sweet crude has a higher price per barrel than heavy crude, simply because it takes additional refining processes and is more expensive to refine.	Consolidated Response OIL-4 addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils. As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries.
1554	45	Merz	Evelyn		pipelines are inherently safe. That is only true if you believe Titanic is an unsinkable ship, and that offshore oil drilling never has accidents. There is nothing in this world that is inherently safe I'm afraid. I wish there was such a thing.	Consolidated Response SAF-1 describes the regulatory requirements and Project-specific Special Conditions that Keystone would comply with to construct, operate, maintain, inspect, and monitor the proposed Project. It also describes the monitoring, inspections, and reviews of the proposed Project that the Pipeline and Hazardous Materials Safety Administration would conduct to ensure compliance with those regulatory requirements.
1554	46	Merz	Evelyn		Short term benefits are jobs certainly, but there are a lot of short term jobs that aren't necessarily for the good for society. In this case I believe that it's not for the greater good to decrease the air quality in areas such as Houston or Port Arthur with large quantities and population. If the air quality was good and everything was perfect in Houston right now, there would not be so many people working so hard to try to force, -that's probably not too strong a word - force the refining industries there to actually operate in accordance with the provisions of the Clean Air Act. Within the past 2 years, the Houston Sierra Club and the Lonestar Chapter has sued Shell to force them to comply with the provisions of the Clean Air Act, because of repeated upsets, or what they claim are upsets, of their plant, which they said were unforeseen, but which happen constantly. And we are doing the same thing for Exxon Mobil. So life is not honky dory down there in Houston. And we do need to improve our air quality there, I am saying this as a person who lives there.	Consolidated Response ECO-1 addresses potential socioeconomic impacts associated with construction and normal operation of the proposed Project. As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries. Also see Consolidated Response JUS-1 which addresses potential impacts to minority and low-income populations.
1554	15	Merz	Evelyn	Lonestar Chapter of the Sierra Club	The Department of State has violated the sense and the spirit of the National Environmental Policy Act. As best I can determine no advance publicity of the public hearings in any of the 4 cities in Texas has been done. ...We should not all be	Consolidated Response CMT-3 addresses the level of information provided to the public regarding the proposed Project and the draft EIS scoping meeting locations and schedules.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					expected to read the Federal Register every morning to learn about meetings that affect the quality of the air we breathe and the welfare of our streams and our wetlands.	
1554	16	Merz	Evelyn	Lonestar Chapter of the Sierra Club	the nearest library to Houston that had a copy was in Bay Town. That is quite a drive if you don't live there.	Consolidated Response CMT-6 addresses issues related to the availability of paper copies of the draft EIS. Hardcopies of the final EIS will be made available at additional public libraries in the Houston area.
628	1	Meyer	Daniel		The Ogallala Aquifer is a precious national resource that demands protection and preservation. Regardless of the expense of moving the pipeline to prevent a leak into the aquifer seems minor compared to the potential disaster. Will we not learn from the Gulf tragedy?	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. Consolidated Response ALT-1 addresses potential alternative routes, including routes that would avoid much of the Northern High Plains Aquifer system.
630	1	Meyer	Allison		I cannot believe the Keystone XL Pipeline will cross over the Ogallala Aquifer. Please don't let them endanger the country's water supply. Make them move it!	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
630	2	Meyer	Allison		None of the company's assurances that leaks will be at a minimum gives me any comfort at all. One leak will be too much. And if (when) it happens, how long will it take them to discover it. It crosses over a despoil part of Nebraska. The leak could go on for weeks before anyone would discover it. And then it would probably be a rancher and not the company's inspectors.	Consolidated Response OIL-1 addresses the likelihood of spills from the Project, and Consolidated Response OIL-3 addresses small releases from the Project. Large spills would be detected immediately and the pipeline shut down within minutes to stop the leak as discussed in Section 3.13.5. As noted in Consolidated Response SAF-1, Keystone would be required to monitor the entire pipeline route 26 times per year, at intervals not to exceed 3 weeks. That monitoring plus the remote detection systems described in Consolidated Response OIL-3 and Section 3.13.5.5 would assist in identifying most leaks in a timely fashion.
459	1	Michaelson	Jerrie		Please put a hold on this project until the pipeline company has given their detailed plans on how a leak would be "fixed" and experts are satisfied the plans would work. The Ogallala Aquifer is a treasure that we must not contaminate. We must avoid even a change of a mess like is in the Gulf happening again.	Consolidated Response AQF-3 provides information on hypothetical spills from the Project over two areas of the Northern High Plains Aquifer System and also addresses response actions. As described in Consolidated Response GLF-1, the risks associated with the proposed Project are substantially different from those associated with the BP Deepwater Horizon Project.
1402	1	Michels	Patrick		I write in support of TransCanada's Keystone XI crude oil pipeline project and urge the department to grant a permit for the pipeline... I urge the granting of the permit. Thank you for the opportunity to comment.	Comment acknowledged.
1402	4	Michels	Patrick		Michels Pipeline Construction, a division of Michels Corporation, along with several of our other operating units, is proud to be a leading contractor on behalf of TransCanada. In recent years, the Keystone Project has provided literally thousands of jobs each year of skilled trade union jobs as well as millions of dollars spent in goods and services and local support along the route of these pipelines. As in the past, this project stands to provide a powerful private sector economic stimulus to the many rural communities along the way. In addition to the employment of skilled trades, local governments will have a steady source of income from economic activity associated with construction and from property taxes the pipeline company will pay. Rejection of the permit or suspension of the review would sacrifice the significant economic benefits this project stands to deliver and force U.S. consumers to rely on other sources of crude oil not	Comment acknowledged.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					economically and politically allied with U.S. interests. This would be a mistake. Considering the economic [and energy security] benefits of these vital resources, we should continue to expand America's access to safe, affordable energy to help ensure [improved domestic and global energy security and] stable prices for consumers.	
1402	5	Michels	Patrick		One of our Core Values is to perform our work safely and with care for the environment. TransCanada believes this is our primary responsibility and has awarded us for achieving remarkable success in this regard. Michels has constructed pipelines for over 50 years throughout the U.S. and Canada. In our expert opinion, pipelines are the safest, most reliable, economical and environmentally favorable way to transport oil and petroleum products, as well as other energy liquids throughout the U.S.	Comment acknowledged.
1546	197	Miles	Emily		Coal companies also claim to help the economy, but when you visit a mine you find poverty, high cancer rates, shorter life spans. It seems likely tar sands will cause the same thing.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information on current and future production. As noted in that Consolidated Response, without the proposed Project, oil sands development would continue at or above the current level until at least 2020, with or without the proposed Project. Consolidated Response OIL-4 addresses the composition of the Canadian crude oil that would be transported by the proposed Project, including concerns relative to the corrosivity and erosivity of the crude oil. As noted in that Consolidated Response, that crude oil is similar in composition and properties to other heavy crude oils that are currently transported within the U.S. pipeline system and similar in composition and properties to other heavy crude oils that are currently refined in PADD III.
1546	198	Miles	Emily		I don't want our country to continue social injustice by taking advantage of indigenous communities.	As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries. Also see Consolidated Response JUS-1 which addresses potential impacts to minority and low-income populations.
90	1	Miller	Andrew		I am opposed to the construction of this pipeline through Nebraska's most precious resource. Nebraska doesn't have a great deal to point to in terms of natural resources but the Ogallala Aquifer is a true jewel beneath the surface.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
90	2	Miller	Andrew		Were this to become contaminated through an undetectable pinhole leak or worse, the devastation would likely be irreversible.	The potential impacts of a spill from the Project, including from a pinhole leak, are discussed in Sections 3.13.5 and 3.13.6 of the EIS. Consolidated Response OIL-3 addresses small releases from the Project.
239	1	Miller	Sam		Emergency equipment, personnel, and resources need to be readily available to respond to a pipeline leak, terrorist event, or mishap and avoid unnecessary contamination of localized area. An emergency response team should be identified with emergency plans on how to react to various emergency events in a timely manner.	Consolidated Response RES-1 addresses issues related to preparation and review of emergency response plans for the proposed Project.
239	2	Miller	Sam		2. Project documents need to spell out specifics to define Montana and N. Dakota on ramps with costs to share in the	Consolidated Response ALT-3 addresses issues related to a potential pipeline connection to the proposed Project in

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					proportional Project Pipeline costs.	Montana. As noted in that response, the Bakken Marketlink Project is in the early stages of development and the specifics regarding costs and revenues are not available. However, all costs associated with developing the Bakken Marketlink Project would be borne by Keystone Marketlink LLC, and the costs of connecting to the Bakken Marketlink Project would be borne by the producers that ship crude oil through the Bakken Marketlink Project.
239	3	Miller	Sam		The Department of State (DOS) needs to verify the qualifications and technical experience of those Federal personnel (or Contract Personnel) that will be Project Managing for the U.S. Government. Qualifications need to meet or exceed the needs of the project. My experience with DOS is they do NOT DEMONSTRATE SUFFICIENT TECHNICAL KNOWLEDGE, SKILLS, OR ABILITIES (even when contracted) to meet the project needs with pipeline projects they take the lead as the Lead Federal Agency. The DOS generally assigns junior staff members to these projects or attorneys with inadequate desire to perform sufficiently; the results are project participants, other federal agencies, and States are redundant with submitted materials and inadequate coordination with project participants occurs.	The Department of State serves as the lead federal agency for the environmental review of the proposed Project. This responsibility includes management of the environmental review process and overseeing the technical studies and evaluations. Many levels of The Department of State staff are involved in the review, including senior staff with experience in dealing with the technical and legal issues associated with the environmental review process and the National Interest Determination. The Department of State selected a third-party contractor with extensive experience in preparing EISs for proposed pipeline projects and experience on projects in the states crossed by the proposed routes and alternatives. Additional information related to this comment is presented in Consolidated Response REG-2.
427	2	Miller	Richard	Creighton University	The tar sands project is accelerating us into the climate catastrophe because extracting oil from the tar sands produces 2 to 3 times more carbon dioxide pollution than conventional oil and part of the process involves clear cutting of sections of the boreal forest. In this context, supporting the Tar Sands project by building a pipeline from the Canadian Tar Sands through the United States would be terribly destructive.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project. Consolidated Response GHG-4 addresses concerns regarding the loss of boreal forest and peat bogs. Consolidated Response GHG-1 addresses GHG life-cycle analyses.
555	1	Miller	Charlotte		Careful planning must accompany the placement of the pipeline. I am concerned about it crossing the Ogallala aquifer, either underground or above ground.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
555	2	Miller	Charlotte		Any break in it would be a tremendous disaster to a very valuable natural resource. Please reroute it around the aquifer to eliminate all possible dire consequences.	Consolidated Response ALT-1 addresses potential alternative routes, including routes that would avoid much of the Northern High Plains Aquifer System and the Sand Hills area. Issues related to the Northern High Plains Aquifer System are addressed in Consolidated Responses AQF-1 through AQF-4. Consolidated Response AQF-3 provides information on hypothetical spills from the Project over two areas of the Northern High Plains Aquifer System.
811	1	Miller	Marci	Backyard Harvest	This is an atrocity of astronomical proportions! It not only takes more energy to produce the oil, but it will destroy critical wildlife habitat, aquifers, and any natural area it crosses.	Identification of sensitive environments crossed by the proposed Project is discussed in Consolidated Response ENV-1 and ENV-3. Potential proposed Project impacts to wildlife habitat are discussed in Sections 3.5, 3.6, 3.7, and 3.8 of the EIS, including designated critical habitats for federally protected threatened or endangered species.
811	2	Miller	Marci	Backyard Harvest	Please involve the EPA in your examination of this project.	As noted in Section 1.5.2, EPA was a cooperating agency in preparation of the EIS.
952	1	Miller	Jesse		Please make the correct choice to have nothing to do with this technology. Any type of research will show that this is one of the most inefficient, wasteful, and costly methods of creating energy. No gratuitous statements begging for "continuing to	Consolidated Response ALT-2 addresses the use of alternative technologies, alternative energy sources, and conservation of energy. Consolidated Response P&N-5 addresses issues related to investments in other technologies.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					make this country great" are needed. Tar sands are as hideous as they sound. We the people are speaking. Please act accordingly.	
1146	1	Miller	Willard		Don't let Canada run a pipe line through Nebraska. You can not trust the oil company.	The commenter's opinion is noted.
1146	2	Miller	Willard		If they use cheap pipe there goes our underground fresh water. And you can't replace that. Please don't sell us out. (Don't let them run oil pipe line in Nebraska.)	Consolidated Response PIP-1 addresses the issue of purchasing pipe for the Project. Keystone has withdrawn its application for a Special Permit as described in Consolidated Response REG-1.
1379	1	Miller	Ralph	Prairie Industries, Inc	I am the president of Prairie Industries, Inc., located in Mullen, NE. Our company is the bottler of Windmill Hills bottled water, Nature's Best Water. Our source of water (what could be the purest water in the world) cannot afford even the smallest of oil spills. The sand and gravel that make up the Sandhill region of Nebraska would act as a large sponge in the event of an oil spill, contaminating large areas of water, and possibly the entire Ogallala Aquifer.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
1379	2	Miller	Ralph	Prairie Industries, Inc	The sand and gravel that make up the Sandhill region of Nebraska would act as a large sponge in the event of an oil spill, contaminating large areas of water, and possibly the entire Ogallala Aquifer. This is something that could compare to the Gulf oil well disaster, or worse.	As described in Consolidated Response GLF-1, the risks associated with the proposed Project are substantially different from those associated with the BP Deepwater Horizon proposed Project. Section 3.13 of the EIS presents the probability of a spill from the proposed Project, cleanup procedures that would be conducted, and the impacts of such a release. Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4..
1379	3	Miller	Ralph	Prairie Industries, Inc	Burying an oil pipeline into our water would compare to burying the Alaska pipe line in the permafrost. That would have warmed the frozen ground allowing the pipe to move and break. Although the pipe buried in the sand and gravel most likely wouldn't move once in place...If there is going to be a pipeline north and south through Nebraska, I request that it be west of Antioch, NE, or east of Anselmo, NE. The soil in these areas would be more friendly to control oil spills.	Issues related to an aboveground pipeline are addressed in Consolidated Response CST-1. Issues related to the Northern High Plains Aquifer System are addressed in Consolidated Responses AQF-1 through AQF-4. Section 4.3 of the EIS addresses potential alternative routes, including a route west of Antioch. The proposed route is east of Anselmo.
1379	4	Miller	Ralph	Prairie Industries, Inc	Building the pipe line would create miles of open sand that may take more than 50 years to heal back and would require covering with straw and watering to get it grassed over again. In the event this was not done properly, the sand would blow, covering grassed areas and making the open sand spread (small version of this we call a blowout). A project such as a pipeline could convert us back to the dust-bowl days.	Identification of sensitive environments crossed by the proposed Project is discussed in Consolidated Response ENV-1 and ENV-3. Issues related to the Sand Hills area are addressed in Consolidated Response ERO-1.
1379	5	Miller	Ralph	Prairie Industries, Inc	I am for oil and oil drilling and for becoming energy independent.	The commenter's opinion is noted.
1542	94	Miller	Randy	International Pipeliners Union, Local 799	The level of detail that the Federal Energy Regulatory Commission deals with for these pipelines is phenomenal. They do a huge job. They don't always get it right, we know they don't. But my point is that there is a great deal of information that's accumulated, from soil depths, soil types, environmental corridors, every land owner, rights of way, etc. We as pipeliners use this information.	Comment acknowledged.
1542	95	Miller	Randy	International Pipeliners	We don't stand to gain from the misery of people. Most of these welders are rural property owners across the country	Comment acknowledged.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
				Union, Local 800	and care about the pipelines coming through their property, just like you do.	
1542	96	Miller	Randy	International Pipeliners Union, Local 801	Our country has to have this. There are pipelines across the country that have been working for the last 80 years.	Comment acknowledged.
1542	97	Miller	Randy	International Pipeliners Union, Local 802	We are here because of TransCanada. We've worked with TransCanada in different places across the country as welders, as skilled labor. I've watched pipelines being built. I've dealt with land owners, union problems of working conditions and worker safety. TransCanada is a good company.	Comment acknowledged.
1542	99	Miller	Randy	International Pipeliners Union, Local 804	TransCanada does better work than much of the industry in terms of environmental compliance. I'm not paid to say this.	Comment acknowledged.
1542	100	Miller	Randy	International Pipeliners Union, Local 805	They are going to build a pipeline that's protected. Every drop of oil that is lost is precious. It's in the company's best interests to keep their profit in their pockets.	Comment acknowledged.
1542	101	Miller	Randy	International Pipeliners Union, Local 806	If TransCanada gets the right to build the pipeline, we believe they will do a good job.	Comment acknowledged.
1553	32	Miller	Randy	International Pipeliners Union	I am down here on behalf of the union to say that these pipelines, this pipeline will bring a huge number of jobs for American workers. The jobs need to be given to American workers. They need to be given to skilled American workers. We need to make sure this pipeline is built in a way that it will serve and benefit this community and the other communities it passes near.	Comment acknowledged.
1553	33	Miller	Randy	International Pipeliners Union	This pipeline will not change the signature of the air quality in these areas. Your refineries will...without those refineries these communities don't exist....But the refineries at the end of the day have to refine it in a way so that their air emissions don't change. If they can't refine sulphurous oil, and let me tell you something, the Permian basin has more hydrogen sulfide sour crude, sour gas, than any other large regional area in this nation.	As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries. Also see Consolidated Response JUS-1 which addresses potential impacts to minority and low-income populations.
1553	34	Miller	Randy	International Pipeliners Union	So 1 thing to remember is we are not going to change the quality of this community. We are as a community going to realize more jobs. There's going to be a boom in the economy,	Comment acknowledged.
1553	35	Miller	Randy	International Pipeliners Union	the crude that will be brought here is crude that can be used here. And the crude that is used here will fuel our cars, fuel our industry, fuel the local economy, so long as the American worker gets the opportunity to work on the projects as they come through.	Comment acknowledged.
1553	36	Miller	Randy	International Pipeliners Union	This is a good company, this is a much-needed project, it is for our country, it is for the economy down here. It will not change your air, it will not change your water, but offshore spills will. Increased public transportation and population	Comment acknowledged.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					growth will. We have to find those alternatives. This country has to stay strong while we are looking for them. The technology lies in pipelines, not in any other, not nuclear plants or anything else.	
1559	59	Miller	Randy		Pipeline technology is the safest technology in the world and in this country. Even if Canadians refine it, we still have to pipe it down here to use it. Gasoline or kerosene or any refined oil product, is worse in a spill than crude oil because it spreads faster. We don't want trucks trucking hydrocarbons.	Consolidated Response SAF-1 describes the regulatory requirements and Project-specific Special Conditions that Keystone would comply with to construct, operate, maintain, inspect, and monitor the proposed Project. It also describes the monitoring, inspections, and reviews of the proposed Project that the Pipeline and Hazardous Materials Safety Administration would conduct to ensure compliance with those regulatory requirements. Consolidated Response OIL-4 addresses the composition of the Canadian crude oil that would be transported by the proposed Project, including concerns relative to the corrosivity and erosivity of the crude oil. As noted in that Consolidated Response, that crude oil is similar in composition and properties to other heavy crude oils that are currently transported within the U.S. pipeline system and similar in composition and properties to other heavy crude oils that are currently refined in PADD III.
1559	60	Miller	Randy		What we need is a pipeline that is built right. Our refineries are starving. If the pipeline does not go here, jobs will go to other American cities.	Comment acknowledged.
424	1	Milligan	Katherine		I think we need to step back and look again at the Keystone project.	The commenter's opinion is noted.
424	3	Milligan	Katherine		The Ogallala Aquifer is at risk and therefore a source/great source of groundwater is at risk. We need to think very hard, listen to all voices and act responsibly. If everyone is thinking alike, then someone is not thinking.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
426	1	Milligan	Margaret		To Secretary of State Clinton: Please do not approve this project.	Comment acknowledged.
426	2	Milligan	Margaret		Please use common sense to not allow TransCanada to bury an oil pipeline across North America's largest freshwater Aquifer. The costs far outweigh the benefits. Please think of future generations- of people, eco systems, communities, and farmers- who depend on the Ogallala Aquifer to survive. Even a tiny amount of oil could potentially render the water toxic. I am begging you to not approve this project. Please come to central Nebraska, read a little about groundwater, and decide to choose long term security and safety over oil.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
426	3	Milligan	Margaret		Even a tiny amount of oil could potentially render the water toxic. I am begging you to not approve this project. Please come to central Nebraska, read a little about groundwater, and decide to choose long term security and safety over oil.	Issues related to the Northern High Plains Aquifer System are addressed in Consolidated Responses AQF-1 through AQF-4. Consolidated Response AQF-3 provides information on hypothetical spills from the Project over two areas of the Northern High Plains Aquifer System.
415	1	Millnitz	Jessica		Having lived in Nebraska my entire life, and having parents who've chosen the same, I have a great appreciation and respect for the Midwest culturally and the plains ecologically. I feel I have a great understanding of our history through my education, participation, past representation of my school at state and national levels in academics in high school and my participation in my community through the arts in college at	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					the University and through close relationships with community members like Susan Seacrest, founder of the groundwater foundation. The Ogallala Aquifer in central Nebraska is one of our state's greatest resources. The groundwater here in Nebraska is incredibly pure and has been said to be cleaner and better for you than bottled water by nutritionists. This is the land over which there is already a pipeline. Your proposal for this new pipeline project however would run this oil transportation directly through our state's aquifer, through the entirety of central Nebraska.	
415	2	Millnitz	Jessica		whereas pinhole leaks in the current pipeline can be located and repaired in days it is unlikely that any necessary repairs or maintenance to this proposed pipeline could be detected within weeks. It is also probable that it would be detected not before but rather because of oil plumes contaminating our aquifer. I am disappointed, disgusted, saddened and frustrated by this project and I hope desperately that our voices and protests will be heard and recognized.	Consolidated Response OIL-3 addresses issues related to small leaks in the pipeline.
415	3	Millnitz	Jessica		Please, with everything that oil has already done to our planet and is still doing right this very moment, let's propose ways to power things with cleaner resources and innovations instead of funding projects that will contribute to the same disasters and environmental damage we've already incurred.	Consolidated Response ALT-2 and Section 4.1 address the use of alternative technologies, alternative energy sources, and conservation of energy. Consolidated Response P&N-5 addresses issues related to investments in other technologies.
816	1	Mills	Jean		I am very concerned about the safety of the XL pipeline project. The eight states that depend on the Ogallala Aquifer for water could not recover from a disaster such as we are seeing take place in the gulf of Mexico today. I would like to see Sec. Clinton vote no on granting land use for this project.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. As described in Consolidated Response GLF-1, the risks associated with the proposed Project are substantially different from those associated with the BP Deepwater Horizon Project.
854	1	Milner	Maribeth		I strongly oppose the Keystone project in general and the proposed route over the Ogallala aquifer in particular. The continuing Gulf oil volcano has demonstrated the industry's failure to take remediation seriously. For example, recent reporting indicates BP spent zero dollars on clean up research. June's Utah pipeline spill of 500 barrels of oil has devastated the community where the leak occurred. To my knowledge, the pipeline engineering in that case followed standard protocol. The proposed Keystone high pressure pipeline engineering does not.	Consolidated Response ALT-1 addresses potential alternative routes, including routes that would avoid much of the Northern High Plains Aquifer system. Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. As described in Consolidated Response SAF-1, the Pipeline and Hazardous Materials Safety Administration (PHMSA) has regulatory requirements that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project. In addition, PHMSA developed 57 Project-specific Special Conditions that Keystone has agreed to implement. In addition, PHMSA would inspect the proposed Project to ensure that the Project is in compliance with those regulations.
854	2	Milner	Maribeth		The Ogallala Aquifer is a precious resource serving major production areas in the dryland Great Plains not just Nebraska. It is foolhardy to place the livelihood of those producers (and the people and animals they serve) at risk when alternative energy sources can be readily developed. Developing alternative energy solutions would allow us to grow out of the Great Bush Recession, which, thanks to "deficit hawks", is about to take a second dip.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. Consolidated Response ALT-2 addresses the use of alternative technologies, alternative energy sources, and conservation of energy.
854	3	Milner	Maribeth		Finally, we need smart energy independence. That means investing in low energy production footprint alternatives like Nebraska's abundant wind and solar. However, the tar sands have an enormous energy production footprint. From a climate	Consolidated Response P&N-1 addresses the need that the Project has been proposed to meet. Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1. Consolidated Response

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					change (and therefore a long term sustainability) point of view... facilitating tar sands production is NOT in our national interests. When you factor in potential production losses and the costs associated with climate change, the Keystone project doesn't add up. Please don't let the pipeline run through Nebraska.	ALT-2 addresses the use of alternative technologies and alternative energy sources.
1083	1	Milner	Susan		It is in the best interest of the citizens of Nebraska and the environment to not allow for the expansion of the Keystone pipeline. This attempt to place the line through the precious Ogallala Aquifer is too risky and unnecessary. Please deny this application.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
1550	47	Milton-Lightening	Heather	Indigenous Environmental Network	So firefighters, police, you know, ambulance, whoever, EMTs would be the people first on the job.... the people have a responsibility to know exactly what those diluents are, what's going to happen in the process of the spill before the pipeline is even talked about because there is the duty to consult in this country.	Consolidated Response OIL-4 addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils. Consolidated Response RES-1 addresses issues related to preparation and review of the emergency response plan for the proposed Project.
1550	48	Milton-Lightening	Heather	Indigenous Environmental Network	It's big, big money for folks. But what happens, though, is that two environmental officers are not there 24/7. The due diligence is on the companies to report and do their regulatory processes. And I guess one of the things that we're trying to say is learn from our mistakes because these companies have come in without due diligence to the people, without due diligence to the First Nations people.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project.
1550	49	Milton-Lightening	Heather	Indigenous Environmental Network	We're seeing people dying of rare cancers. We're seeing whole way of life completely dying. We're seeing the moose, the animals, the fish all with cancer sores on them. The water you can't drink it. You know the companies are dumping effluent into it, and they're allowed to. The Alberta government allows them to. They're sucking dry every single water resource in the region.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project.
1550	50	Milton-Lightening	Heather	Indigenous Environmental Network	I don't know if you've been to a refinery community, but some of the things that we've noticed is that when these pipelines or when this kind of development happens it happens to people that are poor, people that are not necessarily really rich, that don't have political power, if it's Native communities, people of color. Those are where these sites go, and there is a reason for that. We call it environmental racism. And either way, the way we believe is that all people have the right to clean water, to clean air, and to have a safe place to live.	Consolidated Response JUS-1 and Section 3.10.1.2 of the DEIS describe the counties in the project area with higher populations of minority and low-income groups that may be impacted by the project. This analysis is consistent with CEQ guidance for analysis of potential environmental justice effects. The proposed Project is not expected to result in adverse impacts that would fall disproportionately on minority or low-income populations located along the pipeline route. Moreover, project-related spending and tax revenues would result in substantial socioeconomic benefits in the region of influence, which may positively affect low-income and minority populations and Native American tribes through increased employment opportunities, income benefits, and improved public service levels. As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries.
1550	51	Milton-Lightening	Heather	Indigenous Environmental	Because the reality is, is the people that monitor those pumps wear respiratory masks in order to check the pumps. So are	Consolidated Response OIL-4 addresses the composition of the Canadian crude oil that would be transported by the

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
				Network	respiratory masks going to be provided to every citizen along that pipeline? I mean are you going to be told what the impacts of those diluents are, because we definitely weren't.	proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils. Citizens would not be issued masks since they would not be working on pump stations where there is a potential for fugitive emissions (see Section 3.12). Where those minor emissions occur, the concentration would not be measureable outside of the perimeter fencing.
1	1	Mitchell	Robert&Joyce		As instructed by an article that recently appeared in the Great Falls Tribune, I am writing to voice my concern about the proposed 1980 mile pipe line to be built by Keystone for TransCanada and Conoco/Phillips Company. What is being proposed does not make sense nor cents, that is, to build a pipe line from the northern border of the USA to the Gulf of Mexico. Unless, of course, there are other motives and objectives to be gained by its construction. By having the crude oil refined at a gulf port, it becomes readily available for shipment to the highest bidder throughout the world. Such an operation would minimize the amount of crude oil that the United State market would receive, thus resulting in keeping gas prices inflated. This can be considered another form of "outsourcing" at the expense of the American consumer. In keeping with capitalistic values, it would be only meet and right to sell the surplus to other markets after the demand at home has been satisfied. It is my understanding that there is more oil in the ground in northern Canada than there is under Saudi Arabia. If this be true and if Canada were to sell their oil to us, we would not be subject to price of crude on the world market. A surplus of oil within the U. S. would reduce gas prices, save the consumer money, increase his purchasing power, which in turn would create other jobs and improve our economy in general. In addition, having an adequate reserve of crude would make us not dependent upon the nations of the near east. This could alter our relations with these countries. From a business point of view, the expense of building a pipe line all the way to Texas to refine crude does not make sense when considering that there are refineries already existing in Montana, North Dakota and Wyoming. These refineries could be enlarged to handle the increase of crude. Another factor to consider is that these refineries would be located closer to their markets for purposes of distribution. Please excuse me if I seen suspicious of things that originate in Texas. For instance, Senator Phil Gramm's bill that was passed by Congress relieved the banks of the controls that FDR had put in place back in the 1930s. This bill undoubtedly has a bearing on our present financial situation. Another act that involved Texas was the Enron fiasco. If Texas was not a power grid unto itself, this "con job" might have been avoided. The lower 48 states are divided into three power grids – Eastern, Western and Texas. If there had Texas been a Central Power Grid at that time involving 17 states including Texas, Ken Lay likely could not have gotten away with his scheme. At one time LS/MFT meant "Lucky Strikes Means Fine Tobacco". Today it has come to mean, Lord Save Me from Texas. For reasons I have expressed here, the construction of a 1980 mile pipe line would be an unnecessary expense for the citizens of this	Consolidated Response P&N-1 addresses the need that the Project has been proposed to meet. Consolidated Response P&N-2 provides information on the export of refined product from Gulf Coast refineries. Consolidated Response P&N-8 addresses issues related to shipping Canadian crude oil to refineries that are closer to the source of oil. Consolidated Response P&N-4 provides information on investments by Chinese companies in Canadian oil sands project.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					country – either as a taxpayer or as a consumer. While writing this letter, I heard that Conoco/Phillips sold their 9% interest in the Canadian oil field to a Chinese company. This would seem to confirm my suspicions about why the proposed pipe line is going to end up at a gulf port in Texas.	
460	1	Mitchell	Mitch&Carolene		As residents of the State of Nebraska, we do not understand why such a pipeline is going to be built through our state. The area proposed does not have the right kind of soil in which to bury pipes	Issues related to the Sand Hills area are addressed in Consolidated Response ERO-1.
1132	1	Mitchell	Kurt		I'm also concerned that the federal government isn't using the best expertise available to ensure the absolute safety of our state's greatest natural resource.	As described in Consolidated Response SAF-1, the Pipeline and Hazardous Materials Safety Administration (PHMSA) has regulatory requirements that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project in a manner that protects the health and safety of the public and the environment. In addition, PHMSA developed 57 Project-specific Special Conditions that Keystone has agreed to implement. Incorporation of those conditions would result in a Project that would have a degree of safety over any other typically constructed domestic oil pipeline system under current code and a degree of safety along the entire length of the pipeline system similar to that which is required in HCAs as defined in 49 CFR 195.450. It also describes the inspections and reviews of the proposed Project that the Pipeline and Hazardous Materials Safety Administration would conduct to ensure compliance with those regulatory requirements. Issues related to the High Plains Aquifer System are addressed in Consolidated Responses AQF-1 through AQF-4.
1544	181	Mitchell	Beverly	U.S. Pipeline	We build a pipeline for economic growth in the region and we put the land back exactly as we found it.	Comment acknowledged.
1013	1	Moerles	Mark		I am writing this letter to voice my deep concern with the proposed Keystone XL pipeline, coming to Nebraska. proposed to cross Our Great State, directly across the Ogallala Aquifer,	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
1013	4	Moerles	Mark		Well, We have also seen the results of cost trimming and safety measures being waived. I strongly urge you, as a Nebraska Representative, to oppose any pipeline in Nebraska that compromises Our States' safety or health, in any manner. Please do Your Sworn Duty to protect Me, as a Citizen of the Great State of Nebraska.	Consolidated Response SAF-1 describes the regulatory requirements and Project-specific Special Conditions that Keystone would comply with to construct, operate, maintain, inspect, and monitor the proposed Project. It also describes the monitoring, inspections, and reviews of the proposed Project that the Pipeline and Hazardous Materials Safety Administration would conduct to ensure compliance with those regulatory requirements.
1298	1	Moffat	Jane	Canadian American Business Council	I am here today on behalf of the Canadian American Business Council and am speaking in further support of the council's June 4 written submission to the US Department of State. As you know, Canada and the US have a very long history of cooperation in many areas, including on energy issues. We are here today in support of the Keystone XL pipeline.	Comment acknowledged.
1298	2	Moffat	Jane	Canadian American Business Council	As a bilateral organization, the council supports the project as it will bring Canadian crude oil from the Canadian oil sands to the Gulf Coast region.	Comment acknowledged.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
1298	3	Moffat	Jane	Canadian American Business Council	In addition to bringing this secure source of oil to the US, the pipeline project will create an estimated 350,000 new jobs in the US.	Consolidated Response ECO-1 and Section 3.10.2.2 address potential socioeconomic impacts.
1298	4	Moffat	Jane	Canadian American Business Council	The council supports the Keystone XL pipeline for several reasons, the first of which is that the economic effect of the project will be very positive in the US. Construction of the pipeline will create jobs and bring economic benefits both in the states and regions where the pipeline will be located, and also across the US by reason of the significant procurement that will be associated with the pipeline project.	Comment acknowledged.
1298	5	Moffat	Jane	Canadian American Business Council	The council supports the project because of the strategic implications for the US of obtaining oil from Canada -- its closest friend and ally -- rather than from more dangerous -- and hostile -- sources, such as Venezuela and the Middle East. Indeed, the Gulf Coast refineries that will be the destination for the Canadian oil carried through the Keystone XL pipeline are currently used to refine oil from countries that have a history of hostility toward the US, as exhibited by OPEC in the 1970s.	Comment acknowledged.
1298	6	Moffat	Jane	Canadian American Business Council	The Keystone XL pipeline will bring Canadian crude to refineries in the Gulf that currently depend on crude from less dependable or friendly sources. In other words, Canadian volumes will displace volumes from Venezuela.	Comment acknowledged.
1298	7	Moffat	Jane	Canadian American Business Council	The Canadian American Business Council encourages the Department of State to give significant weight to the energy security implications of bringing friendly and reliable supplies of oil from Canada -- the US's largest trading partner.	Comment acknowledged.
1298	8	Moffat	Jane	Canadian American Business Council	Pursuant to the Clean Energy Dialogue, the US and Canada have agreed to build a low-carbon economy together. The two countries share an economic space, just as they share the challenges and the results of energy's effect on the environment. During the North American transition to renewables and to a low carbon economy, Canadian oil provides a safe and reliable source for the US.	Comment acknowledged.
1298	9	Moffat	Jane	Canadian American Business Council	As part of its written submission in support of the Keystone XL pipeline, the Canadian American Business Council endorsed a 2009 report of the Council on Foreign Relations titled: "The Canadian Oil Sands: Energy Security vs. Climate Change." That report reiterates that shifting the supply of oil from hostile nations, such as Iran and Venezuela, to nearby Canada will enhance US energy security.	Comment acknowledged.
1298	10	Moffat	Jane	Canadian American Business Council	As acknowledged by the International Energy Agency, the US economy will continue to rely on fossil fuels for the foreseeable future through the transition to a low-carbon economy. During that transition to a low-carbon economy, the US will rely on foreign supplies of oil. That foreign reliance should be on Canada.	Comment acknowledged.
1298	11	Moffat	Jane	Canadian American Business Council	The Canadian American Business Council supports the conclusion of the report of the Council on Foreign Relations that the US government should aim to ensure that US regulatory processes for pipelines and refineries that will	Comment acknowledged.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					handle Canadian oil sands products -- such as this very permitting process -- should not be used to block oil sands imports based on assertions about climate change.	
1298	12	Moffat	Jane	Canadian American Business Council	The report addresses the arguments about environmental implications in Canada of oil sands production and development and concludes that regulation in that regard falls solely within the jurisdiction of Canadian authorities. The permitting process at issue here is about nothing more than the Keystone XL pipeline. It is not about climate change concerns related to the oil sands. Any consideration of environmental impacts should accordingly be limited to any environmental impacts of actually transporting oil through the pipeline.	Comment acknowledged
1298	13	Moffat	Jane	Canadian American Business Council	We agree with the finding of the Council on Foreign Relations that a carbon market -- and not the Department of State's regulatory permitting process -- is the best way to address GHG emissions from the Canadian oil sands. The issue of the carbon footprint of oil is beyond the scope of a Presidential pipeline review and is indeed for the Government of Canada or Congress.	Comment Acknowledged
1298	14	Moffat	Jane	Canadian American Business Council	In further support of our written submission -- I direct your attention to a recent report of another independent and non-partisan organization: IHS Cambridge Energy Research Associates (CERA). That report was released last month and projects that Canadian oil sands will become the top source of US crude oil imports in 2010. Currently, Canadian oil sands constitute 8% of the total crude oil imports to the US. By 2030, imports from the Canadian oil sands may constitute between 20-36% of total US crude oil imports -- a prospect that would certainly increase US energy security in the coming decades during which the US, by all accounts, will remain the world's leading oil market.	Comment acknowledged.
1546	2	Moffet	Jane	Canadian American Business Council	Pipeline project will create an estimated 350,000 jobs in the United States. It will bring jobs and economic benefits to both the states where the pipeline is located and across the country.	Consolidated Response ECO-1 and Section 3.10.2.2 of the EIS address potential socioeconomic impacts.
1546	3	Moffet	Jane	Canadian American Business Council	Second, the Counsel supports the project because of the strategic implication for the U.S., of obtaining oil from Canada, its closest friend and ally, rather than from more dangerous and hostile sources, such as Venezuela and the Middle East. Indeed, the gulf coast refineries that will be a destination for this Canadian oil are currently used to refine oil from countries that have a history of hostility towards the United States, as exhibited by OPEC in the 1970's.	Comment acknowledged.
1546	4	Moffet	Jane	Canadian American Business Council	Canadian volumes will displace volumes from Venezuela.	Comment acknowledged.
1546	7	Moffet	Jane	Canadian American Business Council	During the North American transition to renewables, into a low carbon economy, Canadian oil provides a safe and reliable source for the United States.	Comment acknowledged.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
1546	8	Moffet	Jane	Canadian American Business Council	Canadian American Business Council in 2009 endorsed Counsel on Foreign Relations report, "The Canadian oil sands, energy security versus climate change," which reiterates using oil from Canada will enhance U.S. energy security.	Comment acknowledged.
1546	9	Moffet	Jane	Canadian American Business Council	As acknowledged by the International Energy Agency, the U.S. economy will continue to rely on fossil fuels for the foreseeable future, during that transition to a low carbon economy, the U.S. will rely on foreign supplies of oil. That foreign reliance should be on Canada.	Comment acknowledged.
1552	18	Moffett	Irene	Northern Plains Resource Council	Concern about the DEIS stating that the land will be expected to return to full production the next season following construction, page 3.14-25 and 3.14-26.	The EIS has been revised in response to this comment. Section 3.9.1.3 and Consolidated Response FRM-1 address compensation for lost crops.
1552	19	Moffett	Irene	Northern Plains Resource Council	The soil is composed of layers. The next couple feet below the 12 inches are a lot better for growing crops than the next level. If you mix those six feet together, then your production will be much lower, not just for one year, as stated in the DEIS, but for many years.	Keystone would comply with the requirements of segregating topsoil and restoring topsoil as described in Consolidated Response SOI-2 and Section 3.2.2.1 of the EIS. By following those procedures, there would not be a mixing of subsoil and topsoil.
1552	20	Moffett	Irene	Northern Plains Resource Council	On page 3.13-50, the DEIS states that spills may result in loss of crop, which would be reimbursed by Keystone. How are you going to get Keystone to pay?	Consolidated Response LIA-1 addresses Keystone's liability if there is a spill of hazardous materials or fuel during construction or a spill of crude oil from the proposed Project.
1552	21	Moffett	Irene	Northern Plains Resource Council	Also stated is that the oil would weather and likely have minimal impact on the next season's crop. Have you ever thrown out waste oil and seen how long the soil takes to recover? I have seen that soil doesn't recover in a year or even in a few years. It takes a very long time for soil to recover.	The EIS was revised to reflect that the potential impacts to agricultural land from a spill from the proposed Project and subsequent response actions may last for one to a few years, depending upon the amount of oil, area impacted, and the type of cleanup actions taken by Keystone. In general, oil that remains on and/or in the soils after cleanup is weathered through biodegradation by micro-organisms, photodegradation by sunlight, and physical-chemical degradation. These basic processes generally reduce or eliminate the lighter fractions of oil that may be harmful to plants and/or animals and do so in a few months to a year or two. The heavier fractions of the oil may persist for longer periods of time but are not toxic to organisms. The response actions may disturb the soils and provide habitat for weeds, reduce or remove the native or agricultural vegetation, and otherwise have impacts that may persist for a year or more. However, the soil would be replaced or restored to assist in the restoration of agricultural production.
1552	23	Moffett	Irene	Northern Plains Resource Council	Who is going to take responsibility for the spills?	Consolidated Response LIA-1 addresses Keystone's liability if there is a spill of hazardous materials or fuel during construction or a spill of crude oil from the proposed Project.
638	1	Mog	Justin	University of Louisville	I am absolutely shocked at the irresponsibility of the proposed Keystone XL Pipeline Project. A pipeline of this scale running the entire length of our Heartland, across fertile farmland and the vital Ogalla aquifer would be unacceptable in normal times. But in these days of global climate change and the oil crisis in the Gulf of Mexico, it is an outrage to learn of such a plan. Such insanity must not be approved in this day and age. We need plans to drastically reduce our fossil fuel consumption not plans to build a trans-continental pipeline simply to speed exploitation of another marginal fossil fuel resource...driving us off the cliff even faster!	Consolidated Response ALT-1 addresses potential alternative routes, including routes that would avoid much of the Northern High Plains Aquifer system. Issues related to aquifers along the proposed Project corridor are addressed in Consolidated Responses AQF-1 through AQF-4. As described in Consolidated Response GLF-1, the risks associated with the proposed Project are substantially different from those associated with the BP Deepwater Horizon Project.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
638	2	Mog	Justin	University of Louisville	It is obvious to me that a disaster is sure to result from this project - whether it be the destruction of valuable farmland	The impacts associated with implementation of the proposed Project are addressed in Section 3.0 of the EIS. As noted in that section, construction and normal operation the proposed Project would not result in significant environmental impacts. Section 3.13 of the EIS addresses reliability and safety issues, including calculations of the probability of a spill from the proposed Project and the potential environmental impacts associated with spills.
638	4	Mog	Justin	University of Louisville	spills polluting precious surface and groundwater, or simply the greenhouse gas emissions resulting from the burning of Alberta tar sands.	Consolidated Response FRM-1 addresses potential ranch of farmland impacts and compensation for lost crops. Section 3.13 of the EIS addresses reliability and safety issues, including calculations of the probability of a spill from the proposed Project and the potential environmental impacts associated with spills, including spills to surface water and groundwater. As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries. Consolidated Response GHG-1 addresses the greenhouse gas life-cycle analyses presented in the revised EIS.
1540	132	Mognet	Wayne		I've spent time working in the North Dakota oil field. During that time I had seen a lot of things happen that should not happen, but people disregard safety practices, safety regulations.	Consolidated Response SAF-1 describes the regulatory requirements that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project in a manner that protects the health and safety of the public and the environment. It also describes the inspections and reviews of the proposed Project that the Pipeline and Hazardous Materials Safety Administration would conduct to ensure compliance with those regulatory requirements.
1540	136	Mognet	Wayne		I've seen several times where Enbridge controls the flow from different operations from their main office hundreds of miles away, electronically. They don't know what's going on.	Enbridge is not the applicant for the proposed Project and that firm's pipeline control operations are not relevant to the evaluation of the proposed Project. Sections 2.4 and 3.13.5.5 describe the operation of the proposed Project, including the operations control center in Calgary, Canada and the remote monitoring equipment and systems that would be in place during operation of the proposed Project.
1540	137	Mognet	Wayne		Often the different oils don't mix well and keeps cycling through the pipeline until it meets the specifications to go through the line. The way it's designed, all the oil goes into one tank which will overflow.	Crude oil would not be injected into the Keystone XL pipeline until it has met the specifications in the contract for transport of the oil and the terms and conditions of transport in the Federal Energy Regulatory Commission's tariff for the oil to be transported in the proposed Project. Crude oil transported by the Project would be shipped in batches, with each batch having the same type of oil. It is not clear what "one tank" the commenter is referring to. The proposed Project has been designed to transport crude oil to delivery facilities in Texas and there would be no break-out tanks along the route. Crude oil transported to the delivery facilities would be transferred to storage tanks that can accommodate the volume of crude oil provided without overflowing. Similarly, some crude oil would be held temporarily in storage tanks in Cushing, and those tanks would be able to accommodate the maximum flow of crude oil.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
1540	139	Mognet	Wayne		The electronic devices they have to check the wells, they do not catch everything.	Consolidated Response OIL-3 addresses the leak detection capabilities of the proposed Project, including the SCADA system, supplementary leak detection methods, physical leak detection methods, and concerns related to smaller leaks from the pipeline that may be under the SCADA detection threshold.
1540	140	Mognet	Wayne		As far as putting people to work, it's only going to be for a short time until they're done putting it through. Then all their jobs are going to keep going on down the line.	Consolidated Response ECO-1 addresses potential socioeconomic impacts associated with construction and normal operation of the proposed Project.
1540	141	Mognet	Wayne		Up in North Dakota along the pipeline, all the landowners' property values dropped drastically. There is methane gases, butane gases and H2S gas flows through with the oil.	Consolidated Response ECO-1 addresses potential socioeconomic impacts associated with construction and normal operation of the proposed Project. Consolidated Response OIL-4 addresses the composition of the Canadian crude oil that would be transported by the proposed Project, including concerns relative to the corrosivity and erosivity of the crude oil. As noted in that Consolidated Response, that crude oil is similar in composition and properties to other heavy crude oils that are currently transported within the U.S. pipeline system and similar in composition and properties to other heavy crude oils that are currently refined in PADD III. Consolidated Response OIL-5 addresses concerns regarding the potential for an explosion and also addresses concerns regarding hydrogen sulfide.
1540	142	Mognet	Wayne		The tar oil is garbage oil in the industry. That's why they don't want anything to do with it in this country. They want to take it to China, refine it over there, mix it with good oil, and send it back to us. The price is not going to be cheap.	Consolidated Response OIL-4 addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils. Crude oil derived from Canadian oil sands production is currently being refined in about 70 refineries in the U.S. Consolidated Response P&N-2 provides information on the export of refined product from Gulf Coast refineries as well as exporting WCSB crude oil from the Gulf Coast.
267	1	Moline	Aaron		I would like to express my support for the U.S. Department of State's Draft Environmental Impact Statement (DEIS) on the Keystone XL pipeline project, which concluded that the delivery of secure and affordable supplies of Canadian energy to American consumers would have minimal impacts on the environment.	Comment acknowledged.
267	2	Moline	Aaron		As discussed in the DEIS, the evaluation studied the project's potential impact on a number of environmental matters. I appreciate the efforts by the State Department to evaluate the potential environmental consequences of the Keystone project and agree with the Agency's findings that the proposed project would result in limited adverse environmental impacts during both the construction and operation.	Comment acknowledged.
1544	118	Moline	Aaron	Consumer Energy Alliance	We at CEA agree with the findings of the Draft Environmental Impact Statement on the Keystone XL Pipeline Project. The DEIS evaluation studied the project's potential impact on various environmental matters, upon which it was found that the project result in "limited adverse environmental impacts during both construction and operation".	Comment acknowledged.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
1544	120	Moline	Aaron	Consumer Energy Alliance	The secure energy supply from the proposed pipeline will strengthen America's energy and economic security.	Comment acknowledged.
1544	121	Moline	Aaron	Consumer Energy Alliance	The project will create hundreds of high paying, family supporting jobs.	Consolidated Response ECO-1 and Section 3.10.2.2 of the EIS address potential socioeconomic impacts.
1544	122	Moline	Aaron	Consumer Energy Alliance	The government of Alberta projects that U.S. imports of Canadian oil sands will increase from current amounts of 1.5 million barrels daily to nearly 4.3 billion barrels a day over the next two decades in order to meet increasing demand.	Comment acknowledged.
1544	123	Moline	Aaron	Consumer Energy Alliance	CEA hopes that the benefits of such a project like the Keystone XL will be considered and fully supported by the federal government, especially at a time when we are importing more and more energy supplies from places around the world that do not share our strategic interests.	Comment acknowledged.
1544	124	Moline	Aaron	Consumer Energy Alliance	CEA believes that the environmental analysis for the Keystone Pipeline Project should not include a lifecycle GHG analysis of the fuels it will move. The DEIS that has been prepared for this project properly evaluates the greenhouse gas emissions that will directly result from the project. Any evaluation of the indirect GHG emissions (such as from oil sands production or the transportation sector) would be purely speculative and should not be considered.	Comment acknowledged.
1544	125	Moline	Aaron	Consumer Energy Alliance	Despite efforts to develop alternatives, crude oil will remain a critical component of meeting America's energy needs for the foreseeable future. Ensuring access to affordable, reliable energy from our North American allies that provides economic and energy security benefits should be a national priority. Projects such as the Keystone pipeline ensure increased domestic energy security, stable prices for consumers, along with minimal environmental impacts.	Consolidated Response P&N-1 addresses the need for the Proposed Project.
1560	1	Moller	Raymond		Keystone has only told them how they will handle oil pipeline leaks during construction, but not how they will handle their own leaks or ruptures.	Response to a spill from the proposed Project would be accomplished in accordance with Keystone's Emergency Response Plan (ERP) and its Spill Prevention, Control, and Countermeasure (SPCC) plans. Consolidated Response RES-1 addresses issues related to preparation and review of the ERP for the proposed Project. SPCC plans are addressed in Sections 2.3 and 3.13.5 of the EIS and in the Construction, Mitigation, and Reclamation Plan presented in Appendix B of the EIS.
1560	17	Moller	Raymond		Concerned about the pipeline running through the water table of the Ogallala Aquifer. This is an aquifer that cannot be contaminated, and the pipeline is going right through it rather than above or below it.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
1560	19	Moller	Raymond		If Keystone has such a great leak detection system, why haven't they mentioned the 120,000 gallon pipeline leak in January of 2010 in North Dakota?	Consolidated Response OIL-3 addresses the leak detection capabilities of the proposed Project, including the SCADA system, supplementary leak detection methods, physical leak detection methods, and concerns related to smaller leaks from the pipeline that may be under the SCADA detection threshold. According to PHMSA technical staff (2011), the incidents experienced on the existing Keystone pipeline are not unusual start-up issues that occur on pipelines and are not unique. However, the number of incidents that has occurred prompted PHMSA to take action by issuing a temporary

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
						Corrective Action Order that has subsequently been lifted. According to PHMSA technical staff, there is no evidence that any of these incidents resulted from internal corrosion or erosion issues (PHMSA Pers. Comm. 2011).
1560	20	Moller	Raymond		If pipeline forms a leak on a landowners property, is the landowner held responsible?	Consolidated Response LIA-1 addresses Keystone's liability if there is a spill of hazardous materials or fuel during construction or a spill of crude oil from the proposed Project.
1560	21	Moller	Raymond		Need a thicker-walled pipe through the aquifer, at least as good as the pipe used in wetlands.	Keystone has withdrawn its application for a Special Permit as described in Consolidated Response REG-1. As described in Consolidated Response SAF-1, the Pipeline and Hazardous Materials Safety Administration (PHMSA) has regulatory requirements that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project. In addition, PHMSA developed 57 Project-specific Special Conditions that Keystone has agreed to implement. Incorporation of those conditions would result in a Project that would have a degree of safety over any other typically constructed domestic oil pipeline system under current code and a degree of safety along the entire length of the pipeline system similar to that which is required in HCAs as defined in 49 CFR 195.450. Issues related to the Northern High Plains Aquifer System are addressed in Consolidated Responses AQF-1 through AQF-4. Heavier-walled pipe would be used through the portion of the route in the vicinity of the aquifer as indicated in Table 2.3.1-1 of the EIS.
1560	19	Moller	Raymond	(public meeting transcript)	If Keystone has such a great leak detection system, why haven't they mentioned the 120,000 gallon pipeline leak in January of 2010 in North Dakota?	Consolidated Response OIL-3 addresses the leak detection capabilities of the proposed Project, including the SCADA system, supplementary leak detection methods, physical leak detection methods, and concerns related to smaller leaks from the pipeline that may be under the SCADA detection threshold. According to PHMSA technical staff (2011), the incidents experienced on the existing Keystone pipeline are not unusual start-up issues that occur on pipelines and are not unique. However, the number of incidents that has occurred prompted PHMSA to take action by issuing a temporary Corrective Action Order that has subsequently been lifted. According to PHMSA technical staff, there is no evidence that any of these incidents resulted from internal corrosion or erosion issues (PHMSA Pers. Comm. 2011).
658	2	Moloney	Tom		Require public Annual spill/rupture simulations co-designed with property owners	Consolidated Response RES-1 addresses issues related to preparation and review of emergency response plans for the proposed Project. Simulation drills would be conducted as required by the Pipeline and Hazardous Materials Safety Administration regulations.
658	3	Moloney	Tom		Require quarterly, signed declarations from CEO on pipeline conditions.	All issues related to design specifics and operation of the proposed pipeline system are under the jurisdiction of the Pipeline and Hazardous Materials Safety Administration (PHMSA), as explained in Sections 2.3, 2.3.1, and 3.13.1 and in Consolidated Response SAF-1. Keystone has agreed to comply with the reporting requirements of PHMSA Project-specific Special Conditions 52, 56, and 57.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
108	1	Monnier	Arlene		Please stop the oil pipeline that is to run under the central United States, my state of Nebraska in particular. It's clear that oil companies will put their own profits ahead of the safety of our underground water. Regulations can be ignored by the company or waived at the whim of an overworked official. They are already proposing thinner pipe. An oil company has already destroyed the economy of the gulf coast, and put the east coast at risk. Do not allow them to destroy the heartland of America as well.	Consolidated Response ENR-1 provides information on the Department of State's environmental review process, the National Interest Determination process, and the need to complete those reviews before approving or denying the Presidential permit for the proposed Project.
1506	1	Monzingo	Reginald		We have had quite a bad experience with East Texas gathering pipeline. These people misrepresented where the line would go, did not respond to our request for a reasonable reroute of the line from the front yard of our planned and developed home site, made a final offer for use of the work space that was much below the appraised value of the timber. The condemnation documentation, while changed from that initially provided includes numerous unnecessary and unreasonable conditions. Our property was condemned on March 2 and the pipeline is in the ground but a long way from finished. We have a trial scheduled for the middle of August. I will have no trust that any representative of a pipeline with right of eminent domain. The for profit company is out for the bottom dollar without regard to the locals. They don't live here locally and the profits won't stay here. I think new refineries should be built at the source and the refined product distributed by smaller lines and other delivery means. If you are approached for a preliminary survey, require a map of the line and then go to court; the preliminary survey will be the final survey - it's cheaper (maybe).	As noted in Consolidated Response EAS-2, state laws dictate under what circumstances eminent domain may be used and define the eminent domain process within the state. DOS has no legal authority or ability to intervene in the easement negotiations or in eminent domain proceedings. Consolidated Response P&N-8 addresses issues related to shipping Canadian crude oil to refineries that are closer to the source of oil.
2	1	Moore	Shirley		I have just read about the environmental impact draft for the petroleum pipeline that is projected to come through our state! I am so upset that anyone could even possibly consider running something like that through our state when we have one of the nation's greatest treasures of the nation underneath us! Then, to read there are no provisions for cleanup or damage to that aquifer during or after construction, is beyond belief. As a former governor of this great state, please do what you can, talk with whom you can to stop this project from going forward. Though, I believe that this should be up to our state to handle, I assume that since the State Dept is involved because of international implications, someone thinks it is in our national interest that this project progresses. In today's world, if we have a national disaster, that aquifer could provide one of the two necessary elements for survival. It needs to be treated as such, and protected at all costs. If we can protect wetlands and little bitty bugs that don't know they can survive across the highway, we should be protecting this national resource with as much zeal!	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
479	1	Moore	Glenda		I am against having the Keystone Pipeline cut through Nebraska for two very important environmental reasons. First of all, Nebraska sits on top of the Ogallala Aquifer, a very precious source of water that would never be able to be replaced if any oil leaked into it.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
479	2	Moore	Glenda		A second reason is the fragility of the Sandhill region which	Issues related to the Sand Hills area are addressed in

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					cannot be readily reconstructed nor relegated after the proposed pipeline would be constructed. Please do not allow the proposed pipeline to be built through Nebraska; another route needs to be found.	Consolidated Response ERO-1.
480	1	Moore	Rodney		Furthermore, this pipeline should not be routed through the Ogallala (High Plains) Aquifer. When the pipeline corrodes and starts leaking, or a weak spot starts leaking, it would be next to impossible to contain and clean up the affected area of the aquifer without spending millions upon millions upon millions of dollars. Farmers cannot use water contaminated with spilled pipeline oil for irrigation. Livestock growers cannot use water contaminated with leaked pipeline oil for their animals. The industries of the high plains cannot use water contaminated with pipeline oil. The economic devastation from a pipeline leak into the aquifer would be millions upon millions upon millions of dollars. Cities, towns, and rural citizens cannot use water contaminated with leaked pipeline oil. The current projected route of this pipeline would negatively impact huge numbers of people when a leak happened. The economy of the high plains states would be devastated where clean water from the Ogallala aquifer is not available. There should not be a waiver regarding pipeline thickness/pressure in any area where the pipeline would be crossing an aquifer.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. As described in Consolidated Response GLF-1, the risks associated with the proposed Project are substantially different from those associated with the BP Deepwater Horizon Project. OIL-1 addresses the likelihood of spills from the proposed Project. Keystone has withdrawn its application for a Special Permit as described in Consolidated Response REG-1.
480	3	Moore	Rodney		The soil and vegetation of the Sand Hills needs to be protected from the digging and disruption it would take to build and monitor this pipeline. Large amounts of soil will blow away from wind erosion.	Issues related to the Sand Hills area are addressed in Consolidated Response ERO-1.
1487	1	Moore	Alex	Friends of the Earth	I am writing to submit my concerns about the impacts the proposed Keystone XL pipeline would have on the climate and communities - and urge you to deny a permit for this pipeline. Tar sands oil is dirtier than conventional oil, causing three times more greenhouse gas emissions than regular gasoline...The expanded production of tar sands oil enabled by this pipeline would also result in more destructive strip mining and drilling in Canada and bring more air pollution to refinery communities in Texas. I urge you to stand up to Big Oil and protect the public interest by rejecting the permit for the Keystone XL pipeline.	As noted in Consolidated Response OIL-4, the composition of crude oil that would be transported by the proposed Project would be essentially the same as that of other heavy crude oils refined in the U.S. Consolidated Response GHG-1 addresses GHG life-cycle analyses. Consolidated Response GHG-2 addresses the potential causal connection of implementation of the proposed Project and expanded oil sands production in Alberta and increases in refining. As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries. Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project.
1487	2	Moore	Alex	Friends of the Earth	The 900,000 barrels of dirty oil that would be pumped through this pipeline every day would add 38 million tons of carbon dioxide to the atmosphere annually, which is equal to adding six million tons of carbon dioxide to the atmosphere annually, which is equal to adding six million new cars to the road. Your draft environmental impact statement ignores how this pipeline would make global warming worse, a serious oversight that must be amended.	Consolidated Response GHG-1 addresses the greenhouse gas life-cycle analyses presented in the revised EIS. Climate change is addressed in Section 3.14.3.14. As noted in that Section, implementation of the proposed Project is unlikely to result in a measureable climate change.
1546	98	Moore	Alex	Friends of the Earth	Pipeline will put people and the environment at risk through every stage.	The impacts associated with implementation of the proposed Project are addressed in Section 3.0 of the EIS. As noted in

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
						that section, construction and normal operation the proposed Project would not result in significant environmental impacts. Section 3.13 of the EIS addresses reliability and safety issues, including calculations of the probability of a spill from the proposed Project and the potential environmental impacts associated with spills.
1546	100	Moore	Alex	Friends of the Earth	Pipeline creating a human health crisis for the indigenous people living nearby.	Consolidated Response CAN-1 and Section 3.14.4 of the EIS address issues related to development of oil sands projects in Canada.
1546	101	Moore	Alex	Friends of the Earth	To reach the tar sands, people have been strip mining the boreal forests, or drilling and pumping steam underground to "get at this mucky form of oil." This creates toxic waste pools that stretch for dozens of square miles and leak into rivers.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information on current and future production. As noted in that Consolidated Response, without the proposed Project, oil sands development would continue at or above the current level until at least 2020, with or without the proposed Project. Consolidated Response GHG-4 addresses concerns regarding the loss of boreal forest and peat bogs.
1546	102	Moore	Alex	Friends of the Earth	Pollution from this project contains carcinogenic chemicals such as arsenic, which causes higher rates of cancer and other autoimmune diseases.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information on current and future production. As noted in that Consolidated Response, without the proposed Project, oil sands development would continue at or above the current level until at least 2020, with or without the proposed Project.
1546	103	Moore	Alex	Friends of the Earth	One community, Fort Chipewyan, it's a community of 1,200 people, and in the last decade 100 people have died of cancer and other autoimmune related diseases. This isn't just random, this is a community that's just directly downstream from the world's biggest and most dirty project.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information on current and future production. As noted in that Consolidated Response, without the proposed Project, oil sands development would continue at or above the current level until at least 2020, with or without the proposed Project.
1546	105	Moore	Alex	Friends of the Earth	Refining tar sands puts mercury and other dangerous pollutants into the air in places like Port Arthur, which is already considered a toxic "hot spot" and a serious concern by the EPA. This project will make these people more sick.	As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries. Consolidated Response OIL-4 also addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils.
1546	106	Moore	Alex	Friends of the Earth	This project will be a real test for the Obama administration.	The commenter's opinion is noted.
258	2	Morgan	Danny	State Representative OK District 32	As I understand it, Keystone XL will create more than 13,000 high-wage construction and manufacturing jobs during the project's 2011~2012 construction schedule. Many of those jobs will be created in rural and in my districts, where too many of our residents continue to find it difficult to find good jobs. With Keystone XL, they will have an opportunity to work on the project or for businesses that provide supplies, goods and services for its construction and operation.	Consolidated Response ECO-1 addresses potential socioeconomic impacts, and Consolidated Response TAX-1 addresses concerns regarding taxes.
258	3	Morgan	Danny	State Representative OK District 32	In addition to the jobs Keystone XL will create, the project will generate substantial economic benefits for the United States and in states and communities along the proposed route. Like our counties, in many cases these are areas where economic	Consolidated Response ECO-1 addresses potential socioeconomic impacts, and Consolidated Response TAX-1 addresses concerns regarding taxes.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					performance has stagnated or is shrinking. It is my understanding that TransCanada commissioned a study to measure the projects economic stimulus to the U.S. and the states along the route. The study found that in the U.S. Keystone XL would generate \$20.9 billion in total expenditures, \$9.6 billion in output (gross product), personal income of \$6.5 billion and 118,935 person years of employment (jobs).	
258	4	Morgan	Danny	State Representative OK District 32	In addition, the report concluded that during construction, Keystone XL would generate \$486.36 million in tax revenue for state governments along the route and \$99.1 million for local taxing entities where the pipeline is located. In Oklahoma, the study found Keystone XL expenditures during construction would total \$1.2 billion and generate an economic gross product of nearly \$1.1 billion. Keystone 'XL construction also would generate more than \$7.7 million in tax revenue for local government and \$31.4 million for state government.	Consolidated Responses TAX-1 and ECO-1 address the estimated increases in the tax base and the jobs generated by the proposed Project. Also see the revisions to Sections 3.10.2.3 and 3.10.2.4 of the EIS.
258	8	Morgan	Danny	State Representative OK District 32	I enthusiastically support the Keystone XL Pipeline Project and encourage the Department of State to confirm the findings of the Draft Environmental Impact Statement, which found that the proposed Keystone XL Pipeline would have "limited adverse environmental impact during construction and operation."	Comment acknowledged.
539	1	Morgan	Daniel		Build it now.	Comment acknowledged.
1516	1	Morgan	Michael		In my former capacity as a state legislator I became familiar with TransCanada's Keystone XL crude oil pipeline project and now write in support of the project. I urge the department to grant a permit for the pipeline. It will bean asset to the United States and for my home state of Oklahoma. This project is a vital link to secure energy supplies for the United States. According to the U.S. Energy Information Administration, oil and natural gas will continue to supply over 50 percent of U.S. energy needs in 2030. Canada is a valued trading partner and our most reliable supplier of foreign-based crude oil. The Keystone project will have the added benefit of potential links to growing domestic supplies of crude oil in Montana and North and South Dakota. The environmental benefits of Keystone XL should not be overlooked. The current tragedy in the Gulf underscores the importance of a diverse portfolio of energy supplies. Within the spectrum of viable options, it is appropriate to seek a growing role for oil resources that are:• Land-based;• North American; and,• Transported by pipeline. This project meets each of these criteria. Securing stable and affordable energy from our North American allies through projects such as the Keystone pipeline is in the national interest. Considering the economic and energy security benefits of these vital resources, we should continue to expand America's access to safe, affordable energy to help ensure improved domestic and global energy security and stable prices for consumers. Pipelines are the safest, most reliable, economical and environmentally favorable way to transport oil and petroleum products, as well as other energy liquids, throughout the U.S. America depends on the more than 168,000 miles of liquid	Comment acknowledged.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					pipelines to move energy and raw materials our country relies on. Additional pipeline capacity will help consumers and businesses throughout the United States. This project also stands to provide a powerful private sector economic stimulus. During construction, Keystone XL will create more than 13,000 jobs funded with private investment. In addition, local governments will have a steady source of income from economic activity associated with construction and from property taxes the pipeline company will pay. Rejection of the permit or suspension of the review would sacrifice the significant economic benefits this project stands to deliver and force U.S. consumers to rely on other sources of crude oil not economically and politically allied with U.S. interests. This would be a mistake. I urge the granting of the permit. Thank you for the opportunity to comment.	
1501	1	Morris	Stephen	Joint Leadership of the Kansas Legislature	I write in support of TransCanada's Keystone XL crude oil pipeline project and urge the department to grant a permit for the pipeline. This project is a vital link to secure energy supplies for the United States. According to the U.S. Energy Information Administration, oil and natural gas will continue to supply over 50 percent of U.S. energy needs in 2030. Canada is a valued trading partner and our most reliable supplier of foreign-based crude oil. The Keystone project will have the added benefit of potential links to growing domestic supplies of crude oil in Montana and North and South Dakota. 1501	2	Morris	Stephen	Joint Leadership of the Kansas Legislature	This project also stands to provide a powerful private sector economic stimulus. During construction, Keystone XL will create more than 13,000 jobs funded with private investment. In addition, local governments will have a steady source of income from economic activity associated with construction and from property taxes the pipeline company will pay.	Consolidated Response ECO-1 addresses potential socioeconomic impacts, and Consolidated Response TAX-1 addresses concerns regarding taxes.
48	1	Morrison	Gloria		No oil pipeline in Texas!	The commenter's opinion is noted.
265	1	Morrison	Matt	PNWER	The Pacific North West Economic Region (PNWER) supports the Keystone XL (KXL) crude oil pipeline project and encourages the U.S. Department of State to grant a permit for the pipeline.	Comment acknowledged.
265	2	Morrison	Matt	PNWER	The regional economic impact from this project stands to provide a powerful private sector economic stimulus. During construction, Keystone XL will create more than 13,000 jobs funded with private investment.	Consolidated Response ECO-1 addresses potential socioeconomic impacts, and Consolidated Response TAX-1 addresses concerns regarding taxes.
265	3	Morrison	Matt	PNWER	This project is a vital link to secure, energy supplies for the United States and foster greater collaboration with Canada.	Comment acknowledged.
265	4	Morrison	Matt	PNWER	The Keystone project will have the added benefit of potential links to growing domestic supplies of crude oil in Montana. Specifically, this, project will create significant jobs and tax revenue in Montana. The project is estimated to generate approximately \$1 billion of investment in Montana, creating 790 construction jobs, 10 permanent jobs and generate more	Consolidated Response ECO-1 addresses potential socioeconomic impacts, and Consolidated Response TAX-1 addresses concerns regarding taxes.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					than \$62 million annually in property tax revenue.	
265	5	Morrison	Matt	PNWER	The benefits of this project go beyond the win fall for Montana. The region will have opportunities for utilizing a well educated workforce, encouraging technical training development, and bolstering the tertiary economy associated with the project.	Consolidated Response ECO-1 and Section 3.10.2.2 of the EIS address the potential socioeconomic impacts of the proposed Project.
265	6	Morrison	Matt	PNWER	Pipelines are a safe, reliable, economical and environmentally favorable way to transport oil and petroleum products, as well as other energy liquids throughout the U.S. Additional pipeline capacity wil1 help consumers and businesses throughout the United States. Our nation depends on the more than 68,000 miles of liquid pipelines to move energy and raw materials.	Comment acknowledged.
265	7	Morrison	Matt	PNWER	We trust in the permitting processes already in place and believe they are sufficient to gauge whether or not the project will meet environmental standards.	Comment acknowledged.
265	8	Morrison	Matt	PNWER	The companies involved with this project have a highly regarded environmental record.	Comment acknowledged.
265	9	Morrison	Matt	PNWER	The Pacific North West Economic Region (PNWER) fully supports the permitting of the Keystone XL Project.	Comment acknowledged.
1495	1	Morrison	Ken		I respectfully encourage your Department to expeditiously approve a permit for the construction of TransCanada' s Keystone XL pipeline project. The Draft EIS adequately considers the pipeline impacts and provides appropriate safeguards for the environment, wildlife and landowners. Keystone XL is a project that is beneficial for the State of Montana and our Nation. I support the pipeline project for the following reasons: 1. Reliable transport - The United States is currently receiving oil supplies from unfriendly sources overseas that require long and hazardous transport. The Keystone pipeline will provide a direct and reliable link between a secure friendly supply and our country's major refining facilities using a long-established means of safe transport. In addition, it could provide Montana producers a new reliable means to move their products. 2. Economic benefits - Communities along the planned route, including many in Montana, are facing financial difficulties. Major economic activity created by the Keystone XL pipeline project will provide needed economic stimulus and revenues for schools and local governments. 3. Reduced risk - This country has long used land based pipelines to efficiently and safely move our energy resources. It is a proven method of transporting liquid energy to processing facilities and then to consumers. It avoids the environmental risks inherent in other transportation methods such as tanker ships and rail cars. Thank you for the opportunity to comment.	Comment acknowledged.
861	1	Mosier	Melissa	University of Nebraska	Commenting on the proposed Keystone Pipeline. I believe that this project should be postponed until a more detailed study is completed on the potential environmental hazards posed by the pipeline. The Sandhills of Nebraska is a unique and valued ecosystem. The future of the plains region and those who inhabit it are dependent on the state of the High Plains aquifer. Please consider postponing until a more thorough study has been completed in order to ensure that all possible contingencies are addressed. Damage to the region through	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. Issues related to the Sand Hills area are addressed in Consolidated Response ERO-1.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					which this proposed pipeline will run could have disastrous consequences for the ecosystems and those dependent on them.	
1546	86	Moskowitz	Richard	American Trucking Association	A pipeline is needed: Virtually every consumer commodity in the United States is brought by trucks, which rely on diesel fuel (37 billion gallons a year).	Comment acknowledged.
1546	88	Moskowitz	Richard	American Trucking Association	Pipeline will actually reduce emissions. Whether we consume the tar sands oil here in the U.S. or not, it will get used. Pipeline will have a lower footprint than any other mode of transporting oil.	Consolidated Response GHG-1 addresses the greenhouse gas life-cycle analyses presented in the revised EIS.
1036	1	muffy@nponline.net	Muffy		I am vehemently opposed to the Keystone XL proposal through the Ogallala Aquifer.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
669	1	Muhly	Ernest	EcoResolve	I am totally opposed to construction of a pipeline within the United State to transport tar sands oil from Canada into the United States. 1. The oil is exceptionally dirty and doesn't meet U.S. standards;	Consolidated Response OIL-4 addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils.
669	2	Muhly	Ernest	EcoResolve	Construction of the pipeline as plans puts the Ogallala Aquifer at risk;	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
354	1	Mulcahy	Mary		I own a section of Valentine soil Sand Hill pasture in Greeley, Nebraska. TransCanada proposes to bring a thin pipe using high pressure to deliver crude oil of 700,000 barrels of oil a day through my pasture. The line is called Keystone XL project. I manage the pasture by using good agricultural guidelines, hiring a good man who runs cattle, and making sound environmental judgments. The Keystone XL pipeline would significantly undermine my economic livelihood.	Keystone has withdrawn its application for a Special Permit as described in Consolidated Response REG-1. As described in Consolidated Response SAF-1, the Pipeline and Hazardous Materials Safety Administration (PHMSA) has regulatory requirements that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project in a manner that protects the health and safety of the public and the environment. In addition, PHMSA developed 57 Project-specific Special Conditions that Keystone has agreed to implement. As noted in Section 3.9 of the EIS, after construction and reclamation of the pipeline are completed, most existing land uses, particularly agricultural uses, could continue on the right-of-way above the pipeline.
354	2	Mulcahy	Mary		The pipeline does NOT have to go through my pasture. It can go to the west side between Hwy 281 and my fence line. They can then go south to cut across State owned ground.	Consolidated Response PVT-2 addresses concerns regarding the proximity of the proposed project to existing structures and facilities and routing concerns across private property.
354	3	Mulcahy	Mary		The Sand Hills sits on the Ogallala Aquifer the largest aquifer in the United States. The pipeline would go thru 112 miles of Sand Hills.	Concerns regarding potential risk to Northern High Plains Aquifer system and other aquifer systems are addressed in AQF-1.
354	4	Mulcahy	Mary		The Gulf oil spill has heightened my concern for better regulation by the Federal and State government over the TransCanada company and its working subsidiaries.	As described in Consolidated Response GLF-1, the risks associated with the proposed Project are substantially different from those associated with the BP Deepwater Horizon Project. Consolidated Response SAF-1 describes the regulatory requirements of the Pipeline and Hazardous Materials Safety Administration (PHMSA) that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project. It also describes the inspections and reviews of the proposed Project that PHMSA would conduct to ensure compliance with those regulatory requirements.
354	5	Mulcahy	Mary		Are 2010 changes being made and enforced by the State and Interior Dept agency which sets and regulates TransCanada and its subsidiaries?	It is not clear what 2010 changes the commenter is referring to. As noted in Consolidated Response SAF-1, the Pipeline and Hazardous Materials Safety Administration (PHMSA) has regulatory authority over the construction, operation,

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
						maintenance, inspection, and monitoring of the proposed Project. The PHMSA regulations are also addressed in the response and in Sections 2.3.1 and 3.13.1.1 of the EIS.
354	6	Mulcahy	Mary		Has the State and Interior Dept reviewed how much responsibility has been given to TransCanada in the setting of Safety policies regulation? Have studies been reviewed independently?	Neither the Department of State (DOS) nor the Department of the Interior have regulatory control over the proposed Project. As described in Consolidated Response ENR-1, DOS is responsible for the review of Keystone's application of a Presidential permit and is the lead federal agency for the NEPA review of the proposed Project. Keystone would be under the regulatory jurisdiction of the Pipeline and Hazardous Materials Safety Administration (PHMSA). Consolidated Response SAF-1 provides information on the PHMSA regulatory requirements. Keystone would not be setting safety policies but would have to comply with the PHMSA regulations and the Project-specific Special Conditions developed by PHMSA (see Appendix U of the EIS).
354	7	Mulcahy	Mary		Have industry procedures and equipment reviews been currently and increasingly tested .before put into-practice? Are they made available for review by the public? Can the devices and new procedures insure a successful shut down if a leak occurs? What is the Safety Review policy?	The Pipeline and Hazardous Materials Safety Administration (PHMSA) is responsible for reviewing industry practices and incorporating acceptable practices into its regulations where appropriate. Information on many of PHMSA's reviews, regulatory procedures, and other activities are provided on its website: http://phmsa.dot.gov/ .
354	8	Mulcahy	Mary		Does the Federal and State government have the appropriate 2010 chemicals---previously tested and approved---in place for a Sand Hills leak on the Ogallala Aquifer?	It is not clear what "appropriate 2010 chemicals" the commenter is referring to. Consolidated Response RES-1 addresses issues related to preparation and review of the emergency response plan for the proposed Project. Consolidated Response AQF-3 provides information on hypothetical spills from the proposed Project over two areas of the Northern High Plains Aquifer system.
354	9	Mulcahy	Mary		Is the equipment and maps in place to measure temperature, soil (Valentine), chemicals, mixture of liquid and solids in the crude oil leaching into the ground and water?	The only time crude oil would reach soil or water would be after a spill from the proposed Project. Consolidated Response RES-1 addresses issues related to preparation and review of the emergency response plan for the proposed Project.
354	10	Mulcahy	Mary		What insurance and liability will TransCanada, Federal and State government put in place? What insurance and liability will I need?	Consolidated Response LIA-1 addresses Keystone's liability if there is a spill of hazardous materials or fuel during construction or a spill of crude oil from the proposed Project. Consolidated Response LIA-2 addresses the issue of bonding for the proposed Project.
354	11	Mulcahy	Mary		The wounding of my pasture ground would be economically and environmentally devastating to me and the Sand Hills and Ogallala Aquifer.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. Issues related to the Sand Hills area are addressed in Consolidated Response ERO-1.
1557	7	Murfin	Jerry		Mayor of Stroud, representing the city. Pipeline will bring jobs to Stroud and townspeople will be protected because they have to follow guidelines and standards. This is progress, and progress must move forward. If we don't get the pipeline here, we will lose jobs to other towns. This is a real blessing for the city.	Comment acknowledged.
1053	1	Murlaschitz	Alberta		I urge all possible safety precautions be taken for the Ogallala Aquifer.	As described in Consolidated Response GLF-1, the risks associated with the proposed Project are substantially different from those associated with the BP Deepwater Horizon Project.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
23	1	Murphy	Monica		In late 2008, I received letter from both the U.S. Department of State and the Keystone XL Pipeline Deis Company concerning the pending intent to place a pipeline from Canada, possibly through my 160 acres of property in Harding, South Dakota. To this end, the Keystone XL Pipeline Deis Company was to survey the property and notify me of their intent. I have not received any information until Saturday, April 17, 2010. I received an unsealed (peel and seal covering still intact), empty envelope with a label secured from the U.S. Post Office checked: "Received Possibly Damaged and Received Unsealed at the Torrance Post Office" from: United States Department of State Bureau of Oceans and International Environmental and Scientific Affairs OES/ENV Room 2657 Washington, D. C. 20520 Concerning: KEYSTONE XL PIPELINE DEIS INFORMATION Would you kindly send me all information from 2008 to present concerning this possible pipeline being laid across the United States?	Consolidated Response REQ-2 provides information for request of locations of paper copies of the EIS and that copies of the draft EIS, other specific information, or references be sent directly to the commenter. As noted in that response, all stakeholders who specifically requested paper copies were accommodated.
23	2	Murphy	Monica		I am not adverse to the government burying this pipeline across the property, if no debris or contamination occurs.	Comment acknowledged.
23	3	Murphy	Monica		I am not adverse to the government burying this pipeline across the property, if you would kindly put in a functioning well for water, so grazing animals could have a water source	If approved, the proposed Project would be constructed and operated by Keystone, a private company. The Department of State is reviewing Keystone's application for a Presidential Permit. All landowner requests for specific actions by Keystone on landowner property should be addressed during easement negotiations. Consolidated Response EAS-2 addresses issues related to easement negotiations. As noted in that response, DOS has no legal authority in the easement negotiation process.
23	4	Murphy	Monica		I understand my property is somewhat flat. Are you interested in leasing the property to secure your equipment while the proposed work is being completed in the nearby areas in Harding, South Dakota? If this proposal would meet your needs to complete this task, please advise me of your intent.	DOS is not the proponent for the proposed Project. This comment has been forwarded to Keystone for its consideration.
436	1	Murphy	Patti	McCone Electric	The revenue that will be generated for our local counties and state plus the local Rural Electrics Cooperatives will help keep rising costs down. We need this for Eastern Mt.	Comment acknowledged.
731	1	Murphy	Sarah	The DC Project	I strongly oppose the Keystone XL pipeline...	Comment acknowledged.
731	2	Murphy	Sarah	The DC Project	...the Keystone XL pipeline ... would bring massive amounts of tar sands to American refineries. Tar sands are the dirtiest fuel we use...	Consolidated Response OIL-4 addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils. As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries.
731	3	Murphy	Sarah	The DC Project	[Tar sands] ..., creating 3 times the greenhouse gases as conventional oil...	Consolidated Response GHG-1 addresses the greenhouse gas life-cycle analyses presented in the revised EIS.
731	4	Murphy	Sarah	The DC Project	[Tar sands] ... contaminating entire rivers and watersheds from leaking toxic tailings lakes and devastating an area of Canada the size of Florida.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
						and without the proposed Project.
806	1	Murphy	Deborah		Please do not route the Keystone Pipeline through the ecologically sensitive areas of the Nebraska Sand Hills.	Identification of sensitive environments crossed by the proposed Project is discussed in Consolidated Response ENV-1 and ENV-3. Issues related to the Sand Hills area are addressed in Consolidated Response ERO-1. Consolidated Response ALT-1 addresses potential alternative routes, including routes that would avoid much of the Northern High Plains Aquifer system and the Sand Hills area.
1545	17	Murphy	Patti	McCone Electric	McCone Electric welcomes the opportunity to serve Keystone pipeline in our service area. The economic benefit to the McCone Electric consumers is a win-win to have such a large industrial load.	Comment acknowledged.
1123	1	Murrell	Annie		I vote a NO to the oil sludge pipeline being proposed across the US, including Oklahoma.	Consolidated Response OIL-4 addresses the composition of the Canadian crude oil that would be transported by the proposed Project, including concerns relative to the corrosivity and erosivity of the crude oil. As noted in that Consolidated Response, that crude oil is similar in composition and properties to other heavy crude oils that are currently transported within the U.S. pipeline system and similar in composition and properties to other heavy crude oils that are currently refined in PADD III.
257	2	Myers	David	Senate OK District 20	As I understand it, Keystone XL will create more than 13,000 high-wage construction and manufacturing jobs during the project's 2011-2012 construction schedule. Many of those jobs will be created in rural districts, where too many of our residents continue to find it difficult to find good jobs. With Keystone XL, they will have an opportunity to work on the project or for businesses that provide supplies, goods and services for its construction and operation.	Consolidated Response ECO-1 addresses potential socioeconomic impacts, and Consolidated Response TAX-1 addresses concerns regarding taxes.
257	3	Myers	David	Senate OK District 20	In addition to the jobs Keystone XL will create, the project will generate substantial economic benefits for the United States and in states and communities along the proposed route. Like our counties, in many cases these are areas where economic performance has stagnated or is shrinking. It is my understanding that TransCanada commissioned a study to measure the project's economic stimulus to the U.S. and the states along the route. The study found that if the U.S. Keystone XL would generate \$20.9 billion in total expenditures, \$9.6 billion in-output-(gross product), personal income of \$6.5 billion and 118,935 person years of employment (jobs).	Consolidated Response ECO-1 addresses potential socioeconomic impacts, and Consolidated Response TAX-1 addresses concerns regarding taxes.
257	4	Myers	David	Senate OK District 20	In addition, the report concluded that during construction, Keystone XL would generate \$486.36 million in tax revenue for state governments along the route and \$99.1 million for local taxing entities where the pipeline is located. In Oklahoma, the study found Keystone XL expenditures during construction would total \$1.2 billion and generate an economic gross product of nearly \$1.1 billion. Keystone XL construction also would, generate more than \$7.7 million in tax revenue for local government and \$31.4 million for state government.	Consolidated Responses TAX-1 and ECO-1 address the estimated increases in the tax base and the jobs generated by the proposed Project. Also see the revisions to Sections 3.10.2.3 and 3.10.2.4 of the EIS.
257	8	Myers	David	Senate OK District 20	I enthusiastically support the Keystone XL Pipeline Project and encourage the Department of State to confirm the findings of the Draft Environmental Impact Statement, which found that	Comment acknowledged.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					the proposed Keystone XL Pipeline would have "limited adverse environmental impact during construction and operation."	
1411	1	Myers	David	Ponca City Development Authority	On behalf of the Ponca City (Oklahoma) Development Authority, we strongly encourage the U.S. Department of State to approve an energy infrastructure project that not only will strengthen long-term energy security in the United States, but also will provide a powerful private sector economic stimulus to the communities along the pipeline route during its construction at a time when our economy continues to struggle... We support the Keystone XL Pipeline Project and would be happy to provide any additional information of the benefits of the project to local areas and to our nation.	Comment acknowledged.
1411	3	Myers	David	Ponca City Development Authority	On behalf of the Ponca City (Oklahoma) Development Authority, we strongly encourage the U.S. Department of State to approve an energy infrastructure project that [not only will strengthen long-term energy security in the United States, but also] will provide a powerful private sector economic stimulus to the communities along the pipeline route during its construction at a time when our economy continues to struggle. As we understand it, Keystone XL will create more than 13,000 high-wage construction and manufacturing jobs during the project. In addition to the jobs the project will create, it will also generate substantial economic benefits for the United States and in states and communities along the proposed route. It is our understanding that TransCanada commissioned a study to measure the project's economic stimulus to the U.S. and the states along the route. The study found that in the U.S., Keystone XL would generate \$20.9 billion in total expenditures, \$9.6 billion in output (gross product), personal income of \$6.5 billion and 118,935 person years of employment (jobs). In addition, the report concluded that during construction, Keystone XL would generate \$486.36 million in tax revenue for state governments along the route and \$99.1 million for local taxing entities where the pipeline is located. In Oklahoma, the study found Keystone XL expenditures during construction would total \$1.2 billion and generate an economic gross product of nearly \$1.1 billion. Keystone XL construction also would generate more than \$7.6 million in tax revenue for local government and \$31.4 million for state government.	Consolidated Response ECO-1 addresses potential socioeconomic impacts, and Consolidated Response TAX-1 addresses concerns regarding taxes.
1509	1	Myers	Cindy		Why would we allow an oil pipeline to pass across the largest supply of fresh, pure water on our entire planet? The Ogallala Aquifer is one of the largest in the world and most of the aquifer is located within the borders of Nebraska. Regarding the DEIS related to the Keystone XL Oil Pipeline Project, I have grave concerns and dire predictions. My primary concern is the contamination of our ground water, which is supplied by one of the world's largest aquifers which is vast, yet shallow. According to an article titled "Ogallala Aquifer" found in Water Encyclopedia, Science and Issues: "The Ogallala Aquifer, whose total water storage is about equal to that of Lake Huron, is the single most important source of water in the High Plains region. The future economy of the High Plains depends	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. Consolidated Response OIL-4 addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils. As described in Consolidated Response GLF-1, the risks associated with the proposed Project are substantially different from those associated with the BP Deepwater Horizon Project.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					<p>heavily on the Ogallala Aquifer, the main source of water for all uses. The Ogallala will continue to be the lifeblood of the region only if it is managed properly to limit both depletion and contamination." I live two miles south of Stuart, Nebraska, Which is approximately three miles east of the planned pipeline route. Our water table is unusually close to the surface. Amazingly, flowing (artesian) wells bubble freely throughout this area because of the immense quantity of water in close proximity to the surface. When I use my spade to dig holes for planting shrubbery or trees near my house, the hole fills with water before I am able to set the plant in. We must preserve Nebraska's most wonderful resource!• The disturbance of soil and water during the process of placing the pipeline has the potential to cause water contamination.• Once the pipeline is placed, there will forever be a foreign object in the natural scheme, providing a physical conduit for the migration of contaminants that can leech downward to the aquifer.• A geologist stated "I don't know how they will keep the pipe in the ground with all the water pressure pushing it up." If this statement becomes reality, the instability of the pipeline could only mean increased chances of rupture.• Any leak from the pipeline would pose a devastating, unimaginable catastrophe to the Ogallala Aquifer, which is one of the world's largest and purest. This contamination could never be rectified, and nearly every life in Nebraska would be affected since the majority of communities throughout the entire state depend on this source of water for drinking, livestock, or agriculture. Furthermore, benzene, a known carcinogenic, and other toxic chemicals are added to the sludgy tar oil to speed movement through the pipeline. One leak could mean dire consequences. There really is no effective, plausible process to cleanse heavy tar oil and toxins once they have seeped down through the vulnerable sandy soil into the vast Ogallala Aquifer. The Draft Environmental Impact Statement acknowledges that oil spills occur and that some could go undetected for days or weeks. Keystone XL has pointed to techniques that are used to minimize the exposure and avoid seeping. Minimize does not mean infallible, and I think we can all agree there are no human creations that can be deemed infallible. The oil disaster in the Gulf of Mexico is evidence of the fallible nature of human creations. We, along with nearly all rural homes and communities throughout the entire state of Nebraska, obtain our drinking water from wells drilled into the Ogallala Aquifer. According to Wikipedia, the Ogallala Aquifer provides drinking water to 82% of people who live within the aquifer boundary. Our drinking water comes from our private home well, directly from the Ogallala Aquifer. It is so pure, we do not even need to use chlorine or any type of purification system. Any pollutants from the proposed pipeline to be constructed just west of our well could easily migrate to our water source and into my drinking glass. A spillage of the dense oil, along with the added toxins/carcinogens, will rapidly leech through our sandy soil into our ground. Because of the movement of the aquifer, one leak could contaminate the drinking supplies for vast numbers of people. The aquifer can</p>	

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					<p>be described as an underground river moving in an easterly, south-easterly direction. I have heard the comment by a person familiar with wells that you can hear the underground water rush, just like a river. Once contaminants leech into this enormous aquifer, they may have the potential to spread great distances as the aquifer flows in a general easterly direction, reaching innumerable private and community water sources across the state. The Sand Hills region of Nebraska is basically comprised largely of sand, which is extremely vulnerable to leeching. Any leak of tar oil/toxic diluents would rapidly leech through our sandy soil and then the short distance to the aquifer and in some cases directly from the pipe to the many bodies of natural water which will most likely surround the pipe in several locations. I have the experience of working as an RN for 30 years, and I know too well how impurities can affect one's health. How about baseline water analyses before the pipeline is placed and vigilant water analyses after placement? Who will be responsible for testing? Who will take financial responsibility for unplanned/unforeseen consequences? Whose responsibility will it be if we are no longer able to use our ground water for drinking? Will I be forced to install a water purification system at my private residence that will hopefully remove these new contaminants? My right to be able to drink pure water from our ground well could be tragically lost to me, and thousands of other Nebraskans. The time for action is NOW, before we destroy one of the best sources of drinking water on our planet. Oil in drinking water is not a good mix. Let's not wait until years down the road when we have an insidious manifestation of unusual cancers and diseases and we then figure out why, much too late. We must focus on our children and leaving them a clean environment and drinking water. Even more important, is nurturing generations yet to be born. The lives of future generations of Nebraskans depend on protecting this indispensable resource. Water is life. Pure drinking water will sustain life, and oil supplies will not matter if we don't have pure water. By permitting this construction, we are continuing to allow precedence for future incursions that can permanently affect our environment and ecology. My ideal vision is my descendants drinking the same pure water I am drinking, directly from our enormous aquifer, without having to add chlorine or passing through a purification system. I feel a responsibility for the future. There really can be no perfect solution for removing oil from the aquifer once contaminated. In addition, this permanent foreign object embedded in our environment is obviously not meant to be, in an ecological sense. I truly believe "nature knows best". The Sand Hills of Nebraska are a very unique geographically area, very pristine and natural, and relatively untouched by human hands. A lawyer visiting from Arkansas expressed to my brother: "This is the last of truly undiscovered wilderness in the United States." If the oil pipelines are abandoned, will they be left in the ground? If they are not removed, they will eventually corrode, allowing the remnants coated with residual toxins to leech into our water supply. The BP disaster is a</p>	

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					magnanimous ecological disaster that will ripple indefinitely into the future. Oil gushing into our ocean will have far-reaching consequences to all forms of life. Oil and toxins polluting our Ogallala Aquifer would have even more direct, lethal effects to humans as the contaminants have the potential to be directly ingested by people simply drinking water from their faucets. Wise people avoid mistakes. I am asking you to make a wise decision. President Obama declared on TV news as he referred to the BP disaster: "They didn't think through the consequences of their actions."	
1552	47	Myran	Amy	Dawson Research Council	The Draft Environmental Impact Statement does not analyze the full climate impacts of tar sands to be transported on the pipeline.	Consolidated Response GHG-1 addresses the greenhouse gas life-cycle analyses presented in the revised EIS.
1552	48	Myran	Amy	Dawson Research Council	The Department of State should follow the new guidelines from the Council on Environmental Quality on analyzing climate impacts of major federal actions, and should ask the EPA to conduct a full life-cycle analysis of the tar sands.	Consolidated Response GHG-1 addresses the greenhouse gas life-cycle analyses presented in the revised EIS. Consolidated Response GHG-5 explains that the DOS assessment of GHG emissions was conducted in accordance with CEQ guidance.
1552	50	Myran	Amy	Dawson Research Council	What are the environmental impacts of the increased use of the pumping stations?	Pump stations constructed for the proposed Project would be new facilities. Impacts associated with pump stations include habitat loss, habitat alteration, and disturbance due to human activity, lighting, and noise from the facility as described in the resource subsections of Section 3.0 of the EIS. Montana-specific information is presented in Appendix I of the EIS.
1552	51	Myran	Amy	Dawson Research Council	As the pumping stations will require a huge increase of output energy along the route, what will be the rate impacts to Rural Electric Coop members?	Consolidated Response ELE-1 addresses issues regarding the potential need for additional energy sources to provide electrical power for the pump stations and mainline valves. An analysis of the potential impacts on utility electric rates are outside of the scope of this EIS.
1552	52	Myran	Amy	Dawson Research Council	The DEIS assumes that the pipeline is needed, but does not give any data or analysis to support that assumption. There has been recent news about pipeline overcapacity due to the economic downturn.	Sections 1.2 and 1.4 of the EIS provide a thorough and independent analysis of need, as described in Consolidated Response P&N-1. As noted in Consolidated Response P&N-1, the Project has been proposed to meet the heavy crude oil needs of refineries in the Gulf Coast area, not for the U.S. in general. There is not sufficient pipeline capacity to that location. The Alberta Clipper and existing Keystone pipeline projects serve other markets and do not meet the demands of the Gulf Coast refineries.
1212	1	Nabity	Lisa		As a resident of Nebraska, and as someone who has grown up in Nebraska on a farm in south central Nebraska, I am greatly concerned to hear about the proposal of an oil pipeline across the state of Nebraska. The Ogallala Aquifer is too much to risk, no matter what safety measures they say will be in place. Animal & human life & farming production depend on it.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
1212	2	Nabity	Lisa		I urge you to NOT allow the Keystone pipeline project!! Please refuse the Keystone pipeline!!!!	Comment acknowledged.
298	1	Nakada	Jeanette		Please do not permit the TransCanada pipeline to pass through the Ogallala Aquifer. Please use the tragedy of the Gulf of Mexico oil spill for good: for our sake and the sake of our children and all living creatures who now flourish in the vast area above the Ogallala Aquifer.	As described in Consolidated Response GLF-1, the risks associated with the proposed Project are substantially different from those associated with the BP Deepwater Horizon Project.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
461	2	Nass	Candy		Do not route this oil line thru our Ogallala Aquifer!	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. Consolidated Response ALT-1 addresses potential alternative routes, including routes that would avoid much of the Northern High Plains Aquifer system.
1018	1	nativeprincess2d@yahoo.com			we don't need this pipeline could be real bad for Nebraska.	Consolidated Response P&N-1 addresses the need that the Project has been proposed to meet.
6	1	Neary	Robert		I am a landowner in McCone County, Montana. My ranch lies South of the Missouri River and runs from the river South for approximately 6 miles. The Proposed Oil Pipeline (KEYSTONE XL PROJECT) goes thru several pieces of my property. My concerns are as follows: The Pipeline Company proposes to BORE under the Missouri River in Section 32 at MP 89. I have concerns about the possible water contamination in the event of a rupture of this pipeline. I realize this has been addressed by "experts". Hopefully not the same "experts" that evaluated and approved the Gulf of Mexico Oil fiasco. My biggest concern is when the pipeline goes up the South Bank Breaks of the Missouri River and goes thru Section 32, Section 4 and Section 9 (MP 89 to MP 92) where any spill or problem will be magnified and extremely detrimental to the Missouri River ecosystem. This particular portion of the Missouri River is a Crystal clear fish bearing stream and is unique in that it is the only Clearwater stretch that I know of in Eastern Montana. The water comes from Fort Peck Lake and is not yet affected by the muddy waters of the Milk River until about 5 miles downstream... Once the proposed pipeline is above the South breaks (MP92) there would be less concern and the issues should be addressable as they would deal mostly with small streams that drain into Fort Peck Lake. The proposed route thru Section 32, Section 4 and Section 9 (MP89 to MP92) are my greatest concern. I do not believe that "anyone" can state with absolute assurance that we will never have a pipe rupture or spring a leak. The Engineers and all these folks that are assuring us that everything is fine will be long gone when something adverse does happen.	Water contamination by drilling muds during boring are addressed in Consolidated Response WAT-4. DOS acknowledges in Consolidated Response OIL-1 and Section 3.13 of the EIS that there is a possibility that a spill from the proposed Project may occur and that oil may reach the surface soils and adjacent water bodies. Consolidated Response SAF-1 describes the regulatory requirements that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project in a manner that protects the health and safety of the public and the environment. This includes the 57 Project-specific Special Conditions (see Appendix U of the EIS) developed by PHMSA and agreed to by Keystone. Incorporation of those conditions would result in a proposed Project that would have a degree of safety over any other typically constructed domestic oil pipeline system under current code and a degree of safety along the entire length of the pipeline system similar to that which is required in high consequence areas (HCAs) as defined in 49 CFR 195.450.
6	2	Neary	Robert		Any heavy equipment work on the steep clay bank structure (which is the South River Breaks) will in the event of a heavy rain or a high moisture year cause extreme silting of this beautiful portion of the Missouri River.	Issues related to the potential for erosion adjacent to streambanks and private land area are addressed in Consolidated Response ERO-2.
6	3	Neary	Robert		The USFWS and the MDFWP should be very concerned as we do have several species that are notable in this immediate area. What effect will an oil spill have on the Pallid Sturgeon (endangered and nearly extinct)? Are there any issues with the declining Sage Grouse?	The U.S. Fish and Wildlife Service, the Montana Department of Fish, Wildlife, and Parks and the Bureau of Land Management have been working with DOS and Keystone to minimize impacts of the Project on habitats used by the greater sage-grouse, which is a candidate species for federal protection under the Endangered Species Act. Section 3.8.1.2 of the EIS addresses potential impacts to the greater sage-grouse. Information on potential spill impacts to fish and sensitive, threatened, and endangered species such as at the Missouri River crossing in Montana are addressed in Section 3.13.6.5 of the EIS.
6	4	Neary	Robert		I believe when you propose to undertake a project of this magnitude that you need to look at "worst case scenarios". I	Consolidated Response OIL-2 addresses maximum-sized releases from the Project. Section 3.13.4.2 addresses

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					know our government doesn't always do this and we have disasters like the present "Oh it will never happen" case in the Gulf of Mexico. We will "never" have a huge magnitude earth quake either. I respectfully ask that you folks who are charged with protecting our environment and our Endangered Species look at the Worst Case Scenario and figure that is probably what will happen.	impacts associated with a maximum spill volume scenario. Consolidated Response RES-1 addresses issues related to emergency response plans for the proposed Project. As noted in that response, the Pipeline and Hazardous Materials Safety Administration requires that the response plan submitted include the worst-case release scenario.
6	5	Neary	Robert		My proposal is that the pipeline company bore not only under the River but completely out of the Missouri River Basin on the South Bank. The least amount of surface disturbance on these "breaks" is imperative to good business and ecological practices. I am not anti-pipeline. I am anti-ruining of our water and tender ecosystems. I am aware that the cost will go up if the company is required to bore thru Section 32, Section 4 and Section 9 but these costs will be miniscule in comparison to the litigation a spill will cause. My ranch has approximately 3 miles of River Frontage immediately below the proposed pipe line route. If this company is allowed to progress as proposed I will be very upset and "WHEN" we have an environmental issue you may be assured I will be heard from. This morning I spoke with Mr. Tom Ring who is heading up the Montana DEQs oversight of this project. He was extremely knowledgeable and helpful. He has stated that he wants to see this area also so we are to meet late in June or early July to walk the proposed route out of the Missouri Breaks. My present position would be to move the pipeline to the West between the two tower hill sites or at least look into it. I will have further comment when I meet with Mr. Ring. I have numerous water rights which include 273 acres of irrigation water rights out of the Missouri River just below the proposed pipeline and Stock Ponds and flowing springs in the area where the proposed pipeline is to traverse.	<p>The Project would be constructed in accordance with the regulatory requirements of the Pipeline and Hazardous Materials Administration (PHMSA) as noted in Consolidated Response SAF-1. In addition, as noted in Section 3.13.1, Keystone has agreed to incorporate 57 Special Conditions into the proposed Project as requested by PHMSA, including special requirements for valve placement. These procedures would serve to increase the safety of the Project.</p> <p>As described in Section 3.0 of the EIS, impacts of installing the pipeline at upland locations such as that noted by the commenter would not result in significant impacts. Further, the horizontal directional drilling method is used for installing pipelines under environmentally sensitive areas, not in areas where the open cut method and restoration and reclamation result in minor and temporary to short-term environmental impacts. Section 3.13 of the EIS addresses reliability and safety issues, including calculations of the probability of a spill from the proposed Project and the potential environmental impacts associated with spills.</p>
216	1	Nelson	Susan		My biggest concern with this pipeline is an oil spill. No matter how well something is constructed, accidents can and will happen. This pipeline runs less than 0.5 mile from our home and ranch buildings and this land is our livelihood. Will someone from Keystone follow up inspection of easement recovery over a period of years?	Section 3.13 of the EIS was revised to update spill incident statistics and projections, provide additional information on composition of the crude oil that would be transported by the proposed Project, additional information on potential impacts to the Northern High Plains Aquifer system, and other key information. This section addresses reliability and safety issues, including calculations of the probability of a spill from the proposed Project and the potential environmental impacts associated with spills. Consolidated Response SAF-1 describes the regulatory requirements that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project. The response also addresses monitoring frequency and describes the inspections and reviews of the proposed Project that the Pipeline and Hazardous Materials Safety Administration would conduct to ensure compliance with those regulatory requirements. As noted in Section 4.15.4 of the Construction, Monitoring, and Reclamation Plan in Appendix B of the EIS, Keystone has committed to "monitor reclamation on the right-of-way for several years and repair erosion and reseed poorly revegetated areas as necessary."
216	2	Nelson	Susan		One of my other concerns is the damage to the land and	Consolidated Response RDS-1 addresses concerns about the

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					roads and complete reclamation across the easement path. I have seen pictures from the pipeline in the eastern part of SD where reclamation was very poor.	condition of roadways and roadway structures associated with construction and operation of the proposed Project as well as traffic safety measures that would be incorporated into the Project. Reclamation of the right-of-way is addressed in Section 2.3.2.8 of the EIS and in Keystone's Construction, Mitigation, and Reclamation Plan (see Appendix B of the EIS).
238	1	Nelson	Elaine	I.U.O.E. Local #400 Operator Engineers Union	Colstrip Business Agent of the LU.O.E. Local #400 Operator Engineers Union in Montana. ...we are in support of the Keystone Pipeline Project going through Southeastern Montana... The agreement with the LU.O.E. Local #400 and the NPLA in contracting with Keystone XL, insures that for every company worker, a dispatched qualified Union member will be put to work in a 50/50 job ratio, decreasing the Montana unemployment numbers. For this and the following reasons we support this project.	Comment acknowledged.
238	2	Nelson	Elaine	I.U.O.E. Local #400 Operator Engineers Union	job opportunities afforded to Montanans and also our members, if not on the pipeline and station work itself, then for the fringe job employment opportunities. For example; heavy equipment operators who will be needed to do the various prep-works and clearing, the maintenance of the approved county roads and other access roads, the building of the man camps or crew "towns", and the more permanent positions at the pumping stations.	Consolidated Response ECO-1 and Section 3.10.2.2 of the EIS address the potential socioeconomic impacts of the proposed Project. The pump stations would not have permanent employees but would be fully automatic.
238	3	Nelson	Elaine	I.U.O.E. Local #400 Operator Engineers Union	Eastern Montana is a land rich but cash poor section of the state. The tax base is "saturated" and the list of infrastructure repairs needed on our roads and bridges has by far exceeded the county roads budgets. Of the one billion dollars slated to be spent on the Montana section of the Keystone Pipeline, 7.2 million is expected to be infused into the economy and tax base. This boon will allow the much needed repairs and upkeep necessary to keep our roads and bridges safe for all travelers.	Consolidated Response ECO-1 addresses potential socioeconomic impacts, and Consolidated Response TAX-1 addresses concerns regarding taxes.
238	4	Nelson	Elaine	I.U.O.E. Local #400 Operator Engineers Union	The next point I would like to make is that the towns themselves will be seeing an increase in sales, services rendered, and general prosperity (however temporary) due to the influx of 600 Keystone employees who will be spending money in whichever town is closest to their camp. This influx of monies will also create job opportunities for the citizens of the towns through the summer months and afford the business owners a slight cushion in profits to help carry them through some of the hardships of the current economic crisis facing this country.	Consolidated Response ECO-1 addresses potential socioeconomic impacts associated with construction and normal operation of the proposed Project.
238	5	Nelson	Elaine	I.U.O.E. Local #400 Operator Engineers Union	Finally, I would like to point out that some of the transient workers from the pipeline will become permanent residents of Eastern Montana as the jobs they will perform on the pipeline become full-time maintenance positions. This will also add to the tax base of each community affected by the pipeline.	Consolidated Response ECO-1 addresses potential socioeconomic impacts, and Consolidated Response TAX-1 addresses concerns regarding taxes.
575	1	Nelson	Cheryl		Please stop the Keystone Pipeline. Oil companies value their profits over our Sandhills.	Identification of sensitive environments crossed by the proposed Project is discussed in Consolidated Response ENV-1 and ENV-3. Issues related to the Sand Hills area are addressed in Consolidated Response ERO-1.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
1366	1	Nelson	Ken		Recently a number of advocacy groups sent a letter seeking suspension of the permitting of the Keystone XL pipeline. I encourage you to reject the request and to continue to review the proposed project... I live within the impacted area and I feel that the permitting processes in place are appropriate and should proceed so that a final determination can be made about the impacts of the project and whether it is in the national interest. Please reject the request to suspend the process and continue with the review.	Comment acknowledged.
1366	4	Nelson	Ken		At the same time, construction of this project stands to bring significant economic benefits to the areas where it will be built as well as tax and other financial benefits for many years on into the future.	Comment acknowledged.
1434	1	Nelson	Patricia	In Situ Oil Sands Alliance	The Keystone XL pipeline has the potential to deliver significant energy security benefits to the United States to meet the increasing demands for energy supplies. The North American Pipeline system is truly one of the most integrated systems in the world, and has the history to prove it to be the most effective network of supplying a safe, secure and stable source of energy to meet the needs of the United States. Canada and the United States enjoy a special relationship that is the envy of the entire world. We have stood beside each other through good times and through some very difficult times, and we have been able to work together as neighbours on both sides of the border. Feeling safe, secure, and having the knowledge that we are reliable partners is a benefit not shared by most nations. We encourage you to approve yet another secure link in our partnership with the Keystone XL pipeline.	Comment acknowledged.
1526	3	Nelson	E.Benjamin	US Senate	With the ongoing tragedy in the Gulf of Mexico and today's pipeline break into the Kalamazoo River in southwest Michigan, it is important in my view that the State Department seeks out all of the analyses it can regarding the Keystone XL pipeline, not only from federal sources, but also from state government agencies.	As noted in Section 1.5 of the EIS, the Department of State was assisted in preparing the EIS by many federal, state, and local agencies and Indian tribes.
1526	4	Nelson	E.Benjamin	US Senate	Doing so will help in answering the many concerns and uncertainties my constituency has raised regarding the proposed pipeline and ensure that whatever decision the State Department makes will take into full account the importance of the Ogallala Aquifer.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
1526	5	Nelson	E.Benjamin	US Senate	With the ongoing tragedy in the Gulf of Mexico and today's pipeline break into the Kalamazoo River in southwest Michigan, it is important in my view that the State Department seeks out all of the analyses it can regarding the Keystone XL pipeline, not only from federal sources, but also from state government agencies. Doing so will help in answering the many concerns and uncertainties my constituency has raised regarding the proposed pipeline and ensure that whatever decision the State Department makes will take into full account the importance of the Ogallala Aquifer and the Sandhills to Nebraska's economic and agricultural livelihood.	As described in Consolidated Response GLF-1, the risks associated with the proposed Project are substantially different from those associated with the BP Deepwater Horizon Project. DOS has consulted with Nebraska state agencies and university experts regarding issues related to the Northern High Plains Aquifer system and the Sand Hills area. Those contacts are noted in the revisions to Section 3.3 of the EIS. Issues related to the High Plains Aquifer System are addressed in Consolidated Response AQF-1 through AQF-4. Consolidated Response AQF-3 provides information on hypothetical spills from the Project over two areas of the Northern High Plains Aquifer System.
1526	7	Nelson	E.Benjamin	US Senate	Therefore, I respectfully request an update as to the State	All substantive comments on the draft EIS that relate to the

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					Department's efforts, including copies of letters from the agency and responses received, to gain a greater understanding from state and local officials surrounding the environmental and economic impacts the proposed pipeline will have on my home state of Nebraska. Mr. Under Secretary, thank you for your consideration of my request.	NEPA environmental review or the National Interest Determination are provided in the EIS. DOS has responded to those comments and, where appropriate, has revised the EIS in response to those comments. Copies of the comment letters and transcripts are in the Administrative Record for the proposed Project.
1542	91	Nelson	John		I am willing to turn my thermostat up a couple degrees, pay a couple more cents, in order to avoid burying my friends and neighbors.	As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries.
760	1	Neuberger	Emma		The fact that any environmental disaster is possible to occur above the largest reservoir of water in the world is disastrous in itself. If the water in the aquifer is contaminated what other things could that effect in the environment?	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
760	2	Neuberger	Emma		...What is the plan for clean up incase of disaster? Is this plan proven effective? ...WHAT COULD HAPPEN IN THE OCCURRENCE OF ANY MECHANICAL MALFUNCTION?	Consolidated Response RES-1 addresses issues related to preparation and review of the Emergency Response Plan for the proposed Project. The commenter's question about "any mechanical malfunction" is too broad to answer. However, Section 3.13 of the EIS addresses reliability and safety issues, including calculations of the probability of a spill from the Project. The probability analysis and associated impact assessments consider a wide range of spill sizes, from minor leaks to maximum spill volume, irrespective of the cause of the release. In essence this section answers the question "what if" and does not rely on specific causes.
760	4	Neuberger	Emma		Due to this project, TransCanada has expressed their responsibility to the financial and environmental after effects of any malfunction in the transportation of oil.	Required emergency response plans for the proposed Project are discussed in Consolidated Response RES-1. As discussed in Section 3.13 of the EIS, federal, state, and local agencies would participate in response activities and soil, surface water, and groundwater cleanup consistent with their authorities and duties under applicable regulations and consistent with the requirements of the Emergency Response Plan and the Pipeline Spill Response Plan. A list of applicable regulations relative to remediation of crude oil spill contamination at the federal and state level is provided in Table 3.13.5-10. Required mitigation for crude oil or oil products spill impacts would be determined by these agencies.
760	5	Neuberger	Emma		...Has the public been properly notified of the possible risks of this project/ that this project is happening at all? ...	Consolidated Response CMT-2 addresses issues related to comment meetings on the draft EIS and requests for additional public involvement.
760	7	Neuberger	Emma		... Will jobs be created for United States citizens due to this project? ...	Consolidated Response ECO-1 addresses potential socioeconomic impacts, and Consolidated Response TAX-1 addresses concerns regarding taxes.
310	1	Newman	Svein		I'm concerned about the Keystone XL DEIS. It doesn't contain a complete emergency response plan, which Montanans should have a right to know.	Consolidated Response RES-1 addresses issues related to preparation and review of emergency response plans for the proposed Project.
310	2	Newman	Svein		It doesn't analyze the effects of tar sands oil.	Consolidated Response OIL-4 addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils. Section 3.13 of the EIS addresses the impacts of a release of crude oil from

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
						the proposed Project. As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries.
310	3	Newman	Svein		It doesn't justify why the existing Clipper and Keystone I pipelines couldn't be used.	As noted in Sections 1.2 and 1.4 of the EIS, the Alberta Clipper and existing Keystone pipeline projects serve other markets and do not meet the demands of the Gulf Coast refineries.
492	1	Newman	Emma	UO Climate Justice League	Please do not extend the Keystone XL pipeline!!! It is way too risky because it would endanger bird migration, the Ogallala aquifer, and tribal lands.	The impacts associated with implementation of the proposed Project are addressed in Section 3.0 of the EIS. As noted in that section, the proposed Project would not result in significant environmental impacts. Migratory birds are addressed in Section 3.14.4.4. Issues related to the High Plains Aquifer System are addressed in Consolidated Responses AQF-1 and AQF-4. Consolidated Response CUL-1 and Section 3.11 of the EIS address protection of historic properties and the consultations conducted in compliance with Section 106 of the National Historic Preservation Act, including consultation with Indian tribes.
647	1	Nichols	Shannon	Heamour Farm	Considering the current oil well disaster in the Gulf of Mexico that is destroying our environment, I think that allowing another foreign company/government to install another poorly designed system in our country is a bad idea. I would respectfully ask that you think about American Citizens, not foreign companies when considering proposals that could destroy the environment in the United States. This is not designed well, cheap may make the corporation proposing the project extreme profits, but this is not good for job growth or sustainability in the long run.	As described in Section 1.0 of the EIS and in Consolidated Response RES-2, TransCanada-Keystone Pipeline LP (Keystone) is not a foreign corporation. It is a limited partnership organized under the laws of the state of Delaware. Keystone has the same rights as other pipeline companies in the U.S. to propose projects. Keystone has withdrawn its application for a Special Permit as described in Consolidated Response REG-1. Consolidated Response SAF-1 describes the regulatory requirements that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project in a manner that protects the health and safety of the public and the environment.
1545	20	Nickels	Steve	Landowner	The erosion is going to come off of [the pipeline site] and wash down into private land. Who is going to take care of that?	Issues related to the potential for erosion adjacent to streambanks and private land area are addressed in Consolidated Response ERO-2.
828	1	Nidess	Rael		I am against the Keystone XL pipeline and I am also against the use of tar sands as a source of oil. The reasons are that the tar sands are the most polluting means of obtaining oil that exist. In addition, they require an energy input greater than the energy yield to realize any production. Hence, they are entirely inefficient. Further, the environmental damage done to Alberta, Canada and surrounding water run-off areas is incalculable and has caused severe distress & damage to the First Nations people who depend on a functional ecology for their subsistence. Thus, the use of tar sands oil is an environmental, humanitarian, and energy-losing disaster. The Keystone Pipeline, as a means of facilitating the use of the oil produced by such a disastrous process is, itself, another part of the disaster.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project.
131	2	Nielsen	Christi		If natural gas were to leak into the Ogallala Aquifer, the devastation would be unimaginable. With our water supply contamination, the gas would also seep its way into our food	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					supply.	
131	3	Nielsen	Christi		I beg you not to allow this disastrous project.	Consolidated Response ENR-1 provides information on the Department of State's environmental review process, the National Interest Determination process, and the need to complete those reviews before approving or denying the Presidential permit for the proposed Project.
133	1	Nielsen	Christi		Polluting the pristine Aquifer with oil would be a crime against nature and impossible to clean up. Please, prevent such a disaster in the only way possible -- do not allow the pipeline to be built.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
135	1	Nielsen	Kim		I understand that the Keystone XL Pipeline Project will build an oil pipeline through the Ogallala Aquifer and that the company is asking the US Govt. to allow the use of thinner pipe with a larger circumference. This is an unacceptable risk to the aquifer and to the environment. If this is going to be done, it MUST be done in the safest way possible, despite any increased costs. The safest option, of course, is to not build this pipeline at all or at least, keep it away from the Ogallala Aquifer which is a resource that cannot be contaminated.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. Consolidated Response ALT-1 addresses potential alternative routes, including routes that would avoid much of the Northern High Plains Aquifer system. Keystone has withdrawn its application for a Special Permit as described in Consolidated Response REG-1. As described in Consolidated Response GLF-1, the risks associated with the proposed Project are substantially different from those associated with the BP Deepwater Horizon Project. Consolidated Response SAF-1 describes the regulatory requirements that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project in a manner that protects the health and safety of the public and the environment.
476	1	Nielsen	Rebecca		No amount of money or potential energy is worth risking the Ogallala Aquifer to contamination. Our family absolutely does not want the project to proceed.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
614	1	Nielsen	Kathy		Keep the pipeline out of the Nebraska Sand Hills. The Sand Hills are a beautiful and fragile ecosystem that sits above a major water source.	Identification of sensitive environments crossed by the proposed Project is discussed in Consolidated Response ENV-1 and ENV-3. Issues related to the Sand Hills area are addressed in Consolidated Response ERO-1.
614	2	Nielsen	Kathy		The Sand Hills are a beautiful and fragile ecosystem that sits above a major water source.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
614	3	Nielsen	Kathy		The oil industry claiming that the damage from any leaks and spills would be minimal is equivalent to the tobacco industry claiming smoking does not cause cancer. It totally lacks credibility. The oil industry has yet to prove that it can deliver on promises to protect the ecosystems through which the pipelines run - Red Butte Creek, Minnesota wetlands, Delta Wildlife Refuge, Kenai Wildlife Refuge. Then there is the Gulf of Mexico. Oil and the Sand Hills is a very bad combination.	The commenter has attributed the state to the oil industry in general and the EIS does not state that "damage from any leaks and spills would be minimal." Section 3.13 of the EIS was revised to update spill incident statistics and projections, provide additional information on composition of the crude oil that would be transported by the proposed Project, additional information on potential impacts to the Northern High Plains Aquifer system, and other key information. This section addresses reliability and safety issues, including calculations of the probability of a spill from the proposed Project and the potential environmental impacts associated with spills.
1198	1	Nielsen	Louise		Hi, I think they should be very careful with this entire project. ... Please try to keep this from going any further. Louise Nielsen	Consolidated Response ENR-1 provides information on the Department of State's environmental review process, the National Interest Determination process, and the need to complete those reviews before approving or denying the Presidential permit for the proposed Project.
1198	2	Nielsen	Louise		An oil spill is the last thing we need in Nebraska.	Consolidated Response SAF-1 describes the regulatory requirements and Project-specific Special Conditions that Keystone would comply with to construct, operate, maintain,

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
						inspect, and monitor the proposed Project. It also describes the monitoring, inspections, and reviews of the proposed Project that the Pipeline and Hazardous Materials Safety Administration would conduct to ensure compliance with those regulatory requirements.
5	T	Niemi	Debra		I enjoyed talking with you when you visited my hometown of Buffalo, SD the first time in March 2009. As you well know, there are several fossils in the ground on my parents' ranch in Harding County, South Dakota. You may have been on the scene while TransCanada dug Keystone One; yet, I was not and can only imagine with what speed the trench was dug. Does TransCanada take extreme care of checking each inch of soil as it is dug and then, moved to either side of the nine foot trench. Aside from a spill, this is the most pressing environmental issue that will happen on this project. The digging on my parents and brother's ranch property should take several years if proper inspection happens with an appropriate and knowledgeable paleontologist inspecting each inch of precious soil. I urge your office to place specific policies for TransCanada to follow when digging through Harding County.	Potential impacts to paleontological resources are addressed in section 3.1.2 of the EIS. That section describes how these resources are protected depending on the land ownership.
1543	11	Niemi	David		I'm a property owner who is directly affected by this pipeline.	Consolidated Response PVT-2 addresses concerns regarding the proximity of the proposed project to existing structures and facilities and routing concerns across private property.
1543	12	Niemi	David		I feel like there should be some conditions to this presidential permit, such as bonding requirements for reclamation.	The Presidential Permits granted by the Department of State are for construction and maintenance of facilities at the international border. The permits are subject to the conditions specified therein, including the mitigation measures specified in the EIS. Bonding is addressed in Consolidated Response LIA-2.
1543	13	Niemi	David		There should be bonding requirements in case there's a major pipeline rupture or leak, covering clean up and compensation of damages and loss for property owners.	Consolidated Response LIA-1 addresses Keystone's liability if there is a spill of hazardous materials or fuel during construction and from a spill of crude oil from the Project. Consolidated Response LIA-2 addresses the issue of bonding for the proposed Project.
1543	15	Niemi	David		If this pipeline company fails, the line would need to be cleaned or even possibly removed. There needs to be some funding available for that.	Consolidated Response LIA-2 addresses the issue of bonding for the proposed Project.
1543	16	Niemi	David		In March of this year, the South Dakota Public Utilities Commission issued a siting permit for the construction of this line in South Dakota. They attached 50 conditions to that siting permit. That PUC siting permit should also be a condition of the presidential permit.	Section 1.10 of the EIS identifies the permits and authorizations that the proposed Project must obtain before it would be able to proceed. South Dakota has the authority under its own laws and regulations to regulate pipeline placement in that state, and Keystone would be required to comply with the conditions of siting permit.
1447	3	Noble	Dianna	Texas Department of Transportation	Cultural Resources: Cultural resource surveys undertaken in preparation for the project have documented 80 resources, including 42 archaeological sites, 16 historic structures, and 22 isolated finds, as detailed in Table 3.11.3-6. Two of the archaeological sites, 41 NA 156 and 41 LR2, have been determined eligible for the NRHP by DOS. The former includes both precontact and historic-period components and is associated (along with several other sites) with the Camino Real de los Tejas National Historic Trail. The latter is the	Consolidated Response CUL-1 and Section 3.11.4.3 of the EIS address the consultation process between DOS and Indian tribes. As noted in Consolidated Response CUL-1, a Programmatic Agreement (PA) has been developed for the Project under Section 106 of the National Historic Preservation Act. The PA includes mitigation measures for known adverse effects and provides a process for ongoing surveys to be conducted in areas where access was not granted during the EIS process. The Traditional Cultural Property (TCP) reports

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					Sanders Site, a prehistoric (likely Caddo or Woodland) village complex that is one of the most important archaeological sites in northeast Texas. According to the DEIS, avoidance measures will be taken at both sites, as well as at all other sites which have not undergone formal NRHP evaluation.	(noted in Section 3.11.4-3 of the EIS) may not be disclosed due to concerns regarding confidentiality. Potential impacts to cultural resources are addressed in Section 3.11.3.1 of the EIS. DOS considers this assessment to be in compliance with NEPA environmental review requirements.
1447	4	Noble	Dianna	Texas Department of Transportation	Overall, the Cultural Resources section reflects a cautious approach, avoiding both NRHP-eligible resources and unevaluated resources (i.e., essentially assuming unevaluated resources are eligible and planning avoidance at the outset). The special prominence of the Camino Real de los Tejas National Historic Trail demands particular care, and the DEIS includes numerous ongoing and planned investigations to pinpoint the exact location of the trail. In most areas the pipeline appears to avoid the trail, however, the document mentions two areas crossed by the trail. If avoidance of the trail is not possible, mitigation measures may need to be undertaken with input from THC, NPS, and relevant stakeholders.	As noted in Consolidated Response CUL-1, a Programmatic Agreement (PA) has been developed for the Project under Section 106 of the National Historic Preservation Act. The PA includes mitigation measures for known adverse effects and provides a process for ongoing surveys to be conducted in areas where access was not granted during the EIS process. The PA includes an appendix entitled "Historic Trail and Archaeological Monitoring Plan" which discusses the impacts and specific mitigation measures regarding historic trails, including the El Camino Real de los Tejas National Historic Trail. This appendix was developed in consultation with the THC, National Park Service and Indian tribes.
1447	5	Noble	Dianna	Texas Department of Transportation	The DEIS mentions that an Unanticipated Discovery Plan will be formulated to establish a protocol for the treatment of unforeseen cultural materials and human remains, per Section 106 of the NHPA and NAGPRA. This plan must be in place, in consultation with THC/SHPO and any relevant Native American tribes, prior to beginning construction activities within TxDOT right-of-way.	As noted in Consolidated Response CUL-1, a Programmatic Agreement (PA) has been developed for the Project under Section 106 of the National Historic Preservation Act. The PA includes mitigation measures for known adverse effects and provides a process for ongoing surveys to be conducted in areas where access was not granted during the EIS process. The PA also includes an Unanticipated Discovery Plan for each state including Texas. The Plan for Texas was prepared in consultation with the THC, federal agencies, and Indian tribes.
1447	6	Noble	Dianna	Texas Department of Transportation	Historic Resources: The Cultural Resources sections of the DEIS are prepared in the manner of a phased review process, which seems entirely appropriate for the nature of the proposed project. As noted in several places in Section 3.11, this is also consistent with the Section 106 regulations pertaining to identification efforts for corridors or large land areas. The overview of the Section 106 process and the state-by-state summaries of survey methods and coordination clearly communicate the current status of preliminary identification of cultural resources. The Section 3.11 overview of eligibility, impacts, and mitigation along with the state-by-state status also provide a clear understanding of the known sites and the process that will be used to complete the resource identification, impacts assessment, mitigation and coordination. Both sections appropriately refer the reader to the Programmatic Agreement (PA) prepared under Section 106, which commits DOS and participating agencies to the standards and protocols for meeting the regulatory requirements. Section 3.11-44, Historic Structures (paragraph 1, 4th sentence): Consider stating that avoidance is recommended for all unevaluated sites and sites that may be determined NRHP-eligible during the ongoing surveys. As written, the NEPA document does not disclose how project impacts will be addressed for those historic structures that may be determined eligible. It may not be adequate to limit the consideration of impacts and mitigation measures for	Section 3.11 of the EIS has been revised to state that avoidance is recommended for all unevaluated sites and sites that may be determined NRHP-eligible during the ongoing surveys. It should be noted that the results of subsequent surveys for historic structures inside and outside the HPAs are now included in the EIS.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					historic structures that have been identified within the archeological high probability areas (as currently stated) since historic structures may be identified outside of the archeological sensitivity areas. As stated in paragraph 2 on page 3.11-44, additional inventories have yet to be conducted and, as stated on page 3.11-12, the APE of the project corridor has not yet been surveyed by qualified architectural historians. It is quite likely that NRHP eligible historic structures and/or landscapes will be documented once those surveys are performed, considering the length of the corridor and its path through heritage-rich areas of Texas.	
1447	7	Noble	Dianna	Texas Department of Transportation	Oil Spill Risk Assessment and Environmental Consequence Analysis: Section 3. 13 Oil Spill Risk Assessment and Environmental Consequence Analysis provides a detailed and substantive discussion of potential oil spill risks and potential impact scenarios. One overarching question at the time of this writing is: How specifically does Keystone plan to address the current public concern about the transportation of oil given the recent catastrophic BP petroleum spill? In Sections 3.13.5 and 3.13.6 Keystone Actions to Prevent, Detect, and Mitigate Oil Spills, the DEIS states that, "In general, Tier 1 emergency response equipment would be pre-positioned for access by Keystone personnel", with specific locations of emergency responders " ... determined upon conclusion of the detailed location and design of the proposed pipeline". This generic commitment may need to be more specific, given the number and sensitivity of water, wetland and groundwater resources crossed in Texas by the pipeline, as well as the density of residential and commercial enterprises and length of pipeline to be located in the state. We urge Keystone to commit to placing adequate spill response resources at a defined number of specific locations within the state of Texas.	Consolidated Response RES-1 addresses issues related to preparation and review of the Emergency Response Plan or the proposed Project. Spill Prevention, Control, and Countermeasure (SPCC) plans are addressed in Sections 2.3 and 3.13.5 of the EIS and in the Construction, Mitigation, and Reclamation Plan presented in Appendix B of the EIS.
1447	8	Noble	Dianna	Texas Department of Transportation	On a related note, the following statement on page 3.13-41 sounds conclusory: "Most oil spills reaching larger lakes would result in minimal effects on water quality. DO levels would not be affected. Direct toxicity would be minimal because of the high dilution volume in these lakes". We suggest that this statement be revised or source documentation provided.	Section 3.13 of the EIS has been revised to reflect the concern of the commenter.
1447	10	Noble	Dianna	Texas Department of Transportation	Thank you for the opportunity to provide comments on the Keystone DEIS. We appreciate your consideration of our comments, and would be available to address questions or concerns related to TxDOT's responsibilities within our state.	Comment acknowledged.
1556	41	Noem	Kristi		I just want you to know that we're [the house of representatives] firm believers that farmers and ranchers and landowners care about the land, and they recognize that the good Lord's not making any more new land and that you want to take care of it. And it that's why I came tonight to make sure that I could sit here and listen to you and to listen to your concerns and make sure that you're heard as we go forward.	Consolidated Response FRM-1 addresses potential ranch or farmland impacts, and Consolidated Response FRM-2 addresses potential impacts to irrigated cropland.
1238	1	Nootz	Larry	Nationwide Personal Lines Training Specialist	Why not have it run above ground to make lead detection, repair, and clean up easier, cheaper, and much more timely?	Issues related to an aboveground pipeline are addressed in Consolidated Response CST-1.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
355	1	Noren	Carl		I am writing in opposition to the pending permit for the Keystone XL pipeline.	Comment acknowledged.
1505	1	Nugent	Patrick	Texas Pipeline Association	Recently, a number of advocacy groups sent a letter seeking suspension of the permitting of a proposed interstate oil pipeline in Texas. I encourage you to reject the request and to continue to review the proposed project on its merits. The project has the potential to deliver significant energy security benefits to the United States, increasing access to significant land-based sources of oil from a trading partner with whom we are closely allied. At the same time, construction of this project stands to bring significant economic benefits to the areas where it will be built. Provided it has limited impact on the environment, this project could be an important part of the solution to our energy supplies. The permitting processes in place are appropriate and should proceed so that a final determination can be made about the impacts of the project and whether it is in the national interest. Pipelines are a safe, reliable, economical and environmentally favorable way to transport oil, natural gas, and petroleum products, as well as other energy liquids, throughout the U.S. America depends on the more than 168,000 miles of liquid pipelines to move energy and the raw materials our country relies on. Additional pipeline capacity will help consumers and businesses throughout the United States. Please reject the request to suspend the process and continue with the review.	Comment acknowledged.
1544	143	O'Brien	Colleen		I am opposed to this project.	Comment acknowledged.
1544	145	O'Brien	Colleen		The boreal forest surrounding the tar sands location in Canada are the fourth largest carbon sink in the world. It's the North American version of a rainforest.	Consolidated Response GHG-4 addresses concerns regarding the loss of boreal forest and peat bogs.
1137	1	O'Daniel	Kathleen		We don't always "learn our lesson" the first time around.. Please don't "cut corners" on the Ogallala pipeline that may open the door to a Nebraska- based calamity. It is water that connects the world's land.. No more diminished safety! Our lives depend upon safe, clean water! Everywhere!	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
120	1	O'dell	Robert		Seawater contaminated with petroleum is a dire problem. Contamination of Nebraska's underground water, the Ogallala (High Plains) Aquifer, with petroleum is lethal. sources.	As described in Consolidated Response GLF-1, the risks associated with the proposed Project are substantially different from those associated with the BP Deepwater Horizon Project. Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
120	2	O'dell	Robert		Experience has demonstrated that pursuing yet another pipeline across the heart of this Nation's most abundant groundwater supply is not only greed-driven foolishness but fosters a "when" rather than an "if" disaster upon failure or abandonment.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. Issues related to the life of the Project and taking the Project out of service are presented in Consolidated Response DEC-1.
512	1	O'doherty	Colleen		The TransCanada's project to pump tars and oil through NE is a terrible idea that endangers a freshwater source and the local environment. Please stop this project from going further.	Consolidated Response ENR-1 provides information on the Department of State's environmental review process, the National Interest Determination process, and the need to complete those reviews before approving or denying the Presidential permit for the proposed Project.
432	1	Offutt	Steve		Greetings, I am writing in opposition to the Keystone XL Pipeline project.	Comment acknowledged.
432	3	Offutt	Steve		Tar sands are extremely intense producers of CO2, the main	Issues related to development of oil sands projects in Canada

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					greenhouse gas. By building this pipeline, the US will be sending a signal that business as usual is still business as usual. However, weather as usual is not. It is critical that we make significant and rapid changes in our energy infrastructure. This pipeline is a backwards looking energy solution being proposed when forward looking solutions are needed more than ever. Please be smart about climate change and do not support the continuing exploitation of tar sands.	are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project. Consolidated Response GHG-1 addresses GHG life-cycle analyses.
282	1	Ogle	Kathy		This idiotic idea must be stopped! We absolutely cannot risk contaminating the last source of pure water in the world. If a pipeline is necessary it MUST be routed around the Ogallala Aquifer, not through the middle of it.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. Consolidated Response ALT-1 addresses potential alternative routes, including routes that would avoid much of the Northern High Plains Aquifer system.
564	1	Ohlmann	Patricia		I oppose the Keystone pipeline proposed to cross the Nebraska Sand Hills and the Ogallala Aquifer, source of water for many Nebraskans. Do not allow this pipeline to take any route over the Sandhills.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
564	2	Ohlmann	Patricia		The record of pipelines in sensitive areas is full of leaks. The assurances by oil companies that these pipelines are safe, rarely leak, will be closely monitored so any "rare" leak will be discovered quickly, is refuted by the record to which you surely have access.	Statistics related to spills from liquid pipelines are presented in Section 3.13.2 of the EIS.
564	4	Ohlmann	Patricia		By the way, the address by which one finds this website it certainly obscure--I got it from a newspaper column about the pipeline. It makes me wonder whether the Dept. of State really wants comments from the common folk.	The address of the DOS Project website was included in the Notice of Intent for the proposed Project and the Notice of Availability for the draft EIS. Those notices were mailed to thousands of interested parties and were published in the Federal Register.
88	1	Ohlson	Nils		Please do not allow this pipeline to cross Nebraska.	The commenter's opinion is noted.
88	2	Ohlson	Nils		The tar sands project is an environmental disaster from the beginning, and should not be allowed to spread to American soil.	Section 3 of the EIS addresses the impacts of construction and operation of the proposed Project. Section 3.13 of the EIS addresses the risk and environmental impacts of a crude oil spill from the proposed Project.
1396	1	Olsen	Louise	Cottonwood Inn Suites	Recently a number of advocacy groups sent a letter seeking suspension of the permitting of the Keystone XL pipeline. I encourage you to reject the request and to continue to review the proposed project... The permitting processes in place are appropriate and should proceed so that a final determination can be made about the impacts of the project and whether it is in the national interest. Please reject the request to suspend the process and continue with the review.	Comment acknowledged.
1396	3	Olsen	Louise	Cottonwood Inn Suites	At the same time, construction of this project stands to bring significant economic benefits to the areas where it will be built.	Comment acknowledged.
356	1	Olson	Bill	WorleyParsons	Recently a number of advocacy groups sent a letter seeking suspension of the permitting of the Keystone XL pipeline. I encourage you to reject the request and to continue to review the proposed project.	Comment acknowledged.
356	2	Olson	Bill	WorleyParsons	The project has the potential to deliver significant energy security benefits to the United States, increasing access to significant land-based sources of oil from a trading partner with whom we are closely allied.	Comment acknowledged.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
356	3	Olson	Bill	WorleyParsons	At the same time, construction of this project stands to bring significant economic benefits to the areas where it will be built.	Comment acknowledged.
356	5	Olson	Bill	WorleyParsons	I write in support of TransCanada's Keystone XL crude oil pipeline project and urge the department to grant a permit for the pipeline.	Comment acknowledged.
356	10	Olson	Bill	WorleyParsons	This project also stands to provide a powerful private sector economic stimulus. During construction, Keystone XL will create more than 13,000 jobs funded with private investment. In addition local governments will have a steady source of income from economic activity associated with construction and from property taxes the pipeline company will pay.	Consolidated Response ECO-1 addresses potential socioeconomic impacts, and Consolidated Response TAX-1 addresses concerns regarding taxes.
356	11	Olson	Bill	WorleyParsons	Rejection of the permit or suspension of the review would sacrifice the significant economic benefits this, project stands to deliver and force U.S. consumers to rely on other sources of crude oil not economically and politically allied with U.S. interests. This would be a mistake. I urge the granting of the permit. Thank you for the opportunity to comment.	Comment acknowledged.
405	2	Olson	Johanna		I am against the TransCanada Keystone pipeline project and feel that it will do a great disservice to any progress we have made to reduce our use of oil.	Consolidated Response ALT-2 addresses the use of alternative technologies, alternative energy sources, and conservation of energy.
769	1	Olson	Peggy		Even while million of gallons of oil spew into the Gulf of Mexico there is actual consideration of a pipeline [that could destroy the Ogallala Aquifer]...	Section 3.13 of the EIS addresses reliability and safety issues, including calculations of the probability of a spill from the proposed Project and the potential environmental impacts associated with spills. Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
769	2	Olson	Peggy		[Even while millions of gallons of oil spew into the Gulf of Mexico] there is actual consideration of a pipeline that could destroy the Ogallala Aquifer. That is, even in the best case scenario, a serious pollutant.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. As described in Consolidated Response GLF-1, the risks associated with the proposed Project are substantially different from those associated with the BP Deepwater Horizon Project.
769	3	Olson	Peggy		...Please say no to the pipeline. Where will you buy air we can breathe and water we can drink?	The commenter's opinion is noted.
843	1	Omara	Michael		This pipeline isn't really necessary, except to make money for the pipeline company. The Aquifer is far more important than this high cost-low quality oil. This oil will be pumped to a decades old, inefficient refinery. Run the pipeline through Canada where this company is based and listen to the outrage from Canadian citizens. Not a good idea for America to let a foreign company build a pipeline across our very important national water resources.	Consolidated Response P&N-1 addresses the need that the Project has been proposed to meet. Issues related to the High Plains Aquifer System are addressed in Consolidated Response AQF-1. Consolidated Response P&N-3 addresses issues related to emissions from refineries. As noted in Consolidated Response EAS-2 and Section 1.0 of the EIS, Keystone is a U.S. corporation.
1551	11	Ost	Rick		I speak in favor of this project.	Comment acknowledged.
1551	14	Ost	Rick		Looking at the positives that will result from this project, it's a no-brainer. Either we ship all this product to North Dakota or we keep it here and make it work.	Comment acknowledged.
938	1	Ostdiek	Charles	The Nebraska Green Party	Please deny permission to Keystone XL for their proposed new pipeline plotted to run through the sensitive Sandhills of NE, above the precious Ogallala Aquifer. They have the money to route the pipeline where there is less of a certainty that the environment will be impacted.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. Consolidated Response ALT-1 addresses potential alternative routes, including routes that would avoid much of the Northern High Plains Aquifer system.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
527	1	Osterman	Kathie		Please reconsider extending the Keystone Pipeline as planned across Nebraska. Yes, this resource is important and will benefit the country; however, its proximity to the Ogallala Aquifer is a serious concern due to our reliance on it as a source of irrigation and drinking water. If safety of the water quality could be guaranteed, these concerns voiced by many could be questioned. The recent calamity in the Gulf, however, has done nothing to build confidence in this regard. It would be a tragedy for this situation to be repeated on land and contaminate this unique and precious resource. Thank you for the opportunity to comment and for extending the comment period.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. As described in Consolidated Response GLF-1, the risks associated with the proposed Project are substantially different from those associated with the BP Deepwater Horizon Project.
221	1	Otterberg	Mike		My concern is with the landowners ability to control access to his property. The rancher who's property I hunt on does not allow any off road travel. All access to his property is by foot or horseback. With this pipeline comes an access road. The rancher will not now be able to control vehicle access through his land. Vehicle traffic will adversely affect the quality of the hunting on his ranch.	There will not be an access road that extends along the entire proposed route. Access roads will be maintained for access to specific portions of the route. If there is an access road on the property the commenter is concerned about, the landowner can request that Keystone install a fence to limit access to the property as a part of the easement negotiation process. However, if there is an access road on the property, even with a fence there may be undesired use of the access road as noted by the commenter. On ranching or farming property, the right-of-way can usually be returned to the same use that occurred prior to construction. That would minimize impacts to use of the land for hunting and would not increase access to the land.
1484	1	Ottman	Richard		Please do NOT approve the Keystone XL pipeline project to move tar sand oil from Alberta Canada to the Gulf Coast. Tar sands oil is extremely polluting in terms of greenhouse gas emissions.	Consolidated Response GHG-1 addresses GHG life-cycle analyses.
329	1	Ottoson	Andrew	andrewottoson.com	Kansans currently depend on reliable, plentiful sources of oil for transportation, agriculture and other economic activities, but some of us recognize that the habit helped lead our nation into a senseless and costly war in Iraq. It now leads us to accept the necessity of forfeiting huge tracts of land and associated local tax revenues to connect producers in Canada with refiners in Texas. But apart from feeding our dependence on oil, what do Kansans gain from the pipelines now being carved into our state? Will these lines bring permanent jobs here? No, I think some of our refining jobs will be moved toward the terminals—in Missouri and Oklahoma and Texas.	Consolidated Response ECO-1 addresses potential socioeconomic impacts, and Consolidated Response TAX-1 addresses concerns regarding taxes.
329	2	Ottoson	Andrew	andrewottoson.com	Will these lines be without risk? No, I think these lines already pose risks to our groundwater and are likely to harm our land and resources at some point during the course of a hundred-year lifetime.	Section 3.13 of the EIS addresses reliability and safety issues, including calculations of the probability of a spill from the Project and the potential environmental impacts associated with a spill.
84	1	Ozark	Stan	Kltz/Klan Radio	I fully support the construction of the Keystone XL Pipeline Project.	Comment acknowledged.
721	1	P	Jazmynn	Westminster college	PLEASE reject the oil industry and thier selfish interests and vote instead on behalf of the people who have elected you...By approving he pipeline we are sending the message to the rest of the world that we do not care about progression and that we will succomb to the interests of big oil. PLEASE do not make this decision for us.	Consolidated Response ENR-1 provides information on the Department of State's environmental review process, the National Interest Determination process, and the need to complete those reviews before approving or denying the Presidential permit for the proposed Project.
1560	1	Packard	Nancy		Wants to know who stands to profit from this pipeline?	Consolidated Response P&N-1 addresses the need that the

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
						Project has been proposed to meet. Consolidated Response ECO-1 and Section 3.10.2.2 of the EIS address potential socioeconomic impacts.
243	1	Paddack	Susan	Senate OK District 13	As a state senator from the State of Oklahoma, I strongly encourage the U.S. Department of State to approve an energy infrastructure project that not only will strengthen long-term energy security in the United States, but also will provide a powerful private sector economic stimulus to the mostly rural communities along the pipeline route during its construction at a time when our economy continues to struggle. As I understand it, Keystone XL will create more than 13,000 high-wage construction and manufacturing jobs during the project's 2011~2012 construction schedule. Many of those jobs will be created in rural and in my districts, where too many of our residents continue to find it difficult to find good jobs. With Keystone XL, they will have an opportunity to work on the project or for businesses that provide supplies, goods and services for its construction and operation.	Consolidated Response ECO-1 addresses potential socioeconomic impacts, and Consolidated Response TAX-1 addresses concerns regarding taxes.
243	2	Paddack	Susan	Senate OK District 14	In addition to the jobs Keystone XL will create, the project will generate substantial economic benefits for the United States and in states and communities along the proposed route. Like our counties, in many cases these are areas where economic performance has stagnated or is shrinking. It is my understanding that TransCanada commissioned a study to measure the projects economic stimulus to the U.S. and the states along the route. The study found that in the U.S. Keystone XL would generate \$20.9 billion in total expenditures, \$9.6 billion in output (gross product), personal income of \$6.5 billion and 118,935 person years of employment (jobs). In addition, the report concluded that during construction, Keystone XL would generate \$486.36 million in tax revenue for state governments along the route and \$99.1 million for local taxing entities where the pipeline is located. In Oklahoma, the study found Keystone XL expenditures during construction would total \$1.2 billion and generate an economic gross product of nearly \$1.1 billion. Keystone XL construction also would generate more than \$7.7 million in tax revenue for local government and \$31.4 million for state government.	Consolidated Response ECO-1 addresses potential socioeconomic impacts, and Consolidated Response TAX-1 addresses concerns regarding taxes.
243	3	Paddack	Susan	Senate OK District 15	Furthermore, the delivery of secure and affordable supplies of Canadian energy to American consumers would have minimal impacts on the environment. This is a vital project that will strengthen U.S. energy security and reduce our dependence on unstable foreign sources of oil.	Comment acknowledged.
243	4	Paddack	Susan	Senate OK District 16	Canada has more than 50 percent of the non-state controlled reserves in the world. Long-term supply is critical in a world where supply risks are growing, whether due to declining production from a once-reliable source, an unstable geo-political climate~ or uncertainties in key oil producing regions. Construction of additional pipeline facilities such as the Keystone XL Project, to transport oil sands production to the vitally important Gulf Coast area is critical. These refineries also have excess capacity as a result of reduced production from Mexico, where heavy oil production is in steep decline,	Comment acknowledged.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					and Venezuela, which is moving to other markets. Turning to Canada for a secure oil supply is a logical step.	
1546	140	Pagel	Lauren	Earth Works	Rural farmland and ranch land where the pipeline will be placed are considered "low consequence," meaning they are not subject to integrity management standards.	Incorporation of the existing regulatory requirements of the Pipeline and Hazardous Materials Safety Administration (PHMSA) and the 57 Project-specific Special Conditions developed by PHMSA would result in a Project that would have a degree of safety over any other typically constructed domestic oil pipeline system under current code and a degree of safety along the entire length of the pipeline system similar to that which is required in high consequence areas as defined in 49 CFR 195.450.
1546	141	Pagel	Lauren	Earth Works	Pipeline Safety Trust recently testified before the House Transportation Infrastructure Committee that only 44% of hazardous liquid pipelines that fall under the pipeline safety rules are ever inspected.	Consolidated Response SAF-1 describes the regulatory requirements and Project-specific Special Conditions that Keystone would comply with to construct, operate, maintain, inspect, and monitor the proposed Project. It also describes the monitoring, inspections, and reviews of the proposed Project that the Pipeline and Hazardous Materials Safety Administration would conduct to ensure compliance with those regulatory requirements.
1546	142	Pagel	Lauren	Earth Works	Over the past five years there have been 1,300 significant spills or incidents at pipelines across the country that have put the public at risk, including 69 fatalities.	Section 3.13 of the EIS addresses reliability and safety issues, including calculations of the probability of a spill from the proposed Project and information on previous liquid hazardous materials pipeline incidents (Section 3.13.4.2). Many of the fatalities referred to by the commenter occurred due to incidents to natural gas pipelines.
1546	143	Pagel	Lauren	Earth Works	People in rural communities are more at risk because pipeline safety requirements are not applied to their communities. TransCanada applied for a waiver that would decrease the safety further.	Keystone has withdrawn its application for a Special Permit as described in Consolidated Response REG-1. As described in Consolidated Response SAF-1, the Pipeline and Hazardous Materials Safety Administration (PHMSA) has regulatory requirements that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project in a manner that protects the health and safety of the public and the environment. In addition, PHMSA developed 57 Project-specific Special Conditions that Keystone has agreed to implement. Incorporation of those conditions would result in a Project that would have a degree of safety over any other typically constructed domestic oil pipeline system under current code and a degree of safety along the entire length of the pipeline system similar to that which is required in high consequence areas as defined in 49 CFR 195.450.
1546	144	Pagel	Lauren	Earth Works	A March 2010 report by the Department of Transportation's Inspector General found that the Pipeline Safety Agency was not checking the safety records of companies, and did not follow through to make sure conditions of pipeline permits were being met.	Consolidated Response SAF-1 describes the regulatory requirements and Project-specific Special Conditions that Keystone would comply with to construct, operate, maintain, inspect, and monitor the proposed Project. It also describes the monitoring, inspections, and reviews of the proposed Project that the Pipeline and Hazardous Materials Safety Administration would conduct to ensure compliance with those regulatory requirements.
1133	1	Pakiz	Catherine		I am very concerned about the threat to our most important natural resource posed by the Keystone pipeline. I am adamantly opposed to approving this pipeline route, as proposed, over the aquifer. No amount of oil is worth polluting our clean groundwater.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
1133	2	Pakiz	Catherine		Please stop this pipeline from being built!	Consolidated Response ENR-1 provides information on the Department of State's environmental review process, the National Interest Determination process, and the need to complete those reviews before approving or denying the Presidential permit for the proposed Project.
1339	1	Palmer	Robbin		I am opposed to the tar sands pipeline. Keystone XL is not in America's national interest. The Department of State should not give permits for pipelines importing the world's dirties fuel while the rest of the country fights to prevent catastrophic climate change. Tying our future to toxic tar sands will never be in our national interest. Please consider the true impact of this pipeline by including the devastating effects of mining, refining, and burning this fuel when you make the decision. I am asking you to fulfill your role as protector of our country and say no to tar sands.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project. Consolidated Response OIL-4 addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils. Consolidated Response P&N-9 describes the National Interest Determination process.
77	1	Paloff	Minelle		Isn't Texas and the rest of the country polluted enough? The pipeline project is an attack against the environment and the people.	The commenter's opinion is noted.
1257	1	Panec	William		The Ogallala Aquifer is one of the world's largest aquifers. It covers a wide area portions of which are in eight states. Keystone XL Pipeline plans to run a pipeline from the northern edge of Nebraska through this aquifer with one single pipe 36 inches in diameter. By so doing, there are no safeguards from pinhole or larger leaks of oil from the 36 inch pipeline.	As described in Consolidated Response GLF-1, the risks associated with the proposed Project are substantially different from those associated with the BP Deepwater Horizon Project. Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
1257	2	Panec	William		If a leak occurs, and it probably will, this pristine aquifer which provides clear clean water for humans, crops, uncultivated plants, livestock and wildlife in the eight state region it encompass. Protection of this valuable resource is vital to all. Neither Keystone XL nor the US State Department have come up with a method to protect against oil contamination of the aquifer.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
1257	3	Panec	William		One possible solution is a double wall for the pipeline, or a pipe within a pipe to prevent pinhole and larger leaks into the water of the Ogallala Aquifer. The catching of the leaks by the second pipe encompassing the oil pipeline will protect the water from infusion with "tar sand oil" which will be passing through the pipeline at the rate of 970,000 barrels per day. The pipe in a pipe is the only way we can assure protection of the aquifer and permit the safely transport of "tar sand oil" through the pipeline going through the aquifer. Technology has the ability to provide a constant monitoring of leaks from the pipeline and catch them in the confines of the second outer pipe before the leaks can get into the aquifer.	All pipeline companies must comply with the requirements of the Pipeline and Hazardous Materials Safety Administration (PHMSA) for construction of oil pipelines in the U.S. There is no PHMSA requirement for double-walled pipe and DOS is not aware of any oil pipeline system that is constructed with double-walled pipe for a 36-inch-diameter transportation pipeline.
1257	4	Panec	William		The pipe within a pipe method will also provide an opportunity to repair the oil pipeline where these leaks are located and also keep the leaking oil out of aquifer water. With the outer pipe enclosing the oil pipeline, oil leaks will be capped from invading the aquifer water. The 36 inch pipeline could be loosely incased in a 38 inch, or larger pipe, designed to protect aquifer water and to warn of any oil leaks from the inner pipe carrying the "tar sand oil". Thereby, an Exxon Valdez type oil spill into the aquifer can be avoided and checked by the outer pipe and leaks in the pipeline itself can	All pipeline companies must comply with the requirements of the Pipeline and Hazardous Materials Safety Administration (PHMSA) for construction of oil pipelines in the U.S. There is no PHMSA requirement for double-walled pipe and DOS is not aware of any oil pipeline system that is constructed with double-walled pipe for a 36-inch-diameter transportation pipeline.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					be repaired reasonably soon after they occur.	
1257	5	Panec	William		The pipe within a pipe method will create an additional cost to the pipeline. However, the aquifer needs to be protected at any cost. After all, we can drink water but not oil.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. AQF-6 addresses the potential for using double-walled or triple-walled pipe.
1257	6	Panec	William		However, the aquifer needs to be protected at any cost. We need water for human consumption, crop irrigation, livestock and wildlife. We simply cannot do that with "tar sand oil".	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. Consolidated Response AQF-3 provides information on hypothetical spills from the Project over two areas of the Northern High Plains Aquifer System and also addresses response actions. Consolidated Response SAF-1 describes the regulatory requirements and Project-specific Special Conditions that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project in a manner that protects the health and safety of the public and the environment.
1257	7	Panec	William		There should be a pipe in a pipe anywhere the oil pipeline is in water—such as the Ogallala Aquifer, any other aquifer, wetlands, water well fields, and other similar areas.	All pipeline companies must comply with the requirements of the Pipeline and Hazardous Materials Safety Administration (PHMSA) for construction of oil pipelines in the U.S. There is no PHMSA requirement for double-walled pipe and DOS is not aware of any oil pipeline system that is constructed with double-walled pipe for a 36-inch-diameter transportation pipeline.
1257	8	Panec	William		Those who do not want the protection of the aquifer must carry the great burden of oil contamination of Ogallala Aquifer water by oil leaks.	Consolidated Response OIL-1 addresses the likelihood of spills from the Project. Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
1257	9	Panec	William		Those who may criticize the pipe within a pipe idea must come up with a way to protect the aquifer other than by keeping the oil pipeline out of the Aquifer. Let them clearly state what they propose.	Issues related to aquifers along the proposed Project corridor are addressed in Consolidated Responses AQF-1 through AQF-4.
1560	7	Panec	William		Pipeline runs through the Ogallala Aquifer which is a very large and important source of freshwater source for 8 states. This aquifer must not get contaminated.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
1560	9	Panec	William		Also, want a bonding by Keystone XL to assure that any damage that does occur can be repaired.	Consolidated Response LIA-2 addresses the issue of bonding for the proposed Project.
145	2	Parfait	Kari		I believe the environmental hazards passed by this project are far too dangerous and therefore far too costly to be worthwhile. I say No! to dirty tar sand oils.	Consolidated Response OIL-4 addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils. The impacts associated with implementation of the proposed Project are addressed in Section 3.0 of the EIS. As noted in that section, construction and normal operation the proposed Project would not result in significant environmental impacts.
1112	1	Park	MaryAlice		The proposed plans by Keystone XL for laying a pipeline from Canada to the Gulf through Midwestern states, including Nebraska, are raising many questions among the general public. As a Nebraska citizen I definitely want the Keystone XL proposal to be studied and debated thoroughly.	The impacts associated with implementation of the proposed Project are addressed in Section 3.0 of the EIS. As noted in that section, construction and normal operation the proposed Project would not result in significant environmental impacts. Section 3.13 of the EIS addresses reliability and safety issues, including calculations of the probability of a spill from the proposed Project and the potential environmental impacts associated with spills.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
1112	2	Park	MaryAlice		The Ogallala Aquifer is our state's most valuable asset--a precious resource which must be protected!	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
86	1	Parker	Mary		I am totally OPPOSED to this taking place. Why would we do this? Why not take it through to another state?	Consolidated Response P&N-1 addresses the need that the Project has been proposed to meet.
86	2	Parker	Mary		We spend millions of tax dollars trying to preserve our natural resources through such organizations as the NRCS, but yet we would take a pretty penny to potentially ruin one of the last greatest fresh water basins left on the face of this earth. A water resource that we negate to allow neighboring governments to tap when they have expended all their resources. This makes absolutely no sense to me.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
86	3	Parker	Mary		Marketers throw out such phrases as, "oh, there will be minuscule significant impact IF there were to be a leak because the pipeline is only 36" in diameter." It may be 36" in diameter, but it will be through our great state of Nebraska, from north to south. Also, having the potential to pollute our water source.	Consolidated Responses AQF-1 and AQF-3, address potential impacts to the Northern High Plains Aquifer System. Consolidated Responses OIL-1 and OIL-2 address the likelihood of large spills from the Project. Section 3.13 of the EIS was revised to update spill incident statistics and projections, provide additional information on composition of the crude oil that would be transported by the proposed Project, additional information on potential impacts to the Northern High Plains Aquifer system, and other key information. This section addresses reliability and safety issues, including calculations of the probability of a spill from the proposed Project and the potential environmental impacts associated with spills.
86	4	Parker	Mary		NO WAY! Not worth the risk! When you add the fact that we have over 55,000 miles of crude oil trunk lines in the US and 30, 000 - 40,000 miles of crude oil gathering lines centralized in the midwest alone. NO FRIGGIN' WAY! Absolutely not!!!	Consolidated Response OIL-1 provides a summary of the range of spill frequency estimates addressed in the EIS. Consolidated Response OIL-2 addresses maximum-sized releases from the Project.
198	1	Parker	Annise	Mayor of Houston	It has come to my attention that a draft Environmental Impact Statement has been prepared for this project, the termination of which is proposed to occur in Harris County, Texas. I understand that the comment period for the DEIS ended on May 31, 2010, but I respectfully request a 15- day extension, pursuant to the provisions of 40 CFR § 1502 et seq. until June 15, 2010, to provide comments to the Department. Further, while I understand that 20 separate scoping meetings have already occurred in the vicinity of the proposed route of this pipeline, and that four of those meetings did occur in Texas, no meetings have occurred in Houston, which is proposed to be the site of the project's terminus. I respectfully request that at least one more public meeting occur in Houston. Finally, I note that libraries in some of the smaller cities and towns in the vicinity of the proposed Project are repositories of paper copies of the DEIS, yet no copies are proposed to be sent to Houston's Public Library system. My final request is that copies of the DEIS be made available in Houston's libraries. Houston is the country's fourth-largest city and it continues to have a robust partnership with the oil and gas transportation and refining industries. However, Houston's citizens should be afforded the opportunity to inform themselves about this project and offer comments to the Department if they so choose. It seems particularly important at this time to seek greater public participation in evaluating the environmental impacts of permitting decisions.	Consolidated Response CMT-2 addresses issues related to the decision to not hold public meetings on the supplemental draft EIS. During September 2011, DOS will also host public meetings in each of the six states through which the proposed pipeline would pass. The meetings will be held in the state capitals of Montana, South Dakota, Nebraska, Kansas, Oklahoma, and Texas, with an additional meeting in the Sand Hills region in Nebraska and along the Gulf Coast near Port Arthur, Texas. This will be followed by a final public meeting in Washington, DC. These meetings will provide an opportunity to voice views on whether granting or denying a Presidential Permit for the pipeline would be in the national interest and to comment on economic, energy security, environmental and safety issues relevant to that determination. Consolidated Response CMT-6 addresses issues related to the availability of paper copies of the draft EIS.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
1240	1	Parker	Annise	Mayor of Houston	I very much appreciate the courtesy given to the City by the Department in granting an extension of time for public comment until July 2, 2010.	Comment acknowledged.
1240	2	Parker	Annise	Mayor of Houston	The modern history of Houston is inextricably connected to the oil and gas transportation and refining industries. Many technical innovations occurred in Houston that have had national and international implications for the country's transportation security. However, Houston and the nation must carefully consider the environmental implications for any large pipeline project, such as this one, before committing financial and human resources to such an undertaking.	Comment acknowledged.
1240	3	Parker	Annise	Mayor of Houston	I wish to express my concern that the scoping process for this DEIS appears to have omitted participation by several Texas agencies whose expertise in the analysis of this Project would be invaluable. Although I am heartened to see participation by the Texas Parks and Wildlife Department in the Scoping Summary Report attached as Appendix A to the DEIS, I wish DOS to explain why neither the state's environmental agency (Texas Commission on Environmental Quality), its regulatory agency for oil and gas pipelines (Texas Railroad Commission) nor the agency responsible for managing state lands (Texas General Land Office) have been included as cooperating (or otherwise participating) agencies.	Consolidated Response CMT-5 addresses the concern that that all state and federal activities and agencies that could be involved in review of the proposed Project were not identified through scoping or in the draft EIS.
1240	4	Parker	Annise	Mayor of Houston	The DEIS only addresses air quality impacts from construction and operation of the pipeline and should also address the effect on ambient air quality of both the transport of the heavy sour crude from the terminus (Moore Junction) to refineries in the greater Houston area as well as the actual refining of the 700,000 bpd of high sulfur crude anticipated by the Project.	As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries. Consolidated Response OIL-4 also addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils.
1240	5	Parker	Annise	Mayor of Houston	The FEIS must discuss what effect the boosting of production with this ready supply of crude will have on the ability of the Houston region to attain compliance with the Clean Air Act. Currently, the Houston-Galveston-Beaumont region is non-attainment for ozone. However, the City's Department of Health and Human Services carefully monitors the concentration of fine particulate matter, because this ambient air constituent is of increasing concern in the industrial area in southeast Houston. Coordinated mitigation measures have been instituted to control concentrations to levels below the National Ambient Air Quality Standards. Introduction of new activities that generate fine particulates must be carefully controlled to maintain levels protective of human health.	As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries. Consolidated Response OIL-4 also addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils.
1240	7	Parker	Annise	Mayor of Houston	If the pipeline anticipates delivering 700,000 bpd of crude oil to the Houston area, the material will certainly require further refining. Those indirect effects must be addressed in the FEIS. See <i>Mid States Coalition for Progress, et al. v. Surface Transportation Board</i> , 345 F.3d 520 (8th Cir. 2003).	As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries. Consolidated Response OIL-4 also addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
1240	9	Parker	Annise	Mayor of Houston	The FEIS should provide much more detail on health effects of communities in eastern Harris County, with information provided by census tract. Historically, the populations of these communities have been substantially under-reported. A study conducted on behalf of the City of Houston identified systematic undercounting in the census of persons living in low income areas. Four of the neighborhoods studied are in east Houston, near the refineries that likely would receive the crude oil from this Project. The underreporting discrepancies between the 2000 census and the actual population were as much as 19% depending upon the census tract in question. See Houston Neighborhood Market Drilldown, Social Compact Inc., November 2007, p. 9 (http://www.houstontx.gov/planning/planningstudies/drildwn.htm).	As discussed in the EnSys 2010 report, the quantity of crude oil refined in PADD III is driven by market conditions and is independent of the existence of the proposed Project. The proposed Project would provide access to WCSB crude oil in PADD III refineries that would supplant supplies from other sources, including Venezuela and Mexico. As discussed in Section 3.13.5.1 of the EIS and Consolidated Response OIL-4, the composition of WCSB crude oils that could be transported by the proposed Project is not dissimilar from other heavy crude oils currently refined in PADD III. There is therefore no credible evidence that implementation of the proposed Project would lead to disproportionate adverse impacts on minority and low income populations near PADD III refineries. Also see Consolidated Response JUS-1 which addresses potential impacts to minority and low-income populations.
1240	10	Parker	Annise	Mayor of Houston	The FEIS must focus its analysis on the actual groups of citizens likely to be most adversely affected by air pollution in order to accurately reflect the disproportionate manner in which the Project will affect Houston's poorest citizens.	As discussed in the EnSys 2010 report, the quantity of crude oil refined in PADD III is driven by market conditions and is independent of the existence of the proposed Project. The proposed Project would provide access to WCSB crude oil in PADD III refineries that would supplant supplies from other sources, including Venezuela and Mexico. As discussed in Section 3.13.5.1 of the EIS and Consolidated Response OIL-4, the composition of WCSB crude oils that could be transported by the proposed Project is not dissimilar from other heavy crude oils currently refined in PADD III. There is therefore no credible evidence that implementation of the proposed Project would lead to disproportionate adverse impacts on minority and low income populations near PADD III refineries.
1240	11	Parker	Annise	Mayor of Houston	There appears to be a gross disparity between the environmental costs to the Houston region and the purported tax benefit generated by the Project. The DEIS states that "[l]ocal counties would be the primary beneficiaries of estimated property tax benefits." (DEIS, 3.10-54.) Yet, "[t]he increase in property taxes along the Houston Lateral is 2.1 percent above 2006 levels," id., which is dramatically lower than those increases predicted for other counties (e.g., some counties are estimated to receive increased property tax revenues of more than 300%).	Revised Section 3.10.2 of the EIS presents estimates of the tax revenues that would occur with implementation of the proposed Project based on the tax rates that were effective at the time the EIS was prepared.
1240	12	Parker	Annise	Mayor of Houston	The FEIS should describe in more detail what procedures the pipeline operator will have in place to address risks to water resources, both bayous and ultimately Galveston Bay, from the Project.	As described in Consolidated Response SAF-1, the Pipeline and Hazardous Materials Safety Administration (PHMSA) has regulatory requirements that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project in a manner that protects the health and safety of the public and the environment. In additions to its regulations in 49 CFR Parts 194 and 195, PHMSA developed 57 Project-specific Special Conditions that Keystone has agreed to implement and to incorporate into its manual for operations, maintenance, and emergencies that is required by 49 CFR 195.402. Incorporation of those conditions would result in a Project that would have a degree of safety over any other typically constructed domestic oil pipeline system under current code and a degree of safety along the entire length of

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
						the pipeline system similar to that which is required in HCAs as defined in 49 CFR 195.450. Keystone would have an Emergency Response Plan and an Oil Spill Response Plan in place during operation of the pipeline as described in Section 3.13.5.5 of the EIS and in Consolidated Response RES-1.
1240	13	Parker	Annise	Mayor of Houston	The City of Houston is particularly interested in the risks to surface water resources and natural resources that are presented both during construction and in future operation of the Project.	Section 3.3 addresses the potential impacts to surface water. The resource sections in Section 3.0 address the potential impacts of other natural resources.
1240	15	Parker	Annise	Mayor of Houston	The Draft Environmental Impact Statement does not provide a sufficient level of detail to adequately analyze the environmental conditions presented to the Houston area by this Project.	The proposed Project does not extend into Houston. With regard to refineries in the Houston area that may process crude oil transported by the proposed Project, as described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries.
1240	16	Parker	Annise	Mayor of Houston	The Department should request participation by relevant Texas agencies.	Texas Parks & Wildlife, Texas Historical Commission, as well as various Texas offices of USACE, USFWS, and NRCS have been consulted.
	8	Parker	Annise	Mayor of Houston	Insufficient description of health effects on low socioeconomic communities in the vicinity of the terminus of the pipeline. The draft EIS merely considered income levels and ethnic distribution based on Harris County in its entirety. See Tables 3.10.1-8 and 3.10.2-3.	As discussed in the EnSys 2010 report, the quantity of crude oil refined in PADD III is driven by market conditions and is independent of the existence of the proposed Project. The proposed Project would provide access to WCSB crude oil in PADD III refineries that would supplant supplies from other sources, including Venezuela and Mexico. As discussed in Section 3.13.5.1 of the EIS and Consolidated Response OIL-4, the composition of WCSB crude oils that could be transported by the proposed Project is not dissimilar from other heavy crude oils currently refined in PADD III. There is therefore no credible evidence that implementation of the proposed Project would lead to disproportionate adverse impacts on minority and low income populations near PADD III refineries.
198	1	Parker	Annise	Mayor of Houston	It has come to my attention that a draft Environmental Impact Statement has been prepared for this project, the termination of which is proposed to occur in Harris County, Texas. I understand that the comment period for the DEIS ended on May 31, 2010, but I respectfully request a 15- day extension, pursuant to the provisions of 40 CFR § 1502 et seq. until June 15, 2010, to provide comments to the Department. Further, while I understand that 20 separate scoping meetings have already occurred in the vicinity of the proposed route of this pipeline, and that four of those meetings did occur in Texas, no meetings have occurred in Houston, which is proposed to be the site of the project's terminus. I respectfully request that at least one more public meeting occur in Houston. Finally, I note that libraries in some of the smaller cities and towns in the vicinity of the proposed Project are repositories of paper copies of the DEIS, yet no copies are proposed to be sent to Houston's Public Library system. My final request is that copies of the DEIS be made available in Houston's libraries. Houston is the country's fourth-largest city and it continues to have a robust partnership with the oil and gas transportation	Consolidated Response CMT-1 addresses issues related to the length of the comment period for the draft EIS and supplemental draft EIS. Consolidated Response CMT-2 addresses issues related to comment meetings on the draft EIS and requests for additional public involvement. Consolidated Response CMT-6 addresses issues related to the availability of paper copies of the draft EIS.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					and refining industries. However, Houston's citizens should be afforded the opportunity to inform themselves about this project and offer comments to the Department if they so choose. It seems particularly important at this time to seek greater public participation in evaluating the environmental impacts of permitting decisions.	
1240	3	Parker	Annise	Mayor of Houston	I wish to express my concern that the scoping process for this DEIS appears to have omitted participation by several Texas agencies whose expertise in the analysis of this Project would be invaluable. Although I am heartened to see participation by the Texas Parks and Wildlife Department in the Scoping Summary Report attached as Appendix A to the DEIS, I wish DOS to explain why neither the state's environmental agency (Texas Commission on Environmental Quality), its regulatory agency for oil and gas pipelines (Texas Railroad Commission) nor the agency responsible for managing state lands (Texas General Land Office) have been included as cooperating (or otherwise participating) agencies.	Consolidated Response CMT-5 addresses the concern that that all state and federal activities and agencies that could be involved in review of the proposed Project were not identified through scoping or in the draft EIS.
1240	16	Parker	Annise	Mayor of Houston	The Department should request participation by relevant Texas agencies.	Texas Parks & Wildlife, Texas Historical Commission, as well as various Texas offices of USACE, USFWS, and NRCS have been consulted. Consolidated Response CMT-5 addresses the concern that that all state and federal activities and agencies that could be involved in review of the proposed Project were not identified through scoping or in the draft EIS.
1512	1	Partridge	Alex		I am upset to hear that there are advocacy groups seeking suspension of the permitting of the Keystone XL project. I fully support the Keystone Project! It is an important part of the solution on dependence to foreign oil. This project will be a great benefit to our local economy. We are a farming community that has been affected by drought, low commodity prices, decreasing population, and a rise in unemployment. I live in Valley County, Montana. I am not part of an advocacy group. I am a manager at a local business and live in the area the Keystone project will impact. This project will be a very positive impact on our rural and local economy. Please reject the request to suspend the process, and grant the permit. Thank you for your consideration!	Comment acknowledged.
495	1	Patton	Jessa		You might be wondering why an average teen girl all the way from Washington who isn't even part of an organization, might care about something so far away. It's because even I know this is wrong, and it upsets me that lawmakers would propose such a thing. You can email me and I can tell you why I oppose this.	Comment acknowledged.
493	1	Pearson	Keith&Ruth		In view of recent spills in the Gulf of Mexico and in Utah, we question the security of the pipeline as it passes over the vast Ogallala Aquifer, a fresh water resource upon which much of the great plains depends. Will future generations be placed at risk because other options did not seem as convenient or perhaps, politically agreeable? Have all reasonable options been fully explored?	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. As described in Consolidated Response GLF-1, the risks associated with the proposed Project are substantially different from those associated with the BP Deepwater Horizon Project.
782	1	Pease	Michael		...For whatever it's worth I suggest we pursue any alternative that does not involve the above outcomes.	Consolidated Response ALT-1 addresses potential alternative routes and system alternatives, including rail and barge networks.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
782	2	Pease	Michael		[Really? This is the best we can do?] The old tear the earth apart to extract a terribly inefficient and GHG-intensive fuel ...	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project.
782	3	Pease	Michael		[Really? This is the best we can do?] The old tear the earth apart ... which will leave our ... water contaminated for generations? ...	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project.
782	4	Pease	Michael		[Really? This is the best we can do?] The old tear the earth apart which will leave our soil contaminated for generations?	Issues related to the Sand Hills area are addressed in Consolidated Response ERO-1. Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. Consolidated Response AQF-3 provides information on hypothetical spills from the Project over two areas of the Northern High Plains Aquifer system and also addresses response actions.
1551	21	Pelej	Jenny	National Wildlife Federation	We need to consider the impacts to the tar sands region of Canada.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project.
1551	22	Pelej	Jenny	National Wildlife Federation	This pipeline as constructed, is essentially going to bring the tar sands recourse to the Gulf, which is going to open it up to an international market, potentially driving massive expansion of the tar sands development.	Although there are likely pipeline connections from the delivery points in Texas to ports along the Gulf Coast, it is not likely that crude oil transported by the proposed Project would be exported using those pathways. As noted in Consolidated Response P&N-2, there are relatively minor volumes of refined product exprotrd from the Gulf Coast area within PADD III, and that is likely to continue, with or without the proposed Project. As noted in Consolidated Response P&N-1 and in Section 1.4 of the EIS, the crude oil that would be shipped by the proposed Project would primarily replace existing sources of crude oil that are declining. Consolidated Response GHG-2 addresses the expansion of oil sands production activity in relation to the proposed Project.
1551	23	Pelej	Jenny	National Wildlife Federation	The tar sands extraction process is one of the most destructive ways to produce oil. It uses two to three barrels of fresh water for every barrel of production, it requires the clear cutting of the boreal forest, the draining of wetlands, the diverting of waterways, which are habitats of Woodland Caribou, grizzly bear, and 50 percent of North America's migratory birds. They'll be replacing this habitat with vast tailings ponds, so big that you can see them from space.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project.
1551	24	Pelej	Jenny	National Wildlife Federation	The tar sands extraction process puts the health of the First Naitons People of Canada at risk, and it also puts our health at risk in the refinery communities.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project. As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries.
1551	26	Pelej	Jenny	National Wildlife Federation	The Keystone XL pipeline and its impacts are too costly to overlook.	The commenter's opinion is noted.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
1555	14	Pelej	Jennie	National Wildlife Federation	I'm here to voice concerns about the Keystone XL pipeline and the associated Draft EIS.	Comment acknowledged.
1555	15	Pelej	Jennie	National Wildlife Federation	My first concern relates to the need for this pipeline. The Draft EIS assumes we will consume oil at a rate requiring additional importation from the tar sands region of Canada. This assumption is poorly analyzed and does not take into consideration that this pipeline network is already overbuilt, with excessive capacity available.	Consolidated Response P&N-1 addresses the need for the Proposed Project and provides an explanation of the thorough and independent analysis of need that was conducted for the EIS. As noted in Consolidated Response P&N-1, the Project has been proposed to meet the heavy crude oil needs of refineries in the Gulf Coast area, not for the U.S. in general. There is not sufficient pipeline capacity to that location. The Alberta Clipper and existing Keystone pipeline projects serve other markets and do not meet the demands of the Gulf Coast refineries.
1555	18	Pelej	Jennie	National Wildlife Federation	This pipeline will impact resources and wildlife in six states, including hundreds of acres of wetlands, countless streams, the Missouri River, and more.	The impacts associated with implementation of the proposed Project are addressed in Section 3.0 of the EIS. As noted in that section, construction and normal operation the proposed Project would not result in significant environmental impacts. Potential impacts to wetlands and water resources addressed in Sections 3.3 and 3.4, respectively. Additional discussion concerning the identification of sensitive resources are provided in Consolidated Response ENV-1 and Montana specific information is provided in Appendix I of the EIS.
1555	21	Pelej	Jennie	National Wildlife Federation	The EIS does not account for ancillary construction impacts such as habitat fragmentation by rights-of-way, transmission lines, and roads.	Potential habitat fragmentation impacts are discussed in Section 3.6.2. Potential habitat and potential impacts to wildlife from power distribution lines are discussed in Section 3.6.4
1555	22	Pelej	Jennie	National Wildlife Federation	Ancillary construction impacts caused by rights-of-way, transmission lines, and roads create a pathway for invasive species.	Keystone would implement measures to prevent the spread of noxious weeds and invasive aquatic animals as described in Sections 3.5.5.4 and 3.7.3.1 of the EIS. Section 3.7.3.1 of the EIS was revised to include additional measures Keystone would implement to prevent the spread of aquatic invasive species. The measures described were recommended by federal and state management agencies. Keystone will develop and implement weed control plans which includes identification of weed sources identified along the ROW that includes additional specific descriptions of methods for containment and control as part of its Construction, Mitigation, and Reclamation Plan, which is in Appendix B of the EIS.
1555	23	Pelej	Jennie	National Wildlife Federation	Ancillary construction impacts cut up migratory corridors, and give predators more of an edge to prey off of.	Potential habitat fragmentation impacts are discussed in Section 3.6.2, including facilitation of predator movements.
1555	24	Pelej	Jennie	National Wildlife Federation	The EIS dismisses the potential impacts of oil spills and leakage.	Section 3.13 of the EIS addresses reliability and safety issues, including the potential environmental impacts associated with spills. The potential impacts have been described in sufficient detail for decision-makers to understand the potential impacts due to a wide variety of spill sizes. The EIS has not dismissed those potential impacts.
1555	25	Pelej	Jennie	National Wildlife Federation	The EIS dismisses the potential impacts on wildlife.	Section 3.6 of the EIS identifies potential wildlife habitat loss, alteration, and fragmentation; potential direct and indirect mortality of wildlife; and the potential for reduced survival or reproduction of wildlife due to construction and operation of the proposed Project. Consolidated Response WIL-2 addresses species covered by the Migratory Bird Treaty Act and the Endangered Species Act.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
1555	26	Pelej	Jennie	National Wildlife Federation	The EIS does not account for the stressor of climate change.	Climate change is addressed in Section 3.14.3.14. Consolidated Response ENV-6 addresses concerns regarding the influence of climate change on the potential impacts of the proposed Project.
1555	27	Pelej	Jennie	National Wildlife Federation	Wildlife is predicted to adapt to climate change by migrating to other habitats likely upslope and northward. Migrating species will already be stressed and unable to deal with additional stressors. The EIS does not discuss impacts in terms of climate change pressure for wildlife to migrate and survive.	Section 3.14 of the EIS was revised in response to this comment to add information on potential Project-related effects on wildlife in light of predicted climate change. That issue is also addressed in Consolidated Response ENV-6.
39	1	Pell	Jerry	DOE	Merely a request for 2 electronic copies of the DEIS on CD or DVD, to be sent to my home address, above.	Consolidated Response REQ-2 provides information for request of locations of paper copies of the EIS and that copies of the draft EIS, other specific information, or references be sent directly to the commenter. As noted in that response, all stakeholders who specifically requested paper copies were accommodated.
63	1	Penn	Julia		TAR SANDS IS DIRTY OIL	Consolidated Response OIL-4 addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils.
65	1	Penn	Julia		PLEASE STOP TAR SANDS OIL PIPELINE EXPANSION IN TEXAS!! PLEASE!	The commenter's opinion is noted.
1349	1	Penner	Abe		As a landowner on the Keystone Pipeline System, I write in support of the proposed KeystoneXL crude oil pipeline project. The Draft Environmental Impact Statement (DEIS) on the Keystone XL pipeline project concluded that the delivery of secure and affordable supplies of Canadian energy to American consumers would have minimal impacts on the environment. This is part of why I support the project.	Comment acknowledged.
1349	4	Penner	Abe		The significant effort to build this project offers our area a significant economic stimulus at a time when our economy continues to struggle. As occurred during Keystone construction in 2008 and 2009, local businesses and governments in the area of Keystone XL construction will have the chance for increased revenues from economic activity associated with construction.	Comment acknowledged.
1349	5	Penner	Abe		In addition, local taxpayers, schools and government services will benefit from significant additions to local tax base.	Comment acknowledged.
1349	6	Penner	Abe		The current tragedy in the Gulf underscores the importance of a diverse portfolio of energy supplies. Keystone offers a supply that is land-based, local to North America and transported by pipeline. Each of these factors seems to be advantageous compared to other options. Pipeline construction can be intrusive. However, as mentioned above, I support this project and encourage the department to issue a permit so it can be built. Thank you for considering my comments.	As described in Consolidated Response GLF-1, the risks associated with the proposed Project are substantially different from those associated with the BP Deepwater Horizon Project.
637	1	Peppers	Dan		I find the idea of allowing a pipeline to be built across a state treasure such as the Sand Hills to be ludicrous at best. The oil companies have failed time and again to demonstrate even a basic concern for the environment. Do not allow this to happen here in Nebraska.	Identification of sensitive environments crossed by the proposed Project is discussed in Consolidated Response ENV-1 and ENV-3. Issues related to the Sand Hills area are addressed in Consolidated Response ERO-1.
1544	18	Perez	Juan	Texas Environmental	I ask you to seriously consider Environmental Justice and the impact on the communities.	As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
				Justice Advocacy Services		would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries. Also see Consolidated Response JUS-1 which addresses potential impacts to minority and low-income populations.
1544	19	Perez	Juan	Texas Environmental Justice Advocacy Services	On behalf of those that are not here, I ask that you look at the issue of eminent domain. I don't think that it's a fair deal to the communities and residents that are impacted by it. They never seem to get a fair shake of what they're giving up in exchange for us benefitting from the service when they come.	As noted in Consolidated Response EAS-2, state laws dictate under what circumstances eminent domain may be used and define the eminent domain process within the state. DOS has no legal authority in the easement negotiations or in eminent domain proceedings.
1544	20	Perez	Juan	Texas Environmental Justice Advocacy Services	Emissions will increase in the entire Houston area.	As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries. Consolidated Response OIL-4 also addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils.
1544	21	Perez	Juan	Texas Environmental Justice Advocacy Services	This is going to keep us on the unattainment list for another 10, 20 years. We need to address the ozone standards.	As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries. Consolidated Response OIL-4 also addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils. Based on the nonattainment status of Texas counties in which the pipeline will pass, a General Conformity analysis was prepared (see Section 3.12.1.3). It was determined that construction emissions for the Project would be accounted for in the SIP emissions budget and the proposed activity within the Houston-Galveston-Brazoria nonattainment area was presumed to conform to the SIP.
1547	26	Pergutan	Bob		I have one comment to make on the leases that they brought me, different leases to sign. They want to give the pipeline back to me if they abandon it after two years. What am I going to do with 36 inch pipeline, especially if it creates an environmental hazard in the future?	Issues related to taking the Project out of service at the end of the life of the Project are presented in Consolidated Response DEC-1.
1547	16	Perkins	Bob		My main concern, if they run the pipeline parallel with the South Canadian River, which overflows constantly, all the protection that I have against the South Canadian River is timber and grown- up brush that I don't ever destroy or disturb. Well, they're going to come in and clean this 110 foot right-of-way within 150 foot of the channel of the South Canadian River. So it concerns me, maybe not so much this year, but maybe next year the river gets up and follows this pipeline north, right across our field, and we've lost our bottom land. (maps shown meeting)	The South Canadian River would be crossed using the horizontal directional drilling (HDD) method. The area of the crossing is illustrated on the U.S. Department of States web site at http://www.keystonepipeline-xl.state.gov/clientsite/keystonexl.nsf?Open . Click on "Project Documents," then "Supplemental Filing (May 19, 2010)." The crossing referred to by the commenter is depicted in Plan 18 and uses the name Canadian River, instead of South Canadian River. The crossing plan shows that the HDD crossing begins and ends on either side of the forested riparian area for this crossing such that timber and brush lining the river would remain intact. After the crossing, the proposed route crosses Arbeca Creek and then approaches the

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
						Canadian River within about 200 feet where it turns to extent parallel to an existing corridor.
1547	25	Perkins	Edmon		Concerned about whether there is still sand in the oil when its in the pipeline. If so, will this create abrasion hazards?	In its tariff stipulations, the U.S. Federal Energy Regulatory Commission (FERC) would require that the proposed Project reject crude oil streams that exceed a combined bottom (or basic) sediment and water (BS&W) content of 0.5 percent by volume. FERC would also require the following: "Petroleum shall not contain sand, dust, dirt, gums, impurities or other objectionable substances in quantities that may be injurious to Carrier, the Pipeline System or downstream facilities, or which may otherwise interfere with the transportation of Petroleum in the Pipeline System." As a result, there would be the same potential for abrasion during transport of the crude oil in the proposed Project as there is in other crude oil pipelines.
1544	204	Perrot	Jeannine	Resident of Houston	I am concerned that because of the current status of the overall project, there may be a strong tendency to approve the project without adequately considering the impacts to our health and environment.	<p>The impacts associated with implementation of the proposed Project are addressed in Section 3.0 of the EIS. The assessments considered potential impacts to both human health and the environment. As noted in that section, construction and normal operation the proposed Project would not result in significant environmental impacts.</p> <p>As noted in Consolidated Response ENR-1, the environmental review, including preparation of this EIS, has been conducted consistent with the DOS regulations pertaining to NEPA (22 CFR Part 161) as well as the Council on Environmental Quality (CEQ) regulations for implementing NEPA (40 CFR Part 1500). As a result, DOS considers the EIS to be in full compliance with the requirements of a NEPA environmental review.</p>
595	1	Peters	David		I was born and raised in the Nebraska Sand Hills. As a native son there are two reasons why routing an oil pipeline through the Sand Hills is a very dangerous idea. First, the water table in the Sand Hills is so high that in many valleys it is at the surface. These lakes and hay meadows are the upper level of the Ogallala Aquifer which provides drinking water for a large area of the Midwest. Any leak in the pipeline will immediately contaminate the aquifer.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
595	2	Peters	David		Second, it is hard to describe how truly remote nearly all the Sand Hills are. From my home town of Valentine you drive south for 130 miles without passing through another town. A leak in the pipeline is unlikely to be discovered for a considerable length of time.	Issues related to the Northern High Plains Aquifer System are addressed in Consolidated Responses AQF-1 through AQF-4. Consolidated Response AQF-3 provides information on hypothetical spills from the Project over two areas of the Northern High Plains Aquifer System. Consolidated Response OIL-3 addresses the detection of small leaks. Section 3.13 of the EIS was revised to update spill incident statistics and projections, provide additional information on composition of the crude oil that would be transported by the proposed Project, additional information on potential impacts to the Northern High Plains Aquifer system, and other key information. This section addresses reliability and safety issues, including calculations of the probability of a spill from the proposed Project and the potential environmental impacts associated with spills.
438	1	Petersen	Dianne		The Salt Lake City oil spill hasn't gotten big headlines here, but my--it shows that this is too big a risk to put a pipeline	Issues related to the Northern High Plains Aquifer System are addressed in Consolidated Responses AQF-1 through AQF-4.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					through our aquifer.	Consolidated Response AQF-3 provides information on hypothetical spills from the Project over two areas of the Northern High Plains Aquifer System.
438	2	Petersen	Dianne		Do we need domestic oil? Yes. Do we need oil in an aquifer?- No! Refine the oil in the north closer to where the oil is drilled-- don't pipe it through all the states ruining the land and creating a dire situation for our aquifers. Water is our most precious resource and should trump the need for oil companies to do whatever they please.	Consolidated Response P&N-8 addresses issues related to shipping Canadian crude oil to refineries that are closer to the source of oil.
1168	1	Petersen	Jackie	Sperry TV Service	Try to imagine the United States without the aquifer. That makes it crystal clear what the real issue is. Jackie L Petersen Sperry TV Service 1115 N. 47th Lincoln Ne 68503 (402)464-9181	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
95	1	Peterson	Bruce		Whole hearted support for Keystone XL Project- Valley County Commissioner	Comment acknowledged.
775	1	Peterson	Virgil		I am growing weary of having our energy policy stymied at every turn by a very small group of environmentalists who do not have the best interests of the United States at heart. When they stop flying all over in their jets and using air conditioners, etc., I will take them more seriously. Until then, they should be disregarded and our policy based on what is best for the country--this pipeline is a perfect example.	The commenter's opinion is noted.
1073	1	Peterson	Stan&Beth		To All Concerned: I'm sure there are numerous land owners, environmental groups and other residents of Nebraska that have contacted you regarding their opposition to the XL Keystone Pipeline. Count me as one of those concerned. I am a fourth generation Nebraskan that grew up in the middle of the Sandhills of western Nebraska, along with my four children and eight grandchildren. My concern is not for myself, but for them..... I plan to die here, but preferable to natural causes, not as the result of catering to the interest of big business that care for nothing more than "The Almighty Dollar."	Consolidated Response ALT-1 addresses potential alternative routes, including routes that would avoid much of the Northern High Plains Aquifer system. Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. Issues related to the Sand Hills area are addressed in Consolidated Response ERO-1..
1073	2	Peterson	Stan&Beth		A rupture in the XL Keystone Pipeline would not only destroy the Ogallala Aquifer contaminating the groundwater supply that 85% of Nebraskans depend on, and put 30% of our nation's food supply at risk,	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
1073	3	Peterson	Stan&Beth		It could also destroy the delicate ecosystem of the native grasslands present in the Sandhills of Nebraska. If this ecosystem were destroyed it is very unlikely that it could be reestablished and the "Dust Bowl" scenario of the 1930's and 40's would be repeated!	Identification of sensitive environments crossed by the proposed Project is discussed in Consolidated Response ENV-1 and ENV-3. Issues related to the Sand Hills area are addressed in Consolidated Response ERO-1.
1073	4	Peterson	Stan&Beth		Concerns are rampant, not only among the people of Nebraska, but in every state in which this pipeline would traverse, including the Canadian Province of Alberta, where the likelihood of environmental damage and destruction of one of the world's largest forest ecosystems: the Boreal Forest. It's loss would be catastrophic! With the loss of the Boreal Forest which serves as a natural carbon sink, global warming would be greatly accelerated!	Consolidated Response GHG-4 addresses potential loss of boreal forests and peat bogs.
1073	5	Peterson	Stan&Beth		In the words of William J. Panec of Fairbury, Nebraska, "The aquifer needs to be protected at anycost. We can drink water, but not oil."	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
1378	1	Peterson	Bruce	Board of County Commissioners Valley County, Monta	The Valley County Commissioners write this letter in support of the TransCanada Keystone XL crude oil pipeline project and urge your department to grant a permit for this pipeline project... Valley County has considered all the pros and cons and we are absolutely convinced this project should proceed. Hopefully this project will be built sooner rather than later... I urge the granting of the permit. Thank you for the opportunity to comment.	Comment acknowledged.
1378	2	Peterson	Bruce	Board of County Commissioners Valley County, Monta	This project stands to provide a powerful private sector economic stimulus for Valley County which will have a steady source of income from economic activity associated with the construction and from property taxes the pipeline company will pay to our county. During construction, Keystone XL will create more than 13,000 jobs across the projected site areas and this stimulus boost is a needed and appreciated outcome for Valley County... Securing [stable and] affordable energy from our North American allies through projects such as the Keystone pipeline is in the national interest. Considering the economic [and energy security] benefits of these vital resources, we should continue to expand America's access to safe, affordable energy to help ensure improved domestic and global energy security and stable prices for consumers... Rejection of the permit or suspension of the review would sacrifice the significant economic benefits this project stands to deliver to Valley County and the U. S. forcing consumers to rely on other sources of crude oil not economically and politically allied with U.S. interests. This would be a mistake... Northern Border Pipeline Company has a gas pipeline that spans across Valley County which produced a big economic boost to the county during its construction in addition to the taxes now collected.	Consolidated Response ECO-1 addresses potential socioeconomic impacts, and Consolidated Response TAX-1 addresses concerns regarding taxes.
1378	6	Peterson	Bruce	Board of County Commissioners Valley County, Monta	Additional pipeline capacity will help consumers and businesses throughout the United States.	Comment acknowledged.
1498	2	Peterson	Ken	Kansas Petroleum Council	I am writing in support of TransCanada's Keystone XL crude oil pipeline project. I urge the Department to grant a permit for the pipeline to cross the U.S./Canadian Border. This project is a vital link to secure energy supplies for the United States. Canada is a valued trading partner and our most reliable source of foreign-based crude oil.	Comment acknowledged.
1498	3	Peterson	Ken	Kansas Petroleum Council	Kansas will benefit from the jobs created by the pipeline that will run through the state and link up with refineries on the route to Cushing, Oklahoma, and the Gulf. Shovel-ready jobs caught the fancy of our Rejection of the permit forces U.S. consumers to rely on other sources of crude oil not economically and politically allied with our interests. The Kansas Petroleum Council urges department approval of the permit. Thank you for your attention to this important energy matter.	The proposed Project would use the existing Cushing Extension through Kansas and would require construction and operation of two new pump stations in Kansas. There would not be new pipeline in Kansas as a part of the proposed Project. Consolidated Response ECO-1 addresses potential socioeconomic impacts, and Consolidated Response TAX-1 addresses concerns regarding taxes.
1538	1	Peterson	Bruce		Meeting well done. Strongly in favor. Positive tax implication and really no negatives.	Comment acknowledged.
1540	144	Peterson	Travis		There's lots of positive things about a pipeline coming through	Comment acknowledged.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					with different forms of taxes and boosting the economy.	
1540	145	Peterson	Travis		TransCanada is one of the safest contractors, held at a higher level than most of the companies require them to be.	Comment acknowledged.
747	1	Petroelje	David		Please deny the permit for this pipeline...	Comment acknowledged.
747	3	Petroelje	David		...Oil sands and shales are the worst forms of oil, and mining them causes huge environmental impacts.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project.
1196	1	Pfabe	Esther		The proposed route for the Keystone XL Pipeline will cross parts of the precious Ogallala Aquifer in Nebraska. That source of fresh water is so valuable to the country [that an alternate route seems absolutely necessary.] There is no foolproof system that can insure that the pipeline will never threaten this water treasure.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. Consolidated Response ALT-1 addresses potential alternative routes, including routes that would avoid much of the Northern High Plains Aquifer system.
1204	1	Pfabe	Jerrald	Concordia University	I write in oppose the plan to run a petroleum pipeline through the Sandhills of Nebraska. I am particularly concerned about the potential environmental damage which could occur in the area of the pipeline. A significant consideration for me is the matter of the high water table in this region. The pressures of water could make the security of the pipeline quite questionable. It could be a very unstable situation. Any break or leak in the pipeline could be quite harmful to the aquifer in that area.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
1204	2	Pfabe	Jerrald	Concordia University	The aquifer is one of our state's most important natural resources. We should make strong efforts to protect it because it is so vital. In my judgment, that means: do not build the pipeline.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
558	1	Pfaff	Patricia		Do not allow this pipeline to cross our Nebraska Sandhills and our precious Ogallala Aquifer.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
559	1	Pfaff	Charles		Keep this pipeline away from the Nebraska Sandhills and our Ogallala Aquifer!	Issues related to the Sand Hills area are addressed in Consolidated Response ERO-1. Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
1195	1	Pfeifer	Phyllis		Please don't let them do this.	Comment acknowledged.
1195	2	Pfeifer	Phyllis		It seems as you said, the expertise on these subjects are not all correct. Will they stake their lively hood and be financially responsible if and when there is a problem with it?	Consolidated Response LIA-1 addresses Keystone's liability if there is a spill of hazardous materials or fuel during construction or a spill of crude oil from the proposed Project.
1181	1	Pflanz	Norman		Please do not build this pipeline across the State of Nebraska.	Consolidated Response ALT-1 addresses potential alternative routes, including routes that would avoid much of the Northern High Plains Aquifer system.
1181	2	Pflanz	Norman		The safety of the Ogallala Aquifer is much too important to be placed at risk by this scheme.	Issues related to the Sand Hills area are addressed in Consolidated Response ERO-1. As described in Consolidated Response GLF-1, the risks associated with the proposed Project are substantially different from those associated with the BP Deepwater Horizon Project. , Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
401	1	Pfoltner	Brian		Please do not allow this pipeline to be built. If the disaster in the gulf has done nothing else, it has served to show the dangers of such structures. Having this pipeline above the Ogallala Aquifer is a huge risk and not worth taking. A huge	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. As described in Consolidated Response GLF-1, the risks associated with the proposed Project are substantially different

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					spill could damage this crucial water source beyond repair. Please learn from the disaster in the Gulf. Such risks to the environment are not worth the gains.	from those associated with the BP Deepwater Horizon Project.
341	1	Phelan	Joan	Lincoln Public Schools	I am hoping that the Keystone project can be averted. We need to wean ourselves from our petroleum addiction. The world is watching the human-made disaster in the Gulf, where we have unleashed a genie that no one foresaw. We should do all we can to change plans that have such potential for environmental harm -- save the Ogallala aquifer, save our water supply from similar danger by not proceeding with the plans for the Keystone pipeline.	Issues related to the Northern High Plains Aquifer System are addressed in Consolidated Responses AQF-1 through AQF-4.
754	1	Philleo	Wendy		Please do not allow this pipeline...	Comment acknowledged.
754	2	Philleo	Wendy		...this pipeline ... the risk to our land ... is too great.	Section 3 of the EIS addresses the impacts of construction and operation of the proposed Project. Section 3.13 of the EIS addresses the risk and environmental impacts of a crude oil spill from the proposed Project.
754	3	Philleo	Wendy		... this pipeline - the risk to our ... water is too great.	Section 3 of the EIS addresses the impacts of construction and operation of the proposed Project. Section 3.13 of the EIS addresses the risk and environmental impacts of a crude oil spill from the proposed Project.
739	1	Phillippi	Janet		Keep this pipeline far away from our Nebraska Sand Hills. This area needs to remain as it is for many reasons, which you all ready know!	Identification of sensitive environments crossed by the proposed Project is discussed in Consolidated Response ENV-1 and ENV-3. Issues related to the Sand Hills area are addressed in Consolidated Response ERO-1. Consolidated Response ALT-1 addresses potential alternative routes, including routes that would avoid much of the Northern High Plains Aquifer system and the Sand Hills area.
750	1	Picken	Mary		I am AGAINST the Keystone pipeline in the Nebraska Sand Hills. Please keep our Sand Hills oil-free!	Consolidated Response ALT-1 addresses potential alternative routes, including routes that would avoid much of the Northern High Plains Aquifer system and the Sand Hills area.
1553	4	Pickett	Ellis		Well it looks like now what we are trying to do is import some of the most difficult to refine oil into this country. I don't think that's an answer either. We should be trying to create a greener power source in this country. Yeah it's gonna take a long time but in 35 years how many steps have we made? We certainly haven't made too many. I don't see a whole lot of commitment there from the Federal Government.	Consolidated Response Oil-4 addresses the composition of the Canadian crude oils that would be transported by the proposed Project. As noted in that response, the Canadian crude oil that would be transported is similar in composition to other heavy crude oils. Consolidated Response ALT-2 addresses the use of alternative technologies, alternative energy sources, and conservation of energy.
1553	5	Pickett	Ellis		I don't like the idea of bringing this tar sand into Texas. We're sitting right here in what's called a non-attainment zone. Our air quality is terrible here in Liberty. And if you look around Liberty, you don't see a whole lot of smokestacks, as a matter of fact most of them are barbecue pits or fireplaces.	As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries. Consolidated Response OIL-4 also addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils.
1553	6	Pickett	Ellis		Were going to suffer from more [air] pollution here, we are going to suffer from more health issues, more people are going to die of Cancer and Leukemia and Emphysema. And it's because we are bringing tar sands in from Canada. Maybe they ought to refine it there, and we can just use the pipeline to ship the gasoline down here.	As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries. Consolidated Response OIL-4 also addresses the composition

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
						of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils.
623	1	Pieper	Charles		I am adamantly opposed to building an oil pipeline over the Ogallala Aquifer or anywhere near it.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
1539	3	Pleffner	Mary	US Department of Commerce	Department of Commerce Comments: The Department of Commerce (DOC) does not feel that the Draft EIS for the Keystone XL Pipeline supplies enough information to adequately evaluate the impacts associated with the project.	As noted in Consolidated Response ENR-1, the environmental review, including preparation of this EIS, has been conducted consistent with the DOS regulations pertaining to NEPA (22 CFR Part 161) as well as the Council on Environmental Quality (CEQ) regulations for implementing NEPA (40 CFR Part 1500). As a result, DOS considers the EIS to be in full compliance with the requirements of a NEPA environmental review.
1539	4	Pleffner	Mary	US Department of Commerce	Additional information and/or analysis is needed in the following resource areas: • Greenhouse Gas emissions	Consolidated Response GHG-1 addresses the greenhouse gas life-cycle analyses presented in the revised EIS.
1539	5	Pleffner	Mary	US Department of Commerce	Additional information and/or analysis is needed in the following resource areas: • Impacts of the proposed new 230 kV transmission line from Lower Brule to Witten,	The assessment of potential impacts due to construction and operation of the Big Bend to Witten (formerly the Lower Brule to Witten) 230-kV transmission in the EIS is based on the information for the proposed project that was available at the time the EIS was prepared. Additionally, as a result of a request for financing from Basin Electric Power Cooperative to the Rural Utilities Service (RUS) of the U.S. Department of Agriculture for the transmission line compliance with NEPA, Section 106 of the NHPA, and other environmental review requirements will be the responsibility of the RUS as the lead federal agency.
1539	7	Pleffner	Mary	US Department of Commerce	Additional information and/or analysis is needed in the following resource areas: • Catastrophic spill response and impacts,	Consolidated Response RES-1 addresses issues related to preparation and review of emergency response plans for the proposed Project. As noted in that response, the Pipeline and Hazardous Materials Safety Administration requires that the emergency response plan include the worst-case release scenario. Section 3.13.4.2 and Consolidated Response OIL-2 address the maximum spill volume.
1539	8	Pleffner	Mary	US Department of Commerce	Additional information and/or analysis is needed in the following resource areas: • Catastrophic spill impacts,	Sections 3.13.5.6, including Table 1.13.5-10, and 3.13.6 of the EIS, address potential impacts, including catastrophic impacts, of many spill sizes, including a maximum spill volume.
1539	9	Pleffner	Mary	US Department of Commerce	Additional information and/or analysis is needed in the following resource areas: • Potential impacts associated with smaller spills and leaks on public water supplies, private wells, and shallow aquifers,	Issues related to aquifers along the proposed Project corridor are addressed in Consolidated Responses AQF-1 through AQF-4. Consolidated Response WAT-1 addresses concerns regarding potential water quality impacts.
1539	10	Pleffner	Mary	US Department of Commerce	Additional information and/or analysis is needed in the following resource areas: • Potential impacts to migratory birds/ timing of pipeline construction to take into consideration nesting/fledging cycles.	Keystone is developing pre-construction vegetation clearing plans for periods outside of the nesting season and continues to work with USFWS to develop a measures to avoid and minimize impacts to migratory birds as discussed in Section 3.6.2 of the EIS.
1539	11	Pleffner	Mary	US Department of Commerce	Additional information and/or analysis is needed in the following resource areas: Potential impacts associated with construction camps, staging areas, and access roads,	The resource sections of Section 3.0 of the EIS have been revised to include additional information on construction camps, staging areas, and access roads, including the potential impacts associated with use of those facilities.
1539	12	Pleffner	Mary	US Department of Commerce	Additional information and/or analysis is needed in the following resource areas: Potential impacts to aquifers.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
1539	13	Pleffner	Mary	US Department of Commerce	Additional information and/or analysis is needed in the following resource areas: Potential impacts to private wells and stock watering ponds,	Section 3.3.1 of the EIS has been revised to provide information on the likely occurrence of potable groundwater in water wells within 1 mile of the proposed pipeline centerline using publicly available and searchable databases maintained by water resource agencies within each state that would be crossed by the proposed Project. The databases were searched for domestic, irrigation, and public water supply well data. Data accessed included well locations, well total depth, and depth to first water (if available) or static water level. It is not likely that wells used for domestic purposes, irrigation, and livestock would be affected during construction and normal operation of the proposed Project. However, if there is damage, Compensation to landowners is addressed in Consolidated Response FRM-1 and in Section 2.5 of the Keystone Construction, Mitigation, and Reclamation Plan in Appendix B of the EIS. If there is a spill from the proposed Project, Keystone or the incident response team would inform all landowners in the vicinity of the spill that the release had occurred and advise the landowners of the appropriate precautions. Keystone would be liable for all costs associated with cleanup and restoration as well as other compensations, as noted in Consolidated Response LIA-1. If a stock pond or a well used as a source of domestic or irrigation water is affected, Keystone would provide water until the affected water is proven to be acceptable for use.
1539	15	Pleffner	Mary	US Department of Commerce	Additional information and/or analysis is needed ... [for] crossing other pipelines and buried utility lines,	Section 2.3.3.2 of the EIS has been revised to provide additional information on this subject.
1539	16	Pleffner	Mary	US Department of Commerce	Additional information and/or analysis is needed in the following resource areas: Potential impacts to Historic Trails,	The appendix to the Programmatic Agreement entitled "Historic Trails and Archaeological Monitoring Plan" has been expanded to include information that was not available at the time the DEIS was prepared.
1539	17	Pleffner	Mary	US Department of Commerce	Additional information and/or analysis is needed in the following resource areas: • Potential impacts to environmental justice communities.	Sections 3.10.1.1, 3.10.1.2, and 3.13.6.7 of the EIS have been revised to include additional information related to environmental justice.
1539	20	Pleffner	Mary	US Department of Commerce	Impacts of the proposed new 230 kV transmission line from Lower Brule to Witten. The proposed transmission line (approximately 70 miles of new 230kV line from Lower Brule to Witten) was acknowledged as being a related action (necessary to supply electricity to the substations) but was not adequately analyzed as "DOS, Western and other cooperating Agencies do not have sufficient design and construction information to establish an Agency preferred alternative..." (pg. ES-7).	The assessment of potential impacts due to construction and operation of the Big Bend to Witten (formerly the Lower Brule to Witten) 230-kV transmission in the EIS is based on the information for the proposed project that was available at the time the EIS was prepared. Additionally, as a result of a request for financing from Basin Electric Power Cooperative to the Rural Utilities Service (RUS) of the U.S. Department of Agriculture for the transmission line compliance with NEPA, Section 106 of the NHPA, and other environmental review requirements will be the responsibility of the RUS as the lead federal agency.
1539	22	Pleffner	Mary	US Department of Commerce	Evaluation of alternative energy sources to fulfill the energy needs identified as the need for the project. The document only identifies the need for crude oil, resource availability, and future trends relative to crude oil production and usage. It does not evaluate alternative methods of achieving energy security, only states alternative energy cannot meet the demand for crude oil. While it is understood this document is produced to evaluate the impacts associated with a specific pipeline, to limit the alternatives analyzed to only oil supplying	Consolidated Responses P&N-1 and ALT-2 and Section 4.1 of the EIS address the use of alternative technologies, alternative energy sources, and conservation of energy.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					pipelines, while making statements about the US “reliance on oil from countries with declining or uncertain production horizons” does not fully capture the need for this project. DOC believes that a more thorough analysis of alternative energy options would produce a more robust document.	
1539	23	Pleffner	Mary	US Department of Commerce	Catastrophic spill response and impacts. Catastrophic spills and impacts are generally addressed in the document as being statistically improbable and are therefore not fully evaluated. While DOC appreciates that TransCanada will comply with all safety requirements and has a good record of resolving safety compliance issues, the possibility of a catastrophic spill cannot be ignored.	Sections 3.13.5.6, including Table 1.13.5-10, and 3.13.6 of the EIS, address potential impacts, including catastrophic impacts, of many spill sizes, including a maximum spill volume.
1539	24	Pleffner	Mary	US Department of Commerce	The document does not adequately identify the maximum volume that could be discharged or the methods that would be employed in the unlikely event that automatic shut-off devices malfunctioned.	Consolidated Response OIL-3 describes the maximum potential spill volume. All issues related to design specifics and operation of the proposed pipeline system are under the jurisdiction of Pipeline and Hazardous Materials Safety Administration (PHMSA) as explained in Sections 2.3, 2.3.1, and 3.13.1 and in Consolidated Response SAF-1. The EIS describes the basic elements of design, construction, and operation that need to be considered in assessments of the potential impacts of construction and normal operation. As a result, not all equipment that would be installed if the Project is approved is listed and not all operating conditions are listed. The probability of a spill presented in Section 3.13.4 is based on PHMSA incident data, and the impacts of a spill presented in Sections 3.13.5.6 and 3.13.6 describe what would likely occur if oil were to be release, irrespective of the reason for the release.
1539	25	Pleffner	Mary	US Department of Commerce	The document does not adequately identify the methods that would be employed in the unlikely event that automatic shut-off devices malfunctioned.	Our NEPA review did not address the details of operation of the Project but addressed the basics of normal operation and the potential impacts. We also addressed the impacts of abnormal operation in Section 3.13.5 of the EIS. As described in Consolidated Response SAF-1, the Pipeline and Hazardous Materials Safety Administration (PHMSA) has regulatory requirements that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project. In addition, PHMSA developed 57 Project-specific Special Conditions that Keystone has agreed to implement. Those regulations and Special Conditions address operating procedures for pipelines, including procedures for upset conditions.
1539	28	Pleffner	Mary	US Department of Commerce	Questions arise regarding not only environmental issues, but more basic issues such as how would people and livestock impacted by a catastrophic spill obtain water;	Irrespective of the size of a release, as noted in Consolidated Response LIA-1 if there is a spill of hazardous materials or fuel during construction or a spill of crude oil from the Project that affects water sources, Keystone would provide water until the normally used supply is restored or a replacement source is arranged.
1539	29	Pleffner	Mary	US Department of Commerce	Questions arise regarding not only environmental issues, but more basic issues such as who would be responsible for reimbursing individuals impacted by the spill- TransCanada or, if the spill were caused by a rupture, the individual who caused the rupture; and who would be responsible for the	Consolidated Response LIA-1 addresses Keystone’s liability if there is a spill of hazardous materials or fuel during construction or a spill of crude oil from the proposed Project.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					clean-up.	
1539	31	Pleffner	Mary	US Department of Commerce	Potential impacts to migratory birds. While it is understood that the Canadian portion of this project is beyond the scope of this EIS, large numbers of migratory birds utilize the boreal forests for breeding and sustenance. This document does not adequately address the impacts of deforestation on the US migratory bird population or those populations living along the border regions.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project. Consolidated Response ENV-4 addresses issues related to oil sands production and migratory birds.
1539	32	Pleffner	Mary	US Department of Commerce	Potential impacts associated with construction camps, staging areas, and access roads. The document states that these activities "cannot be assessed until the actual locations of for these sites are determined" (3.4.3). DOC believes that the potential impacts of these activities, particularly to critical habitats and wetlands, are required to fully evaluate the impacts associated with this project.	The resource sections of Section 3.0 of the EIS have been revised to include additional information on construction camps, staging areas, and access roads, including the potential impacts associated with use of those facilities.
1539	33	Pleffner	Mary	US Department of Commerce	Potential impacts to aquifers. The following statement: "the proposed pipeline route does not cross any sole-source aquifers in (fill in the State) as identified by EPA Region X", while being technically correct, fails to inform the reader of what percentage of the state's water comes from the aquifer(s) that the pipeline does cross. For example in Nebraska, the pipeline crosses an area that supplies approximately 78% of the public water supply and 83% of its irrigation needs. DOC suggests that less emphasis be placed on impacts associated with sole-source aquifers and more on potential impacts on aquifers that the pipeline does cross.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
1539	34	Pleffner	Mary	US Department of Commerce	Potential impacts to private wells and stock watering ponds. The area traversed by the proposed pipeline contains numerous private drinking wells, ranches, and cattle yards. There is no analysis of the impact of spills and leaks from both construction equipment and the pipeline on these smaller, yet still critical, resources.	Section 3.13 of the EIS addresses reliability and safety issues, including calculations of the probability of a spill from the proposed Project and the potential environmental impacts associated with spills that reach water used for drinking, irrigation, or cattle watering. Section 3.13 addresses potential surface water and groundwater impacts, including impacts to the types of facilities mentioned by the commenter. The text of the EIS has been revised in response to this comment.
1539	36	Pleffner	Mary	US Department of Commerce	Crossing other pipelines or buried utility cables. The document does not adequately identify the impacts to existing pipelines or buried utilities. It identified potential pipeline projects located in the project area, but fails to adequately explain how they would be accommodated.	Use of the construction methods described in Section 2.3 of the EIS would avoid impacts to utilities crossed by the proposed pipeline.
1539	37	Pleffner	Mary	US Department of Commerce	Potential impacts to Historic Trails. The document states the pipeline route will cross six national historic trails, but does not state how they will be crossed or if the burying of the pipeline will disturb the surface of the trails. DOC recommends that the trails be directionally bored to avoid contact with the surface features.	The appendix to the Programmatic Agreement entitled "Historic Trails and Archaeological Monitoring Plan" has been expanded to include information that was not available at the time the DEIS was prepared. Monitors will be positioned consistent with the HTAM Plan as stipulated in the PA.
1539	38	Pleffner	Mary	US Department of Commerce	Potential impacts to environmental justice communities. The document does not adequately identify Tribal issues,	Consolidated Response JUS-1 addresses environmental justice issues.
1539	39	Pleffner	Mary	US Department of Commerce	The document does not adequately identify nor does it utilize census tract data (a more reliable indicator of minority and low-income populations) to adequately identify the presence of environmental justice communities.	Sections 3.10 and 3.10 of the EIS have been revised to address issues related to use of census tracts.
1539	40	Pleffner	Mary	US Department	A Programmatic Agreement was included in the Appendix	The Programmatic Agreement (PA) will be finalized and

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
				of Commerce	with signature blocks for numerous Tribal governments, but the copy provided was unsigned.	signed by signatory parties prior to the Record of Decision (ROD) for the Project.
1539	41	Pleffner	Mary	US Department of Commerce	Outreach efforts to tribal governments was also not identified.	Consolidated Response CUL-1 and Section 3.11.4.3 of the EIS address the consultation process between DOS and Indian tribes. As noted in Consolidated Response CUL-1, a Programmatic Agreement (PA) has been developed for the Project under Section 106 of the National Historic Preservation Act. The PA includes mitigation measures for known adverse effects and provides a process for ongoing surveys to be conducted in areas where access was not granted during the EIS process. The Traditional Cultural Property (TCP) reports (noted in Section 3.11.4-3 of the EIS) may not be disclosed due to concerns regarding confidentiality. Potential impacts to cultural resources are addressed in Section 3.11.3.1 of the EIS. DOS considers this assessment to be in compliance with NEPA environmental review requirements.
1539	41	Pleffner	Mary	US Department of Commerce	Outreach efforts to tribal governments was also not identified.	Consolidated Response CUL-1 and Section 3.11.4.3 of the EIS address the consultation process between DOS and Indian tribes. As noted in Consolidated Response CUL-1, a Programmatic Agreement (PA) has been developed for the Project under Section 106 of the National Historic Preservation Act. The PA includes mitigation measures for known adverse effects and provides a process for ongoing surveys to be conducted in areas where access was not granted during the EIS process. The Traditional Cultural Property (TCP) reports (noted in Section 3.11.4-3 of the EIS) may not be disclosed due to concerns regarding confidentiality. 882	1	Pleskac	Maggie		it is irresponsible of our government to use our fiscal resources to tap out non-renewable environmental resources. oil is not the answer.	Consolidated Response P&N-1 addresses the need that the Project has been proposed to meet. Consolidated Response ALT-2 addresses the use of alternative technologies and alternative energy sources.
882	2	Pleskac	Maggie		If there is any truth and transparency left in our government then light would be shed on the dangers of digging through our underground aquifers. Please be a government for the people by the people. leave a world behind that you would have wanted to live in.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
851	1	Pluhacek	Kristin		Please do not allow the routing of the Keystone oil pipeline through the Nebraska Sandhills. I think that all would agree that the Ogallala Aquifer is an extremely valuable natural resource that should not be threatened in any way - even remotely - by a deliberate and avoidable act. Potable water absolutely trumps oil as a basic human need.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
1474	1	Poe	Ted	US Congress	As members Of the United States Congress, we strongly. encourage the U.S, Department of State to approve Keystone XL; an energy infrastructure project. This project will not only will strengthen long-term energy security in the United States, but also provide a powerful private sector economic stimulu6 to the mostly rural communities along the pipeline route during its construction. At a time when our economy continues to struggle. • a project like Keystone XL is Vital. We are proud to	Comment acknowledged.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					represent the congressional districts along the proposed Keystone XL route from the point it enters Texas to its final destination	
1474	2	Poe	Ted	US Congress	It is our belief that Keystone XL will create more than 13,000 high-wage construction and manufacturing jobs during the project's 2011-2012 construction schedule. Many of those jobs will be created in rural Texas and in areas of our districts where too many of our residents struggle to find good jobs. With Keystone XL. They will have an opportunity to work on the project or for businesses that provide supplies, goods and services for its construction and operation.	Consolidated Response ECO-1 addresses potential socioeconomic impacts, and Consolidated Response TAX-1 addresses concerns regarding taxes.
1474	3	Poe	Ted	US Congress	In addition to the creation of jobs, Keystone XL will generate substantial economic benefits for the United States, specifically in states and communities along the proposed route. Like our counties, these proposed areas are where economic performance has stagnated or is shrinking. It is our understanding that TransCanada commissioned a study measuring the project's economic affect on our country and the states along the route. The TransCanada study found that in the U.S., Keystone XL would generate \$20.9 billion in total expenditures, \$9.6 billion in output (gross product), personal income of \$6.5 billion and 118,935 person years of employment (jobs). Additionally, in the study's conclusion they found that during construction, Keystone XL would generate \$486.36 million in tax revenue for state governments along the route and \$99.1 million for local taxing entities where the pipeline is located. The study found that Keystone XL expenditures during construction would total \$5.4 billion and generate an economic gross product of nearly \$2.86 billion in Texas. Keystone XL construction also would generate more than \$64.5 million in tax revenue for local government and \$152 million for state government.	Consolidated Response ECO-1 addresses potential socioeconomic impacts, and Consolidated Response TAX-1 addresses concerns regarding taxes.
1474	5	Poe	Ted	US Congress	We enthusiastically support the Keystone XL Pipeline project and encourage the Department of State to confirm the findings of the Draft Environmental Impact Statement, which found that the proposed Keystone XL Pipeline would have "limited adverse environmental impact during construction and operation." We look forward to the issuance of a Final Environmental Impact Statement followed by a Presidential Permit that allows the construction of Keystone XL and enables our districts, the state of Texas, and the United States to collect the substantial economic benefits Keystone XL would create.	Comment acknowledged.
715	1	Pollack	John		...Terrorism would be impossible to prevent, but it could also be a target for extortion, vandalism, or accidental penetration. Extortion could be accomplished by burying corrosive substances (even rock salt) next to the pipe, and asking for money to reveal the locations before the pipe corrodes through...	Consolidated Response TER-1 addresses the potential for terrorism.
715	4	Pollack	John		[What, if anything, can be done to protect this pipeline from penetration?] Passing through long stretches of remote areas, buried only 4 feet underground, ... it is uniquely vulnerable...	As described in Consolidated Response SAF-1, the Pipeline and Hazardous Materials Safety Administration (PHMSA) has regulatory requirements that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project in a manner that protects the health and

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
						safety of the public and the environment. In addition, PHMSA developed 57 Project-specific Special Conditions that Keystone has agreed to implement. Incorporation of those conditions would result in a Project that would have a degree of safety over any other typically constructed domestic oil pipeline system under current code and a degree of safety along the entire length of the pipeline system similar to that which is required in HCAs as defined in 49 CFR 195.450. The burial depth would be greater than the regulatory requirements, and there would be pipeline markers along the route to identify the location of the pipeline.
715	5	Pollack	John		The pipeline, as proposed, is perched right above the deepest part of the Ogallala Aquifer in an environmentally sensitive area.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
715	6	Pollack	John		The pipeline, as proposed, also passes through a seismic risk zone in north central Nebraska...	Consolidated Response GEO-2 addresses potential seismic hazards.
414	1	Pollard	Sarah		As a lifelong Nebraska citizen and conservation advocate, I would like to formally express my outrage. Please do not do this.	Consolidated Response ENR-1 provides information on the Department of State's environmental review process, the National Interest Determination process, and the need to complete those reviews before approving or denying the Presidential permit for the proposed Project.
1356	1	Poor	Tim	American Superconductor Corporation	Recently a number of advocacy groups sent a letter seeking suspension of the permitting of the Keystone XL pipeline. I encourage you to reject the request and to continue to review the proposed project.	Comment acknowledged.
1356	2	Poor	Tim	American Superconductor Corporation	We have been a supplier of Smart Grid solutions on other similar projects - and this pipeline holds promise for US manufacturing jobs to produce similar advanced technology equipment for the Keystone XL pipeline.	Comment acknowledged.
1356	3	Poor	Tim	American Superconductor Corporation	The project has the potential to deliver significant energy security benefits to the United States, increasing access to significant land-based sources of oil from a trading partner with whom we are closely allied.	Comment acknowledged.
1356	4	Poor	Tim	American Superconductor Corporation	At the same time, construction of this project stands to bring significant economic benefits to the areas where it will be built.	Comment acknowledged.
1356	5	Poor	Tim	American Superconductor Corporation	Provided it has limited impact on the environment, this project could be an important part of the solution to our energy supplies. The permitting processes in place are appropriate and should proceed so that a final determination can be made about the impacts of the project and whether it is in the national interest. American Superconductor urges you to reject the request to suspend the process and continue with the review.	Comment acknowledged.
393	1	Pope	Joanna		I am very concerned about the placement of this pipeline in the profile of the Ogallala Aquifer. This aquifer is a precious resource for most of our state. Over 90% of our state gets its drinking water from groundwater.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
393	2	Pope	Joanna		I am concerned and alarmed that this project, if there is a spill/breach would destroy this resource. I am also very concerned that disturbing the fragile grassland in the Sandhills region will be difficult to re-establish. This area receives above	Issues related to the Northern High Plains Aquifer System are addressed in Consolidated Responses AQF-1 through AQF-4. Consolidated Response AQF-3 provides information on hypothetical spills from the Project over two areas of the

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					average wind and below average rainfall. This could be a recipe for disaster in an area with extremely light/sandy soils.	Northern High Plains Aquifer System. Issues related to the Sand Hills area are addressed in Consolidated Response ERO-1. The impacts associated with implementation of the proposed Project are addressed in Section 3.0 of the EIS. As noted in that section, the proposed Project would not result in significant environmental impacts.
393	3	Pope	Joanna		I would strongly suggest that the State Department concentrate on assisting with the development of alternative energy sources rather than furthering our dependency on oil – an unsustainable and finite resources.	As noted in Consolidated Responses ENR-1 and P&N-9, the Department of State is neither a proponent nor an opponent of the proposed Project. The DOS review of the proposed Project consists of conducting (1) an environmental review of the proposed Project in accordance with the National Environmental Policy Act (NEPA), and (2) conducting a National Interest Determination. Consolidated Response ALT-2 addresses the use of alternative technologies, alternative energy sources, and conservation of energy.
318	1	Porte	Sanna		With respect, the DEIS for the Keystone XL tar sands pipeline, proposed to cross 283 miles of eastern Montana, is grossly inadequate.	As noted in Consolidated Response ENR-1, the environmental review, including preparation of this EIS, has been conducted consistent with the DOS regulations pertaining to NEPA (22 CFR Part 161) as well as the Council on Environmental Quality (CEQ) regulations for implementing NEPA (40 CFR Part 1500). As a result, DOS considers the EIS to be in full compliance with the requirements of a NEPA environmental review.
318	2	Porte	Sanna		To name one huge, major problem: The DEIS does not contain or evaluate a complete emergency response plan. Can't we learn a lesson from the heartbreaking BP oil spill in the gulf?	Consolidated Response RES-1 addresses issues related to preparation and review of emergency response plans for the proposed Project.
318	4	Porte	Sanna		The DEIS doesn't analyze the environmental effects of tar sands oil -- the dirtiest form of energy available, according to experts.	Consolidated Response OIL-4 addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils. Section 3.13 of the EIS addresses the impacts of a release of crude oil from the proposed Project. As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries.
1160	1	possumsbus@yahoo.com			This is a state issue, not a federal issue.	Keystone would be required to obtain many state permits as indicated in Table 1.8.1-1 of the EIS. However, overall regulatory authority for the design, construction, operation, maintenance, inspection, and monitoring of the proposed Project would be under the regulatory jurisdiction of the Pipeline and Hazardous Materials Safety Administration as described in Consolidated Response SAF-1. As noted in Consolidated Response ENR-1 and Section 1.0 of the EIS, the Department of State is responsible for reviewing the Presidential permit for the proposed Keystone XL proposed Project and must assess the impacts associated with that proposed Project.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
1553	16	Poteet	Carle		I'm a realtor in this area...my concern is several concerns about you know going through areas where there is potential subdivisions to be brought in to where land can be sold for subdivisions. How far from the line is it safe? How far is it a protected area? What can be done about that and what is going to be the valuation of crossing these lands and everything, and what the pipeline will eventually be confiscating for some of the property land.	Consolidated Response VAL-1 addresses concerns regarding property values. All issues related to design specifics and operation of the proposed pipeline system are under the jurisdiction of Pipeline and Hazardous Materials Safety Administration (PHMSA), as explained in Sections 2.3, 2.3.1, and 3.13.1 and in Consolidated Response SAF-1. PHMSA regulations do not limit the distance between crude oil pipelines and residences, although the regulations do address construction procedures for pipelines within 25 feet of a residence. There would be restrictions regarding buildings and trees within the proposed 50-foot-wide permanent right-of-way of the Project, although other land uses would be permitted within that area. Consolidated Response EAS-2 addresses issues related to easement negotiations. As noted in that response, DOS has no legal authority in the easement negotiation process.
1553	17	Poteet	Carle		Interested in using methanol from switchgrass as a fuel source and into looking into this rather than using more oil.	Consolidated Response ALT-2 addresses the use of alternative technologies and alternative energy sources.
716	1	Pranger	Samantha		...A pipeline that long would be a magnet for would-be terrorists...	Consolidated Response TER-1 addresses potential terrorism associated with the proposed Project.
716	2	Pranger	Samantha		I can't think of a worse idea!	The commenter's opinion is noted.
716	3	Pranger	Samantha		...and what if there was simply a leak?	Consolidated Response OIL-3 and Section 3.13.5 of the EIS describe the leak detection system for the Project. Response times will vary according to environmental conditions, logistics, and other operational variables. After a leak is detected, the procedures listed in the Emergency Response Plan (ERP) would be implemented. Consolidated Response RES-1 addresses issues related to preparation and review of the ERP for the proposed Project.
189	1	Prenger	Suzy		This letter is to urge you to re-visit the proposed TransCanada Keystone XL Pipeline that is slated to go through the fragile ecosystem of the Nebraska Sandhills and the groundwater of the Ogallala Aquifer. The pipeline is scheduled to tunnel under the scenic Niobrara River and through a fragile topography. I am not opposed to an oil pipeline. I am opposed to it going through one of the most unique ecosystems in the world that provides Nebraskans and the entire country with the infrastructure of a breadbasket; has one of the last natural aquifers; and is the amazing home to the yearly migration of thousands of Sandhills and whooping cranes. (Please come see it sometime, it is a wondrous event that all should experience in their lifetime.)	Identification of sensitive environments crossed by the proposed Project is discussed in Consolidated Response ENV-1 and ENV-3. Issues related to the Sand Hills area are addressed in Consolidated Response ERO-1 and Issues related to the Sand Hills area are addressed in Consolidated Response ERO-1. Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. Potential Project impacts on sandhill cranes are discussed in Section 3.6 and potential impacts on whooping cranes are discussed in Section 3.8 and Appendix T of the EIS.
189	2	Prenger	Suzy		Groundwater. Think about this. The diluting chemicals, such as naphtha, that flow with the oil spread very quickly and would destroy our water system. Why take this risk, when moving the pipeline a hundred or so miles to the east would completely miss the aquifer and eliminate the blowout potential in the Sandhills?	Consolidated Response OIL-4 addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils. Consolidated Response ALT-1 addresses potential alternative routes, including routes that would avoid much of the Northern High Plains Aquifer system. Issues related to the Sand Hills area are addressed in Consolidated Response ERO-1.
189	3	Prenger	Suzy		I want to be able to take my grandkids there, and not as an object lesson in how we destroy with man-made projects - but how we conserve and celebrate our ecosystems. And how	Consolidated Response ALT-1 addresses potential alternative routes, including routes that would avoid much of the Northern High Plains Aquifer system and the Sand Hills area.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					reasonable people made a decision to move the pipeline to a better spot so we would not risk such destructiveness. How a company listened to the concerns of people and became a better company for it.	
1416	1	Prewett	Kari&Adam	Prewett Interiors	I write in support of TransCanada's Keystone XL crude oil pipeline project and urge the department to grant a permit for the pipeline. I urge the granting of the permit. Thank you for the opportunity to comment.	Comment acknowledged.
1416	4	Prewett	Kari&Adam	Prewett Interiors	Considering the economic [and energy security] benefits of these vital resources, we should continue to expand America's access to safe, affordable energy to help ensure [improved domestic and global energy security and] stable prices for consumers... This project also stands to provide a powerful private sector economic stimulus. During construction, Keystone XL will create more than 13,000 jobs funded with private investment. In addition, local governments will have a steady source of income from economic activity associated with construction and from property taxes the pipeline company will pay... Rejection of the permit or suspension of the review would sacrifice the significant economic benefits this project stands to deliver and force U.S. consumers to rely on other sources of crude oil not economically and politically allied with U.S. interests. This would be a mistake.	Consolidated Response ECO-1 addresses potential socioeconomic impacts, and Consolidated Response TAX-1 addresses concerns regarding taxes.
1416	5	Prewett	Kari&Adam	Prewett Interiors	Pipelines are the safest, most reliable, economical and environmentally favorable way to transport oil and petroleum products, as well as other energy liquids, throughout the U.S.	Comment acknowledged.
656	1	Price	Virginia		I vote against this dirtiest and most expensive mining procedure that cause community health problems. (cancer, asthma, etc)	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project.
656	2	Price	Virginia		The Keystone XL pipeline ruins the ground nutrients and takes many years for re-growth.	See Consolidated Response SOI-2 and Section 3.2.2.1 of the EIS for a discussion of topsoil handling and restoration concerns.
899	1	Price	Aaron	Gracie Creek ranch	I'm a fifth generation rancher from the Nebraska Sand Hills and I'm taking a strong stance against the Keystone XL pipeline. Installing the Keystone pipeline to push tar-sand oil through the USA's Heartland is a grand mistake. Of most concern to me is the high capacity pipeline's path of Nebraska's deepest part of the Ogala Aquifer—one of our nation's greatest natural resources assets. Most of Nebraska is full of permeable soils that easily leech chemicals into the soil, eventually contaminate the aquifer, and end up downstream in large metropolitan water supplies and finally the Gulf. If disaster strikes with this pipeline over the aquifer, I fear given our track record in the Gulf, devastating damages will accumulate in ways that will render this area of aquifer useless and slowly impact individuals and ecosystems down the line as I described. Certain areas of the aquifer are facing water shortage stress and its important to remember that dirtying precious ground water has the same effect as pumping out water that doesn't replenish. Increasing problems of water quality equals decreasing amounts of clean groundwater. I know that if contamination occurs at deep	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. As described in Consolidated Response GLF-1, the risks associated with the proposed Project are substantially different from those associated with the BP Deepwater Horizon Project.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					levels in the aquifer, we may never be able to clean it up, because I'm all too familiar with my state's struggle to clean up the aquifer. Cleaning up a gulf spill poses grand challenges, but if a large spill occurs in my state over our greatest freshwater natural resource, we risk devastating our nation's future in an era where people readily say my generation will see a day where water is more valuable than water.	
899	2	Price	Aaron	Gracie Creek ranch	In light of climate change and energy issues today, we need to learn to adapt to greener technologies vs. falling into traditional short-term solutions. This administration is severely lacking visionary energy and environmental policy and I voted for this administration based on these platforms. Energy policy is complex and we need a certain degree of fossil fuels to continue meeting energy demands, but plans to build a pipeline over the greatest aquifer in the US seems idiotic if disaster strikes -probability states it will as we've seen in the Gulf. Thank-you for listening, but I'd appreciate some visionary action.	Consolidated Response ALT-2 addresses the use of alternative technologies and alternative energy sources. Issues related to the High Plains Aquifer System are addressed in Consolidated Response AQF-1.
629	1	Pioreschi	Mary		Exposing such an important source of water, protected by the fragile and porous soil of the Sandhills, to the risks associated with a new technology can only be described as irresponsible.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. Consolidated Response OIL-1 addresses the likelihood of spills from the Project.
1084	1	Prosterman	Lyle&Janice		We don't want the Keystone pipeline in Nebraska.	Comment acknowledged.
9	1	Pyette	Willie		Please note that I am a supporter of the XL Pipeline that is proposed to cross Montana. As a life resident and landowner please note that me and my family support this project.	Comment acknowledged.
897	1	Pyrzynski	James		The routing of the pipeline through the Nebraska Sand Hills is ill advised. The Ogallala Aquifer, one of the largest aquifers in the U. S., is under this region and it is close to the surface. Any leakage from the pipeline would cause a catastrophe. There have been other pipeline breaks in recent days (Utah for one) which point to the possible consequences. Also, Keystone should not be seeking to use shortcuts in materials simply as a matter of course. The BP oil spill in the Gulf of Mexico is a vivid example of what can happen. The bottom line - reroute the pipeline to avoid the Nebraska Sand Hills and other environmentally sensitive areas and don't take short cuts in materials.	Issues related to the Northern High Plains Aquifer System are addressed in Consolidated Responses AQF-1 through AQF-4. Issues related to the Sand Hills area are addressed in Consolidated Response ERO-1. Consolidated Response ALT-1 addresses potential alternative routes, including routes that would avoid much of the Northern High Plains Aquifer System. Consolidated Response SAF-1 describes the regulatory requirements that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project in a manner that protects the health and safety of the public and the environment. The proposed Project would be constructed and operated in compliance with those regulations. High consequence areas (HCAs) area defined by the Pipeline and Hazardous Materials Safety Administration (PHMSA) in 49 CFR 195.450 and are based on population levels and environmentally sensitive areas. Keystone submitted a list of HCAs along the proposed route to PHMSA.
704	1	Queen	Carly		Tar sands are the absolute WRONG direction for America's energy future.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information on current and future production. As noted in that Consolidated Response, without the proposed Project, oil sands development would continue at or above the current level until at least 2020, with or without the proposed Project.
704	2	Queen	Carly		No Keystone XL Pipeline!!!	Comment acknowledged.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
1357	1	Quick	Lyle	McCone Agricultural Protection Organization	I am writing in response to the DEIS on the Keystone XL pipeline. I have some concerns that need to be addressed in future drafts of the EIS. My concerns are in regards to the pressure waiver/proposed thinner pipe in "low consequence areas," abandonment of the pipeline, and agriculture.	Keystone has withdrawn its application for a Special Permit as described in Consolidated Response REG-1.
1357	2	Quick	Lyle	McCone Agricultural Protection Organization	The pressure waiver concerns me because the DEIS does not analyze the risks or potential impacts of spills of alternative thicknesses of pipe, or disclose what areas are "high consequence areas"	Keystone has withdrawn its application for a Special Permit as described in Consolidated Response REG-1. The Project would be constructed in accordance with PHMSA regulations and in accordance with the 57 Project-specific Special Conditions (see Appendix U of the EIS) developed by PHMSA and agreed to by Keystone. Incorporation of those conditions would result in a Project that would have a degree of safety over any other typically constructed domestic oil pipeline system under current code and a degree of safety along the entire length of the pipeline system similar to that which is required in high consequence areas (HCAs) as defined in 49 CFR 195.450.
1357	3	Quick	Lyle	McCone Agricultural Protection Organization	The pressure waiver concerns me because the DEIS does not analyze the risks or potential impacts of spills of alternative thicknesses of pipe, or disclose what areas are "high consequence areas"	Keystone has withdrawn its application for a Special Permit as described in Consolidated Response REG-1. As described in Consolidated Response SAF-1, the Pipeline and Hazardous Materials Safety Administration (PHMSA) has regulatory requirements that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project. In addition, PHMSA developed 57 Project-specific Special Conditions (see Appendix U of the EIS) that Keystone has agreed to implement. Incorporation of those conditions would result in a proposed Project that would have a degree of safety over any other typically constructed domestic oil pipeline system under current code and a degree of safety along the entire length of the pipeline system similar to that which is required in high consequence areas (HCAs) as defined in 49 CFR 195.450.
1357	4	Quick	Lyle	McCone Agricultural Protection Organization	The Department of Transportation has said that it will issue a separate Environmental Analysis and proposed special permit allowing a waiver for TransCanada to use thinner pipe outside of "high consequence areas." The DEIS should have analyzed the real potential risks and impacts of a spill under the waiver-granted scenario.	Keystone has withdrawn its application for a Special Permit as described in Consolidated Response REG-1, and the Pipeline and Hazardous Materials Safety Administration will not be preparing a separate analysis. The Project would be constructed in accordance with PHMSA regulations and in accordance with the 57 Project-specific Special Conditions (see Appendix U of the EIS) developed by PHMSA and agreed to by Keystone. Incorporation of those conditions would result in a Project that would have a degree of safety over any other typically constructed domestic oil pipeline system under current code and a degree of safety along the entire length of the pipeline system similar to that which is required in high consequence areas (HCAs) as defined in 49 CFR 195.450.
1357	6	Quick	Lyle	McCone Agricultural Protection Organization	Lastly, I am concerned about agricultural land. The EIS severely underestimates the impact that construction or any potential leaks would have on agricultural land, saying that agricultural land will recover in 1 year. Farmers know that it takes many seasons to recover from soil damage, weed introduction, settling, and everything else that will be associated with a massive construction project with huge heavy machinery. Also, the idea that our crops will grow back	Consolidated Response FRM-1 describes potential impacts to farmland and ranches and Keystone's responsibilities to compensate for damage to these crops. The EIS was revised to reflect that the potential impacts to agricultural land from construction and from an oil spill and subsequent response actions may last for one to a few years, depending upon the amount of oil, area impacted, and the type of cleanup actions taken by Keystone. In general, oil on and/or in the soils is

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					after nature fixes the problem of any spills within one year is absolutely inaccurate. Thank you for your time and for taking these concerns into account. I look forward to seeing future drafts of the EIS.	weathered through biodegradation by micro-organisms, photodegradation by sunlight, and physical-chemical degradation. These basic processes generally reduce or eliminate the lighter fractions of oil that may be harmful to plants and/or animals and do so in a few months to a year or two. The heavier fractions of the oil (commonly called tar or asphalt) may persist for longer periods of time but are not toxic to organisms. The response actions may disturb the soils and provide habitat for weeds, reduce or remove the native or agricultural vegetation, and otherwise have impacts that may persist for a year or more.
1242	3	Quigley	Mike	Congress	In the mining, oil companies use three times more fresh water than fuel produced. This water is polluted in the process and is dumped into massive, toxic "tailing ponds," where it stays for decades. These toxic waste dumps are so large they can be seen from space.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project.
1242	4	Quigley	Mike	Congress	Upgrading the tar sands results in high levels of dangerous air pollutants. Chicago, my hometown, is also the hometown of over 500,000 asthmatics. We're dealing with skyrocketing rates of death due to asthma – giving Chicago the unfortunate title of the "Nation's asthma capital." But, we're not the only city with this problem. A report released by the American Lung Association reported nearly 60 percent of Americans live in areas where air pollution has reached unhealthy levels that can make people sick. These people are sick because of pollutants like tar sands.	Consolidated Response CAN-1 addresses development of Canadian oil sands.
494	1	Quirk	Jennifer		I cannot see how, in the wake of the Deepwater Horizon spill and after it's been made very clear that government regulators have not been up to the job of adequately policing this industry, that it makes any sense to put an international oil pipeline through the Nebraska Sandhills and its underlying aquifer. This is one of the most environmentally unique and fragile landscapes in our nation, and destruction of the aquifer would mean agriculture in the state of Nebraska would take a hit that would be economically more devastating than the one the shrimpers in Louisiana are experiencing right now (I say this not to belittle their ongoing tragedy but to explain the scale of devastation such a corporate malfeasance would create). We can't afford this pipeline right now. Period.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. Issues related to the Sand Hills area are addressed in Consolidated Response ERO-1. As described in Consolidated Response GLF-1, the risks associated with the proposed Project are substantially different from those associated with the BP Deepwater Horizon Project.
494	2	Quirk	Jennifer		This is one of the most environmentally unique and fragile landscapes in our nation.	Consolidated Response ENV-1 addresses concerns related to sensitive and fragile environmental and ecosystems.
541	1	Quisno	Patricia	Fort Belknap Tribes	I think this oil pipeline will have a great and beneficial impact on Phillips County and to the State of Montana. It will also have a positive impact on the USA, decreasing the amount of foreign oil needed from the middle-west. This pipeline will have the capability to also carry oil from other oil fields along the way to the gulf. I wish we had a pumping station in Blaine County!!	Comment acknowledged.
382	2	Rab	Fa'iz		The pipeline would cut cross the Nebraska Sand Hills, a fragile and unique ecosystem that is easily damaged and difficult to repair.	Identification of sensitive environments crossed by the proposed Project is discussed in Consolidated Response ENV-1 and ENV-3. Issues related to the Sand Hills area are addressed in Consolidated Response ERO-1.
382	3	Rab	Fa'iz		It is a threat to the Ogallala Aquifer, one of the world's largest	Issues related to the Northern High Plains Aquifer system are

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					supplies of groundwater, and the primary source of groundwater for agriculture and domestic use in Nebraska. Once an aquifer is contaminated, it is expensive and difficult to clean up. Experience has taught us that most cleanup efforts have focused on containment rather than actual removal of contaminants.	addressed in Consolidated Responses AQF-1 through AQF-4.
382	4	Rab	Fa'iz		Building the pipeline would provide oil companies more incentives for further development of the tar sands in Canada, an expensive and extremely environmentally damaging process that generates greenhouse gases, pollutes watersheds and destroys woodlands and other wildlife habitat.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project. Consolidated Response GHG-1 addresses GHG life-cycle analyses. Consolidated Response GHG-2 addresses the potential causal connection of implementation of the proposed Project and expanded oil sands production in Alberta and increases in refining.
382	8	Rab	Fa'iz		The bottom line is that this pipeline is not worth the risk it presents to the environment.	Consolidated Response SAF-1 describes the regulatory requirements and Project-specific Special Conditions that Keystone would comply with to construct, operate, maintain, inspect, and monitor the proposed Project. It also describes the monitoring, inspections, and reviews of the proposed Project that the Pipeline and Hazardous Materials Safety Administration would conduct to ensure compliance with those regulatory requirements.
1497	1	Radakovich	Mike		My name is Mike Radakovich and I am currently the Superintendent of schools in Circle, Montana. There have been a few individuals spurred on by a number of advocacy groups seeking suspension of this and all other development in the area. These individuals use more energy than most but refuse to do their part to assist the nation in obtaining the necessary energy to fuel our economy. They are for the most part reactionaries. Thus I ask you to disregard their blanket non-support for any and all development in our area. The project has the potential to deliver significant energy security benefits to the United States, increasing access to significant land-based sources of oil from a trading partner with whom we are closely allied... Provided it has limited impact on the environment, this project could be an important part of the solution to our energy supplies. The permitting processes in place are appropriate and should proceed so that a final determination can be made about the impacts of the project and whether it is in the national interest. Please reject the request to suspend the process and continue with the review.	Comment acknowledged.
472	1	Rainbolt	Ellen		I am opposed to the Keystone Pipeline running underground above the Ogallala Aquifer. There are other alternative such as running the pipeline above ground or processing the oil in Canada and not having a pipeline altogether. This is a huge risk to take given that oil companies do not always tell the truth about their projects and are wanting to make a profit so often cut corners. The disaster currently in the Gulf of Mexico and the oil spill in Salt Lake City are examples of carelessness which end up costing the citizens dearly. I am not wanting to take this risk for my own sake and the sake of future generations. I would be willing to pay more and/or consume less rather than risk another environmental disaster. Hopefully our leaders will consider another alternative and not place this	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. Consolidated Response P&N-8 addresses issues related to shipping Canadian crude oil to refineries that are closer to the source of oil. Issues related to an aboveground pipeline are addressed in Consolidated Response CST-1. As described in Consolidated Response GLF-1, the risks associated with the proposed Project are substantially different from those associated with the BP Deepwater Horizon Project.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					pipeline underground in the State of Nebraska.	
961	1	Ranallo	Richard		Please reconsider the pathway of the pipe line - have we not learned anything from earlier oil spills - they do happen - and most often cant be corrected - this goes over the water system supplying the midwest - PLEASE USE COMMON SENSE AND DIRECT IT ELSWHERE	Consolidated Response ALT-1 and Section 4.3 of the EIS address potential alternative routes, including routes that would avoid much of the Northern High Plains Aquifer System.
1541	21	Randash	William	Fallon County Commissioners	We haven't heard for sure where this campsite is going to be put up. The city seems to have an indication where it's going to be, but we haven't received official word.	Keystone has selected general areas for the locations of work camps as noted in Section 2.2 of the EIS.
1541	22	Randash	William	Fallon County Commissioners	We're going to have a lot of heavy traffic over fragile roads.	Consolidated Response RDS-1 addresses concerns about the condition of roadways and roadway structures associated with construction and operation of the proposed Project.
1541	23	Randash	William	Fallon County Commissioners	I understand that some of the states south of here, Nebraska and Kansas, have asked TransCanada to post a bond for their roads, and have gotten a bond posted.	Consolidated Response LIA-2 addresses the issue of bonding for the proposed Project.
1541	24	Randash	William	Fallon County Commissioners	How are you going to administer taking care of our roads? Who is going to evaluate them now and who is going to evaluate them a year and a half or two years from now, so that we get treated fairly?	Consolidated Response RDS-1 addresses concerns about the condition of roadways and roadway structures associated with construction and operation of the proposed Project. As noted in that response, Keystone would be responsible for roadway improvements and restoration if damage occurs due to Project-related activities.
1541	25	Randash	William	Fallon County Commissioners	We are concerned with the clean up of the campsite when you leave our county.	Section 2.2.7.4 provides information on the construction camps, including decommissioning of the camps.
1107	1	Rasmussen	Allen		I am very disappointed in your reluctance the support the pipeline. This is a very important step in the road to our energy independence. Pipelines are the safest and most efficient way to transport liquids. Energy independence is not only good economic policy, but it is a mater of national security.	Consolidated Response ENR-1 provides information on the Department of State (DOS) environmental review process, the National Interest Determination process, and the need to complete those reviews before approving or denying the Presidential permit for the proposed Project. As noted in that response, DOS is neither a proponent nor an opponent of the proposed Project.
1172	1	Redding	Marge	Creighton University	I am concerned about the pipeline impact on the aquifer. Please continue to pursue this. We cannot afford another man-made disaster affecting our U.S. natural resources.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
723	1	Redstone	Cori	Redstone Action	Miles of unchecked and unsecured pipeline cannot be allowed to run through our borders. We are just beginning to learn of the gross negligence of the Oil industry in ignoring and dismissing potential risks and even spills. They do everything they can to make a profit. In Utah, thanks to a recent spill that occurred as a result of gross negligence we learned that the oil company will NEVER pay the true cost of a spill. They are washing the oil downstream. It is penetrating our drinking water and soil. They aren't cleaning up, but they are covering up. Oil is a dying technology and the Department of State should not lift a finger to prop up old technologies whose risk exceeds their value to the public.	Regarding the Red Butte Creek spill in Utah, the pipeline company is in fact cleaning up the oil and restoring the habitats to a better condition than existed prior to the spill. Consolidated Response LIA-1 addresses Keystone's liability if there is a spill of hazardous materials or fuel during construction and from a spill of crude oil from the Project.
390	1	Reese	Robert		To whom it may concern at the State Dept. regarding the Keystone Pipeline Project, Please do not build this pipeline through our state.	Consolidated Response ALT-1 addresses potential alternative routes and system alternatives, including rail and barge networks.
604	1	Reese	Sarah		I am concerned about a lot of aspects of this project, but I will focus on one that is especially important to me, and that relatively few people seem to consider when they voice their	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					own concerns. I am deeply afraid (please mark my language, which is not this intense unless I am serious) for the wildlife of Alberta, the Houston area, and the entire country through which the proposed pipeline will pass. The only thing I will note about Canadian wildlife is the following, as the focus for the United States is on the pipeline within our own country. The oil sands project in Alberta is widely judged to be the MOST environmentally and ecologically destructive project in the world, far surpassing strip mining or anything comparable in the scale of death and destruction wrought. Is this really the type of enterprise with which the United States, with its professed dedication to “clean energy” and progress, wishes to associate itself? The utter annihilation of ancient arboreal forest looks like, feels like, and IS hell on earth for those affected, human and non-human. I will now concern myself with the plight of wildlife in southeastern Texas. The EIS does thoroughly assess types and species of animal, as well as respective habitat. However, it does not propose sufficient mitigation for the level of anticipated damage. There is good reason for this apparent lack: nothing is sufficient to adequately mitigate the anticipated damage. The proposed solution for extensive habitat loss and degradation, the effects of which will be felt for generations? Essentially “we’ll tell the workers not to feed the ducks.” I’m not kidding. This COUNTS as a mitigation strategy? Not feeding the wildlife? And picking up their trash from lunch? There is NOTHING about the wildlife section of the EIS that instills any confidence in me that local inhabitants (yes, animals) will be treated with true respect and responsibility. I will make one more note, although I know it is not likely to be taken seriously by anyone in any position of authority. The entire structure of the EIS and how it assesses wildlife is tailored to human interests, first and foremost. Even the types of animals are separated into “game” and “non-game.” Such an apparently insignificant detail of report construction only reinforces my conviction that the interests of non-human inhabitants are not being seriously considered on their own merit. As far as this project goes (and every other project, in my opinion), the impact on wildlife should not be considered simply for its impact on humans. Surely the ones living in a place have a legitimate interest in their own lives. This is not a matter of being a tree-hugger; this is a matter of an ethical relationship with others. My primary concern at this point is our ethical and responsible interaction with others in this world. And this project is not it. This is not it.	and without the proposed Project. The approach for wildlife assessments is addressed in Consolidated Response WIL-1. Section 3.14.3 of the EIS was revised to add information concerning the assessment of impacts from oil sands development on wildlife and the boreal forest in Alberta. The approach for wildlife assessments is addressed in Consolidated Response WIL-1. Most habitats affected by construction of the proposed Project would be restored in accordance with the requirements of the Keystone Keystone’s Construction, Mitigation, and Reclamation Plan presented in Appendix B of the EIS. Worker prohibitions against feeding wildlife are directed toward prevention of benefit to predators and prevention of negative impacts due to conditioning predators to garbage. These animals often become problematic and may be killed to ensure worker safety. Mitigation measure brought forward in the EIS are those identified by analysts and resource management agencies.
604	2	Reese	Sarah		I could go on about so many other aspects of this project: the environmental justice consequences for low-income and minority communities;	Consolidated Response JUS-1 addresses potential impacts to minority and low-income populations.
604	3	Reese	Sarah		the effect on attainment with the Clean Air Act;	As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries. Consolidated Response OIL-4 also addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
						similar in composition to other heavy crude oils. Based on the nonattainment status of Texas counties in which the pipeline will pass, a General Conformity analysis was prepared (see Section 3.12.1.3). It was determined that construction emissions for the Project would be accounted for in the SIP emissions budget and the proposed activity within the Houston-Galveston-Brazoria nonattainment area was presumed to conform to the SIP.
1540	104	Reese	Simon	Indigenous Environmental Network, Keepers of the Athabasca	The tar sands is the largest environmental disaster on the planet as of right now. It releases 36 megatons of greenhouse gases a year. You can see the open pit mining from space. It's as large as England and Wales combined. They are producing 1.3 million barrels of dirty oil a day.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information on current and future production. As noted in that Consolidated Response, without the proposed Project, oil sands development would continue at or above the current level until at least 2020, with or without the proposed Project. Consolidated Responses GHG-1 through GHG-5 address concerns related to greenhouse gas, climate change, alternative energy considerations, and approach to assessment of GHG emissions.
1540	105	Reese	Simon	Indigenous Environmental Network, Keepers of the Athabasca	It's actually tar sands, not oil sands. It's unconventional oil, and the methods that they use to extract the oil out of the tar sands is very dangerous and very cheap, with industry taking no responsibility. They're pretty much unaccountable for the damages already done.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information on current and future production. As noted in that Consolidated Response, without the proposed Project, oil sands development would continue at or above the current level until at least 2020, with or without the proposed Project. Consolidated Response OIL-4 addresses the composition of the Canadian crude oil that would be transported by the proposed Project, including concerns relative to the corrosivity and erosivity of the crude oil. As noted in that Consolidated Response, that crude oil is similar in composition and properties to other heavy crude oils that are currently transported within the U.S. pipeline system and similar in composition and properties to other heavy crude oils that are currently refined in PADD III.
1540	106	Reese	Simon	Indigenous Environmental Network, Keepers of the Athabasca	You can listen to the farmers that have been working the lands in northern Alberta for generations and with their intimate relationship with the land of growing and harvesting food, seeing their own impacts on the land, the water. That combined with the traditional knowledge of Native hunters and trappers, there is a big cry out to the world to put a moratorium on the tar sands, to halt all further development and production of this dirty oil.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1.
1540	107	Reese	Simon	Indigenous Environmental Network, Keepers of the Athabasca	Water resources are going to be the most sought after resource in the world after oil. After all the oil is used up, a lot of countries are going to be desperate for water. They use three to five barrels of pristine drinking water just to make one barrel of oil.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1.
1540	108	Reese	Simon	Indigenous Environmental Network, Keepers of the Athabasca	All of that waste, 11 million liters of toxic waste is being leached into the River of the Athabasca every day. These toxic chemicals are PHs, heavy metals, anything you can think of that's bad, it's being leached into that water.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1.
1540	110	Reese	Simon	Indigenous Environmental	No matter if you're Native American or non-Native American, industry does not have your best interests in mind. A lot of	Comment acknowledged.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
				Network, Keepers of the Athabasca	people are dying from rare cancers. Two of my aunties just finished chemo in the last year. My granny just got cancer in the kidneys.	
1540	112	Reese	Simon	Indigenous Environmental Network, Keepers of the Athabasca	Look at the BP disaster in Louisiana and the Exxon Valdez sink, they're still cleaning up the oil. There is no way that industry can guarantee that a spill is never going to happen.	As described in Consolidated Response GLF-1, the risks associated with the proposed Project are substantially different from those associated with the BP Deepwater Horizon Project. As noted in Consolidated Response OIL-1 and Section 3.13.4.2, the risk analysis and spill frequency analyses provided in the EIS do not state that a spill will not happen. They do indicate that small spills are likely to occur during the construction and operation of the Project and that large spills are unlikely to occur but that there is a finite chance that they could occur.
1550	42	Reese	Simon		Fort McMurray is the second biggest oil deposit in the world, only to Saudi Arabia. It's not an oil sand. It's not conventional oil. It's unconventional and the amount of water and chemicals that it takes to break down this tar sand to get the oil out of it is very irresponsible and the oil industry, or the industry up in the north is virtually unaccountable for the mess that they're making.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information on current and future production. As noted in that Consolidated Response, without the proposed Project, oil sands development would continue at or above the current level until at least 2020, with or without the proposed Project.
1550	43	Reese	Simon		So the people up north [north of Ft. McMurray] they're very limited. Their options are very limited. But when I talk about these things I'm getting to the root, I'm getting to the core of where this pipeline is coming from. It's coming from people's homes, people's backyards. Our whole way of life is being destroyed. You can imagine if you can just look at how you would feel if your land or your family's area or farmland is being destroyed. The water is being poisoned. A lot of people are dying of rare cancers, dying before their time.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project.
1550	44	Reese	Simon		A lot of my friends and family they do have to work in the tar sands on the plants. I've worked out there myself. I've worked out there for a couple years, and after I'd seen the amount of destruction and just how careless industry is in regard to the land and the water it is the worst environmental disaster that we have going on. You can see the open pit mines from outer space. The open pit mines combined is the same size as England and Wales together, and that's only 20 percent. The rest, 80 percent, is going to be four or five times the size. And they're going to be using a different process which takes more water. It takes actually 6 to 12 barrels of water for every barrel of oil.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project.
1556	63	Reese	Simon	Indigenous Environmental Network; Keepers of the Athabasca	Where I'm from industry has moved ahead and gone ahead with projects and the provincial and federal government have handed out many, many permits and leases for the expansion for this dirty oil, and it's not conventional oil. They have to use so many different types of chemicals to break this tar sand down. And so by the end product, you're left with a lot of waste. To me, my personal opinion I think the only ones that should be using oil is the ones that harvest food and transport it.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1. Consolidated Response P&N-8 addresses issues related to the use of Canadian crude oil closer to the production areas.
1556	64	Reese	Simon	Indigenous Environmental Network;	But I would just like to say to you people that we do have the choice to make things right. And up north it's the largest industrial project on earth, and it's already proven, you can do	The commenter's opinion is noted.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
				Keepers of the Athabasca	the research yourself, that this is not a sustainable project and we should not be supporting it.	
439	1	Reeves	Robert		The Ogallala (High Plains) Aquifer is one of the largest sources of clean, fresh water on the planet. The proposed pipeline would be built over the fragile Sandhills of Nebraska, under which this wonderful aquifer lies. A leak could be disastrous to the water supplies of communities, irrigators and wildlife, since the aquifer recharges lakes and streams throughout the region. A preferred alternative would be to process this petroleum into gasoline and other products at refineries in Canada, rather than taking the risk of what could be permanent damage to a precious water resource.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. Consolidated Response P&N-8 addresses issues related to shipping Canadian crude oil to refineries that are closer to the source of oil.
1457	1	Reeves	Michael	Ports To Plains Alliance	As president of the Ports to Plains Alliance, a coalition representing rural communities from Alberta through nine states to Texas, we strongly encourage the U.S. Department of State to approve an energy infrastructure project that not only will strengthen long-term energy security in the United States, but also will provide a powerful private sector economic stimulus to the communities along the pipeline route during its construction at a time when our rural economies continue to struggle.	Comment acknowledged.
1457	2	Reeves	Michael	Ports To Plains Alliance	As we understand it, Keystone XL will create more than 13,000 high-wage construction and manufacturing jobs during the project's 2011-2012 construction schedule. Many of those jobs will be created in rural Texas and in our districts, where too many of our residents continue to find it difficult to find good jobs. With Keystone XL, they will have an opportunity to work on the project or for businesses that provide supplies, goods and services for its construction and operation.	Comment acknowledged.
1457	3	Reeves	Michael	Ports To Plains Alliance	In addition to the jobs Keystone XL will create, the project will generate substantial economic benefits for the United States and in states and communities along the proposed route. Like our counties, in many cases these are areas where economic performance has stagnated or is shrinking. It is our understanding that TransCanada commissioned a study to measure the project's economic stimulus to the U.S. and the states along the route. The study found that in the U.S., Keystone XL would generate \$20.9 billion in total expenditures, \$9.6 billion in output (gross product), personal income of \$6.5 billion and 118,935 person years of employment (jobs). In addition, the report concluded that during construction, Keystone XL would generate \$486.36 million in tax revenue for state governments along the route and \$99.1 million for local taxing entities where the pipeline is located.	Consolidated Response ECO-1 addresses potential socioeconomic impacts, and Consolidated Response TAX-1 addresses concerns regarding taxes.
1457	4	Reeves	Michael	Ports To Plains Alliance	In Texas, the study found Keystone XL expenditures during construction would total \$5.4 billion and generate an economic gross product of nearly \$2.86 billion. Keystone XL construction also would generate more than \$64.5 million in tax revenue for local government and \$152 million for state government.	Consolidated Response ECO-1 addresses potential socioeconomic impacts, and Consolidated Response TAX-1 addresses concerns regarding taxes.
1457	5	Reeves	Michael	Ports To Plains Alliance	Furthermore, the delivery of secure and affordable supplies of Canadian energy to American consumers would have minimal impacts on the environment. This is a vital project that will	Comment acknowledged.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					strengthen U.S. energy security and reduce our dependence on unstable foreign sources of oil. Canada is already the largest supplier of energy to the United States, meeting 12 percent of current U.S. petroleum-consumption needs and representing 18 percent of U.S. petroleum imports. Canadian oil sands production is a growing source of reliable crude oil supply for the United States. Canada's 175 billion barrels of oil reserves is second only to Saudi Arabia. Oil sands account for more than 97 percent of that vast reserve: 170 billion barrels of oil with the potential for more than 100 years of production. Canada has more than 50 percent of the non-state controlled reserves in the world. Long-term supply is critical in a world where supply risks are growing, whether due to declining production from a once-reliable source, an unstable geo-political climate, or uncertainties in key oil producing regions. Construction of additional pipeline facilities such as the Keystone XL Project, to transport oil sands production to the vitally important Gulf Coast area is critical. These refineries also have excess capacity as a result of reduced production from Mexico, where heavy oil production is in steep decline, and Venezuela, which is moving to other markets. Turning to Canada for a secure oil supply is a logical step. We enthusiastically support the Keystone XL Pipeline Project and encourage the Department of State to confirm the findings of the Draft Environmental Impact Statement, which found that the proposed Keystone XL Pipeline would have "limited adverse environmental impact during construction and operation."	
1457	6	Reeves	Michael	Ports To Plains Alliance	We look forward to the issuance of a Final Environmental Impact Statement followed by a Presidential Permit that allows the construction of Keystone XL and enables our districts, the State of Texas, and the United States to collect the substantial economic benefits Keystone XL would create.	Comment acknowledged.
1061	1	Reimer	Judy		I too, am concerned about the safety of the pipeline and its effect on our Ogallala Aquifer. I respectfully request that we stop or defer the pipeline until the safety is guaranteed.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
1535	1	Reinhardt	David		I would like to compare this pipeline to Northern Borders gas pipeline. It was installed in the early 1980s and now it is hard to tell where it is even when looking for it. The reclamation procedures are excellent. I welcome Keystone pipeline to Valley Co.	Comment acknowledged.
187	2	Reinkordt	Jane		The safety of this project cannot be guaranteed and the cost of a spill would be too great, if the huge Ogallala Aquifer were to be contaminated. It would be extremely shortsighted and greedy, and just plain stupid to ruin our water supply in an attempt to get every last bit of oil.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. As described in Consolidated Response GLF-1, the risks associated with the proposed Project are substantially different from those associated with the BP Deepwater Horizon Project.
235	3	Reitan	Rodney		Another concern is the routing of the pipeline within fifty feet of the water well and farmstead buildings on the west side of the east half of section 23, T: 35 N, R: 33E.	Consolidated Response SAF-1 describes the regulatory requirements that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project. It also describes the inspections and reviews of the proposed Project that the Pipeline and Hazardous Materials Safety Administration would conduct to ensure compliance with those regulatory requirements. The regulations and Special Conditions that Keystone would follow do not require that the

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
						pipeline be more than 50 feet from water wells or buildings. The commenter can work with Keystone to address potential minor realignments that can be made during final design, assuming the realignments are consistent with the requirements of environmental permits. In addition, Keystone would compensate landowners for damage to private property as described in Section 2.5 of its Construction, Mitigation, and Reclamation Plan presented in Appendix B of the EIS.
235	4	Reitan	Rodney		My final concern is the routing of the pipeline across both of my airplane turf runways. [locations of two runways given].... I would expect that these runways would be left in equal or better condition as turf runways after the installation of the pipeline.	As noted in Section 2.0 and in the Keystone Construction, Mitigation, and Reclamation (CMR) Plan (presented in Appendix B of the EIS), Keystone has committed to restoring the construction right-of-way to as close to pre-construction conditions as possible. This would involve the treatment of soil as necessary to preserve approximate pre-construction capability and the stabilization of the work surface in a manner consistent with the initial land use. Additionally, Keystone has stated that it may deviate from specific requirements of the CMR Plan on specific private lands as agreed to by landowners or as required to suit actual site conditions. The commenter can work with Keystone to address potential minor realignments that can be made during final design, assuming the realignment are consistent with the requirements of environmental permits.
574	1	RespectsNothing	Doris	Oglala Sioux Tribal member	The lands included have titles held by the United States Government under the 1868 Ft Laramie Treaty which was ratified by Congress. The illegal expansion by the Keystone XL Pipeline without any type of consultation process with the Department of Interior, Bureau of Indian Affairs and Tribal Governments involved must cease. The NAGPRA, NEPA, and all other executive orders must be adhered to or matters will taken to higher authorities for discussion. The Black Hills Sioux Nation Treaty Council is the contact persons or any Tribal government officials in the affected areas. Any assistance in this matter will be greatly appreciated as these lands affect our water, culture, and our future.	Consolidated Response CUL-1 and Section 3.11 of the EIS address protection of historic properties and the consultations conducted in compliance with Section 106 of the National Historic Preservation Act, including consultation with Indian tribes. As noted in Section 3.11 DOS has actively consulted with both the BIA and NPS as well as Indian Tribes.
57	1	Rex	Joy		NO TAR SANDS OIL! It causes even more problems than more-conventional oil!	Consolidated Response OIL-4 addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils.
1504	1	Reynolds	C.		I am greatly opposed to the Keystone XL pipe that's going through Oklahoma. I live in rural Alabama and I am concerned about ground water contamination. Eventually the pipe will not be used. I understand the land owners pay or the pipes stay up forever.	Potential impacts to groundwater are presented in Sections 3.3 and 3.13.6.4 of the EIS. Responses related to taking the proposed Project out of service at the end of the life of the proposed Project are presented in Consolidated Response DEC-1.
1504	3	Reynolds	C.		Global warming is a serious concern [illegible]. We need the boreal forest ecosystem. They cannot be reduced to coal (high CO2 produce and nature [illegible] used to bring the dirty oil to the surface. I oppose this threat to the environment. CO2 increase production from Canada cause increased global warming, a serious threat to the security of our nation wars, increased immigration will occur, as well as water wars. This pipeline is totally unacceptable – no subsidies for fossil fuels. We desperately need the [illegible] to go to green technology. Thank you This is a grave security risk to the USA from CO2.	Consolidated Response GHG-1 addresses the greenhouse gas life-cycle analyses presented in the revised EIS. Climate change is addressed in Section 3.14.3.14. As noted in that Section, implementation of the proposed Project is unlikely to result in a measureable climate change. Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project. Consolidated Response GHG-4 addresses potential loss of boreal forests and peat bogs.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
22	1	Rhyne	UtanaSue	Rhyne Ranch	This is in regard to the Keystone XL pipeline project. Please send us a map showing the proposed route of the pipeline.	Maps of the proposed route are included in the EIS. Consolidated Response REQ-1 addresses request for additional information, including detailed maps of the proposed route.
228	1	Rice	Floyd&Claudia		We are looking forward to having Keystone XL Project coming to Stroud, Okla. We need a place for our men and women to work close to home. My husband and I are overjoyed your are considering Stroud.	Comment acknowledged.
712	1	Rich	Ben		As a scientifically trained, voting American citizen, I wish to see all attempts at refining tar sands from Canada eliminated from all consideration. The destruction of natural resources necessary to get the oil from tar sands is wasteful and deadly to people, migratory birds and other animals in the food web. Please consider technologies and resources that do not poison such vast quantities of water.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project. Consolidated Response ENV-4 addresses issues related to oil sands production and migratory birds.
81	1	Richardson	Bob		Please send me a map of the proposed route of the proposed pipeline.	Maps of the proposed route are included in the EIS. Consolidated Response REQ-1 addresses requests for additional information, including detailed maps of the proposed route.
81	2	Richardson	Bob		This project just seems like another disaster waiting to happen.	Consolidated Response SAF-1 describes the regulatory requirements and Project-specific Special Conditions that Keystone would comply with to construct, operate, maintain, inspect, and monitor the proposed Project. It also describes the monitoring, inspections, and reviews of the proposed Project that the Pipeline and Hazardous Materials Safety Administration would conduct to ensure compliance with those regulatory requirements.
804	1	Rickman	Irl		The Keystone xl pipeline is a bad idea and should not be built. The pipeline that was approved and started last year going through Nebraska should be shut down. The political system is caving to big business without any concerns for the citizens of this country. After this oil disaster in the gulf you should mandate electric cars be put into production and not endanger the well being of the citizens of the USA by insisting to push oil down our throats.	Consolidated Response P&N-1 addresses the need that the Project has been proposed to meet. As noted in Consolidated Responses ENR-1 and P&N-9, the Department of State is neither a proponent nor an opponent of the proposed Project, but is reviewing Keystone's application for a Presidential permit. Consolidated Response ALT-2 addresses the use of alternative technologies and alternative energy sources.
529	1	Rickord	Janie		Please do not re-route the oil in the Nebraskan Sand Hills! No. This would be a huge mistake.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. Issues related to the Sand Hills area are addressed in Consolidated Response ERO-1.
1055	1	Rico	Lynn		I personally don't want the pipeline running through Nebraska. Considering how most of the oil handling has been botched in some way, shape or form, I would hate to see our Ogallala aquifer damaged and ruining our greatest natural resource.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
1303	1	Riemer	D.F.	Marathon Oil Company	On behalf of Marathon Oil Company, I am writing to express my support forTransCanada's Keystone XL (KXL) crude oil pipeline, and to urge that the Departmentof State continue its permitting process for this important energy infrastructure project.	Comment acknowledged.
1303	2	Riemer	D.F.	Marathon Oil Company	KXL is important for America's domestic energy security, not only because it will deliver crude to U.S. markets from our closest ally and neighbor, Canada, but because it will also facilitate the ongoing development of the Bakken formation	Consolidated Response ALT-3 addresses issues related to a potential pipeline connection to the proposed Project in Montana that would transport crude oil produced in Montana and North Dakota.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					within the Williston Basin in the United States of America. Energy independence is a national priority. The Bakken formation is the only land-based region of the continental United States where oil production has been increasing in recent years. The U.S. Geological Survey estimates there are between 3 billion and 4 billion barrels of technically recoverable oil in the Bakken formation. This is a tremendous national resource that can displace imports from unfriendly or unstable nations. This resource will not be developed to its full potential without maximizing access to markets and additional pipeline capacity. Standing alone, KXL would alleviate some of the existing congestion in regional pipeline systems and therefore benefit domestic oil production. More importantly, TransCanada is actively working with Bakken producers in Montana and North Dakota to determine if there is sufficient interest and commercial support to provide a connection to KXL for Bakken producers. Such a connection would not only provide access to additional U.S. markets but increase domestic oil production, reduce dependence on foreign oil, increase jobs, and increase tax revenues.	
1303	3	Riemer	D.F.	Marathon Oil Company	I strongly encourage the Department of State to reject calls to halt its rigorous permitting process for this vital national energy infrastructure project. This process, fully compliant with the National Environmental Policy Act and under the auspices not only of the Department of State but an additional eleven cooperating agencies, is fully sufficient to determine whether or not this vital national energy infrastructure project will meet our rigorous environmental standards, and therefore believe the process should continue.	Comment acknowledged.
1341	1	Riess, Sr.	Robert	Sheehan Pipeline Construction Co	On behalf of Sheehan Pipe Line Construction Company, a long-standing member of the PipeLine Contactor's Association, we are supportive of TransCanada's Keystone XL crude oil pipeline project and urge the Department to grant a permit for the pipeline.	Comment acknowledged.
1341	3	Riess, Sr.	Robert	Sheehan Pipeline Construction Co	The environmental benefits of Keystone XL should not be overlooked. The current tragedy in the Gulf underscores the importance of a diverse portfolio of energy supplies. Within the spectrum of viable options, it is appropriate to seek a growing role for oil resources that are: • Land-based; • North American; and, • Transported by pipeline. This project meets each of these criteria. Securing stable and affordable energy from our North American allies through projects such as the Keystone pipeline is in the national interest. Considering the economic and energy security benefits of these vital resources, we should continue to expand America's access to safe, affordable energy to help ensure improved domestic and global energy security and stable prices for consumers.	Comment acknowledged.
1341	4	Riess, Sr.	Robert	Sheehan Pipeline Construction Co	Pipelines are the safest, most reliable, economical and environmentally favorable way to transport oil and petroleum products, as well as other energy liquids, throughout the U.S. America depends on the more than 168,000 miles of liquid pipelines to move energy and raw materials our country relies on.	Comment acknowledged.
1341	5	Riess, Sr.	Robert	Sheehan	Additional pipeline capacity will help consumers and	Consolidated Response ECO-1 and Section 3.10.2.2 of the

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
				Pipeline Construction Co	businesses throughout the United States. This project also stands to provide a powerful private sector economic stimulus. During construction, Keystone XL will create more than 13,000 jobs funded with private investment. In addition, local governments will have a steady source of income from economic activity associated with construction	EIS address the potential socioeconomic impacts of the proposed Project.
1341	6	Riess,Sr.	Robert	Sheehan Pipeline Construction Co	and from property taxes the pipeline company will pay.	Comment acknowledged.
1341	7	Riess,Sr.	Robert	Sheehan Pipeline Construction Co	Rejection of the permit or suspension of the review would sacrifice the significant economic benefits this project stands to deliver and force U.S. consumers to rely on other sources of crude oil not economically and politically allied with U.S. interests. This would be a mistake. I urge the granting of the permit. Thank you for the opportunity to comment.	Comment acknowledged.
1341	8	Riess,Sr.	Robert	Sheehan Pipeline Construction Co	Recently a number of advocacy groups sent a letter seeking suspension of the permitting of theKeystone XL pipeline. On behalf of Sheehan Pipeline Construction Company, we urge you to reject the request and to continue to review the proposed project.	Comment acknowledged.
1341	9	Riess,Sr.	Robert	Sheehan Pipeline Construction Co	The project has the potential to deliver significant energy security benefits to the United States,increasing access to significant land-based sources of oil from a trading partner with whom we are closely allied.	Comment acknowledged.
1341	10	Riess,Sr.	Robert	Sheehan Pipeline Construction Co	At the same time construction of this project stands to bring significant economic benefits the areas where it will be built.	Comment acknowledged.
1341	11	Riess,Sr.	Robert	Sheehan Pipeline Construction Co	Provided it has limited impact on the environment, this project could be an important part of the solution to our energy supplies. The permitting processes in place are appropriate and should proceed so that a final determination can be made about the impacts of the project and whether it is in thenational interest. Please reject the request to suspend the process and continue with the review .	Comment acknowledged.
1280	1	Riley	Jean	Montana Department of Transportation	The information in the document does not allow detailed comments concerning the crossing locations or impacts to the MDT facilities and roadways.	The impacts specific to individual road crossings would be determined when Keystone submits road crossing permit applications to the Montana Department of Transportation. The EIS addresses the types of impacts that may occur and the measures Keystone would incorporate into the Project to minimize impacts. This is similar to the approach taken on river and stream crossings, with the EIS presenting types of impacts and design measures incorporated into the Project to avoid or minimize impacts plus recommended mitigation measures. HOWEVER, the U.S. Army Corps of Engineers is responsible for reviewing individual crossing designs and approving or denying the specific plans, including requirements for specific mitigation measures.
1280	2	Riley	Jean	Montana Department of Transportation	As the project progresses, MDT should be involved in the planning and design process to adequately address impacts to MDT facilities.	Consolidated Response RDS-1 addresses concerns about the condition of roadways and roadway structures associated with construction and operation of the proposed Project as well as traffic safety measures that would be incorporated into the Project.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
1280	3	Riley	Jean	Montana Department of Transportation	The project sponsor (TransCanada Keystone Pipeline, LP) must follow the MDTSystem Impact Analysis Process (SIAP) to obtain permits for encroachments upon and access to MDT right of way. A guide to the SIAP review is available at the following web link: http://www.mdt.mt.gov/publications/docs/brochures/siap_guide.pdf	As noted in Section 1.8 and in Table 1.8-1 of the EIS, Keystone would have to obtain permits from the Montana Department of Transportation. Those permits would likely require stipulations such as the ones suggested by the commenter.
1280	4	Riley	Jean	Montana Department of Transportation	MDT is responsible for the safety of the traveling public.	Comment acknowledged.
1280	5	Riley	Jean	Montana Department of Transportation	The accesses to MDT's roadways must be designed to MDT standards.	As noted in Section 1.8 and in Table 1.8-1 of the EIS, Keystone would have to obtain permits from the Montana Department of Transportation. Those permits would likely require stipulations such as the ones suggested by the commenter.
1280	6	Riley	Jean	Montana Department of Transportation	Additional requirements such as turn lanes (depending on traffic volumes) may be necessary at approach locations.	Consolidated Response RDS-1 addresses concerns about the condition of roadways and roadway structures associated with construction and operation of the proposed Project as well as traffic safety measures that would be incorporated into the Project. In addition, as noted in Section 1.8 and in Table 1.8-1 of the EIS, Keystone would have to obtain permits from the Montana Department of Transportation. Those permits would likely require stipulations such as the ones suggested by the commenter.
1280	7	Riley	Jean	Montana Department of Transportation	The pipeline crossing design for roadways will meet MDT requirements as long as the depth is at least five feet below the flow lines of any ditches, or the lowest point on any fill slope. The boring pits must be located outside MDT right-of-way to prevent adverse impact to the traveling public.	As noted in Section 1.8 and in Table 1.8-1 of the EIS, Keystone would have to obtain permits from the Montana Department of Transportation. Those permits would likely require stipulations such as the ones suggested by the commenter.
1280	8	Riley	Jean	Montana Department of Transportation	MDT recommends the pipeline alignment, except for the roadway crossings, remain at least 150 feet from the centerline of the existing roadway. This will reduce the risk of future roadway construction or improvements from impacting the pipeline.	Pipeline routing in Montana is addressed in Consolidated Response EAS-1. In addition, as noted in Section 1.8 and in Table 1.8-1 of the EIS, Keystone would have to obtain permits from the Montana Department of Transportation. Those permits would likely require stipulations such as the ones suggested by the commenter.
1280	9	Riley	Jean	Montana Department of Transportation	As the detailed alignment of the pipeline is finalized, MDT will work with the project sponsor to determine if there are MDT projects that may impact the construction or construction traffic.	Comment acknowledged.
1280	10	Riley	Jean	Montana Department of Transportation	The information presented indicates the pipeline will cross Interstate 1-94. The Federal Highway Administration (FHWA) will also need to approve any Interstate crossings. MDT's permitting process provides this coordination with FHWA for their approval.	The requirement noted by the commenter is listed in Table 1.8.1-1 of the EIS.
1280	12	Riley	Jean	Montana Department of Transportation	MDT has concerns with construction traffic impacts to our facilities. The project sponsor should coordinate with MDT concerning roadway damage resulting from construction activities.	Consolidated Response RDS-1 addresses concerns about the condition of roadways and roadway structures associated with construction and operation of the proposed Project as well as traffic safety measures that would be incorporated into the proposed Project.
1280	13	Riley	Jean	Montana Department of Transportation	Any oversize or over weight vehicles moving construction materials or equipment must be permitted by MDT's Motor Carrier Services Division.	The requirement noted by the commenter is listed in Table 1.8.1-1 of the EIS.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
1280	16	Riley	Jean	Montana Department of Transportation	All temporary approaches construction purposes, must be removed at the end of the construction, with the sites restored to preconstruction conditions.	Consolidated Response RDS-1 addresses concerns about the condition of roadways and roadway structures associated with construction and operation of the proposed Project. In addition, as noted in Section 1.8 and in Table 1.8-1 of the EIS, Keystone would have to obtain permits from the Montana Department of Transportation. Those permits would likely require stipulations such as the ones suggested by the commenter.
1544	141	Rine	Jim		Compared to the gas shales I work with, the per unit energy produced with gas is half the amount of CO2 emissions of the standard unit from oil. Tar sands could produce 20 to 200 percent more CO2 versus conventional oil. I think we are definitely going in the wrong direction as far as the climate.	Consolidated Response GHG-1 addresses the greenhouse gas life-cycle analyses presented in the revised EIS.
1544	142	Rine	Jim		I understand we need stable sources of energy for national security but climate change is also a national security issue.	Consolidated Response GHG-1 addresses the greenhouse gas life-cycle analyses presented in the revised EIS. Climate change is addressed in Section 3.14.3.14. As noted in that Section, implementation of the proposed Project is unlikely to result in a measureable climate change.
520	1	Rinne	Diana		Absolutely not. Do not put a pipeline through or near the aquifer. Fresh clean water is precious, and rare, and no way should it be put in this danger. There are other options; other routes that would also no endanger the rivers and streams for wildlife usage. Process the oil in Canada or near that border instead of running it through thin pipe clear across the country. How can it even be considered after what is happening in the Gulf. Anyone who cares about human and wildlife safety would not even consider this project.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. Consolidated Response ALT-1 addresses potential alternative routes, including routes that would avoid much of the Northern High Plains Aquifer system. Consolidated Response P&N-8 addresses issues related to shipping Canadian crude oil to refineries that are closer to the source of oil. Keystone has withdrawn its application for a Special Permit as described in Consolidated Response REG-1. As described in Consolidated Response GLF-1, the risks associated with the proposed Project are substantially different from those associated with the BP Deepwater Horizon Project.
1482	1	Risser	Sarah		Please do not approve the Keystone XL Project permit. This pipeline will channel arguably the dirtiest oil in the world, Tar Sands Oil, from Alberta Canada, through the United States to refineries in the Gulf of Mexico. There are many reasons to oppose this permit: 1) The draft EIS does not include a proper lifecycle analysis and incorrectly assumes that the incremental impact of these emissions would be minor	Consolidated Response OIL-4 also addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils being processed in Gulf Coast refineries. As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries. Consolidated Response GHG-1 addresses the greenhouse gas life-cycle analyses presented in the revised EIS. Consolidated Response GHG-2 addresses the potential causal connection of implementation of the proposed Project and expanded oil sands production in Canada and increases in refining. Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project.
1482	2	Risser	Sarah		Please do not approve the Keystone XL Project permit. This pipeline will channel arguably the dirtiest oil in the world, Tar Sands Oil, from Alberta Canada, through the United States to refineries in the Gulf of Mexico. There are many reasons to oppose this permit: 2) Tar Sands oil is not equitable to	Consolidated Response OIL-4 addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils. Consolidated Response GHG-1 addresses GHG life-cycle analyses.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					conventional oil, the mining and refining of this oil is considerably more intensive in terms of greenhouse gas emissions. Consequently the impact on our environment will be significant	
1482	3	Risser	Sarah		Please do not approve the Keystone XL Project permit. This pipeline will channel arguably the dirtiest oil in the world, Tar Sands Oil, from Alberta Canada, through the United States to refineries in the Gulf of Mexico. There are many reasons to oppose this permit:3) To be clear, over its entire lifecycle – the synthetic crude from tar sands emits at least 20% more global warming pollution than conventional oil4) The global warming pollution from this project is unacceptable and is taking us in the wrong direction – we should not be creating a dependence on dirty oil at a time when we should bolster and support clean, renewable energy sources. Please do not grant a permit for the Keystone XL Project.	Consolidated Response OIL-4 also addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils being processed in Gulf Coast refineries. As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries. Consolidated Response GHG-1 addresses the greenhouse gas life-cycle analyses presented in the revised EIS. Climate change is addressed in Section 3.14.3.14. As noted in that Section, implementation of the proposed Project is unlikely to result in a measureable climate change.
291	1	Ritchey	Merlin		I feel that the Keystone pipeline going over the Ogallala aquifer in Nebraska, should either be rerouted around the aquifer, or at least put in the heavier pipe over the aquifer, as a leak into the aquifer would be tragic. There are places where the aquifer is near the surface in the sand hills region of Nebraska. The pipeline company is using heavier pipe in sensitive areas, so why not over the aquifer?	Issues related to the Northern High Plains Aquifer System are addressed in Consolidated Responses AQF-1 through AQF-4. Heavier-walled pipe would be used over the aquifer since that portion of the proposed route has been defined as a high consequence area (see Table 2.3.1-1). Consolidated Response ALT-1 addresses potential alternative routes, including routes that would avoid much of the Northern High Plains Aquifer System.
849	1	Riter	Ken		Please do not allow the pipeline to go through Nebraska. It will destroy our natural resources.	Identification of sensitive environments crossed by the proposed Project is discussed in Consolidated Response ENV-1 and ENV-3. Issues related to the Sand Hills area are addressed in Consolidated Response ERO-1. Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
456	1	Rittal	Jason	Eastern Plains Economic Development Corporation	The Keystone XL Pipeline project will provide a significant overall benefit to southeastern Montana and should be approved. The economic benefits in this instance clearly outweigh risks. Please consider this comment in support of approving the draft Environmental Impact Statement and allowing the Keystone XI Pipeline Project to move forward.	Comment acknowledged.
148	1	Rittenhouse	Ryan		Tar Sands is Dirty Oil: Tar sands oil emits three to four times more greenhouse gases during production than conventional gasoline. About three barrels of water are polluted and dumped in toxic pools (called tailing ponds) for every barrel of oil produced. Tar sands extraction requires strip mining huge tracts of pristine forest. An area the size of Florida is slated for extraction.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project. Consolidated Response GHG-1 addresses GHG life-cycle analyses.
148	2	Rittenhouse	Ryan		The project harms the lives and health of indigenous people living downstream from the tar sands operations and has been connected to high rates of rare cancers, renal failure, lupus, and hyperthyroidism in the area.	Consolidated Response CAN-1 and Section 3.14.4 of the EIS address issues related to development of oil sands projects in Canada.
148	3	Rittenhouse	Ryan		Producing the oil for this pipeline will emit 11million tons of carbon dioxide into the atmosphere annually, even before it	Consolidated Response GHG-1 addresses the greenhouse gas life-cycle analyses presented in the revised EIS. As

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					gets to the U.S. for refining. This equals the annual emissions of 2.7 million cars.	described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries.
148	4	Rittenhouse	Ryan		The pipeline will travel more than 1,700 miles through farmland and fragile ecosystems, such as the Missouri River. Pipeline breaks are not uncommon, as seen in January 2010, when a pipeline in North Dakota spilled 126,000 gallons of oil into the surrounding area.	Consolidated Responses OIL-1 and OIL-2 address the likelihood of large spills from the Project.
148	7	Rittenhouse	Ryan		The tar sands oil produces far more pollution per barrel during refining, increasing the amount of toxins in some of Texas' most polluted cities.	As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries. Consolidated Response OIL-4 addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils.
662	1	Rittenhouse	Ryan	Public Citizen Texas	<p>We met at the Houston DEIS meeting for the Keystone XL. It was mentioned that I should get ya'll the source material for my comparisons of tar sands toxins contents to "conventional" oil - ie: what are we defining as "conventional." Here is the link to the source for the CO2 comparison: http://www.oilsandswatch.org/os101/climateIt has footnote sources for each of the estimates, which includes figures on strip mining the tar sands compared to using in situ mining, etc. I've attached the EIP report on Tarsands, which contains a great deal of pertinent information I hope you find useful. The part I cite in my materials for comparison of toxic emissions can be found on page 5. They cite a report entitled "Heavy Oil and Natural Bitumen Resources in Geological Basins of the World: U.S. Geological Survey Open-File Report 2007-1084," USGS, 2007 (footnote #14 on page 5) - which can be found at this link: http://pubs.usgs.gov/of/2007/1084/OF2007-1084v1.pdf As the footnote says, reference page 14, Table 1 of that report. It separates oil into 4 categories: Conventional, Medium, Heavy, and Natural Bitumen. Granted, the emissions from the refineries will not relate exactly to these percentages as some of the toxins are removed at the mine site - however, due to the extreme differences (sometimes thousands of times the concentrations) it would be naive to assume there would be no increase. As has been seen with other refineries that have switched to refining bitumen crude, such as the BP Whiting refinery, the emissions did increase - perhaps an analysis of these previous refinery conversions (and their relating emissions increases) is in order? Seeing as how the TCEQ's permitting process is woefully inadequate (as is evident from EPA's recent and ongoing actions) it is unlikely that this concern will be adequately addressed by that agency. Hopefully the state department will take these factors more fully into account before granting this permit. When all factors are accounted for, the cons of further reliance upon tarsands</p>	Thank you for providing the information. As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					oil far outweigh any positives. Thanks very much, please let me know if there is more info I can get you.	
663	2	Rittenhouse	Ryan	Public Citizen Texas	Refining the extra heavy sour crude oil extracted from tar sands will result in higher air emissions of harmful pollutants such as sulfur dioxide (SO ₂), hydrogen sulfide (H ₂ S), sulfuric acid mist, and nitrogen oxides (NO _x), as well as toxic metals such as lead and nickel compounds.	As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries. Consolidated Response OIL-4 also addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils.
663	3	Rittenhouse	Ryan	Public Citizen Texas	The more intensive refining of tar sand oil may also produce more greenhouse gas simply because it is more difficult to refine and therefore requires a greater amount of energy.	As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries.
663	6	Rittenhouse	Ryan	Public Citizen Texas	The EPA should also account for the increased air emissions of SO ₂ , H ₂ S, sulfuric acid mist, NO _x , and toxic metals produced as a result of processing tar sand feedstock when issuing construction permits under NSR. In addition, when permitting the pipelines to carry tar sand crude to U.S. refineries, the responsible U.S. environmental and public lands agencies should consider the cumulative effects on air quality and global warming of all U.S. refineries which process tar sand oil, as well as the global warming impacts of extraction of tar sand crude in Canada on the United States.	As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries. Consolidated Response OIL-4 also addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils. Section 3.14.3.14 addresses the cumulative air quality impacts.
663	10	Rittenhouse	Ryan	Public Citizen Texas	Also, in May 2008, one Canadian Native Tribe brought suit alleging that tar sands operations violate treaty rights by infringing on traditional hunting and fishing grounds.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information on current and future production. As noted in that Consolidated Response, without the proposed Project, oil sands development would continue at or above the current level until at least 2020, with or without the proposed Project.
663	12	Rittenhouse	Ryan	Public Citizen Texas	Regardless of feedstock, U.S. refineries remain subject to the emission limitations mandated by the CAA and its implementing regulations, applicable permits (such as "operating permits" under Title V of the CAA and "construction permits" issued under the "new source review" ("NRS") provisions of the CAA), and applicable consent decrees (see http://www.epa.gov/compliance/resources/cases/civil/caa/oil/). However, loopholes in the law exempt from such limits "startup, shutdown, maintenance, and malfunctions" ("SSMM," sometimes called "upsets"), during which emissions are commonly sent to flares or released directly into the air. "Upset emissions" are a major source of pollution from refineries, at times exceeding their total "routine" emissions of some pollutants. U.S. Department of Energy, Energy Information Administration, "Annual Energy Outlook Analysis 2006– Nonconventional Liquid Fuels," 2006, available at http://www.eia.doe.gov/oiaf/aeo/otheranalysis/aeo_2006analysispapers/nlf.html (hereinafter "EIA 2006Analysis"). The term "sour" refers to high sulfur content that "[t]he bitumen in the Canadian oil sands contains Vanadium, Nickel, and other metals in significantly larger quantities than occur in most other oils." In fact, the U.S. Department of the Interior's U.S.	All pollutants, including metals, would be controlled for refining processes at the facility permit level. As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries. Consolidated Response OIL-4 also addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					<p>Geological Survey ("USGS") found in 2007 that "natural bitumen" contains 11 times more sulfur, six times more nitrogen, 11 times more nickel, and five times more lead than conventional oil. Both SO₂ and nitrogen dioxide (NO₂) are "criteria pollutants" under the federal Clean Air Act ("CAA"), meaning that they are known hazards to human health and the environment. Lead is a highly toxic pollutant, considered by the U.S. Environmental Protection Agency ("EPA") to be an "OSHA carcinogen," and listed under the CAA as both a "criteria pollutant" and a "hazardous air pollutant" ("HAP"). Nickel, too, is both a HAP and an OSHA carcinogen. The human health effects caused by SO₂, H₂S, NO_x, and toxic air pollutants such as lead and nickel include premature death; cancer; permanent lung damage; reproductive, neurological, developmental, respiratory, and immunological problems; cardiovascular and central nervous system problems; bio-mutations; respiratory illness (including bronchitis and pneumonia); and aggravation of heart conditions and asthma. Regarding lead alone, the U.S. EPA has stated that Lead is a very toxic element, causing a variety of effects at low dose levels. Brain damage, kidney damage, and gastrointestinal distress are seen from acute (short-term) exposure to high levels of lead in humans. Chronic (long-term) exposure to lead in humans results in effects on the blood, central nervous system (CNS), blood pressure, kidneys, and Vitamin D metabolism. Children are particularly sensitive to the chronic effects of lead, with slowed cognitive development, reduced right-of-way and other effects reported. Reproductive effects, such as decreased sperm, Rettger, P., Arnold, J., Brandenburg, B. and Felch, C. 2006. "THE LONG LAKE INTEGRATED UPGRADING PROJECT: STATUS REPORT and DISCUSSION OF SOOT PROCESSING," Gasification Technologies, (Washington, D.C., Oct. 1 - 4, 2006), available at http://www.gasification.org/Docs/2006_Papers/29RETT-Paper.pdf (emphasis added). Meyer, R.F., Attanasi, E.D., and Freeman, P.A., 2007, "Heavy Oil and Natural Bitumen Resources in Geological Basins of the World: U.S. Geological Survey Open-File Report 2007-1084," USGS, 2007, at page 14, Table 1, available at http://pubs.usgs.gov/of/2007/1084/OF2007-1084v1.pdf. The USGS also found that natural bitumen contains 17,992 times more aluminum; 1,706 times more titanium; 666 times more iron; 102 times more copper; and 21 times more vanadium than conventional oil. Id. See Clean Air Act § 108, 42 U.S.C. § 7408. See also, http://www.epa.gov/air/oaqps/greenbk/o3co.html. "OSHA carcinogens" are "[U.S. EPA Toxics Release inventory ('TRI')] chemicals that are classified as carcinogens under the requirements of the Occupational Safety and Health Administration (OSHA)..." See http://www.epa.gov/tri/chemical/. HAPs are pollutants "which are known to be, or may reasonably be anticipated to be carcinogenic, mutagenic, teratogenic, neurotoxic, which cause reproductive dysfunction, or which are acutely or</p>	

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					chronically toxic ... or [which cause] adverse environmental effects whether through ambient concentrations, bioaccumulation, deposition, or otherwise...." Clean Air Act § 112(b)(2), 42 U.S.C. §7412(b)(2).18 EPA Office of the Inspector General, "EPA Needs to Improve Tracking of National Petroleum Refinery Program Progress and Impacts" (June 22, 2004), Appendix D, available at http://www.epa.gov/oig/reports/2004/20040622-2004-P-00021.pdf (hereinafter "EPA OIG Report"). See also, U.S. EPA, Criteria Pollutants, available at http://www.epa.gov/air/oaqps/greenbk/o3co.html count in men and spontaneous abortions in women, have been associated with high lead exposure. The developing fetus is at particular risk from maternal lead exposure, with low birth weight and slowed post-natal neurobehavioral development noted. See U.S. EPA, Technology Transfer Network, Air Toxics Website, available at http://www.epa.gov/ttn/atw/hlthef/lead.html#ref1 . Environmental damage caused by these pollutants includes acid rain; concentration of toxic chemicals up the food chain; the creation of ground-level ozone and smog; visible impairments that migrate to sensitive areas such as National Parks; and depletion of soil nutrients.	
663	13	Rittenhouse	Ryan	Public Citizen Texas	20 Finally, the more intensive refining of tar sand oil (as opposed to its extraction) likely produces more greenhouse gas than does refining conventional crude because the extra heavy crude is more difficult to refine and therefore requires a greater amount of energy.	As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries.
1114	1	Rittenhouse	Ryan	Public Citizen Texas	Do not permit this pipeline! The entire project is destructive and polluting. We can no longer invest in energy production that has so many permanent negative consequences. Jobs, growth, and survival depend on truly clean renewable energy sources and meaningful conservation of what we do use. I don't want a tar-sand pipeline in my county or anywhere!	Consolidated Response ALT-2 addresses the use of alternative technologies, alternative energy sources, and conservation of energy. Consolidated Response P&N-5 addresses issues related to investments in other technologies.
1542	4	Rittenhouse	Ryan	Public Citizen Texas	We are against the development of this pipeline for a number of reasons.	Comment acknowledged.
1542	5	Rittenhouse	Ryan	Public Citizen Texas	We are concerned about the emissions associated with the pipeline all along the route.	Section 3.12.1.2 addresses the direct emissions from the proposed Project during operation and includes a discussion of all regulations that the Project is required to comply with in order to minimize impacts to air quality.
1542	6	Rittenhouse	Ryan	Public Citizen Texas	This process is about 3 to 4 times as carbon intensive as regular oil is, so that's a big concern for us.	Consolidated Response GHG-1 addresses the greenhouse gas life-cycle analyses presented in the revised EIS.
1542	7	Rittenhouse	Ryan	Public Citizen Texas	The tar sands mines themselves are destroying Canada's boreal forests in Alberta. It's an area of land roughly the size of Florida that contains these tar sands and will be developed and mined. This is also harming the indigenous populations and other people in Alberta who live downstream.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information on current and future production. As noted in that Consolidated Response, without the proposed Project, oil sands development would continue at or above the current level until at least 2020, with or without the proposed Project. Consolidated Response GHG-4 addresses concerns regarding the loss of boreal forest and peat bogs.
1542	8	Rittenhouse	Ryan	Public Citizen Texas	The process of mining the tar sands involves creating huge tailing ponds of toxic waste that are left over after they take out the bitumen. These ponds leech into the ground water and eventually wash downstream, and it can make people sick,	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information on current and future production. As noted in that Consolidated Response, without the proposed Project, oil

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					harm wildlife, and all that sort of thing.	sands development would continue at or above the current level until at least 2020, with or without the proposed Project.
1542	9	Rittenhouse	Ryan	Public Citizen Texas	It's already harming wildlife. Birds and other animals get into the tailing ponds, which are basically big, giant oil slicks for all intents and purposes, only dirtier and more toxic than even what's in the Gulf right now. This is very damaging to the ecosystem up there.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information on current and future production. As noted in that Consolidated Response, without the proposed Project, oil sands development would continue at or above the current level until at least 2020, with or without the proposed Project. As described in Consolidated Response GLF-1, the risks associated with the proposed Project are substantially different from those associated with the BP Deepwater Horizon Project.
1542	10	Rittenhouse	Ryan	Public Citizen Texas	The pipeline itself puts land owners at risk.	Consolidated Response SAF-1 describes the regulatory requirements and Project-specific Special Conditions that Keystone would comply with to construct, operate, maintain, inspect, and monitor the proposed Project. It also describes the monitoring, inspections, and reviews of the proposed Project that the Pipeline and Hazardous Materials Safety Administration would conduct to ensure compliance with those regulatory requirements.
1542	12	Rittenhouse	Ryan	Public Citizen Texas	There is a report by a group called Series, talking about how Canada's oil sands face significant environmental risks as great as those of the BP oil spill. It's already in our report online.	As described in Consolidated Response GLF-1, the risks associated with the proposed Project are substantially different from those associated with the BP Deepwater Horizon Project.
1542	13	Rittenhouse	Ryan	Public Citizen Texas	There is also a profile on TransCanada talking about pipeline safety. Not just the pipeline but safety all along the route, at the refineries and mine sites. There have been a number of environmental health and safety incidents involved with TransCanada over the years, many of them natural gas, but some of them oil related.	Section 3.13.1.2 of the EIS addresses TransCanada's incident history for natural gas pipelines as well as for Keystone's incident history for the existing Keystone Oil Pipeline Project.
1542	14	Rittenhouse	Ryan	Public Citizen Texas	There is a lot of concern with these types of projects. Often it's not necessarily a question of whether or not there is going to be a leak, really it's just a matter of time. It's when will it happen and how bad will it be?	Consolidated Response OIL-1 provides a summary of the range of spill frequency estimates addressed in the EIS. Consolidated Response OIL-2 addresses maximum-sized releases from the Project and addresses concerns about corrosion rate comparisons between the Alberta transmission pipeline system and the U.S. transmission pipeline system.
1542	15	Rittenhouse	Ryan	Public Citizen Texas	There won't be much of an increase in jobs or economic development in the Houston, Beaumont area.	Consolidated Response ECO-1 and Section 3.10.2.2 of the EIS address potential socioeconomic impacts.
1542	16	Rittenhouse	Ryan	Public Citizen Texas	What you are going to get is dirtier air. This Bitumen, this tar sands oil, has many times the amount of pollutants and toxins as regular oil. It has 5 times the amount of lead, 6 times the amount of nitrogen, and 11 times the amount of sulfur. A lot of that ends up going into the air.	As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries. Consolidated Response OIL-4 also addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils.
1542	17	Rittenhouse	Ryan	Public Citizen Texas	Levels of ozone and ozone attainment will go up. The EPA is in the process of making standards stricter, making it harder for communities to meet those standards. This is only going to make that worse for you all.	As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries. Consolidated Response OIL-4 also addresses the composition

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
						of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils.
1542	18	Rittenhouse	Ryan	Public Citizen Texas	That's the bottom line here, Houston and Beaumont don't need more pollution.	As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries. Consolidated Response OIL-4 also addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils.
1544	159	Rittenhouse	Ryan	Public Citizen Texas	We oppose this pipeline.	Comment acknowledged.
1544	160	Rittenhouse	Ryan	Public Citizen Texas	This is the first pipeline we've opposed. The reason is because Keystone XL will be transporting tar sands.	Consolidated Response OIL-4 addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils. Many other pipelines in the U.S. transport crude oil derived from the Canadian oil sands.
1544	163	Rittenhouse	Ryan	Public Citizen Texas	In the debate about whether or not to grant this permit, the State Department should consider that this is not just about jobs or development. This is about what kind of jobs you are going to have and what kind of development you are going to endorse.	Consolidated Response ECO-1 addresses potential socioeconomic impacts associated with construction and normal operation of the proposed Project. Consolidated Response ALT-2 addresses the use of alternative technologies, alternative energy sources, and conservation of energy.
1544	166	Rittenhouse	Ryan	Public Citizen Texas	The tar sands are incredibly destructive. They are probably the single largest destructive enterprise going on right now in the entire world.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information on current and future production. As noted in that Consolidated Response, without the proposed Project, oil sands development would continue at or above the current level until at least 2020, with or without the proposed Project.
1544	167	Rittenhouse	Ryan	Public Citizen Texas	There are settlements among the first tribes in Canada where the cancer rates are many times higher than average, because they live downstream from the tar sands the tales pans are leaching into the river, getting into the food and drinking water, and it's literally killing them.	Consolidated Response CAN-1 and Section 3.14.4 of the EIS address issues related to development of oil sands projects in Canada.
1544	168	Rittenhouse	Ryan	Public Citizen Texas	It is irresponsible for the State Department to not consider the impacts of the oil sands on the local communities in Canada in the EIS.	Consolidated Response CAN-1 and Section 3.14.4 of the EIS address issues related to development of oil sands projects in Canada.
1544	169	Rittenhouse	Ryan	Public Citizen Texas	This project is moving in the wrong direction, building the wrong kind of infrastructure.	The commenter's opinion is noted.
1544	170	Rittenhouse	Ryan	Public Citizen Texas	We already have infrastructure for developing and using oil. We don't need more.	Consolidated Response P&N-1 addresses the need for the Proposed Project.
1544	172	Rittenhouse	Ryan	Public Citizen Texas	While it is true that it's important to rely on domestic sources of energy, for national security, this is still technically foreign energy. Canada is a lot closer than the Middle East, but it's still foreign and that is a concern. This will not solve our national security crisis. We will still be dependent on Middle East oil if we continue to rely on an infrastructure of dirty fossil fuels. There isn't enough tar sand oil to replace it.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
1544	174	Rittenhouse	Ryan	Public Citizen Texas	In light of all the recent disasters, the BP spills, the pipeline bust in Utah, etc, we should be very concerned about all pipeline safety issues.	As described in Consolidated Response SAF-1, the Pipeline and Hazardous Materials Safety Administration (PHMSA) has regulatory requirements that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project in a manner that protects the health and safety of the public and the environment. In addition, PHMSA developed 57 Project-specific Special Conditions that Keystone has agreed to implement. Incorporation of those conditions would result in a Project that would have a degree of safety over any other typically constructed domestic oil pipeline system under current code and a degree of safety along the entire length of the pipeline system similar to that which is required in HCAs as defined in 49 CFR 195.450. It also describes the inspections and reviews of the proposed Project that the Pipeline and Hazardous Materials Safety Administration would conduct to ensure compliance with those regulatory requirements.
1544	175	Rittenhouse	Ryan	Public Citizen Texas	This pipeline is going to be underground and so it will be harder to detect leaks as quickly.	Consolidated Response OIL-3 and Section 3.13.5 of the EIS describe the leak detection system for the Project. Issues related to an aboveground pipeline are addressed in Consolidated Response CST-1.
1544	176	Rittenhouse	Ryan	Public Citizen Texas	Because the tar sands are so toxic, particularly due to its sulfur content, it will be far more corrosive. Has this been studied properly? Why would we put a more corrosive oil in a pipeline with lower integrity?	Consolidated Response OIL-4 addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils. In addition, approximately 1.7 million barrels per day of Canadian crude oil was transported to the U.S. by pipeline in 2009. Keystone has withdrawn its application for a Special Permit as described in Consolidated Response REG-1. As described in Consolidated Response SAF-1, the Pipeline and Hazardous Materials Safety Administration (PHMSA) has regulatory requirements that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project in a manner that protects the health and safety of the public and the environment. In addition, PHMSA developed 57 Project-specific Special Conditions that Keystone has agreed to implement. Incorporation of those conditions would result in a Project that would have a degree of safety over any other typically constructed domestic oil pipeline system under current code and a degree of safety along the entire length of the pipeline system similar to that which is required in HCAs as defined in 49 CFR 195.450. The Special Conditions, presented in Appendix U of the EIS, include many requirements associated with corrosion, including pipe repair if corrosion is detected.
1544	178	Rittenhouse	Ryan	Public Citizen Texas	It makes it harder to bring in new development and new jobs for communities that are out of attainment. Maybe this will bring a few temporary jobs for building the pipeline, but you will scare de-incentivize new businesses and development in the Houston area because we're out of attainment.	As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries.J468
1544	179	Rittenhouse	Ryan	Public Citizen Texas	Many landowners are upset about the project. They have been bullied or threatened by the contractors that have been hired by TransCanada. These people have been coming on to their land and trespassing. Landowners have been threatened	As noted in Consolidated Response EAS-2, state laws dictate under what circumstances eminent domain may be used and define the eminent domain process within the state. DOS has no legal authority in the easement negotiations or in eminent

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					that if they don't sign the deals, they'll have eminent domain and will take the land away from them. That is something I think the State Department should look into, it's a big concern.	domain proceedings.
1553	44	Rittenhouse	Ryan	Public Citizen, Texas	This is the dirtiest oil in the world. This is Canadian tar sands oil, it is many times the amount of toxins that regular oil in it...[concerns about lead, nitrogen, sulfur, aluminum]...	Consolidated Response OIL-4 addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils. As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries.
1553	45	Rittenhouse	Ryan	Public Citizen, Texas	You also heard that the refineries won't increase their emissions. That's not necessarily true. A lot of these refineries are going to be applying for what's called major amendments to their air permits, and that's going to enable them to put out more pollution.	As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries. Consolidated Response OIL-4 also addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils.
1553	46	Rittenhouse	Ryan	Public Citizen, Texas	Concern because added air pollutants will decrease the amount of additional businesses that will be able to locate near the refineries because the air is so bad and the standards will be even harder to meet.	As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries. Consolidated Response OIL-4 also addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils.
1553	47	Rittenhouse	Ryan	Public Citizen, Texas	there is a report out recently by CERES I think that's how you say it, C-E-R-E-S, that references talking about how Canada's oil sands face significant financial and environmental risks as great as those in the BP spill. You can find this on line just search for CERES and tar sands reports, and basically what they have found is that the risks involved, both economical and environmental are as great, if not greater than the BP spill that's going on.	As described in Consolidated Response GLF-1, the risks associated with the proposed Project are substantially different from those associated with the BP Deepwater Horizon Project.
1553	48	Rittenhouse	Ryan	Public Citizen, Texas	You will get more jobs, and they are local jobs, they are American jobs, that will bolster the American economy, when you meet your energy needs with renewable energy, then when you meet them with fossil fuels. And that includes everything. That includes transforming our electrical grid to use renewable energy, wind and solar. We can build manufacturing plants here, that will create a lot of jobs for solar.	Comment acknowledged.
1554	37	Rittenhouse	Ryan	Public Citizen	If we say no to this pipeline, we are going to have to meet that energy need some other way, and that's where we come in, in our advocacy. We're advocating for renewable energy, energy efficiency, and things of that nature. We want to see more electric vehicles, we want to see fuel efficiency go up, have a higher standard on fuel efficiency.	Consolidated Response ALT-2 and Section 4.1 of the EIS address the use of alternative technologies and alternative energy sources.
1554	38	Rittenhouse	Ryan	Public Citizen	We can't meet our energy needs if we just bump up domestic	Consolidated Response ALT-2 addresses the use of

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					production and production in Canada. We need to start reducing our consumption of oil. It's the only way we are going to be able to get off of these foreign sources of oil. And that's what we are all about. The fact of the matter is as far as jobs go, when you meet your energy needs in renewable energy, you will employ more people and they will be longer-term jobs, they'll be local American jobs that when you do it from oil.	alternative technologies, alternative energy sources, and conservation of energy.
1554	39	Rittenhouse	Ryan	Public Citizen	Another thing, this oil is much dirtier. Gasoline is gasoline. When it come out of the refinery, there was 1 man here that asked me about that, it's going to be the same end result, for the most part. But it's what happens before it leaves the refinery that is of such concern. And for those of you who don't think it's any dirtier, if you have the money, fly to Canada. Go to Alberta and see the tar sands, smell the tar sands. Talk to the people that have to live downstream from the tailing ponds, the indigenous tribes whose land is being taken, who's water is getting poisoned by this stuff. Ask them if they think this is as clean as regular oil, and I think you'll get the answer, no, it's not.	Consolidated Response OIL-4 addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils. As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries.
1554	40	Rittenhouse	Ryan	Public Citizen	Remediation doesn't work, it's a Band-Aid that is cosmetic. It doesn't recreate the ecosystem that was initially there. It may look like it did, in most cases it doesn't even look like the same thing. But once you've destroyed the ecosystems, especially when we're talking about ecosystems like the appalachian forests or like the boreal forests up in Canada, these are pristine ecosystems that are very fragile, and once you do this, heavily destructive practice to it, it's gone forever.	Required emergency response plans for the proposed Project are discussed in Consolidated Response RES-1. As discussed in Section 3.13 of the EIS, federal, state, and local agencies would participate in response activities and soil, surface water, and groundwater cleanup consistent with their authorities and duties under applicable regulations and consistent with the requirements of the Emergency Response Plan and the Pipeline Spill Response Plan. A list of applicable regulations relative to remediation of crude oil spill contamination at the federal and state level is provided in Table 3.13.5-10. Required mitigation for crude oil or oil products spill impacts would be determined by these agencies.
1554	41	Rittenhouse	Ryan	Public Citizen	the boreal forests, which I don't think they'll ever to be able to reclaim that. At least not in the areas where they are putting in these tailing ponds.	Consolidated Response GHG-4 addresses concerns regarding the loss of boreal forest and peat bogs.
1554	42	Rittenhouse	Ryan	Public Citizen	[regarding air quality] But many of these refineries, you won't know if they need to do amendments to their permits or not, until they start looking for deals for this tar sands oil. In all likelihood, a lot of them will have to upgrade their facility and when that triggers the permitting process, it'll change what their amendments are, or could change what they are. And in an area that's already out of attainment, why are we considering letting a dirtier source of fuel come in to be refined, which could make it even harder for the businesses and the people from this area, of that area to meet their attainment standards? It just seems like a terrible idea.	As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries. Consolidated Response OIL-4 also addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils.
1554	43	Rittenhouse	Ryan	Public Citizen	the EPA is currently in a processes for setting a new standard for ozone attainment. Right now it's at 85, for which Houston is already out of attainment on. It's going to be dropped down to somewhere between 60 and 70. So if this is going to increase emissions to the Houston, Galveston area, and the standard is going down, which means it's getting stricter, because that's the amount of pollution that is allowed to be in the air. That's going to make this much harder. And not just on the people	As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries. Consolidated Response OIL-4 also addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					who have to breathe this stuff in, but it's going to make it harder for new businesses to move into the area.	similar in composition to other heavy crude oils.
1559	88	Rittenhouse	Ryan		Works at Public Citizen, a national nonprofit organization, who just found out about this project a month ago. Has been going to these hearings all week. Noticed that very few people except affected landowners even know about this project.	Consolidated Response INT-1 addresses concerns related to the Notice of Intent (NOI) to prepare an EIS for the proposed Project. Consolidated Response CMT-2 addresses issues related to comment meetings on the draft EIS and requests for additional public involvement.
1559	90	Rittenhouse	Ryan		Do NOT need tar sands oil. Plenty of alternatives out there, technology exists, but the established fossil fuel industries fight against development of alternative choices. To develop alternative energies you have to stand up to them, not help them develop a dirtier fossil fuel industry. Same goes for national security - if we develop alternative energies then we wouldn't be dependent on foreign fuels.	Consolidated Response ALT-2 and Section 4.1 address the use of alternative technologies and alternative energy sources.
1559	91	Rittenhouse	Ryan		Indigenous tribes are getting poisoned because they are downstream from the area being destroyed.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information on current and future production. As noted in that Consolidated Response, without the proposed Project, oil sands development would continue at or above the current level until at least 2020, with or without the proposed Project.
1559	92	Rittenhouse	Ryan		Canada's boreal forests are being cut, one of the largest and most pristine ecosystems in the world.	Consolidated Response GHG-4 addresses concerns regarding the loss of boreal forest and peat bogs.
1559	93	Rittenhouse	Ryan		This is the dirtiest fuel in the world.	Consolidated Response OIL-4 addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils.
1559	94	Rittenhouse	Ryan		People in Houston and Beaumont will see increased emissions from refineries because this oil is so dirty. Houston/Beaumont is already one of the dirtiest air systems in the country. They are already not meeting Federal Clean Air Act standards, and EPA is about to make those standards stricter.	As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries. Consolidated Response OIL-4 also addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils.
1559	88	Rittenhouse	Ryan		Works at Public Citizen, a national nonprofit organization, who just found out about this project a month ago. Has been going to these hearings all week. Noticed that very few people except affected landowners even know about this project.	Consolidated Response INT-1 addresses concerns related to the Notice of Intent (NOI) to prepare an EIS for the proposed Project. Consolidated Response CMT-3 addresses the level of information provided to the public regarding the proposed Project and the draft EIS scoping meeting locations and schedules.
248	1	Roan	Paul	State Representative OK District 20	As a State Representative of Oklahoma, I strongly encourage the U.S. Department of State to approve an energy infrastructure project that not only will strengthen long-term energy security in the United States, but also will provide a powerful private sector economic stimulus to the mostly rural communities along the pipeline route during its construction at a time when our economy continues to struggle.	Comment acknowledged.
248	3	Roan	Paul	State Representative OK District 20	I enthusiastically support the Keystone XL Pipeline Project and encourage the Department of State to confirm the findings of the Draft Environmental Impact Statement, which found that the proposed Keystone XL Pipeline would have "limited	Comment acknowledged.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					adverse environmental impact during construction and operation." I look forward to the issuance of a Final Environmental Impact Statement followed by a Presidential Permit that allows the construction of Keystone XL and enables my districts, the State of Oklahoma, and the United States to collect the substantial economic benefits Keystone XL would create.	
74	1	Roberson	Cynthia		Tar sands are dirty oil. Tar sands oil emits three times more greenhouse gases during production than conventional gasoline. About three barrels of water are polluted and dumped in toxic pools (called tailing ponds) for every barrel of oil produced. Tar sands extraction requires strip mining huge tracts of pristine forest. An area the size of Florida is slated for extraction. The project harms the lives and health of indigenous people living downstream from the tar sands operations and has been connected to high rates of rare cancers, renal failure, lupus, and hyperthyroidism in the area.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project. Consolidated Response GHG-1 addresses GHG life-cycle analyses.
74	2	Roberson	Cynthia		The Keystone XL Pipeline is dirty for our environment and harmful for us. Producing the oil for this pipeline will emit 11 million tons of carbon dioxide into the atmosphere annually, even before it gets to the U.S. for refining. This equals the annual emissions of 2.7 million cars.	Consolidated Response GHG-1 addresses the greenhouse gas life-cycle analyses presented in the revised EIS. As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries.
74	4	Roberson	Cynthia		The pipeline will travel more than 1,700 miles through fragile ecosystems, such as the Missouri River.	Consolidated Response ENV-1 addresses concerns related to sensitive and fragile environmental and ecosystems.
74	7	Roberson	Cynthia		The company is seeking a special permit to operate at this pressure from the Pipeline and Hazardous Materials Safety Administration.	Keystone has withdrawn its application for a Special Permit as described in Consolidated Response REG-1.
74	8	Roberson	Cynthia		By connecting tar sands oil to the Gulf Coast, the Keystone XL will make our nation's fuels dirtier and undermine the clean energy solutions we need to avert catastrophic climate change.	Consolidated Response P&N-1 addresses the need that the Project has been proposed to meet, including information on crude oil supply and demand from an analysis specific to the proposed Project. As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries. Consolidated Response OIL-4 also addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils.
337	1	Robertson	Donald		It seems silly to have to remind all concerned that all our attempts to get oil have had disastrous results and have damaged our environment. The Gulf spill simply frames it and causes us to be aware of our foibles	As described in Consolidated Response GLF-1, the risks associated with the proposed Project are substantially different from those associated with the BP Deepwater Horizon Project.
337	2	Robertson	Donald		To run this pipeline through a major water system, the Ogallala aquifer, seems foolish beyond comprehension. The dangers to our living world are terrible.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
337	3	Robertson	Donald		Build the refinery in Canada where you have already ruined the lives and living areas of the Indians and animals and fish that have the misfortune to live in that area.	Consolidated Response P&N-8 addresses issues related to shipping Canadian crude oil to refineries that are closer to the source of oil.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
1327	1	Robertson	William	Quintana Capital Group	As an interested stakeholder, Quintana Capital Group GP, Ltd. is pleased to express its support for TransCanada's Keystone XL (KXL) crude oil pipeline and to urge that the Department of State continue its permitting process for this important energy infrastructure project. . .	Comment acknowledged.
1142	1	Robertus	James		I do not want an oil pipeline running through my state.	Consolidated Response ALT-1 addresses potential alternative routes, including routes that would avoid much of the Northern High Plains Aquifer system.
601	1	Robinson	Brenda		I am against the Keystone XL Pipeline Project across the Sandhills of Nebraska. Too many promises of no damage to the environment have been made and broken. We cannot afford to pollute the Ogallala Aquifer under this area of the Sandhills. Please protect the Sandhills and the Ogallala Aquifer.	Identification of sensitive environments crossed by the proposed Project is discussed in Consolidated Response ENV-1 and ENV-3. Issues related to the Sand Hills area are addressed in Consolidated Response ERO-1. Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
601	2	Robinson	Brenda		We cannot afford to pollute the Ogallala Aquifer under this area of the Sandhills. Please protect the Sandhills and the Ogallala Aquifer.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
837	1	Robinson	Malia		As a resident of the State of Nebraska I wish to register my objection to the construction of the TransCanada pipeline through our state. I am not at all convinced of the assurances made regarding its safety, which is paramount considering its proposed placement over the Ogallala Aquifer and some of the most fragile eco-system in the nation.	Issues related to the Northern High Plains Aquifer system, which includes the Ogallala aquifer are addressed in Consolidated Responses AQF-1 through AQF-4. As described in Consolidated Response SAF-1, the Pipeline and Hazardous Materials Safety Administration (PHMSA) has regulatory requirements that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project in a manner that protects the health and safety of the public and the environment. In addition, PHMSA developed 57 Project-specific Special Conditions that Keystone has agreed to implement. Incorporation of those conditions would result in a Project that would have a degree of safety over any other typically constructed domestic oil pipeline system under current code and a degree of safety along the entire length of the pipeline system similar to that which is required in HCAs as defined in 49 CFR 195.450.
837	2	Robinson	Malia		Considering the situation of our economy, high unemployment and concerns about current energy means, it makes no sense that we are outsourcing this work to continue the use of dangerous natural gas. The people of Nebraska was to protect their environment and are willing to work towards developing clean energy, sourced by Nebraskans.	The proposed Project would transport crude oil, not natural gas. Consolidated Response P&N-1 addresses the need that the Project has been proposed to meet. Consolidated Response ECO-1 addresses potential socioeconomic impacts, and Consolidated Response TAX-1 addresses concerns regarding taxes.
570	1	Rodgers	Craig		The Keystone XL project is very dangerous to the environment in general and Ogallala Aquifer in particular. As a resident of Nebraska, I believe it is my responsibility, as it should be the responsibility of all Nebraskans, to protect the aquifer. I think the oil pipeline should be diverted around the aquifer because it is such a precious and irreplaceable water source.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. Consolidated Response ALT-1 addresses potential alternative routes, including routes that would avoid much of the Northern High Plains Aquifer system.
981	1	Rom	Lance	Quality Services Inc	I understand SD SHPO agreed to a sample cultural resources inventory for this project in SD. To adequately determine potential environmental effects to cultural resources from this project a Level III (SD SHPO Terms) complete cultural resources inventory is needed. Guessing just isn't good enough! Actual data is needed.	The methodology for the cultural survey covering 100 percent of the Project APE in South Dakota has been performed for this project in consultation with the South Dakota SHPO. Section 3.11.3.1 of the EIS discusses the effects of the proposed Project on Cultural Resources in South Dakota.
981	2	Rom	Lance	Quality Services	Some Indian tribes consider fossil resources as ethnographic	TCP reports are being conducted by Indian tribes who agreed

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
				Inc	items related to their oral history and spiritual beliefs. Complete paleontological and cultural resources inventories of the entire line is needed, along with on-the-ground monitoring by professional archeologists and paleontologists, and trained tribal TCP monitors.	to become consulting parties for this project. Section 3.11 of the EIS addresses the development of a Tribal Monitoring Plan and a Historic Trails Monitoring Plan for specific locations along the proposed route where monitoring is appropriate. Because paleontological resources are not typically considered archaeological resources, they are not considered "historic property" types under the National Historic Preservation Act. On some occasions, Indian tribes hold beliefs that paleontological resources are also TCPs. As described in Section 3.11 of the EIS, DOS has completed extensive outreach to the tribes to include them in TCP studies which would help determine whether or not the paleontological resources discovered as part of the construction of the proposed Project are associated with TCP sites.
284	1	Rose	Bev		Please find a better way than running the pipeline through the aquifer. Look at what is happening in the gulf right now. Make sure that everything is safe please.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. Consolidated Response ALT-1 addresses potential alternative routes, including routes that would avoid much of the Northern High Plains Aquifer system. As described in Consolidated Response GLF-1, the risks associated with the proposed Project are substantially different from those associated with the BP Deepwater Horizon Project.
1188	2	Ross	Philip		I am writing to express a deep concern about the pipeline project that cuts across Nebraska and represents a credible threat to our great natural resources, [the Ogallala Aquifer] and Sandhills ecosystem.	Identification of sensitive environments crossed by the proposed Project is discussed in Consolidated Response ENV-1 and ENV-3. Issues related to the Sand Hills area are addressed in Consolidated Response ERO-1. Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
1188	3	Ross	Philip		The project should not go forth and jeopardize resources we currently depend, to say nothing of how valuable the water will be to future generations.	Consolidated Response WAT-1 addresses concerns regarding potential water quality impacts.
1188	4	Ross	Philip		Please consider the long range and devastating threat such a pipeline holds for our state. Please work to halt current plans.	Consolidated Response ENR-1 provides information on the Department of State's environmental review process, the National Interest Determination process, and the need to complete those reviews before approving or denying the Presidential permit for the proposed Project.
1413	1	Roulet	Gary	Western Farmers Electric Cooperative	Dear Ms. Orlando: As an electric power and energy provider, Western Farmers Electric Cooperative (WFEC), a rural electric generation and transmission cooperative, and two of our member rural electric distribution cooperatives will provide facilities and electricity for two pipeline stations on the Keystone XL Pipeline Project within the state of Oklahoma. These two projects provide positive economic benefits for WFEC and specifically for our distribution cooperatives and their consumer members within rural Oklahoma.	Comment acknowledged.
1413	2	Roulet	Gary	Western Farmers Electric Cooperative	WFEC is supportive of the Keystone XL Pipeline Project and encourages the Department of State's confirmation of the project.	Comment acknowledged.
1293	1	Rounds	Michael	Governor of South Dakota	I am writing in support of the TransCanada XL crude oil pipeline and to urge the Department of State to continue the permitting process.	Comment acknowledged.
1293	4	Rounds	Michael	Governor of	Construction of the TransCanada XL pipeline will help both the	Comment acknowledged.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
				South Dakota	United States and Canadian economies.	
1293	5	Rounds	Michael	Governor of South Dakota	In addition to the many short-term construction jobs created to build the pipeline, additional long term jobs will be created to operate the pipeline for many years.	Comment acknowledged.
1293	6	Rounds	Michael	Governor of South Dakota	Once in place, the TransCanada XL pipeline will also pay annual property taxes in the counties where it is built. Most of those additional annual property taxes will be allotted to local schools for expanded educational opportunities.	Comment acknowledged.
233	1	Rowden	Ryan	Energy API MO Petroleum Council	As the executive director of the Missouri Petroleum Council, I strongly encourage the U.S. Department of State to approve an energy infrastructure project that not only will strengthen long-term energy security in the United States, but also will provide a powerful private sector economic stimulus to the communities along the pipeline route during its construction at a time when our economy continues to struggle. As we understand it, Keystone XL will directly create more than 13,000 high-wage construction and manufacturing jobs during the project's 2011-2012 construction schedule. In Missouri, TransCanada has just finished up a pipeline stretching across the northern tier of our state which provided a huge economic boost as well as strengthened the regions long term energy security. Below are just some of the benefits communities across the state received during the construction of Keystone here in Missouri:[included in letter] Like construction in Missouri, Keystone XL will generate substantial economic benefits for the United States and in states and communities along the proposed route. In many cases these are areas where economic performance has stagnated or is shrinking. It is our understanding that TransCanada commissioned a study to measure the project's economic stimulus to the U.S., and the states along the route. The study found that in the U.S., Keystone XL would generate \$20.9 billion in total expenditures, \$9.6 billion in output (gross product), personal income of \$6.5 billion and 118,935 person years of employment (jobs). In addition, the report concluded that during construction, Keystone XL would generate \$486.36 million in tax revenue for state governments along the route and \$99.1 million for local taxing entities where the pipeline is located.	Consolidated Response ECO-1 addresses potential socioeconomic impacts, and Consolidated Response TAX-1 addresses concerns regarding taxes.
70	1	Roy	D.A.		Tar sands oil emits three times more greenhouse gases during production than conventional gasoline About three barrels of water are polluted and dumped in toxic pools (called tailing ponds) for every barrel of oil produced. Tar sands extraction requires strip mining huge tracts of pristine forest. The project harms the lives and health of indigenous people living downstream from the tar sands operations and has been connected to high rates of rare cancers, renal failure, lupus, and hyperthyroidism in the area.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project. Consolidated Response GHG-1 addresses GHG life-cycle analyses.
70	2	Roy	D.A.		The Keystone XL Pipeline Producing the oil for this pipeline will emit 11 million tons of carbon dioxide into the atmosphere annually, even before it gets to the U.S. for refining. This equals the annual emissions of 2.7 million cars.	Consolidated Response GHG-2 addresses the potential causal connection of implementation of the proposed Project and expanded oil sands production in Canada and increases in refining. Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
						projects with and without the proposed Project. Consolidated Response GHG-3 addresses the decreased rate of GHG gas emissions from oil sands production in Canada.
70	3	Roy	D.A.		The pipeline will travel more than 1,700 miles through farmland and fragile ecosystems, such as the Missouri River. Pipeline breaks are not uncommon, as seen in January 2010, when a pipeline in North Dakota spilled 126,000 gallons of oil into the surrounding area.	Consolidated Responses OIL-1 and OIL-2 address the likelihood of large spills from the proposed Project. Section 3.13 of the EIS was revised to update spill incident statistics and projections, provide additional information on composition of the crude oil that would be transported by the proposed Project, additional information on potential impacts to the Northern High Plains Aquifer system, and other key information. This section addresses reliability and safety issues, including calculations of the probability of a spill from the proposed Project and the potential environmental impacts associated with spills.
70	5	Roy	D.A.		By connecting tar sands oil to the Gulf Coast, the Keystone XL will make our nation's fuels dirtier and undermine the clean energy solutions we need to avert catastrophic climate change. What more needs to be said?	Consolidated Response GHG-3 addresses the decreased rate of GHG gas emissions from oil sands production in Canada.
1183	2	Rubarth	Lori	Creighton University School of Nursing	I have deep concerns about the safety of the Ogallala Aquifer in Nebraska with the proposed oil pipeline.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
1183	3	Rubarth	Lori	Creighton University School of Nursing	Oil pipelines can leak (as we are seeing in the gulf). I have deep concerns about the safety of the Ogallala Aquifer in Nebraska with the proposed oil pipeline. Please make sure it is safe before you endeavor to spend money on a pipeline under our state.	Section 3.13 of the EIS addresses reliability and safety issues, including calculations of the probability of a spill from the Project. Issues related to the High Plains Aquifer System are addressed in Consolidated Responses AQF-1 through AQF-4. As described in Consolidated Response SAF-1, the Pipeline and Hazardous Materials Safety Administration (PHMSA) has regulatory requirements that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project in a manner that protects the health and safety of the public and the environment. In addition, PHMSA developed 57 Project-specific Special Conditions that Keystone has agreed to implement. Incorporation of those conditions would result in a Project that would have a degree of safety over any other typically constructed domestic oil pipeline system under current code and a degree of safety along the entire length of the pipeline system similar to that which is required in HCAs as defined in 49 CFR 195.450. The proposed Project would be funded by Keystone, the applicant for a Presidential Permit. DOS would not fund the Project.
1268	1	Rudolph	Tom		My name is Tom Rudolph, I'm a grain farmer from Circle, Montana, and I have land crossed by the proposed route of the Keystone XL pipeline. As a landowner directly on the route who stands the most to lose by this project, I feel that the draft Environmental Impact Statement is insufficient in a number of ways.	As noted in Consolidated Response REG-2, DOS takes seriously its responsibilities to thoroughly evaluate the environmental effects of its Presidential Permit decisions consistent with NEPA and other relevant laws and regulations. In conducting the environmental review of the proposed Project, DOS followed NEPA, Council on Environmental Quality regulations and guidance, and all other applicable laws and regulations. In addition, DOS was assisted by a third-party environmental contractor in the environmental review of the proposed Project. That contractor, Cardno ENTRIX, has conducted environmental impact assessments of nearly 30

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
						proposed pipeline projects and has experience in such work throughout the U.S., including in the states along the proposed corridor. DOS also consulted extensively with other relevant federal agencies that have particular technical expertise and authority relevant to the proposed Project. As a result, DOS considers the EIS to be in full compliance with the requirements of a NEPA environmental review.
1268	2	Rudolph	Tom		The first issue I'd like to address is safety. The disaster in the Gulf serves as a warning - if federal officials had paid more attention to the possible consequences of a blowout of BP's rig before the company was allowed to drill, we would have known before it was too late that there was no plan to contain a catastrophic spill. An article on BP in the June 19, 2010 edition of The Economist started with an email from a manager at BP: "Who cares, its done, end of story, will probably be fine", and goes on to state that he spoke of using only a few centralizers when cementing the undersea oil pipe into place. The cement failed considerably more likely with fewer centralizers, experts say- four days after the email was sent!	As described in Consolidated Response GLF-1, the risks associated with the proposed Project are substantially different from those associated with the BP Deepwater Horizon Project. Consolidated Response SAF-1 describes the regulatory requirements and Project-specific Special Conditions that Keystone would comply with to construct, operate, maintain, inspect, and monitor the proposed Project. It also describes the monitoring, inspections, and reviews of the proposed Project that the Pipeline and Hazardous Materials Safety Administration would conduct to ensure compliance with those regulatory requirements.
1268	3	Rudolph	Tom		A spill along the Keystone XL route is a real risk, a risk that the draft EIS largely dismisses.	The EIS does not largely dismiss the risk of a release from the Project. Section 3.13 of the EIS addresses reliability and safety issues, including calculations of the probability of a spill and the potential environmental impacts associated with spills.
1268	4	Rudolph	Tom		The rural, remote siting for most of this project makes the need for local participation in decisions even more important.	Public comment meetings were held in the vicinity of the proposed route to provide affected landowners with the opportunity to attend and provide comments. Also see Consolidated Response CMT-2.
1268	5	Rudolph	Tom		The largely volunteer emergency personnel and potentially affected property owners and others who live near the pipeline deserve an opportunity to comment on TransCanada's emergency response plan prior to issuance of permits and approval of the plan. Yet, the Emergency Response Plan in the DEIS is so incomplete at this time, it is impossible for the public to give proper review and feedback through this process. Therefore, we strongly suggest that once there is a complete draft Emergency Response Plan, you conduct another comment period so that we may address it. Safety is of utmost importance and our local communities need to know there is a good plan in place.	Response RES-1 addresses issues related to preparation and review of emergency response plans for the proposed Project.
1268	8	Rudolph	Tom		The oil contained in the pipe could also drain and this could happen more than once. All the contaminated soil would probably have to be hauled to the nearest hazardous waste dump (60 miles from my farm) and replaced with other soil. If the oil reaches an aquifer, the problem would be worse.	Oil would drain from the pipeline only if there was a rupture of the pipe. As described in Section 3.13.5, mainline valves would be shut to control the release of oil due to a rupture. The appropriate response actions, including the fate of any oiled soil and other material, would be determined at the time of the response by the Incident Commander and in compliance with the response actions identified in the approved Emergency Response Plan or the Spill Prevention, Control, and Countermeasure Plan. Hauling it to a hazardous waste facility is a possible but unlikely option for most of the soil. A more likely option is local "land farming" with possible nutrient enrichment to enhance biodegradation. Section 3.13 of the EIS addresses reliability and safety issues, including the potential environmental impacts associated with spills that

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
						reach groundwater.
1268	9	Rudolph	Tom		My entire farming business could be devastated by continuous leaks and repairs for certainly the rest of my life and possibly my children's lives as well. My land value would decrease drastically. These are very serious issues.	Section 3.13.4.2 of the EIS includes calculations of the probability of a spill from the Project. As noted in that section, there is no likelihood of continuous leaks from a short section of the pipeline. Repairs would only be made when necessary, after monitoring or inspection indicate a problem, as prescribed by federal regulations. Consolidated Response LIA-1 summarizes the actions and costs for which Keystone would be liable in the event of a spill of oil that affects a private party. Keystone would compensate landowners for damages, including lost crops, associated with pipeline repair as described in the Construction, Mitigation, and Reclamation Plan presented in Appendix B of the EIS and as stipulated in easement agreement between the landowner and Keystone.
1268	11	Rudolph	Tom		Yet, the Department of State's draft EIS does not address the higher-pressure, thinner-pipe scenario, or the potential impacts of spills, compromising the accuracy of the information therein. The Department of Transportation has said it will issue a separate Environmental Analysis, but this is too little and too late. The EIS should analyze the real potential risks and impacts of a spill under the waiver-granted scenario.	Keystone has withdrawn its application for a Special Permit as described in Consolidated Response REG-1, and the Pipeline and Hazardous Materials Safety Administration will not be preparing a separate analysis.
1268	12	Rudolph	Tom		The EIS should analyze the real potential risks and impacts of a spill under the waiver-granted scenario.	Keystone has withdrawn the Special Permit request (see Consolidated Response REG-1). As described in Consolidated Response SAF-1, the Project would be constructed in accordance with regulations the Pipeline and Hazardous Materials Safety Administration (PHMSA) and in accordance with the 57 Project-specific Special Conditions (see Appendix U of the EIS) developed by PHMSA and agreed to by Keystone. Incorporation of those conditions would result in a Project that would have a degree of safety over any other typically constructed domestic oil pipeline system under current code and a degree of safety along the entire length of the pipeline system similar to that which is required in high consequence areas as defined in 49 CFR 195.450.
1268	13	Rudolph	Tom		Farm and ranch land should be afforded the same level of safety that cities are.	Consolidated Response SAF-1 describes the regulatory requirements that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project in a manner that protects the health and safety of the public and the environment. This includes the 57 Project-specific Special Conditions (see Appendix U of the EIS) developed by the Pipeline and Hazardous Materials Safety Administration and agreed to by Keystone. Incorporation of those conditions would result in a Project that would have a degree of safety over any other typically constructed domestic oil pipeline system under current code and a degree of safety along the entire length of the pipeline system similar to that which is required in high consequence areas as defined in 49 CFR 195.450.
1268	14	Rudolph	Tom		The pipe should be built aiming for the highest safety standards throughout, with no shortcuts.	Keystone has withdrawn its application for a Special Permit as described in Consolidated Response REG-1. As described in Consolidated Response SAF-1, the Pipeline and Hazardous Materials Safety Administration (PHMSA) has regulatory

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
						requirements that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project in a manner that protects the health and safety of the public and the environment. In addition, PHMSA developed 57 Project-specific Special Conditions that Keystone has agreed to implement. Incorporation of those conditions would result in a Project that would have a degree of safety over any other typically constructed domestic oil pipeline system under current code and a degree of safety along the entire length of the pipeline system similar to that which is required in HCAs as defined in 49 CFR 195.450.
1268	21	Rudolph	Tom		The impacts, actions, and preventive measures to be taken and liability for all problems has to be solidly defined for the long haul, addressed up front and the public must be given time to consider everything and comment.	The EIS describes the proposed action and alternatives and addresses potential environmental impacts and mitigation measures. Those issues were also addressed in the draft EIS and commented on by the public. Also see Consolidated Responses CMT-1 and CMT-2.
1268	22	Rudolph	Tom		I'd like to raise the issue of condemnation for a pipe that so far has had no proof that it is needed. If my productive farm land is to be taken by a company for the purposes of constructing a massive pipeline to transport tar sand crude from Calgary, Alberta to the Gulf Coast of Texas with little to no benefit for those of us in Montana, there should be a demonstrated need, but this is another gap in the DEIS.	Consolidated Response P&N-1 addresses the need that the Project has been proposed to meet. Consolidated Response EAS-2 addresses issues related to easement negotiations and eminent domain.
1268	23	Rudolph	Tom		There are several issues I have not mentioned herein related to landowners' negotiations with TransCanada. If the "Right of Eminent Domain" and Condemnation is used to force us to accept the pipeline, we have no power to negotiate our needs with them. We will be forced to accept the pipeline on their terms. One of our concerns, for example, is that in the contracts we have been presented so far, the landowner can be held liable for accidentally or unintentionally interfering with pipeline throughput, as if we could actually cover their costs when \$72 million worth of oil is passing beneath our land every day. To be forced into a contract with no opportunity to negotiate issues of concern and where need has not been shown isn't fair to me or other landowners in my situation.	As noted in Consolidated Response EAS-2, state laws dictate under what circumstances eminent domain may be used and define the eminent domain process within the state. DOS has no legal authority in the easement negotiations or in eminent domain proceedings. Consolidated Response LIA-1 addresses Keystone's liability if there is an accidental release of hazardous materials or fuel during construction and from an accidental release of crude oil from the Project.
1268	24	Rudolph	Tom		I urge you to commit to a public comment period on the draft Emergency Response Plan.	Consolidated Response RES-1 addresses issues related to preparation and review of emergency response plans for the proposed Project.
1268	27	Rudolph	Tom		Because this draft Environmental Impact Statement is so deficient, and because the project will be of great consequence to those of us who live in its path, I believe that there should be another public comment period on the draft permit if a National Interest Determination is proposed.	As noted in Consolidated Response P&N-9 and in Section 1.3 of the EIS, DOS will provide the public with a 30-day review period after the final EIS is issued .
1545	1	RUDOLPH	TOM	Northern Plains Pipeline Landowners Group	We would welcome the economic boost the pipeline project could possibly provide for our local economy, but we also want to be sure that we don't sustain problems or losses because of the project.	Comment acknowledged.
1545	2	RUDOLPH	TOM	Northern Plains Pipeline Landowners Group	The DEIS does not contain or evaluate a complete emergency response plan which the Department of Transportation must approve prior to pipeline operations. The largely volunteer emergency personnel and potentially affected property owners and others who live near the pipeline deserve an opportunity	Consolidated Response RES-1 addresses issues related to preparation and review of the emergency response plan for the proposed Project.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					to comment on TransCanada's emergency response plan prior to issuance of permits and approval of the plan. The disaster in the Gulf serves as a warning. If federal officials had paid more attention to the lack of a plan for dealing with a blow out of BP's rig before the company was allowed to drill, we would have known before it was too late that there was no plan to contain the catastrophic spill. The emergency response plan, in fact, is so incomplete at this time it was not even to the point that the public could give proper review and feedback through this process. Therefore, we strongly suggest that once there is a complete draft emergency response plan, you conduct another comment period so that we may address it. At this point it's hardly more than an outline, and therefore essentially un-commentable. Safety is of utmost importance, and our local communities need to know there's a good plan in place.	
1545	3	RUDOLPH	TOM	Northern Plains Pipeline Landowners Group	Another point of safety plus other issues is a pressure waiver applied for by TransCanada. This DEIS should have analyzed the real potential risks and impacts of a spill under the waiver granted scenario. If the DOS grants a permit under the scenario of .72 pressure but then the pipeline is allowed at .8, the accuracy of the information in the EIS is compromised.	Keystone has withdrawn its application for a Special Permit as described in Consolidated Response REG-1. As described in Consolidated Response SAF-1, the Pipeline and Hazardous Materials Safety Administration (PHMSA) has regulatory requirements that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project in a manner that protects the health and safety of the public and the environment. In addition, PHMSA developed 57 Project-specific Special Conditions that Keystone has agreed to implement. Incorporation of those conditions would result in a Project that would have a degree of safety over any other typically constructed domestic oil pipeline system under current code and a degree of safety along the entire length of the pipeline system similar to that which is required in HCAs as defined in 49 CFR 195.450.
1545	4	RUDOLPH	TOM	Northern Plains Pipeline Landowners Group	A leak and how it would be handled is one of our greatest concerns as landowners, and this could have a tremendous impact on our property values. As the project is proposed, TransCanada may have the right of eminent domain, meaning the courts may force us into an agreement on their terms with minimal compensation. The easement can be sold to any other company under the present contracts offered. If contamination of our land occurs, especially in later years, and the responsible party cannot or will not pay the cost, government environmental agencies could clean it up and force the landowner to pay for the cleanup. This has happened to landowners when a crystal meth lab was put on their remote property without their knowledge. An oil spill cleanup could potentially cost much more than the value of the property. Because of this overhanging liability, I believe our land values will be drastically reduced.	Consolidated Response LIA-1 addresses Keystone's liability if there is a spill of hazardous materials or fuel during construction and from a spill of crude oil from the proposed Project. As noted in that response, there is legislation requiring that the owner/operator of the Project pay for cleanup costs.
1545	6	RUDOLPH	TOM	Northern Plains Pipeline Landowners Group	the EIS severely underestimates the impact that construction or any potential leaks would have on agricultural land, saying that ag land will recover in one year; that's EIS reference 313-15 and 314-26. Farmers know that it takes many seasons to recover from soil damage, weed introduction, settling and everything else that will be associated with the massive construction project with huge, heavy machinery.	Consolidated Response FRM-2 describes potential impacts to irrigated crops and Keystone's responsibilities to compensate for damage to these crops. The EIS was revised to reflect that the potential impacts to agricultural land from an oil spill and subsequent response actions may last for one to a few years, depending upon the amount of oil, area impacted, and the type of cleanup actions taken by Keystone. In general, oil on

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
						and/or in the soils is weathered through biodegradation by micro-organisms, photodegradation by sunlight, and physical-chemical degradation. These basic processes generally reduce or eliminate the lighter fractions of oil that may be harmful to plants and/or animals and do so in a few months to a year or two. The heavier fractions of the oil (commonly called tar or asphalt) may persist for longer periods of time but are not toxic to organisms. The response actions may disturb the soils and provide habitat for weeds, reduce or remove the native or agricultural vegetation, and otherwise have impacts that may persist for a year or more.
1545	7	RUDOLPH	TOM	Northern Plains Pipeline Landowners Group	Also, the idea that our crops and grass or whatever will grow back after nature fixes the problem of any spills within one year is absolutely inaccurate and verging on offensive. This pipeline will have devastating and permanent effects on irrigated land, which this EIS glossed over and hardly distinguishes from dry land farming.	The draft EIS did not indicate that crops or grasses would be restored without appropriate spill cleanup and remediation. The EIS was revised to reflect that the potential impacts to agricultural land from construction and from an oil spill and subsequent response actions may last for one to a few years, depending upon the amount of oil, area impacted, and the type of cleanup actions taken by Keystone. In general, oil remaining on and/or in the soils is weathered through biodegradation by micro-organisms, photodegradation by sunlight, and physical-chemical degradation. These basic processes generally reduce or eliminate the lighter fractions of oil that may be harmful to plants and/or animals and do so in a few months to a year or two. The heavier fractions of the oil (commonly called tar or asphalt) may persist for longer periods of time but are not toxic to organisms. The response actions may disturb the soils and provide habitat for weeds, reduce or remove the native or agricultural vegetation, and otherwise have impacts that may persist for a year or more.
1545	8	RUDOLPH	TOM	Northern Plains Pipeline Landowners Group	The EIS affords government land some protections but leaves agricultural reclamation up to landowner easements; EIS reference 3.2 to 12. Private landowners should be afforded the same protections as the government.	It is not clear what the commenter is referring to regarding the lack of reclamation on private land since that is not addressed on Page 3.2-12. Keystone would reclaim all lands affected by construction to pre-construction to the extent practicable and described in Sections 2.3.2.8 and 2.3.2.9 of the EIS and in the Keystone Construction, Mitigation, and Reclamation Plan (presented in Appendix B of the EIS) unless the landowner and Keystone agree to an alternate restoration.
1307	1	Ruggeri	Salvatore	VALVITALIA U.S.A. Inc.	I write in support of TransCanada's Keystone XL Crude Oil Pipeline Project. This Project will have significant benefits for many companies and suppliers like Valvitalia, especially in this particular period of global crisis, which caused reduction of our workforce. Keystone Project represents for us a unique opportunity to use our manufacturing capacity and to give a job to our employees and to those of our subcontractors. I trust that Department of State will grant to TransCanada the Regulatory Approval to start with this very strategic and safe Project.	Comment acknowledged.
1546	72	Ruldolph	Tom	Northern Plains Resource Council/Northern Plains Pipeline Landowners Group	Site of pipeline remote, and there are largely volunteer emergency personnel who aren't on a scale to respond to a spill.	Keystone would coordinate with county and local emergency responders, provide response training, and conduct spill drills as described in its Emergency Response Plan (ERP) and its Spill Prevention, Control, and Countermeasure (SPCC) plans. Consolidated Response RES-1 addresses issues related to preparation and review of the ERP for the proposed Project. SPCC plans are addressed in Sections 2.3 and 3.13.5 of the

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
						EIS and in the Construction, Mitigation, and Reclamation Plan presented in Appendix B of the EIS.
1546	73	Ruldolph	Tom	Northern Plains Resource Council/Northern Plains Pipeline Landowners Group	Desires another comment period, after a draft emergency response plan has been conducted.	Consolidated Response RES-1 addresses issues related to preparation and review of the emergency response plan for the proposed Project, including information on the review process for the plan.
1546	77	Ruldolph	Tom	Northern Plains Resource Council/Northern Plains Pipeline Landowners Group	At 900,000 barrels a day and 12 minutes (as stated by James and TransCanada) to shut down the slow, 7,5000 barrels of hazardous material could leak. Plus the oil already in the pipe could drain.	Consolidated Response OIL-2 and Section 3.13.4.2 provide information on the maximum size release that would occur. As noted in that response, the maximum release volume would be 66,500 barrels, or about 2.8 million gallons.
1546	78	Ruldolph	Tom	Northern Plains Resource Council/Northern Plains Pipeline Landowners Group	In the case of a spill, all contaminated soil would have to be hauled to a hazardous dump and replaced with other soil.	The appropriate response actions, including the fate of any oiled soil and other material, would be determined at the time of the response by the Incident Commander and in compliance with the response actions identified in the approved Emergency Response Plan or the appropriate Spill Prevention, Control, and Countermeasure Plan. Hauling it to a hazardous waste facility is a possible but unlikely option for most of the soil. A more likely option is local "land farming" with possible nutrient enrichment to enhance biodegradation.
1546	80	Ruldolph	Tom	Northern Plains Resource Council/Northern Plains Pipeline Landowners Group	My entire farming business could be devastated by continuous leaks and repairs for certainly the rest of my life, and probably my children's lives as well, and my land value would decrease drastically.	Section 3.13 of the EIS addresses reliability and safety issues, including calculations of the probability of a spill from the proposed Project and the potential environmental impacts associated with spills, including information on response actions that would be conducted to mitigate the impacts of a spill. Based on the analysis in that section and historic experience on other crude oil pipelines, it is not likely that there would be continuous leaks at a specific location along the proposed route. Consolidated Response VAL-1 addresses concerns related to property values.
1546	81	Ruldolph	Tom	Northern Plains Resource Council/Northern Plains Pipeline Landowners Group	DOT said it would release a separate environmental analysis, but its too little, too late.	Keystone has withdrawn its application for a Special Permit as described in Consolidated Response REG-1, and the Pipeline and Hazardous Materials Safety Administration will not be preparing a separate analysis.
1546	83	Ruldolph	Tom	Northern Plains Resource Council/Northern Plains Pipeline Landowners Group	And I'd like to raise the issue of condemnation. If we are going to be forced in to accepting the agreement by the right of eminent domain and condemnation, we should first see that there is proof that the oil is actually needed, and it also forces us into a place where I have no power to negotiate our needs with the pipeline company. We'll be forced to accept it on their terms.	As noted in Consolidated Response EAS-2, state laws dictate under what circumstances eminent domain may be used and define the eminent domain process within the state. DOS has no legal authority in the easement negotiations or in eminent domain proceedings. Consolidated Response P&N-1 addresses the need that the Project has been proposed to meet.
1546	84	Ruldolph	Tom	Northern Plains Resource Council/Northern Plains Pipeline Landowners Group	In the contracts presented so far, landowner can be held liable for accidentally or unintentionally interfering with pipeline throughput. No opportunity to negotiate issues of concern and need not shown.	Consolidated Response EAS-2 addresses issues related to easement negotiations and eminent domain. DOS has no legal authority in the easement negotiations or in eminent domain proceedings.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
				Pipeline Landowners Group		
152	1	Runer	Tom		E.2.1 permanent easement width of 50 feet. Is this width necessary for one 36 inch pipe?	The width of the permanent right-of-way is typical of a large-diameter oil pipeline and provides protection from encroachment that could damage the pipe.
152	2	Runer	Tom		ES 6.3.1 Groundwater Keystone's blasting plan to include "post blasting testing for surface water and water wells within 150 feet of centerline" to ensure water quality is not degrade. That is too close to be blasting near a water well. Water is critical in this country for both livestock and human uses.	The Executive Summary of the EIS has been revised. As described in Section 2.3.3 of the EIS, blasting is no longer planned as part of installation activities for the proposed Project. In areas of shallow bedrock and cemented, dense soil, ripping will be employed.
152	3	Runer	Tom		ES.6.5 Terrestrial Vegetation "Grassland impacts due to pipeline construction are expected to be minimal, and affected vegetative communities are generally expected to reestablish within 2 years." Too short! And directly contradicted in Terrestrial Vegetation 3.5.5.1 "Although native grassland would be restored, construction affects (sic) on previously untilled native prairies could be long term, as destruction of the prairie sod during trenching may require more than 100 years for recovery" So how can it be said that grassland impacts will be minimal and "expected to reestablish within 2 years?"	The Executive Summary to the EIS has been revised. Many grasslands crossed by the proposed Project have been altered by previous tillage, grazing, and planting with non-native grasses. Grasslands were evaluated for condition and this information is presented in Section 3.5.5.2.
152	4	Runer	Tom		The soil temperature increases listed in Terrestrial Vegetation 3.5.5.1 "Operation of the project would cause increases in soil temperatures at the soil surface (from 4° to 8° F) primarily during winter, and at depths of 6 inches (from 10° to 15°F) with the most notable increases during spring in the northern portion of the pipeline (Keystone 2009c) (See Appendix L). These increases will certainly affect the reestablishment of climax vegetation in prairie sods, and will affect the growing of crops on farmland.	Consolidated Response ENV-2 addresses concerns related to pipeline temperature effects.
1046	1	Ruskamp	Bill		Do not allow the pipeline to be built in the Sand hills. Too much is unknown and the dangers are real. We are jeopardizing long term livelihood for short term gain.	Identification of sensitive environments crossed by the proposed Project is discussed in Consolidated Response ENV-1 and ENV-3. Issues related to the Sand Hills area are addressed in Consolidated Response ERO-1.
797	1	Russ	Julia		This is in regards to the Keystone XL Pipeline project proposed to run through the Sandhills of Nebraska... the last thing I want in my state is an oil pipeline running through it... I am against this proposed pipeline in my state.....Given the recent oil spill in the Gulf of Mexico, I, as an individual have made the decision to support alternative sustainable and safe energy choices. This will be a long transition and I'm determined to do it. I've started by riding my bike to work. With this in mind, the last thing I want in my state is an oil pipeline running through it...	As described in Consolidated Response GLF-1, the risks associated with the proposed Project are substantially different from those associated with the BP Deepwater Horizon Project.
1214	1	Russell	Quimby		Considering the large cost of building the proposed Keystone pipeline and its attendant risk to the environment, especially the Ogallala Aquifer, why don't the Canadians build a nearby refinery in Canada to handle the shale oil and then ship the product(s) in current conventional pipelines and other transport?	Consolidated Response P&N-8 addresses issues related to shipping Canadian crude oil to refineries that are closer to the source of oil. Consolidated Response P&N-1 addresses the need that the Project has been proposed to meet; transporting Canadian crude oil in the Keystone XL Project to refineries outside of the Gulf Coast region would not meet the current and near-term crude oil needs of those refineries.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
958	1	Rutledge	Kathleen		I am a user of oil. I understand that it's in the best interest of the United States to secure more of its oil supply from friendly countries. Still, I oppose the routing of the Keystone XL pipeline through the environmentally fragile Nebraska Sandhills and across the Ogallala Aquifer.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. Consolidated Response ALT-1 addresses potential alternative routes, including routes that would avoid much of the Northern High Plains Aquifer system.
958	2	Rutledge	Kathleen		Surely the price of moving the proposed pipeline away from these two irreplaceable natural resources is worth the assurance that there won't be an "oops" that destroys the one or pollutes the other.	Consolidated Response ALT-1 and Section 4.3 of the EIS address potential alternative routes, including following the existing Keystone Oil Pipeline System route to minimize the distance the proposed Project would extend across the Northern High Plains Aquifer system. Issues related to the Sand Hills area are addressed in Consolidated Response ERO-1.
958	3	Rutledge	Kathleen		My great-grandfather was part of the European settlement of the Nebraska Sandhills beginning in the 1870s. I'm sure he did his share of exploiting the land as he trapped, hauled freight over the trails, ran cattle and supplied military forts and tribal agencies. I hope we as a nation have come to realize since those frontier days that it's not wise to run roughshod over the Sandhills. They should not be placed in jeopardy, however small the likelihood, for short-term gain.	Issues related to the Sand Hills area are addressed in Consolidated Response ERO-1.
867	1	Ryan	Kristin		Please do not build this pipeline! Tar sands are the dirtiest fuel we use, creating 3 times the greenhouse gases as conventional oil, contaminating entire rivers and watersheds from leaking toxic tailings... ..lakes and devastating an area of Canada the size of Florida! I am opposed to the pipeline when there are many other green alternatives! Please stop!	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project. Consolidated Response GHG-1 addresses GHG life-cycle analyses.
1502	1	Ryan	Don		I write in support of TransCanada's Keystone XL crude oil pipeline project and urge the department to grant a permit for the pipeline. This project is a vital link to secure energy supplies for the United States. According to the U.S. Energy Information Administration, oil and natural gas will continue to supply over 50 percent of U.S. energy needs in 2030. Canada is a valued trading partner and our most reliable supplier of foreign-based crude oil. The Keystone project will have the added benefit of potential links to growing domestic supplies of crude oil in Montana and North and South Dakota. The environmental benefits of Keystone XL should not be overlooked. The current tragedy in the Gulf underscores the importance of a diverse portfolio of energy supplies. Within the spectrum of viable options, it is appropriate to seek a growing role for oil resources that are:• Land-based;• North American; and,• Transported by pipeline.This project meets each of these criteria.Securing stable and affordable energy the Keystone pipeline is in the national interest. Considering the economic and energy security from our North American allies through projects such as benefits of these vital resources, we should continue to expand America's access to safe, affordable energy to help ensure improved domestic and global energy security and stable prices for consumers. Pipelines are the safest, most reliable, economical and environmentally favorable way to transport oil and petroleum products, as well as other energy liquids, throughout the U.S. America depends on the more than 168,000 miles of liquid pipelines to move energy and raw materials our country relies	Comment acknowledged.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					on. Additional pipeline capacity will help consumers and businesses throughout the United States... Rejection of the permit or suspension of the review would sacrifice the significant economic benefits this project stands to deliver and force U.S. consumers to rely on other sources of crude oil not economically and politically allied with U.S. interests. This would be a mistake. I urge the granting of the permit. Thank you for the opportunity to comment.	
708	2	Ryder	Lynette		A leak underground would not be discovered until unknown damage was done...	Consolidated Response OIL-3 and Section 3.13.5 of the EIS describe the leak detection system for the Project. Response times will vary according to environmental conditions, logistics, and other operational variables. Consolidated Response RES-1 addresses issues related to preparation and review of the Emergency Response Plan for the proposed Project.
708	3	Ryder	Lynette		[A leak underground would not be discovered until unknown damage was done.] We can live without cheap gas or big cars, we cannot live without clean water.	Sections 2.4.2.1 and 3.13.5 and Consolidated Response OIL-3 describe the leak detection system that would be used by Keystone. Section 3.13 of the EIS addresses reliability and safety issues, including calculations of the probability of a spill from the proposed Project and the potential environmental impacts associated with spills, including discussions of surface water and groundwater.
714	2	Ryder	Ellen		A leak underground would not be discovered until unknown damage was done...	Consolidated Response OIL-3 and Section 3.13.5 of the EIS describe the leak detection system for the Project. Response times will vary according to environmental conditions, logistics, and other operational variables. Consolidated Response RES-1 addresses issues related to preparation and review of the Emergency Response Plan for the proposed Project.
714	3	Ryder	Ellen		[A leak underground would not be discovered until unknown damage was done.] We can live without cheap gas or big cars, we cannot live without clean water.	Sections 2.4.2.1 and 3.13.5 and Consolidated Response OIL-3 describe the leak detection system that would be used by Keystone.
358	3	Sabenow	Debbie	U.S. Senator	<p>Given these events [Gulf of Mexico disaster], I believe it is important that we take steps to ensure an accident like this can never happen in the Great Lakes. As you know, the Great Lakes make up nearly 90% of the fresh surface water in the United States, and 20% of the world's fresh surface water supply. An oil spill in this area would cripple the Great Lakes States' economies and deeply impact our nation's fresh water supply.</p> <p>In 2001, I authored a ban on new oil and gas drilling in the United States' waters of the Great Lakes. The ban is now permanent. This ban, however, does not extend to Canadian waters. In fact, Canada has extensive oil and gas operations in their part of Lake Erie. The Canadian oil and gas operations have not had an accident since 1959. However, I believe that the events in the Gulf Coast demonstrate that we must remain vigilant because a catastrophic accident could happen at any time.</p> <p>Therefore, I would strongly encourage you to work with the Canadian government to review the safety of their current operations and encourage Canada to ban new oil and gas operations in the Great Lakes. The Canadian government signaled their willingness to discuss these issues with your</p>	DOS agrees with the commenter's statements and will continue to discuss issues regarding energy development in and near the Great Lakes with the Canadian government. However, proposed Project is distant from and would not affect the Great Lakes

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					administration. I am sure that you agree that now is the time to make sure that the Great Lakes we both love are protected from this kind of disaster.	
1503	1	Sagan	T.		This project also stands to provide a powerful private sector economic stimulus. During construction, Keystone XL will create more than 13,000 jobs funded with private investment. In addition, local governments will have a steady source of income from economic activity associated with construction and from property taxes the pipeline company will pay.	Consolidated Response ECO-1 addresses potential socioeconomic impacts, and Consolidated Response TAX-1 addresses concerns regarding taxes.
1554	35	Sage	C.L.		[landowner] I don't understand why they need a 50 foot right-of-way when a 30 foot will do.	The width of the permanent right-of-way is typical of a large-diameter oil pipeline and provides protection from encroachment that could damage the pipe.
1554	36	Sage	C.L.		They really don't care about the landowner. I asked them to notify me when they were going to have a crew in there, they have had three crews at my place, three times, and they never notified me...that is criminal trespass.	State or local trespass and access laws are applicable along the entire route and therefore along each easement negotiated by Keystone. DOS has no legal authority over negotiating easement agreements, no legal status to enforce the conditions of an easement agreement, and no legal authority over Keystone representatives who gain access to private property. The commentator has the option to take up the matter with Keystone or local law enforcement officials, or initiate legal consultation.
1300	1	Saint-Jacques	Guy	Deputy Ambassador at the Canadian Embassy	I currently serve as Deputy Ambassador at the Canadian Embassy in Washington, DC. I am here on behalf of the Government of Canada to register strong support for TransCanada's proposed Keystone XL project.	Comment acknowledged.
1300	2	Saint-Jacques	Guy	Deputy Ambassador at the Canadian Embassy	Keystone XL should be considered in the broader context of the overall Canada-U.S. relationship. Our two countries have a longstanding, fruitful relationship spanning over two centuries. Our shared prosperity is underpinned by the world's largest, most robust trading relationship. Two-way energy flows account for a significant and growing part of this relationship.	Comment acknowledged.
1300	3	Saint-Jacques	Guy	Deputy Ambassador at the Canadian Embassy	Canada-U.S. energy trade is currently valued at over \$100 billion per year and supports many thousands of jobs on both sides of the border.	Comment acknowledged.
1300	4	Saint-Jacques	Guy	Deputy Ambassador at the Canadian Embassy	Equally important is the fact that U.S. dollars spent on Canadian energy are recycled back into the American economy through Canadian purchases of U.S. goods and services. This is a win-win relationship and is key to our shared prosperity and security. We recognize, however, that our future also hinges on our collective ability to manage the environmental risks associated with energy development. That is why both countries have begun in earnest a collective search for lower-carbon alternatives to meet our energy needs.	Comment acknowledged.
1300	6	Saint-Jacques	Guy	Deputy Ambassador at the Canadian Embassy	Canada is the largest supplier of oil to the United States with some 2.5 million barrels crossing the border on any given day. More than half of this supply is derived from the oil sands, reserves that while not quite as large as Saudi Arabia's are significantly larger than established oil producers like Iran or Russia. The strategic value of this resource cannot be	Comment acknowledged.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					overstated, particularly as much of this production is destined for U.S. markets at a time of declining supply from countries like Mexico and Venezuela.	
1300	7	Saint-Jacques	Guy	Deputy Ambassador at the Canadian Embassy	If allowed to proceed, the Keystone XL line will complement the existing network of cross-border energy infrastructure providing a vital link between Western Canada and U.S. markets where many refineries are configured to process heavy oil. This can only help to ensure long-term supply security for the United States at a time when supply risks are growing, whether due to declining conventional production or political uncertainties in unstable oil producing regions elsewhere in the globe.	Comment acknowledged.
1300	8	Saint-Jacques	Guy	Deputy Ambassador at the Canadian Embassy	A recent study undertaken by the Canadian Energy Research Institute projects that between 2011 and 2015, upwards of 343,000 new U.S. jobs will be linked to oil sands activity, an injection of \$34 billion dollars in GDP into the U.S. economy over the same period. New pipelines are an important part of this economic picture.	Comment acknowledged.
1300	9	Saint-Jacques	Guy	Deputy Ambassador at the Canadian Embassy	The construction of Keystone XL would create over 13,000 construction jobs over the 2011-2012 period according to TransCanada.	Consolidated Response ECO-1 and Section 3.10.2.2 address potential socioeconomic impacts.
1300	10	Saint-Jacques	Guy	Deputy Ambassador at the Canadian Embassy	Some 90% of all of the equipment used for Keystone XL will be sourced within North America.	Comment acknowledged.
1300	11	Saint-Jacques	Guy	Deputy Ambassador at the Canadian Embassy	This project represents an important economic stimulus project with significant benefits for both countries.	Comment acknowledged.
1300	14	Saint-Jacques	Guy	Deputy Ambassador at the Canadian Embassy	A sustainable oil industry is a benefit to both of our countries. The oil sands sector has already drawn billions of dollars of investment and has generated many thousands of high-paying jobs on both sides of the border.	Comment acknowledged.
15	1	Salmon	Ryan	National Wildlife Federation, et. al.	TransCanada's proposed Keystone XL tar sands pipeline. The Keystone XL tar sands pipeline should not be built because it will facilitate expansion of the environmentally destructive tar sands oil and lock America into a continued dependence on this high-carbon fuel in direct conflict with the Administration's stated goals of building a clean energy economy and confronting climate change. We ask that you ensure that the full scope of environmental impacts, including the greenhouse gas emissions impacts, of tar sands oil expansion are taken into account in the assessment of this pipeline. The CEQ draft NEPA Guidance on Consideration of the Effects of Climate Change and Greenhouse Gas Emissions has been referred to in the April 16 Department of State draft environmental impact statement (DEIS) on the Keystone XL trans-boundary tar sands pipeline. However, the draft guidance is currently going through its public comment period and it is important that the final guidance is applied to projects with high greenhouse gas emissions such as the Keystone XL tar sands pipeline. The current discussion of global warming issues in the DEIS is	Consolidated Response GHG-1 addresses the greenhouse gas life-cycle analyses presented in the revised EIS. Consolidated Response GHG-2 addresses the potential causal connection of implementation of the proposed Project and expanded oil sands production in Canada and increases in refining. Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project. Consolidated Response GHG-3 addresses the decreased rate of GHG gas emissions from oil sands production in Canada. Consolidated Response GHG-4 addresses potential loss of boreal forests and peat bogs.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					inadequate and the DEIS conclusion that there are minimal greenhouse gas emissions associated from the project is spurious, largely because of the lack of a life-cycle analysis.	
15	3	Salmon	Ryan	National Wildlife Federation, et. al.	Additionally, it is critical to remember the impacts expanded tar sands use will have on the people working and living in and around the mining operations and refineries. First Nations communities living downstream from the tar sands have reported polluted water and wildlife and distressingly high rates of cancer.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project. As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries.
15	4	Salmon	Ryan	National Wildlife Federation, et. al.	Tar sands also create environmental justice issues in the U.S. because the heavier oil leads to higher levels of refining pollution that are typically born by lower-income communities working and living near the tar sands refineries.	As discussed in the EnSys 2010 report, the quantity of crude oil refined in PADD III is driven by market conditions and is independent of the existence of the proposed Project. The proposed Project would provide access to WCSB crude oil in PADD III refineries that would supplant supplies from other sources, including Venezuela and Mexico. As discussed in Section 3.13.5.1 of the EIS and Consolidated Response OIL-4, the composition of WCSB crude oils that could be transported by the proposed Project is not dissimilar from other heavy crude oils currently refined in PADD III. There is therefore no credible evidence that implementation of the proposed Project would lead to disproportionate adverse impacts on minority and low income populations near PADD III refineries.
15	5	Salmon	Ryan	National Wildlife Federation, et. al.	<p>The Keystone XL pipeline will carry up to 900,000 barrels per day of tar sands oil from Alberta, Canada to refineries on the U.S. Gulf Coast. It would be the third and largest recent pipeline delivering this highly carbon-intensive fuel from Canada, more than tripling U.S. imports of tar sands oil. To be filled, the pipeline will require expansion of tar sands oil production. Thus, it is important to assess not only existing greenhouse gas emissions, but projections of what the expansion of tar sands oil operations would mean in terms of all greenhouse gas emissions including those from land use change in the Boreal forest and wetlands carbon reservoir...Increasing our nation's reliance on tar sands oil will undercut initiatives to stop global warming and create the green energy and green jobs we need.</p> <p>If we increase our tar sands imports to 3 million barrels per day this would increase the carbon in our fuel supply by at least 3%. Such an increase in tar sands oil imports would undermine the administration's initiatives to reduce greenhouse gas emissions, such as increased CAFE standards. Tar sands directly compete with homegrown jobs in clean energy, perpetuating a reliance on antiquated, dirty fossil energy, and postponing our transition to an independent energy sector.</p> <p>We ask that you ensure that the best information is developed and included concerning tar sands oil life-cycle greenhouse gas emissions and the other environmental and public health impacts of this tar sands oil pipeline before the permitting process moves forward any farther.</p>	Consolidated Response GHG-1 addresses the greenhouse gas life-cycle analyses presented in the revised EIS. Consolidated Response GHG-2 addresses the potential causal connection of implementation of the proposed Project and expanded oil sands production in Canada and increases in refining. Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project. Consolidated Response GHG-3 addresses the decreased rate of GHG gas emissions from oil sands production in Canada. Consolidated Response GHG-4 addresses potential loss of boreal forests and peat bogs.

17	1	Salmon	Ryan	National Wildlife Federation, et.al.	We ask that EPA ensure that the full scope of environmental impacts, including the greenhouse gas emissions impacts, of tar sands oil expansion are taken into account in the assessment of this pipeline. Following Executive Order 13337 on the issuance of presidential permits for trans boundary pipelines by the Department of State, EPA must be consulted and can request additional information. According to the Executive Order, the time needed to prepare this information shall not be counted as part of the comment period. An adequate assessment of the environmental impacts of the proposed Keystone XL pipeline project, and the fuel it will deliver, cannot be fully undertaken until a comprehensive life-cycle greenhouse gas assessment for tar sands oil has been completed. Given its other work on greenhouse gas emissions life-cycle assessment, EPA is the agency best suited to carry out such an assessment.	Consolidated Response OIL-4 addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils. Consolidated Response GHG-1 addresses GHG life-cycle analyses.
17	2	Salmon	Ryan	National Wildlife Federation, et. al.	TransCanada's proposed Keystone XL tar sands pipeline. The Keystone XL tar sands pipeline should not be built because it will facilitate expansion of the environmentally destructive tar sands oil and lock America into a continued dependence on this high-carbon fuel in direct conflict with the Administration's stated goals of building a clean energy economy and confronting climate change... On April 16, the Department of State published its draft environmental impact statement (DEIS) on the Keystone XL trans-boundary tar sands pipeline. The current discussion of global warming issues in the DEIS is inadequate and the DEIS conclusion that there are minimal greenhouse gas emissions associated from the project is spurious, largely because of the lack of a life-cycle analysis. We will be preparing detailed comments on the DEIS, but initially, we would like to ask EPA to do the following: EPA should complete a full environmental assessment for tar sands oil imports that includes both lifecycle emissions analysis for tar sands, but also a full evaluation of the additional greenhouse gas emissions increase for the transportation sector. EPA should compare this assessment against policies that reduce greenhouse gas emissions. EPA should request that the permitting process for the Keystone XL pipeline not proceed further until an EPA greenhouse gas life-cycle assessment for tar sands is completed and integrated into the DEIS. EPA should request that the permitting process for the Keystone XL pipeline not proceed further until the draft Council on Environmental Quality Guidance on Consideration of the Effects of Climate Change and Greenhouse Gas Emissions under the National Environmental Policy Act (NEPA) is complete and has been applied to the pipeline assessment. EPA should encourage and participate in a transparent, inter-agency process for assessing the environmental impacts of and national interest in the Keystone XL pipeline. The Keystone XL pipeline will carry up to 900,000 barrels per day of tar sands oil from Alberta, Canada to refineries on the U.S. Gulf Coast. It would be the third and largest recent pipeline delivering this highly carbon-intensive fuel from Canada, more than tripling U.S. imports of tar sands oil. To be filled, the pipeline will require expansion of tar sands	Consolidated Response GHG-1 addresses the greenhouse gas life-cycle analyses presented in the revised EIS. Consolidated Response GHG-2 addresses the potential causal connection of implementation of the proposed Project and expanded oil sands production in Canada and increases in refining. Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information on current and future production. Consolidated Response GHG-3 addresses the decreased rate of GHG gas emissions from oil sands production in Canada.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					oil production. Thus, it is important to assess not only existing greenhouse gas emissions, but projections of what the expansion of tar sands oil operations would mean in terms of all greenhouse gas emissions, including those from land use change in the Boreal forest and wetlands carbon reservoir.	
17	3	Salmon	Ryan	National Wildlife Federation, et.al.	Additionally, it is critical to remember the impacts expanded tar sands use will have on the people working and living in and around the mining operations and refineries. First Nations communities living downstream from the tar sands have reported polluted water and wildlife and distressingly high rates of cancer. Tar sands also create environmental justice issues in the U.S. because the heavier oil leads to higher levels of refining pollution that are typically born by lower-income communities working and living near the tar sands refineries. Increasing our nation's reliance on tar sands oil will undercut initiatives to stop global warming and create the green energy and green jobs we need. If we increase our tar sands imports to 3 million barrels per day this would increase the carbon in our fuel supply by at least 3%. Such an increase in tar sands oil imports would undermine the administration's initiatives to reduce greenhouse gas emissions, such as increased CAFE standards. Tar sands directly compete with homegrown jobs in clean energy, perpetuating a reliance on antiquated, dirty fossil energy, and postponing our transition to an independent energy sector. We ask that you ensure that the best information is developed and included concerning tar sands oil life-cycle greenhouse gas emissions before the permitting process moves forward any farther	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project. As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries. Consolidated Response OIL-4 addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils. Consolidated Response GHG-1 addresses GHG life-cycle analyses. Consolidated Response JUS-1 and Section 3.10.1.2 address concerns related to environmental justice.
301	1	Salyer	Terry		I am against having the Keystone pipeline cross Nebraska. We need to protect the environment and the Ogallala Aquifer.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
317	1	Salyer	David		I am opposed to building this tar sand oil pipeline but more specifically about building it across the Sand Hills of Nebraska.	Issues related to the Sand Hills area are addressed in Consolidated Response ERO-1.
317	2	Salyer	David		The pipeline will cross multiple scenic Nebraska rivers that provide habitat and wetlands for both local and migrating wildlife. The Platte River habitat provides the world with one of the most spectacular and populous migration stops for the Sandhill crane and is frequented by the endangered whooping crane.	Most large rivers would be crossed the horizontal directional drilling method. River banks and channels are protected from disturbance using this method. The proposed Project does not cross rivers within any reaches that have been designated as federal Wild and Scenic Rivers nor does it cross any national parks or forests. Sandhill cranes are listed in Table 3.6.1-1 and whooping cranes are discussed in Section 3.8.1.2. Additional discussion of the identification of sensitive resources for the environmental review are provided in Consolidated Response ENV-1.
317	3	Salyer	David		As the pipeline crosses a large portion of the porous Nebraska Sand Hills it also crosses one of the nation's largest clean water aquifers, the Ogallala Aquifer that is shared with many states. It does not make sense to jeopardize one of our countries most precious resources, fresh water. The potential to pollute this priceless fresh water resource with a tar sand oil spill are not worth the risk. Any risk.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. Consolidated Response OIL-1 addresses the likelihood of spills from the Project.
799	1	Sanchez	Frank	Nakota Treaty Delegate	July 1st, 2010 The Nakota Nation is firmly opposed to this pipeline proposal through our aboriginal treaty territories...	Comment acknowledged.
799	2	Sanchez	Frank	Dakota Treaty	[July 1st, 2010 The Nakota Nation is firmly opposed to this	Consolidated Response CUL-1 and Section 3.11.4.3 of the

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
				Delegate	<p>pipeline proposal through our aboriginal treaty territories.] The State Dept needs to clearly deal with outstanding treaty issues and violation first, before such a project can even be considered. On June 7th, 2010, the Department of the Interior and National Parks Service sent Patricia Parker PhD, 'Chief' from the American Indian Liaison Office, to Pipestone, Minnesota to conduct a Midwest regional consultation meeting regarding proposed changes to regulations governing the harvesting of plants and minerals in National Parks. There were several representatives from the Great Sioux Nation in attendance, who stated that we are in fact treaty tribes, retaining our sovereignty. The National Parks attempt to regulate the use of natural resources in our treaty territory (no matter how well intentioned) is a further violation of our treaty agreements. We, the Yankton Sioux (Nakota) Nation, never ceded the Pipestone reservation, nor did we sell the Pipestone quarries, nor would we ever give up our rights and responsibilities to oversee activities at this most important sacred site. It is not sufficient for the Park Service or any other federal body to merely pay lip service to the recognition of our treaty and legal rights, rather it is deeply insulting every time such empty words are expressed. The U.S. Constitution, article VI states, "treaties made with Indian Nations shall be the supreme law of the land; and the judges in every state shall be bound thereby." While in Montana on the campaign trail addressing a Native American rally, President Obama stated: "I believe treaty commitments are paramount law, I will fulfill those commitments as president of the United States...."</p> <p>With regards to the Pipestone reservation there is a 1925 Supreme Court ruling, which acknowledges that clear title belongs to the Yankton Sioux (Nakota) Nation. There has not been any further ruling reversing the court's judgment. Attempts to regulate and manage natural resources at the quarries by the US federal government can therefore be considered illegal. Ten months ago, on behalf of the Nakota people, I made a simple request to both the State Department and the White House seeking guidance regarding the appropriate process for dealing with outstanding treaty issues and violations. As one of the descendant of signers of the 1851 treaty and a recognized traditional chief, I, Frank Sanchez "Wambni Maza", have been following the terms of the treaty and approaching the State Department, on behalf of the Sioux Nation, as did my grandfathers before me, to address these matters. Under article vi from the first 1851 Ft. Laramie Treaty it states: "The parties to the second part of this treaty having selected principals or head chiefs for their respective nations, through whom all national business will thereafter be conducted, do hereby bind themselves to sustain said chiefs and their successors...." The Yankton Sioux constitution affirms that the business and claims committee, which is recognized as a quasi-IRA government, has no authority to act on national business, but rather conducts day-to-day matters. When it comes to 'national business', only the descendants of said signatories have this authority. We descendants are waiting for a response regarding this issue of</p>	<p>EIS address the consultation process between DOS and Indian tribes. As noted in Consolidated Response CUL-1, a Programmatic Agreement (PA) has been developed for the Project under Section 106 of the National Historic Preservation Act. The PA includes mitigation measures for known adverse effects and provides a process for ongoing surveys to be conducted in areas where access was not granted during the EIS process. The Traditional Cultural Property (TCP) reports (noted in Section 3.11.4-3 of the EIS) may not be disclosed due to concerns regarding confidentiality. Potential impacts to cultural resources are addressed in Section 3.11.3.1 of the EIS. DOS considers this assessment to be in compliance with NEPA environmental review requirements.</p>

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					<p>due process. The only email we received from the state department indicated our communications were being forwarded to the department's office of labor and human rights, but we still have not received any further communication regarding our specific requests. Given this lack of communication, it appears to us you are content to blatantly ignore us as well as being content to continue ignoring your own Constitutional laws. Before any regulation matters of plants and minerals can legitimately be explored, these outstanding treaty issues must be addressed. You also need to understand that before projects such as the Keystone TransCanada pipeline can even be considered through our territory, these treaty issues have to be addressed. With regards to the trust responsibility of Department of Interior, we, the descendants and successors of the original Treaty signers, are officially requesting an accounting of all natural resources that have been used and extracted, such as minerals, timber, hydro-electric power, and so on that are still being extracted in our Treaty territory. Through the Freedom of Information Act, we demand this accounting. We also request a summary of the Interiors continued intent to lease these areas without our consent, for industrial use and extraction by private corporations, inside territory that belongs to the Great Sioux Nation. The territory we are concerned with is specified in the 1851 treaty and other treaties pertaining to the Yankton Sioux Nakota Nation (these include 1804, 1815, 1822, 1825, 1837, 1851, 1858, & the 1892 Agreement). We are also inquiring as to whether this administration is pursuing the agenda initiated under the Carter administration, supported by the Council of Foreign Relations, as well as the Trilateral Commission, (whose members consist of Secretary Clinton and former President Clinton) to declare the Great Plains region as a national sacrifice area? If so, we understand your policy is in fact to destroy our environment (with CAFO operations, pipelines, toxic mines), and complete the United States termination policy of its indigenous peoples. Even though the US has not signed the 2007 UN Declaration on the Rights of Indigenous Peoples, which has been adopted and supported by the National Congress of American Indians, the United States has signed the 1948 Geneva Convention, the 1948 UN Declaration of Human Rights and the 1998 UN Declaration of Right and Responsibility. The United States, by not abiding by the US Constitution or these conventions and declarations is committing a genocidal act against the indigenous peoples of this hemisphere, and specifically the Nakota Nation. The Nakota people are inviting the US government to do the honorable thing and address the on-going violations from the 1851 Treaty made with the Sioux and other nations. The survival of the Nakota nation is at stake today. Treaty violations (of which there are many) such as the denial of our hunting, fishing and gathering rights has led to the eradication of our traditional livelihoods, and destruction of our subsistence economy. Currently we are not able to exercise our right to self-determination, and sustain ourselves independently, economically or otherwise. This we wish to do.</p>	

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					<p>This is a basic human right, as specified in the UN Declaration on Indigenous Rights. The 1851 Treaty at Ft Laramie is an international treaty between the USA, Sioux, Crow, Cheyenne, Arapaho, Hidatsa, Mandan, & Arikara nations. It was ultimately a peace treaty, defining territories, designed primarily to assure safe passage for settlers crossing Indian lands, guaranteeing the Indian Nations legal right to forever travel, hunt, gather, in said territories. The Nakota people took this as a solemn agreement, made in a sacred manner, and upheld our side of this agreement and alliance, to the extent of sending scouts to assist the US army in the 1860s, and our warriors have continued to support the US military to the present day. Article 3 from 1851 Treaty: 'In consideration of the rights and privileges acknowledged in the preceding article, the United States bind themselves to protect the aforesaid Indian nations against the commission of all depredations by the people of the said United States, after the ratification of this treaty.' Unfortunately we have experienced many depredations by the US against us. These include but are not limited to loss of territory, resource extraction, and ecological degradation. Even though a 1935 Congressional hearing confirmed that we Nakota people (Yankton Sioux) are not subject to the 1934 Indian Reorganization Act, we still need to demand that our legal sovereignty as a nation is honored. The 1851 treaty is the last legal treaty we signed, and as traditional chiefs, we (Sioux) are standing on this agreement as a constitutionally binding Treaty. We believe that an investigation into the truth of what happened since the ratification of this treaty and a willingness by the US to discuss what can be done today to rectify matters so that at least we have the capacity to address the severe issues facing our people. What we want is the restoration of our ability to sustain ourselves and survive. We need clean air and water, and fertile land. We want to restore our human dignity. We want the opportunity to create employment for our people. We want to be free from extreme rates of infant mortality and teenage suicide. We want to improve our local health services, both modern and traditional practices. Basically, we want the right and means to survive, as a sovereign people, not dependant on the US for handouts. Should the 1851 treaty be revisited, and our basic human rights honored, we believe that our Nakota people and traditions have a lot to offer the US nation at this time, as there is an increasing urgency to find truly sustainable ways of living. We have done this for thousands of years, and we would like to continue to do this, in a manner appropriate today, here on this Turtle Island with all our relatives. The restoration of the prairie as a carbon sink project that includes raising buffalo could be one such initiative. However, because of the situation we find ourselves in, due to the treaty violations and their effects, we are, as termed by the State of South Dakota, "a diminishing tribe with diminishing lands," backed up into a tiny corner with no where to go, having not received any legal justice, despite protracted and unresolved court cases. Due to your continued neglect to address and adhere to these treaties, many of the</p>

					<p>descendants of the original treaty signers are discussing the direction of the World Court as an avenue for action. We would prefer to plan a meeting with the State Department and descendant Chiefs, or there could be a Congressional hearing, facilitated by the Senate Select Committee on Indian Affairs. Either way it would be pertinent to respond to this communication before our upcoming meeting on July 23rd. In summarizing, these are the key issues to address: 1. Fulfillment of the treaty obligations. 2. Accounting of our natural resources. 3. Designation of our territory as a National Sacrifice Area. 4. On going acts of genocide.</p>	
1489	1	Sandstrom	Mary	Sierra Club North Star Chapter	<p>The Department of State should not give permits for pipelines importing the world's dirtiest fuel while the rest of the country fights to prevent catastrophic climate change. Tar sand will increase our transportation emissions, counteract existing efforts to fight global warming, and undermine US energy independence by continuing our dependence on foreign oil. By expanding the US market for tar sands oil, this pipeline will increase air pollution at American refineries and spur further expansion of the tar sands industry in Canada an industry that has caused severe water and air contamination and destroyed hundreds of square miles of wetlands and forests. Please consider the true impact of this pipeline by including the devastating effects of mining, refining, and burning this fuel when you make your decision. I am asking you to fulfill your role as a protector of our country and say no to tar sands.</p>	<p>As noted in Consolidated Response OIL-4, the composition of crude oil that would be transported by the proposed Project would be essentially the same as that of other heavy crude oils refined in the U.S. As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries. Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project. Consolidated Response GHG-1 addresses GHG life-cycle analyses. Consolidated Response P&N-1 addresses the need that the Project has been proposed to meet, including information on crude oil supply and demand from an analysis specific to the proposed Project.</p>
1222	1	Santo	Devin		<p>While I do consider myself a news junkie and get my news from multiple sources, the information below was the first I've heard of this project. Since discovering this information, I've searched and found a half-dozen or so news sources, none of which agree; some say it's going to cost one amount and another source says twice that. Also, one source says it'll carry 400,000 barrels of oil a day, another two or three times that... My point is that the information that has reached the public is sketchy at best.</p>	<p>Consolidated Response CMT-3 addresses the level of information provided to the public regarding the proposed Project and the draft EIS scoping meeting locations and schedules. DOS also issued a Notice of Availability of the draft EIS on April 16, 2010. Information on the proposed Project is provided in the draft EIS. However, DOS has no control over the information on the proposed Project is presented in the media.</p>
1222	3	Santo	Devin		<p>I've so far read nothing about safety measures protecting the Ogallala Aquifer, in the event of leakage, rupture or fracture. The Ogallala Aquifer is a regional resource of extreme importance. If Senator Johanns says that he has concerns that the issue have not been adequately addressed, then they have not been adequately addressed ~ period.</p>	<p>Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.</p>
996	1	Sato	Crystal		<p>I have great concern for the proposed pipeline's location over the Ogallala Aquifer and its environmental impact to this vital natural resource when there is an oil leak.</p>	<p>Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.</p>
996	2	Sato	Crystal		<p>Why can't the proposed pipeline follow the existing route through Nebraska rather than jeopardize and devalue a greater area?</p>	<p>Consolidated Response ALT-1 and Section 4.3 of the EIS address potential alternative routes, including following the existing Keystone Oil Pipeline System route to minimize the distance the proposed Project would extend across the Northern High Plains Aquifer system.</p>
979	1	Sawicki	Mary		<p>PLEASE, PLEASE DO NOT BUILD THIS PIPELINE THROUGH the sandhills! Let Canada mess-up it's water, land</p>	<p>Issues related to the Sand Hills area are addressed in Consolidated Response ERO-1.</p>

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					and wildlife.	
965	1	Schalles	James		There needs to be more research done, and more support for local communities than a one time payment plan.	Consolidated Response EAS-2 addresses issues related to easement negotiations. As noted in that response, DOS has no legal authority in the easement negotiation process. Consolidated Response ECO-1 addresses potential socioeconomic impacts, and Consolidated Response TAX-1 addresses concerns regarding taxes.
97	1	Schank	Julia		We are very confused as to the exact location of this pipeline and if it will cross our land?	Maps of the proposed route are included in the EIS. Consolidated Response REQ-1 addresses requests for additional information, including detailed maps of the proposed route.
953	1	Schardt	Greg		I believe that building an oil pipeline across the USA, for oil that will most likely not be used by American citizens and shipped off to poorer countries, is a terrible and tragic idea.	Consolidated Response P&N-1 addresses the need that the Project has been proposed to meet, including information on crude oil supply and demand from an analysis specific to the proposed Project. Consolidated Response P&N-5 addresses issues related to investments in other technologies.
953	3	Schardt	Greg		The Ogallala Aquifer, one of our nation's last great bodies of clean drinking and irrigation water, will be threatened by this pipeline.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
953	4	Schardt	Greg		Have Canada build their pipeline out to the Pacific Ocean.	Consolidated Response P&N-1 addresses the need that the Project has been proposed to meet; i.e., the crude oil transported by the proposed Project would replace decreasing supplies of heavy crude oil at refineries in the Gulf Coast area. Although there are proposals to build a pipeline as suggested by the commenter, the near-term needs of PADD III could not be met without a new or expanded port on the coast of British Columbia along with a new pipeline. Permitting and construction of those facilities would substantially delay meeting the current and near-term crude oil needs of PADD III.
953	5	Schardt	Greg		Please do not endanger our and future generations for more oil for the sake of few dollars saved.	The commenter's opinion is noted.
1548	3	Schauf	John		it should be the same wall thickness [in both high and low consequence areas]. Not to get into the constitution about equal protection clause.	Keystone has withdrawn its application for a special permit for thinner pipe. As described in Consolidated Response SAF-1, the Pipeline and Hazardous Materials Safety Administration (PHMSA) has regulatory requirements that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project. In addition, PHMSA developed 57 Project-specific Special Conditions that Keystone has agreed to implement. Incorporation of those conditions would result in a Project that would have a degree of safety over any other typically constructed domestic oil pipeline system under current code and a degree of safety along the entire length of the pipeline system similar to that which is required in HCAs as defined in 49 CFR 195.450.
1548	4	Schauf	John		third party landowner liability. I believe that the regulatory agencies should dictate that the pipeline company indemnify and hold harmless the landowner for any damage done to the pipeline, any collateral damage that results from any rupture of the pipeline, especially when considering third parties.	Consolidated Response EAS-2 addresses issues related to easement negotiations, which typically include clauses regarding damages, indemnification, and liability limits. As noted in that response, state laws dictate under what circumstances eminent domain may be used and define the eminent domain process within the state. DOS has no legal authority or ability to intervene in the easement negotiations.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
						Consolidated Response LIA-1 addresses Keystone's liability if there is a spill of hazardous materials or fuel during construction or a spill of crude oil from the proposed Project.
1548	5	Schauf	John		I'm not only thinking in terms of terrorist activities; the Keystone Cushing Extension EIS -- I haven't read the XL EIS, but I've gone through the first EIS. And that recognizes that the pipeline is a terrorist target. And yet the Keystone pipeline people refuse to indemnify the landowner, and the landowner should be held harmless.	Indemnification issues are addressed in the easement agreements between Keystone and landowners. Consolidated Response EAS-2 addresses issues related to easement negotiations. As noted in that response, DOS has no legal authority in the easement negotiation process.
1548	6	Schauf	John		if the landowner happens to do damage to the pipeline, the pipeline company also refuses to hold harmless, to indemnify the landowner. The landowner, unless the landowner deliberately does damage to the pipeline, the pipeline company, Keystone, should hold harmless the liability, should pay for all damages to the pipeline as well as to all of the collateral damage. And as we're witnessing in the Gulf, there is a, can be a lot of collateral damage. And when you talk about several wall thicknesses for out in the rural are, essentially Keystone is saying that the rural folks, who are hard-working farmers and ranchers, are expendable.	Indemnification issues are addressed in the easement agreements between Keystone and landowners. Consolidated Response EAS-2 addresses issues related to easement negotiations. As noted in that response, DOS has no legal authority in the easement negotiation process. As described in Consolidated Response SAF-1, the Pipeline and Hazardous Materials Safety Administration (PHMSA) has regulatory requirements that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project. In addition, PHMSA developed 57 Project-specific Special Conditions that Keystone has agreed to implement. Incorporation of those conditions would result in a Project that would have a degree of safety over any other typically constructed domestic oil pipeline system under current code and a degree of safety along the entire length of the pipeline system similar to that which is required in high consequence areas as defined in 49 CFR 195.450.
1548	8	Schauf	John		Emergency Response Plan. Keystone is going to provide that to certain agencies -- state, county, municipal -- but they will not provide it -- they'll also put it in public places like the libraries, too. But they are not required to, and they're not going to provide emergency response plans to the landowners. The landowners are the ones that are going to be most impacted, and they're going to be the first responders as well. So the EIS, the government regulatory agencies should require the Keystone pipeline company to provide the emergency response plan to the landowners.	Consolidated Response RES-1 addresses issues related to preparation and review of emergency response plans for the proposed Project. As noted in that response, the specific requirements of the plan, including review and distribution of the plan, are the responsibility of the Pipeline and Hazardous Materials Safety Administration (PHMSA). The Department of State has no authority to revise PHMSA regulations.
1548	20	Schauf	John		The landowner again cannot afford to remove the pipeline. This pipeline is going to be a toxic waste facility. This is ugly stuff. This is tar sands oil. This is worse than Alaska oil or any other sweet crude or any other kind of oil. This is ugly, and regulations only go in one direction; they get more stringent.	Consolidated Response OIL-4 addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils. Consolidated Response DEC-1 deals with the decommissioning of the proposed Project.
1564	5	Schauf	Jaye		Weed and Insect control. The Easement Agreement and the Construction, Mitigation, and Reclamation Plan (CMRP) Section 2.13 requires that: "The Contractor shall thoroughly clean all construction equipment, including timber mats, prior to moving the equipment to the job site to limit the potential for the spread of noxious weeds, insects and soil-borne pests." Contrary to these requirements since the commencement of pipeline construction related activities in February of this year TransCanada Keystone Pipeline has not cleaned any equipment or timber mats prior to moving them onto the property. This is not in compliance with the Easement	The commenter is referring to the construction of the existing Keystone Oil Pipeline System, not the proposed Project. Consolidated Response EAS-2 addresses issues related to easement negotiations. As noted in that response, DOS has no legal authority in the easement negotiation process. DOS also has no legal status to enforce the conditions of an easement agreement. The commenter has the option to take up the matter with Keystone or local law enforcement officials, or initiate legal consultation.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					Agreement and is not acceptable.	
1565	2	Schauf	John		Preservation of Wetlands. The Easement Agreement, CMRP Sections 6.1 through 6.7, Pages 51-56 and Section 4.5.2, Pages 25-26 requires detailed measures be taken to preserve, protect, and restore the property's wetlands such as: boundary markings, reduction of right-of-way width, clearing vegetation limits, special methods for equipment access, erosion and sediment control, leaving existing root systems, segregating topsoil, etc. Furthermore the US Department of State Environmental Impact Statement (EIS) Sections 2.2.3.4 and 3.4.1 through 3.4.4, Pages 3.4.1 -3.4.20 specifies protection, preservation, and restoration requirements for pipeline construction across wetlands. Contrary to the requirements explicitly stated in the Easement Agreement, CMRP, and EIS TransCanada Keystone Pipeline has not implemented or complied with any of the specified requirements in any significant manner and has in fact, totally destroyed the wetlands. This is outrageous, not in compliance with the Easement Agreement, and not acceptable. 2. Separation of Topsoil and Subsoil.	Per Consolidated Response PVT-3, the comment is not related to the Keystone XL pipeline, but the existing Keystone pipeline.
1565	8	Schauf	John		Weed and Insect control. The Easement Agreement and the Construction, Mitigation, and Reclamation Plan (CMRP) Section 2.13 requires that: "The Contractor shall thoroughly clean all construction equipment, including timber mats, prior to moving the equipment to the job site to limit the potential for the spread of noxious weeds, insects and soil-borne pests." Contrary to these requirements since the commencement of pipeline construction related activities in February of this year TransCanada Keystone Pipeline has not cleaned any equipment or timber mats prior to moving them onto the property. This is not in compliance with the Easement Agreement and is not acceptable.	The commenter is referring to the construction of the existing Keystone Oil Pipeline System, not the proposed Project. Consolidated Response EAS-2 addresses issues related to easement negotiations. As noted in that response, DOS has no legal authority in the easement negotiation process. DOS also has no legal status to enforce the conditions of an easement agreement. The commenter has the option to take up the matter with Keystone or local law enforcement officials, or initiate legal consultation.
1548	1	Schauf	John		is Keystone planning on using the Cushing Extension as Keystone XL, either near term or long term?... I don't understand why you don't answer questions on the record as opposed to turning off the court reporter and answering questions at that time.	As described in Section 2 of the EIS, the Steele City Segment of the proposed Project would connect with the north end of the Cushing Extension and the Gulf Coast Segment would connect with the south end of the Cushing Extension. Two new pump stations would be constructed along the existing Cushing Extension.
1548	9	Schauf	John		One comment on the one-call list; it takes more than one call to get all the pipelines identified. It's not a one-call list, as the name implies. I have three pipelines that run across my parents' property. It took three calls to get all three pipelines identified and located.	Comment acknowledged.
582	1	Scheitlin	Steve	Scheitlin Ranch Inc.	We would like the TransCanada Keystone Pipeline, LP to go back to its original proposed tract. They said they want to use more State Land on the second tract. If they go back to the original tract I have a piece of State Land that would line up just as easy and would be a better route. Thank you for your time.	Pipeline routing in Montana is addressed in Consolidated Response EAS-1 and in Appendix I of the EIS.
531	1	Schemkes	Anastasia		The Pipeline Project proposed for Nebraska will be hugely more detrimental both socially and environmentally than it will be a benefit to any part of American society.	Consolidated Response ALT-1 addresses potential alternative routes, including routes that would avoid much of the Northern High Plains Aquifer system.
531	4	Schemkes	Anastasia		This area is also the same area as the Ogallala Aquifer, which	Issues related to the Northern High Plains Aquifer system are

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					is one of the world's largest water tables. Water tables are essential - again, essential - to our daily lives as human beings on this planet, and this pipeline puts the largest in jeopardy!	addressed in Consolidated Responses AQF-1 through AQF-4.
531	5	Schemkes	Anastasia		To add insult to the injury, this pipeline would trespass on tribal lands. The indigenous peoples of the United States have been given the short end of the stick time and again in history, and putting a pipeline through their homes, and communities and their backyards threatens their way of life. This pipeline should not even be being proposed. We must pursue alternative means of energy that are more sustainable socially and environmentally.	The proposed Project does not extend across any Indian tribal reservation lands. Consolidated Response CUL-1 and Section 3.11 of the EIS address protection of historic properties and the consultations conducted in compliance with Section 106 of the National Historic Preservation Act, including consultation with Indian tribes. Consolidated Response P&N-1 addresses the need for the proposed Project, including information on crude oil supply and demand from a recent analysis specific to the proposed Project. Consolidated Response ALT-2 addresses the use of alternative technologies, alternative energy sources, and conservation of energy.
1546	57	Scherr	Jacob	Natural Resources Defense Council	Strongly opposed because would transport predominantly heavy, dirty bitumen to already polluted gulf states.	As discussed in the EnSys 2010 report, the quantity of crude oil refined in PADD III is driven by market conditions and is independent of the existence of the proposed Project. The proposed Project would provide access to WCSB crude oil in PADD III refineries that would supplant supplies from other sources, including Venezuela and Mexico. As discussed in Section 3.13.5.1 of the EIS and Consolidated Response OIL-4, the composition of WCSB crude oils that could be transported by the proposed Project is not dissimilar from other heavy crude oils currently refined in PADD III. There is therefore no credible evidence that implementation of the proposed Project would lead to disproportionate adverse impacts on minority and low income populations near PADD III refineries.
1546	58	Scherr	Jacob	Natural Resources Defense Council	We should be looking not only at the immediate impacts of the project, but also be looking at the broader questions of the world's oil and energy future, economy, climate, and other environmental considerations.	Consolidated Response P&N-1 addresses the need that the Project has been proposed to meet. Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information on current and future production. As noted in that Consolidated Response, without the proposed Project, oil sands development would continue at or above the current level until at least 2020, with or without the proposed Project. Consolidated Response ENR-1 provides information on the Department of State's environmental review process, the National Interest Determination process, and the need to complete those reviews before approving or denying the Presidential permit for the proposed Project.
1546	59	Scherr	Jacob	Natural Resources Defense Council	Gulf spill proves that our oil dependence doesn't make sense, exceeds our ability to provide oversight.	Consolidated Response P&N-1 addresses the need that the Project has been proposed to meet, including information on crude oil supply and demand from a recent analysis specific to the proposed Project. Consolidated Response SAF-1 describes the regulatory requirements that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project. It also describes the inspections and reviews of the proposed Project that the Pipeline and Hazardous Materials Safety Administration (PHMSA) would conduct to ensure compliance with those

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
						regulatory requirements.
1546	62	Scherr	Jacob	Natural Resources Defense Council	KXL is unnecessary, will mean further expansion of tar sands oil production, leading to climate change.	Consolidated Response P&N-1 addresses the need that the Project has been proposed to meet. Consolidated Response GHG-2 addresses the potential causal connection of implementation of the proposed Project and expanded oil sands production in Canada and increases in refining. Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project. Consolidated Response GHG-3 addresses the decreased rate of GHG gas emissions from oil sands production in Canada.
1546	63	Scherr	Jacob	Natural Resources Defense Council	Tar sands oil production will critically harm migratory bird habitat.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project. Consolidated Response ENV-4 addresses issues related to oil sands production and migratory birds.
1546	65	Scherr	Jacob	Natural Resources Defense Council	Downstream from tar sands oil production, communities are experiencing elevated cancer rates.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1.
1546	66	Scherr	Jacob	Natural Resources Defense Council	Moreover, the pipeline is asking for safety waivers that once again will mean an oil company cutting corners to save costs.	Keystone has withdrawn its application for a Special Permit as described in Consolidated Response REG-1. As described in Consolidated Response SAF-1, the Pipeline and Hazardous Materials Safety Administration (PHMSA) has regulatory requirements that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project in a manner that protects the health and safety of the public and the environment. In addition, PHMSA developed 57 Project-specific Special Conditions that Keystone has agreed to implement. Incorporation of those conditions would result in a Project that would have a degree of safety over any other typically constructed domestic oil pipeline system under current code and a degree of safety along the entire length of the pipeline system similar to that which is required in HCAs as defined in 49 CFR 195.450.
1364	1	Schieber	Dee	Kay County Board of Commissioners, Oklahoma	As County Officials from the State of Oklahoma, we strongly encourage the U.S. Department of State to approve an energy infrastructure project that not only will strengthen long-term energy security in the United States...We enthusiastically support the Keystone XL Pipeline Project and encourage the Department of State to confirm the findings of the Draft Environmental Impact Statement, which found that the proposed Keystone XL Pipeline would have "limited adverse environmental impact during construction and operation."	Comment acknowledged.
1364	2	Schieber	Dee	Kay County Board of Commissioners, Oklahoma	...we strongly encourage the U.S. Department of State to approve an energy infrastructure project that ... will ... provide a powerful private sector economic stimulus to the communities along the pipeline route during its construction at a time when our economy continues to struggle. As we understand it, Keystone XL will directly create more than 13,000 high wage construction and manufacturing jobs during	Consolidated Response ECO-1 addresses potential socioeconomic impacts, and Consolidated Response TAX-1 addresses concerns regarding taxes.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					<p>the project's 2011-2012 construction schedule. Many of those jobs will be created in Oklahoma and in our counties, where too many of our residents continue to find it difficult to find good jobs. With Keystone XL, they will have an opportunity to work on the project or for businesses that provide supplies, goods and services for its construction and operation. In addition to the jobs Keystone XL will create, the project will generate substantial economic benefits for the United States and in states and communities along the proposed route. Like our counties, in many cases these are areas where economic performance has stagnated or is shrinking. It is our understanding that TransCanada commissioned a study to measure the project's economic stimulus to the U.S. and the states along the route. The study found that in the U.S., Keystone XL would generate \$20.9 billion in total expenditures, \$9.6 billion in output (gross product), personal income of \$6.5 billion and 118,935 person years of employment (jobs). In addition, the report concluded that during construction, Keystone XL would generate \$486.36 million in tax revenue for state governments along the route and \$99.1 million for local taxing entities where the pipeline is located. Moreover, in addition to the construction and manufacturing jobs Keystone XL will create during construction, the economic stimulus provided by the pipeline's construction and development will lead to the creation of more than 100.00 additional jobs in the economy. In Oklahoma, the study found Keystone XL expenditures during construction would total \$1.2 billion and generate an economic gross product of nearly \$1.1 billion. Keystone XL construction also would generate more that \$7.7 million in tax revenue for local government and \$31.4 million for state government... The Perryman study concluded that the long-term increase in stable oil supplies will add at least 250,000 permanent jobs to the U.S. economy, and add \$29 billion to the nation's gross product, conservatively estimated...We look forward to the issuance of a Final Environmental Impact statement followed by a Presidential Permit that allows the construction of Keystone XL and enables our counties, the State of Oklahoma, and the United States to collect the substantial economic benefits Keystone XL would create.</p>	
1364	3	Schieber	Dee	Kay County Board of Commissioners, Oklahoma	Furthermore, the delivery of secure and affordable supplies of [Canadian energy to American consumers] would have minimal impacts on the environment.	Comment acknowledged.
1364	5	Schieber	Dee	Kay County Board of Commissioners, Oklahoma	... Canadian oil sands production is a growing source of reliable crude oil supply for the United States.	Comment acknowledged.
1364	6	Schieber	Dee	Kay County Board of Commissioners, Oklahoma	Construction of additional pipeline facilities such as the Keystone XL Project, to transport oil sands production to vitally important Gulf Coast area is critical. These refineries also have excess capacity as a result of reduced production from Mexico, where heavy oil production is in steep decline, and Venezuela, which is moving to other markets. Turning to	Comment acknowledged.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					Canada for a secure oil supply is a logical step.	
823	1	Schiel	Skip		i strongly oppose any mining, transport, and refinery of tar sands. suppose an accident similar to the bp gulf explosion were to occur. utter destruction. a better solution to the end of oil is to accept the end of oil and work strenuously to utilize alternatives, such as biking, walking, and public transportation.	Consolidated Response P&N-1 addresses the need for the proposed Project. As described in Consolidated Response GLF-1, the risks associated with the proposed Project are substantially different from those associated with the BP Deepwater Horizon proposed Project.
1048	1	Schilke	Helen		I am sure you are aware of the water emergency that faces the agriculture communities along the Republican River, anything that jeopardizes the Ogallala Aquifer is unacceptable to me. Unknowingly, the farmers created a horrific situation already. We violated a compact that we didn't know existed, and now we are doing our best to rectify that situation. Anything that interferes, compromises, or jeopardizes that aquifer is unacceptable. For those of us who live and work in western Ne. WATER is a primary concern. Thank you for keeping Nebraskans apprised of the situation. What can we do to help you help us?	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
833	1	Schindler	David	University of Alberta	I am a US citizen living in Alberta, a professor of Ecology at the U of Alberta. I and a number of my colleagues have undertaken detailed ecological studies of the oilsands. It is probably the world's most unsustainable development. Reclamation is almost non-existent, and specialists indicate that the huge area cannot be reclaimed to a fully functional ecosystem of any sort. My studies, published in the Proceedings of the US National Academy of Sciences (of which I am a member), show that the industry emits large quantities of both airborne and waterborne toxins to the Athabasca River and its watershed. Industry has been largely left in charge of monitoring, and of course they find no problem. Huge tailings ponds also leak into the river and groundwater. An extreme weather event or earthquake could cause a breach in the dikes that hold these huge lakes of toxic water back from the river. If this happened, it would wipe out the entire Mackenzie River system downstream, including much of Lake Athabasca and Great Slave Lake. It would be a disaster at least comparable to the BP disaster in progress. The rights of aboriginal people, guaranteed under Treaty 8, are being violated as their air and water are made toxic. In short, the oil sands development commits an area of ALberta the size of Greece to being a sacrifice zone. This is totally unacceptable to me as a citizen of both Canada and the US, and as a scientist familiar with global problems.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information on current and future production. As noted in that Consolidated Response, without the proposed Project, oil sands development would continue at or above the current level until at least 2020, with or without the proposed Project. As described in Consolidated Response GLF-1, the risks associated with the proposed Project are substantially different from those associated with the BP Deepwater Horizon Project.
655	2	Schlotfeld	MaryJo		My objection to this pipeline is that it will run through the Ogallala Aquifer, which is one of our nation's most precious natural resources. The leaking of a pipe would cause widespread damage to the quality of the groundwater in the aquifer. This is a huge risk to the population that relies on this aquifer for drinking water.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
300	1	Schmidt	Deanna		Please schedule a public hearing in Houston. We deserve to have more input here.	Consolidated Response CMT-2 addresses issues related to comment meetings on the draft EIS and requests for additional public involvement.
912	1	Schmidt	Deanna		Before approving the Keystone XL, the Department of State must consider the environmental pollution produced by the	As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					Houston refineries which will process the tar sands oil. Houston communities are already burdened by unhealthy air and water and unprotected by the Texas Commission on Environmental Quality. Because tar sands oil is dirtier, refining it will produce higher levels of smog and air toxics and increase this undue, racist burden. I strongly urge halting the Keystone XL to protect our community.	would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries. Consolidated Response OIL-4 also addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils.
300	1	Schmidt	Deanna		Please schedule a pubic hearing in Houston. We deserve to have more input here.	Consolidated Response CMT-2 addresses issues related to comment meetings on the draft EIS and requests for additional public involvement.
621	1	Schmidtbauer	Jennifer		The mining of oil from sand is an environmental abomination. The loss of biodiversity on the land destroyed in the process of "mining the sand" is tragic, and the damage further done to ecosystems and cultural resources in building the pipeline is shameful. The State Dept and any other government agency with authority and oversight of this project should not allow the building of this pipeline. Discouraging the mining of oil sands is the morally right thing to do.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project.
269	1	Schoeneure	Andrew	Laborers' Local 430	The Iowa Building Trades Council urges the State Department to proceed without delay to provide the necessary approvals for the Keystone XL pipeline project.	Comment acknowledged.
269	2	Schoeneure	Andrew	Laborers' Local 430	In these difficult economic times, Keystone XL promises to create more than 13,000 high wage construction jobs. These jobs will likely be drawn from a broad pool of skilled craft workers located throughout the Midwest. It is important for Iowa's union workers.	Consolidated Response ECO-1 and Section 3.10.2.2 of the EIS address the potential socioeconomic impacts of the proposed Project.
269	4	Schoeneure	Andrew	Laborers' Local 430	Eleven governmental agencies and the State Department have reviewed this project and we urge you to proceed in the interest of jobs and energy security.	Comment acknowledged.
269	5	Schoeneure	Andrew	Laborers' Local 430	The South Dakota Building Trades Council urges the State Department to proceed without delay to provide the necessary approvals for the Keystone XL pipeline project. This project will create up to 13,000 construction jobs.	Consolidated Response ECO-1 and Section 3.10.2.2 of the EIS address the potential socioeconomic impacts of the proposed Project.
269	6	Schoeneure	Andrew	Laborers' Local 430	The hard-working people of South Dakota believe that project like Keystone XL will stimulate further energy development projects and job growth. Please help South Dakota's 'workers by approving this project.	Comment acknowledged.
269	10	Schoeneure	Andrew	Laborers' Local 430	Pipelines are the safest, most reliable, economical and environmentally favorable way to transport oil and petroleum products, as well as other energy liquids, throughout the U.S. America depends on the more than 168,000 miles of liquid pipelines to move energy and raw materials our country relies on. Additional pipeline capacity will help consumers and businesses throughout the United States.	Comment acknowledged.
269	11	Schoeneure	Andrew	Laborers' Local 430	This project also stands to provide a powerful private sector economic stimulus. During construction, the initial Keystone pipeline project created more than 13,000 jobs funded with private investment. In addition, local governments will have a steady source of income from economic activity associated with construction and from property taxes the pipeline company will pay. Further a secure supply of oil into Houston refining market will ensure the retention of 1,000's of long term	Consolidated Response ECO-1 addresses potential socioeconomic impacts, and Consolidated Response TAX-1 addresses concerns regarding taxes.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					high paying jobs, which support much of our local economy.	
269	12	Schoeneure	Andrew	Laborers' Local 430	Rejection of the permit or suspension of the review would sacrifice the significant economic benefits this project stands to deliver and force U.S. consumers to rely on other sources of crude oil not economically and politically allied with U.S. interests. This would be a mistake.	Consolidated Response ECO-1 and Section 3.10.2.2 of the EIS address the potential socioeconomic impacts of the proposed Project.
1359	1	Schoneberger	RJ	United Piping, Inc	Recently a number of advocacy groups sent a letter seeking suspension of the permitting of theKeystone XL pipeline. I encourage you to reject the request and to continue to review the proposed project.	Comment acknowledged.
1359	2	Schoneberger	RJ	United Piping, Inc	The project has the potential to deliver significant energy security benefits to the United States,increasing access to significant land-based sources of oil from a trading partner with whom we are closely allied.	Comment acknowledged.
1359	3	Schoneberger	RJ	United Piping, Inc	At the same time, construction of this project stands to bring significant and measurable economic benefits to the areas where it will be built.	Comment acknowledged.
1359	4	Schoneberger	RJ	United Piping, Inc	Provided it has limited impact on the environment, this project could be an important part of the solution to our energy supplies. The permitting processes in place are appropriate and should proceed so that a final determination can be made about the impacts of the project and whether it is in the national interest. Please reject the request to suspend the process and continue with the review.	Comment acknowledged.
338	1	Schooley	Carol		It seems silly to have to remind all concerned that all our attempts to get oil have had disastrous results and have damaged our environment. The Gulf spill simply frames it and causes us to be aware of our foibles. To run this pipeline through a major water system, the Ogallala aquifer, seems foolish beyond comprehension. The dangers to our living world are terrible. Build the refinery in Canada where you have already ruined the lives and living areas of the Indians and animals and fish that have the misfortune to live in that area.	Issues related to the Northern High Plains Aquifer System are addressed in Consolidated Responses AQF-1 through AQF-4. Consolidated Response P&N-8 addresses issues related to shipping Canadian crude oil to refineries that are closer to the source of oil.
161	1	Schreiber	Mark	Westar Energy	<p>I am writing to urge the U.S. Department of State to approve an energy infrastructure project that provides a direct, private sector economic stimulus to Kansas. The Keystone XL pipeline route traverses primarily rural areas of our state, where jobs are in short supply. We believe Keystone XL will be a positive and essential stimulus for this region.</p> <p>Westar Energy is one of many energy companies that will supply power to the Keystone pumping stations. Many of our employees were raised and continue to live in rural areas of our state. We know the economic hardships faced by small communities. We believe the impact of construction-related jobs to this area can help this area remain viable. A study TransCanada commissioned to measure the project's economic stimulus to the U.S. and the states along the route points to a broader economic impact. The study found that Keystone XL would generate \$20.9 billion in total expenditures, \$9.6 billion in output (gross product), personal income of \$6.5 billion and 118,935 person years of employment (jobs). In addition, the report concluded that</p>	Consolidated Response ECO-1 addresses potential socioeconomic impacts, and Consolidated Response TAX-1 addresses concerns regarding taxes.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					during construction, Keystone XL would generate \$486.36 million tax revenue for state governments along the route and \$99.1 million for local taxing entities where the pipeline is located. It's my hope that these statistics become reality. I encourage the Department of State to confirm the findings of the Draft Environmental Impact Statement for the proposed Keystone XL Pipeline, and issue a Final Environmental Impact Statement. These steps will enable the rural communities along the pipeline to collect the substantial economic benefits Keystone XL would create.	
163	1	Schreur	Lois		I am very much against having the oil pipeline come through the Sandhills--shifting sands, invariably poor environmental precautions in these projects no matter what is promised, the aquifer below which provides water to a huge part of this region and further south--please do not do this. We do not need our own oil disaster--we need to protect our Sandhills and our aquifer.	Issues related to the Sand Hills area are addressed in Consolidated Response ERO-1. Identification of sensitive environments crossed by the proposed Project is discussed in Consolidated Response ENV-1 and ENV-3. Issues related to the Sand Hills area are addressed in Consolidated Response ERO-1. Information on the High Plains Aquifer System is presented in Consolidated Responses AQF-1 through AQF-4. Section 3.13 of the EIS addresses reliability and safety issues, including calculations of the probability of a spill from the proposed Project and the potential environmental impacts associated with spills.
163	1	Schreur	Lois		I am very much against having the oil pipeline come through the Sandhills--shifting sands, invariably poor environmental precautions in these projects no matter what is promised, the aquifer below which provides water to a huge part of this region and further south--please do not do this. We do not need our own oil disaster--we needed to protect our Sandhills and our aquifer.	Issues related to the Northern High Plains Aquifer System are addressed in Consolidated Responses AQF-1 through AQF-4. Issues related to the Sand Hills area are addressed in Consolidated Response ERO-1.
1176	1	Schreur	Lois		Please do not allow the proposed oil pipeline from Canada across the sandhills.	Consolidated Response ALT-1 addresses potential alternative routes, including routes that would avoid much of the Northern High Plains Aquifer system and the Sand Hills area.
1176	2	Schreur	Lois		BP is the parent company involved. Even before the disaster in the Gulf, PB had a bad record or worker and environmental safety. We are easily looking at another oil disaster here in our own backyard.	BP is not the parent company of Keystone; the parent company of Keystone is TransCanada and TransCanada does not have a parent company (see Section 1.0 of the EIS). BP does not have any involvement in the proposed Project.
1176	3	Schreur	Lois		[We are easily looking at another oil disaster here in our own backyard.] That would ruin not only Nebraska but also the aquifer on which a large area of the Midwest depends. The sifting sand in the Sandhills is another factor that needs to be considered along with the importance of protecting the aquifer--with the sifting sands the pipeline will not remain covered. Humans, plants and animals in this area are dependent on the aquifer.	Issues related to the Sand Hills area are addressed in Consolidated Response ERO-1. Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
917	1	Schroeder	Paul		I am against the Keystone XL pipeline crossing the state of Nebraska, due to sensitive ecological Sandhills region that will be transected by the pipeline. The sandy soils are very difficult to re-vegetate once disturbed. Although they say they have contacted the University of Nebraska about re-vegetating the site no professor in the Range Science department of the University of Nebraska has talked to anybody from the company about this.	Identification of sensitive environments crossed by the proposed Project is discussed in Consolidated Response ENV-1 and ENV-3. Issues related to the Sand Hills area are addressed in Consolidated Response ERO-1. Appendix H to the EIS provides the names and positions of the experts who were contacted regarding construction in the Sand Hills area.
917	2	Schroeder	Paul		Also the Sandhills sits on top of the Ogallala aquifer which is one of the largest deposits of fresh ground water in the world. I	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					am worried that should the pipeline leak we will lose of huge reserve of drinking water. People can live without oil, but people cannot live without drinking water.	
1460	1	Schueth	Dennis	Upper Elkhorn Natural Resources District	The Upper Elkhorn NRD (UENRD) would like to go on record of opposing the current path of the Keystone XL Oil Pipeline Project. This position was taken during the monthly June 28th, 2010 board meeting. The UENRD is concerned that the Ogallala/High Plains aquifer within Nebraska could be put into jeopardy with an undetected oil leak from the pipeline. The Ogallala/High Plains supplies the majority of the domestic water uses within the State of Nebraska and for that reason is a very valuable resource that should not be put into jeopardy.	Consolidated Response ALT-1 addresses potential alternative routes, including routes that would avoid much of the Northern High Plains Aquifer system. Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
116	1	Schultz	Sterling	Lower Niobrara Natural Resources District, Elected	Ref. 3.3.I.I - Groundwater - The important and unusual characteristics of water bearing zones in Nebraska (Northern High Plains Aquifer) is that they are less than 50 feet below the ground surface in the ROW of proposed Keystone XL oil pipeline project. Further, the water is of good to high quality compared to other sources. Ref. Table 3.3.1-2 From time to time, the water table is above the ground surface and above the buried proposed pipeline in many locations. Therefore, to rely on the confining geologic units under the pipeline to inhibit migration of contamination downward into the water bearing zone is not sufficient to protect the groundwater.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
116	2	Schultz	Sterling	Lower Niobrara Natural Resources District, Elected	Ref. 3.3.1.2 - Surface Water - Surface water and groundwater in Nebraska are interconnected. Therefore, prevention and mitigation of pipeline and system failures must address the movement of oil and cutter stock between surface and groundwater.	Consolidated Response OIL-4 addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils and would not separate into "oil and cutter stock." Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. Consolidated Response SAF-1 describes the regulatory requirements that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project in a manner that protects the health and safety of the public and the environment.
116	3	Schultz	Sterling	Lower Niobrara Natural Resources District, Elected	Ref. 3.14 - Cumulative Impacts The citing of rare occurrences of oil spills and accidents based on track records for other pipelines (like offshore oil drilling and leaking nuclear waste dump facilities) is no excuse for summarily dismissing the fact the worst will happen. (Just as a 100 year flood of record can happen tomorrow or not for many years.) When it does the effects are extreme for the unprepared.	Consolidated Response OIL-2 and Section 3.13.4.2 of the EIS address potential maximum spill volume from the Project. Sections 3.13.5 and 3.13.6 of the EIS address the potential impacts of a maximum spill volume.
116	4	Schultz	Sterling	Lower Niobrara Natural Resources District, Elected	It is no comfort to learn in the DEIS that "as a result of the rarity and magnitude of such events (major oil pipeline failures) are not addressed because they are extreme compared to the short and long term effects of normal operation and maintenance". Therefore, the XL project EIS should detail the procedures, equipment, personnel and training to respond to major spills and accidents impacting the surface and groundwater of Nebraska as they are interconnected.	The commenter has provided a partial quote from the Cumulative Impacts section of the draft EIS. The remainder of the text on Page 3.14-1 of the DEIS is as follows: "and require separate response plans. For an assessment of the potential short- and long-term effects of oil releases to the environment, see Section 3.13 (Risk Assessment and Environmental Consequences Analysis)." Consolidated Response OIL-2 addresses maximum spill volumes from the Project, and Sections 3.13.5 and 3.13.6 addresses the potential impacts of a maximum spill volume. Consolidated Response RES-1 addresses issues related to

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
						<p>preparation and review of the Emergency Response Plan (ERP) for the proposed Project. Spill Prevention, Control, and Countermeasure plans are addressed in Section 2.3 of the EIS and in the Construction, Mitigation, and Reclamation Plan presented in Appendix B of the EIS.</p> <p>Consolidated Responses AQF-1 and AQF-3, address potential impacts to the Northern High Plains Aquifer System.</p>
116	5	Schultz	Sterling	Lower Niobrara Natural Resources District, Elected	How will contaminants in the aquifers be extracted, treated, disposed and safe water returned to the water bearing zones and surface water bodies?	Consolidated Response AQF-3 provides information on hypothetical spills from the Project over two areas of the Northern High Plains Aquifer System and also addresses response actions.
116	6	Schultz	Sterling	Lower Niobrara Natural Resources District, Elected	Who is responsible for the total long-term activities and financing of the cleanup operations, the monitoring and reporting on progress?	Consolidated Response LIA-1 addresses Keystone's liability if there is a spill of hazardous materials or fuel during construction or a spill of crude oil from the proposed Project. If a major release occurs, an incident command system would be set up by the agency in charge of incident command (either the U.S. Environmental Protection Agency, or the U.S. Coast Guard) to respond to the release and monitor progress of the cleanup; the incident commander would be responsible for reporting on progress.
116	7	Schultz	Sterling	Lower Niobrara Natural Resources District, Elected	Detail the compensation procedures for farmers, ranchers, communities, businesses, and folks affected by an oil spill release.	Consolidated Response LIA-1 addresses Keystone's liability if there is a spill of hazardous materials or fuel during construction or a spill of crude oil from the proposed Project.
116	8	Schultz	Sterling	Lower Niobrara Natural Resources District, Elected	Ref. 3.14.3.12 - Socio-Economics - Nebraska may be rural and sparsely populated in the XL pipeline project areas, but its agricultural productivity is unmatched as the breadbasket of the United States of America. There should be no holds barred when it comes to protecting Nebraska's water resources.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. Consolidated Response SAF-1 describes the regulatory requirements that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project in a manner that protects the health and safety of the public and the environment.
116	9	Schultz	Sterling	Lower Niobrara Natural Resources District, Elected	Ref. Page 3.13-2, Footnote 1. The Northern High Plains Aquifer should be designated as: 1) High Consequence Area (HCA) 2) Unusually Sensitive Area (USA) Because the water resources are unusually sensitive to the effects from hazardous liquid oil pipeline releases and the socio-economic impacts to Nebraska and the Nation as a whole.	As described in Consolidated Response GLF-1, the risks associated with the proposed Project are substantially different from those associated with the BP Deepwater Horizon Project. Consolidated Response OIL-4 addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils. Consolidated Response AQF-3 provides information on hypothetical spills from the Project over two areas of the Northern High Plains Aquifer System and also addresses response actions.
547	1	Schultz	Bonnie		Please protect our water. As you should have learned from this mess with BP that is currently happening right now, Oil and Water does not mix. Routing an oil pipeline through the soil of the Nebraskan Sandhills could potentially contaminate if not at the moment, but later on.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. As described in Consolidated Response GLF-1, the risks associated with the proposed Project are substantially different from those associated with the BP Deepwater Horizon Project.
1540	128	Schultz	Sterling		Boyd County defeated their dump after years of arguing over whether the economic benefit would overrule common sense. Now we want to destroy the bread basket of Nebraska with the same old line and the same old stories. Look at how many nuclear dump waste site are leaking. Look at BP's project,	As described in Consolidated Response GLF-1, the risks associated with the proposed Project are substantially different from those associated with the BP Deepwater Horizon Project.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					sold to everyone as the best engineering in the world. So I caution you. Think twice about what's happening to your land.	
602	1	Schwartzbeck	Patty		Please keep this pipeline away from the Nebraska Sand Hills.	Identification of sensitive environments crossed by the proposed Project is discussed in Consolidated Response ENV-1 and ENV-3. Issues related to the Sand Hills area are addressed in Consolidated Response ERO-1.
151	1	Schweitzer	Brian	MT Office of Governor	I am writing in support of TransCanada's Keystone XL (KXL)	Comment acknowledged.
151	2	Schweitzer	Brian	MT Office of Governor	This project will create significant jobs and tax revenue in Montana. The project is estimated to generate approximately \$1 billion of investment in Montana, creating 790 construction jobs, 10 permanent jobs and generate more than \$62 million annually in property tax revenue. This is welcome news for these counties that have suffered from years of economic dislocation and decline.	Consolidated Response ECO-1 addresses potential socioeconomic impacts, and Consolidated Response TAX-1 addresses concerns regarding taxes.
151	3	Schweitzer	Brian	MT Office of Governor	Keystone project could also benefit domestic oil production. TransCanada is in discussions with Montana and North Dakota oil producers to determine the value of pipeline access to the Bakken and Williston Basin formations. Montana and North Dakota have seen increased oil production in recent years and the reserves in this region appear to be larger than previously thought. This is a tremendous national resource that can also displace oil from unfriendly or unstable nations overseas. In addition, the anticipated growth of off-shore developments may be in decline given the recent developments in the Gulf Coast. Land based resources such as ours should be given higher national priority but may not be developed to full potential without access to markets that KXL provides.	Consolidated Response ALT-3 addresses issues related to a potential pipeline connection to the Keystone XL Project in Montana that would transport oil produced in Montana and North Dakota.
244	1	Schweitzer	Mary		I am writing in regards to the pipeline that is being considered across the state of Nebraska. This is not a good idea. We do not want our water put in jeopardy with a crude oil pipeline. Consider the environmental hazards. Couldn't a refinery be put in Canada? Please think about this, and not allow it to happen.	Consolidated Response P&N-8 addresses issues related to shipping Canadian crude oil to refineries that are closer to the source of oil.
1136	1	Schwieger	Robert		The Keystone Pipeline proposal in Nebraska is absurd... This project should be dumped before we experience another disaster... Please do not let this project go forward.	Consolidated Response ENR-1 provides information on the Department of State's environmental review process, the National Interest Determination process, and the need to complete those reviews before approving or denying the Presidential permit for the proposed Project.
1136	2	Schwieger	Robert		The recent BP disaster should be enough warning that the risk of such projects is frequently misjudged and we will be paying for this debacle for many years in addition to the damage done to the wildlife, its habitat and the water supply for the country.	As described in Consolidated Response GLF-1, the risks associated with the proposed Project are substantially different from those associated with the BP Deepwater Horizon proposed Project. Section 3.13 of the EIS presents the probability of a spill from the proposed Project, cleanup procedures that would be conducted, and the impacts of spills. Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
549	1	Schy	Jared	Sierra Student Coalition	I vehemently oppose the creation of the Keystone XL Pipeline, it is a disgusting waste of government resources, an idiotic step backwards toward continued reliance in the dirtiest possible way on fossil fuels, and a terrible shame that	The commenter's opinion is noted.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					beautiful natural resources would be destroyed. Do not create this pipeline.	
1527	2	Scott	Robert	Sierra Club of Oklahoma	<p>1. Failure to adequately analyze greenhouse gas emissions. The DEIS does not adequately analyze the climate change impacts of the project. It correctly notes that there is a scientific consensus that the cumulative effects of greenhouse gas (GHG) emissions are causing climate change, and that the DEIS must analyze GHG emissions. However, the EIS must contain a full life-cycle analysis of the GHG emissions associated with a barrel of tar sands crude oil. This analysis should account for the massive amounts of energy and resources necessary to extract the tar sands from the ground and to process it into synthetic crude. It should account for the destruction of Alberta's boreal forests, which are among the largest natural carbon sinks on earth. It should also account for the three barrels of water required to produce each barrel of tar sands crude. The DEIS inexplicably limits its GHG analysis of the project to construction impacts, such as burning diesel fuel in construction vehicles; and operational impacts, such as the electricity used at the pumping stations. It also contains an inadequate analysis of refining impacts. The DEIS pretends that this project begins at the U.S.-Canada border, when in reality it is this pipeline and other similar projects that are driving the demand that is increasing tar sands development. There is a direct causal connection between the Keystone XL pipeline and increased development of the tar sands in Alberta. The DEIS fails to consider the indirect climate change impacts that will occur within the U.S. as a result of increased tar sands development...</p> <p>7. DOS should delay issuance of the DEIS until the new NEPA guidelines are released. The DOS should postpone the NEPA process until CEQ can issue the new GHG NEPA guidance. CEQ is drafting "Guidance on Consideration of the Effects of Climate Change and Greenhouse Gas Emissions" under the National Environmental Policy Act (NEP A). While DOS can and should analyze the full range of GHG impacts associated with Keystone XL, including a life-cycle analysis of tar sands-derived fuel, under existing NEPA regulations, it should put the EIS for the hold until the new CEQ guidance is released.</p>	Consolidated Response GHG-1 addresses the greenhouse gas life-cycle analyses presented in the revised EIS. As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries. Although no GHG thresholds currently exist relevant to the proposed Project, the DOS assessment of GHG emissions was conducted in accordance with CEQ guidance, including CEQ's draft guidance for GHG. The CEQ regulations for implementing NEPA do not require delaying NEPA environmental reviews for the completion of promulgation of regulations that are in draft form during the review period.
1527	5	Scott	Robert	Sierra Club of Oklahoma	<p>Narrow and erroneous statement of purpose and need! ...The DEIS states an impermissibly-narrow statement of purpose and need. An agency cannot define a project's purpose and need so as to preclude consideration of reasonable alternatives. Muckleshoot Indian Tribe v. U.S. Forest Serv., 177 F.3d 800, 812-14 (9th Cir. 1999). The DEIS does just that by narrowly stating its purpose as: "to transport WCSB crude oil from the border with Canada to existing delivery points in PADD III that provide connections to existing refineries in PADD III. An additional purpose of the Project is to supplement WCSB deliveries to the Cushing Oil Terminal in Cushing, Oklahoma, which is in PADD II. Keystone's goal is to initially transport up to 700,000 bpd of crude oil by pipeline from the WCSB to the United States." DEIS 1-3. In other words, DOS says that the "purpose and need" of this tar sands pipeline is to build this tar sands pipeline.</p>	Consolidated Response P&N-7 addresses concerns about the stated purpose of the proposed Project in the EIS. Consolidated Response P&N-1 addresses the need for the proposed Project.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
1527	6	Scott	Robert	Sierra Club of Oklahoma	...insufficient alternatives analysis. The result of this narrow statement of purpose and need is to preclude analyses of reasonable alternatives. For example, if the DEIS stated that its purpose and need is to provide a safe and reliable fuel supply, to lessen our dependence on foreign oil, and to reduce U.S. fuel costs at the pump, the DEIS could have analyzed a range of alternatives to reach this goal, including the use of alternative fuels and efficiency measures. Instead, the DEIS purpose and need presupposes that this very project is necessary and only analyzes minor route variations, etc. The DEIS comes to the unsupported conclusion that if this project were not built, some other pipeline would probably be built to the Pacific coast and the tar sands fuel would be shipped to Asian markets, and summarily rejects the "no action alternative" for the reason that it does not meet the stated purpose and need of the project.	Consolidated Response P&N-7 addresses commenter concerns that the stated purpose of the proposed Project in the EIS is too narrow. Consolidated Response P&N-1 addresses the need for the proposed Project. Sections 1.4.2 and 4.1 of the EIS provide updated information on production from Canadian oil sands projects with and without the proposed Project, and the potential development of projects in Canada to transport Canadian crude oil to markets other than the U.S. Consolidated Response ALT-2 addresses the use of alternative technologies and alternative energy sources.
1527	7	Scott	Robert	Sierra Club of Oklahoma	5. DOS does not have the constitutional authority to issue pipeline permits. DOS does not have the constitutional authority to issue this permit. Everything action taken by the President or an executive agency must come from some legal source-either a statute or the constitution. The constitution expressly gives Congress, not the executive branch, the power over matters of "foreign commerce." An international crude oil pipeline that will transport nearly a million barrels a day from Canada to Texas is foreign commerce, so Congress should be issuing these permits. Congress has not delegated its authority over these tar sands pipelines to the executive, as it has for international bridges, electrical transmission lines, or natural gas pipelines. The only authority that DOS claims is a delegation of the President's "inherent" constitutional authority over foreign affairs. However, the President's implied foreign affairs authority deals mainly with matters of diplomacy and does not include the authority to issue permits for major infrastructure projects or to import products into the U.S. 6. DOS is not the proper lead agency. DOS has no business acting as the lead agency in analyzing the environmental effects of this project pursuant to NEP A. The NEPA regulations set forth a list of factors that are vital in determining the lead agency. 40 CFR 1501.5. These include magnitude of agency's involvement, project approval/disapproval authority, expertise concerning the action's environmental effects, duration of agency's involvement, and sequence of agency's involvement. [d. These factors weigh heavily against DOS acting as the lead agency. DOS acted as lead agency under NEP A for the Keystone I tar sands pipeline, then took the position in court that the process was completely unreviewable because it was really a "presidential action" rather than an agency action. Two federal district court judges in Washington, D.C. and South Dakota both agreed and dismissed the cases. Fortunately, the judge presiding over the Alberta Clipper case in Minnesota did not reach the same conclusion. If the DOS prevails on this legal argument in Keystone XL as it did in Keystone I, it would mean that DOS could issue a wholly inadequate EIS, or even fail to issue one at all, and it would be unreviewable by the	Consolidated Response ENR-1 provides information on the Department of State's environmental review process, the National Interest Determination process, and the need to complete those reviews before approving or denying the Presidential permit for the proposed Project. Consolidated Response REG-2 addresses issues related to concerns about the Department of State being the lead federal agency for the NEPA environmental review and the permits and regulatory approvals that Keystone would have to obtain to construct, operate, maintain, monitor, and inspect the Project.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					courts. In short, DOS should not be permitted to assume the role of lead agency and simultaneously argue that it is protected from judicial review. This contravenes the meaning and intent of NEPA. Second, DOS does not have the requisite level of expertise or involvement to qualify as the lead agency. DOS has nothing that would resemble special expertise in the environmental effects of tar sands crude oil pipelines. The Pipeline and Hazardous Materials Safety Administration (D01) would be a logical choice, as it has particular expertise in pipeline design, safety, and regulation. As would the Army Corp of Engineers, which issues permits for all water crossings to ensure the protection of the environment and natural resources. DOS, however, claims that its only involvement in the project is at the actual border crossing and does not extend to the length of the pipeline.	
1527	8	Scott	Robert	Sierra Club of Oklahoma	8. Refineries. The DEIS fails to adequately consider the impacts of refining the heavy tar sands crude in U.S. refineries. Instead, it concludes that the air and water quality impacts are incidental because the refineries will be regulated under the Clean Air Act and the Clean Water Act. It also reasons that the tar sands crude will only replace existing supplies of heavy crude, so the net increased impacts are slight. These are insufficient rationale for refusing to consider the full host of environmental impacts of refining the tar sands crude.	As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries. As noted in Consolidated Response OIL-4, the Canadian crude oil that would be transported by the proposed Project would be similar to other heavy crude oil transported by pipeline in the U.S.
1547	3	Scott	Robert	Oklahoma Sierra Club	First, the Draft Environmental Impact Statement does not adequately analyze the climate change impacts of the project. It correctly notes that there is a scientific consensus that the cumulative effects of greenhouse gas emissions are causing climate change, and that the DEIS must analyze greenhouse gas emissions. However, the draft environmental impact statement must contain a full life-cycle analysis of the greenhouse gas emissions associated with a barrel of tar sands crude oil, which is will be coming through this pipeline...it should account for the destruction of Alberta's boreal forests...it should also account for the three barrels of water required to produce each barrel of tar sands crude.	Consolidated Response GHG-1 addresses the greenhouse gas life-cycle analyses presented in the revised EIS. Consolidated Response GHG-4 addresses concerns regarding the loss of boreal forest and peat bogs. Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project.
1547	4	Scott	Robert	Oklahoma Sierra Club	The DEIS inexplicably limits its greenhouse gas analysis of the project to construction impacts, such as burning diesel fuel in construction vehicles, and operational impacts such as the electricity used at the pumping stations. It also contains an inadequate analysis of refining impacts.	Consolidated Response GHG-1 addresses the greenhouse gas life-cycle analyses presented in the revised EIS. As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries.
1547	5	Scott	Robert	Oklahoma Sierra Club	The DEIS pretends that this project begins at the U.S.-Canada border when in reality, it is this pipeline and other similar projects that are driving the demand that is increasing the tar sands development. There is a direct causal connection between the Keystone XL pipeline and increased development of the tar sands in Alberta.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project. Consolidated Response GHG-2 addresses the potential causal connection of implementation of the proposed Project and expanded oil sands production in Alberta and increases in refining.
1547	6	Scott	Robert	Oklahoma Sierra Club	The DEIS fails to consider the indirect climate change impacts that will occur within the United States as a result of increased tar sands development.	Consolidated Response GHG-1 addresses the greenhouse gas life-cycle analyses presented in the revised EIS.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
1547	9	Scott	Robert	Oklahoma Sierra Club	Fourth, the draft EIS states an impermissibly- narrow statement of purpose and need. An agency cannot define a project's purpose and need so as to preclude consideration of reasonable alternatives.	Consolidated Response P&N-7 addresses commenter concerns that the stated purpose of the proposed Project in the EIS is too narrow.
1547	10	Scott	Robert	Oklahoma Sierra Club	Fifth, the DOS does not have the constitutional authority to issue this permit.	Consolidated Response REG-2 addresses issues related to concerns about the Department of State being the lead federal agency for the NEPA environmental review and the permits and regulatory approvals that Keystone would have to obtain to construct, operate, maintain, monitor, and inspect the Project.
1547	11	Scott	Robert	Oklahoma Sierra Club	Six, the Department of State has no business acting as the lead agency in analyzing the environmental effects of this project pursuant to NEPA....In short, the Department of State should not be permitted to assume the role of lead agency and simultaneously argue that it is protected from judicial review; that's the point of NEPA.	Consolidated Response REG-2 addresses issues related to concerns about the Department of State being the lead federal agency for the NEPA environmental review and the permits and regulatory approvals that Keystone would have to obtain to construct, operate, maintain, monitor, and inspect the Project.
1547	12	Scott	Robert	Oklahoma Sierra Club	Second, Department of State does not have the requisite level of expertise or involvement to qualify as the lead agency.	Consolidated Response REG-2 addresses issues related to concerns about the Department of State being the lead federal agency for the NEPA environmental review and the permits and regulatory approvals that Keystone would have to obtain to construct, operate, maintain, monitor, and inspect the Project.
1547	13	Scott	Robert	Oklahoma Sierra Club	DOS should postpone the NEPA process until CEQ can issue the new greenhouse gas NEPA guidance.	Consolidated Response GHG-1 addresses the greenhouse gas life-cycle analyses presented in the revised EIS. The DOS assessment of GHG emissions was conducted in accordance with CEQ guidance, including CEQ's draft guidance for GHG. The CEQ regulations for implementing NEPA do not require NEPA environmental reviews for plans, regulations, or goals that are in speculative.
1547	14	Scott	Robert	Oklahoma Sierra Club	the DEIS fails to adequately consider the impacts of refining the heavy tar sands crude in U.S. refineries. Instead, it concludes that the air and water quality impacts are incidental because the refineries will be regulated under the Clean Air Act and the Clean Water Act. It also reasons that the tar sands crude will only replace existing supplies of heavy crude, so the net increased impacts are slight. These are insufficient rationale for refusing to consider the full host of environmental impacts of refining the tar sands crude.	As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries. Consolidated Response P&N-1 addresses the need for the proposed Project.
1547	15	Scott	Robert	Oklahoma Sierra Club	the offsetting potential that this has on our production here in the State of Oklahoma; that can be a major negative force here....when you're putting in the amount of tar sands oil going down to refiner's capacity, that's going to offset the amount that we have here in Oklahoma even though it's a different grade, that can be used for transportation purposes. So that's the analysis that I've received from folks in the oil and gas industry.	Consolidated Response P&N-1 addresses the need that the Project has been proposed to meet. As noted in that response and in Section 1.4 of the EIS, the crude oil that would be transported by the proposed Project would primarily replace diminishing supplies of heavy crude oil obtained from Mexico and Venezuela. It is not likely to displace crude oil produced in Oklahoma.
334	1	Seacrest	Susan		As founder and President of The Groundwater Foundation, I worked for 23 years to help the public understand the nature and value of the nation's precious groundwater supplies. One of these treasures is the Ogallala formation of the High Plains Aquifer system. The Ogallala contains approximately 2/3 of the volume of the High Plains system and represents an enormously important source of fresh water in North America--	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					equal to the water contained in five Lake Eries. The aquifer also provides the ecological underpinning of the largest Sand Dune area in North America. The High Plains aquifer system, of which the Ogallala is a part, recharges numerous lakes, streams and wet meadows throughout Nebraska, Kansas, Oklahoma, and Texas... The health risks to the population that relies on the aquifer for drinking are unacceptably high and the public benefit of large aquifer systems such as this one would be at peril should the project go forward as planned.	
334	2	Seacrest	Susan		The porosity and transmissivity of this system is very high and a leaking pipe—especially a buried leaking pipe would cause instant and widespread damage to the quality of the groundwater. The pollution plume would spread for an indefinite period of time and the threat would grow as the plume traveled... Note the various leaks of the Alaska oil pipeline and the current tragedy in the Gulf of Mexico. US EPA considers pollution prevention as the most viable management strategy for groundwater and this buried pipeline represents a direct assault on this principal.	Crude oil pipelines are not porous and do not leak unless compromised. As described in Consolidated Response GLF-1, the risks associated with the proposed Project are substantially different from those associated with the BP Deepwater Horizon Project. The spill from the <i>Exxon Valdez</i> was an incident involving a marine tank ship and a spill into the marine environment, which is also substantially different for the risks associated with the proposed Project. Issues related to the Northern High Plains Aquifer System are addressed in Consolidated Responses AQF-1 through AQF-4. Consolidated Response AQF-3 provides information on hypothetical spills from the Project over two areas of the Northern High Plains Aquifer System.
409	2	Seacrest	Kelly		The Ogallala Aquifer will be in grave danger. I beg you to stop this before another disaster befalls our country! Groundwater is essential for countless lives; please do not put them at risk. If a leak occurs, it will be too late. There is no system advanced enough that would detect it in time. The Ogallala Aquifer will be forever polluted. Oil, as the nation has witnessed, is one of the most hazardous pollutants. As a citizen of this country and someone who enjoys the beauty of Nebraska as well as one of its most valuable resources, groundwater, I am asking you to stop the Keystone XL Pipeline Project.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
409	3	Seacrest	Kelly		As a citizen of this country and someone who enjoys the beauty of Nebraska as well as one of its most valuable resources, groundwater, I am asking you to stop the Keystone XL Pipeline Project.	Consolidated Response ENR-1 provides information on the Department of State's environmental review process, the National Interest Determination process, and the need to complete those reviews before approving or denying the Presidential permit for the proposed Project.
34	1	Seamans	Paul		I would like to mainly address the pipeline safety and spill section of the Environmental Impact Statement. In regards to the chance of a potential spill on the Keystone XL, TransCanada has stated in the media that the chance of a spill is only 0.0007. What does this mean? Well TransCanada interprets this to being only one chance of a spill in 7400 years. Sounds pretty safe doesn't it? One chance of a spill every 7400 years. In the EIS it is stated a little more accurately. It says, "one incident in 7400 years per mile of pipeline." If you have one chance per mile in 7400 years, then in 7400 miles you would have 7400 chances in 7400 years, or more simply one chance of a spill every year. The Keystone XL pipeline is around 1700 miles long so this would figure out to be one significant spill every 4.5 years. Remember that these are only TransCanada's "projections". Well it just so	Section 3.13 of the EIS was revised to update spill incident statistics and projections, provide additional information on composition of the crude oil that would be transported by the proposed Project, additional information on potential impacts to the Northern High Plains Aquifer system, and other key information. This section addresses reliability and safety issues, including calculations of the probability of a spill from the proposed Project and the potential environmental impacts associated with spills.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					<p>happens that there is a federal agency whose job it is to track oil pipeline spills and safety. The Pipeline and Hazardous Materials Safety Administration, or PHMSA, has records that go back for years. The draft EIS quotes PHMSA as projecting a significant spill for onshore, crude oil trunk lines of 3.86 spills per year. So whose figures does a person believe? TransCanada's projection, and I remind you this is only TransCanada's guess, of one spill every 4.5 years or do you believe PHMSA's records of almost 4 spills per year for each and every year that the Keystone XL is in service. Another of TransCanada's claims that I find of dubious accuracy is the assertion that the average spill will be less than 3 barrels per spill. This is quoted a little different in the EIS where it says, "Keystone's Pipeline Risk Assessment projects that 50 percent of releases would be 3 barrels or less. That's 50 percent of the spills. TransCanada does not project what the other 50 percent of the spills would be. Would they be 10 barrels per spill? Would they be 100 barrels per spill? Or could they even be 1000 barrels per spill. TransCanada leaves that question unanswered. TransCanada has only projections. Again the Pipeline and Hazardous Materials Safety Administration has years of spill records available and they show a somewhat different story. On PHMSA's web site is a table that has a record of pipeline spill from 1986 through 2009. During the 24 years shown there were approximately 3.6 million barrels spilled in 4100 accidents. This averages out to 874 barrels per spill, far above the 3 barrels per spill projected by TransCanada. I feel that TransCanada has been a little less than forthcoming in the figures they have been releasing to the media and I have attempted to clear up a little bit of that misconception tonight.</p>	
1556	1	Seamans	Paul		<p>TransCanada has stated in the media that a chance of a spill is only 0.0007. What does this mean? Well, TransCanada interprets this to be only one chance of a spill in 7400 years. Sounds pretty safe, doesn't it, once chance of a spill every 7400 years? So whose figures does a person believe?</p>	<p>PHMSA does not calculate spill risk projections but provides a database of incidents that have occurred over the past 20 years. The EIS does not state that PHMSA projected the probability of a significant spill for onshore crude oil pipelines of 3.86 spills per year. Section 3.13 of the EIS addresses reliability and safety issues, including calculations of the probability of a spill from the Project based on the PHMSA incident database. Section 3.13 of the EIS was revised to update spill incident statistics, clarify spill frequency projections and the risk analysis, provide additional information on composition of the crude oil that would be transported by the proposed Project, additional information on potential impacts to the Northern High Plains Aquifer system,</p>

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
						and other key information.
1556	3	Seamans	Paul		<p>Another of TransCanada's claims that I find of dubious accuracy is the assertion that the average spill would be less than three barrels per spill. This is quoted a little different in the EIS where it says, "Keystone's pipeline risk assessment projects that 50 percent of releases would be three barrels or less." That's 50 percent of the spills. TransCanada does not project what the other 50 percent of the spills would be. Would they be 10 barrels per spill? Would they be 100 barrels per spill? Or could they even be 1000 barrels per spill? TransCanada leaves that question unanswered. the Pipeline and Hazardous Materials Safety Administration has years of spill records available, and they show a somewhat different story. On PHMSA's website is a table that has record of pipeline spills from 1986 through 2009. During the 24 years shown, there were approximately 3.6 million barrels spilled in 4100 accidents. This averages out to 874 barrels per spill, far above the 3 barrels per spill projected by TransCanada. I feel that TransCanada has been a little less than forthcoming in the figures they have been releasing to the media, and I have attempted to clear up a little bit of that misconception tonight.</p>	<p>A more complete quote of information from Section 3.13.3.2 of the draft EIS is as follows: "Nevertheless, as indicated by the PHMSA data, there are infrequent occurrences of large to very large spills; and their potential impacts need to be addressed. Keystone's Pipeline Risk Assessment projects that 50 percent of releases would be three barrels or less and that less than 0.5 percent of releases would be 10,000 barrels or greater . . .". The remainder of the releases would be in the range of from 3 to 10,000 barrels, with smaller size releases more likely.</p> <p>Section 3.13 of the EIS was revised to update spill incident statistics, clarify spill frequency projections and the risk analysis, provide additional information on composition of the crude oil that would be transported by the proposed Project, additional information on potential impacts to the Northern High Plains Aquifer system, and other key information.</p>
1395	1	Searcy	Jim	Hughes County Commissioners	<p>As a county official from the State of Oklahoma, I encourage the U.S. Department of State to approve an energy infrastructure project that not only will strengthen long-term energy security in the United States, but also will provide a powerful private sector economic stimulus to the communities along the pipeline route during its construction at a time when our economy continues to struggle. We enthusiastically support the Keystone XL Pipeline Project and encourage the Department of State to confirm the findings of the Draft Environmental Impact Statement, which found that the proposed Keystone XL Pipeline would have limited adverse impact environmental impact during construction and operation. We look forward to the issuance of a Final Environmental Impact Statement followed by a Presidential Permit that allows the construction of Keystone XL ...</p>	Comment acknowledged.
1395	3	Searcy	Jim	Hughes County Commissioners	<p>As a county official from the State of Oklahoma, I encourage the U.S. Department of State to approve an energy infrastructure project that [not only will strengthen long-term energy security in the United States, but also] will provide a powerful private sector economic stimulus to the communities along the pipeline route during its construction at a time when our economy continues to struggle. As I understand it, Keystone XL will directly create more than 13,000 high-wage construction and manufacturing jobs during the project's 2011-2012 construction schedule. Many of those jobs will be created in Oklahoma and in our counties. With Keystone XL, local people will have the opportunity to work on the project and businesses that provide supplies, goods and services for its construction and operation. In Oklahoma, one study found Keystone XL expenditures during construction would total \$1.2 billion and generate an economic gross product of nearly \$1.1 billion. Keystone XL construction also would generate more than \$7.7 million in tax revenue for local government and</p>	Consolidated Response ECO-1 addresses potential socioeconomic impacts, and Consolidated Response TAX-1 addresses concerns regarding taxes.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					\$31.4 million for state government... We look forward to the issuance of a Final Environmental Impact Statement followed by a Presidential Permit that allows the construction of Keystone XL and enables our counties, the State of Oklahoma, and the United States to collect the substantial economic benefits Keystone XL would create.	
56	1	Sears	Julie		I am writing to express my objection against the Keystone Pipeline Project. Tar sands oil emits three times more greenhouse gases during production than conventional gasoline. It requires clear-cutting ancient forests and will also suck up water supplies and leave behind massive toxic lakes. This pipeline threatens our country's burgeoning clean energy economy and represents a return to our highly destructive and damaging addiction to fossil fuels.	Consolidated Response GHG-1 addresses the greenhouse gas life-cycle analyses presented in the revised EIS. Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project.
19	1	Sease	Debbie	Sierra Club, et. al.	On April 19, 2010, several of our organizations submitted a joint request asking for an extension of the comment period on the U. S. Department of State's Draft Environmental Impact Statement for the Keystone XL Oil Pipeline Project from 45 to 90 days. This extension is necessary given the many significant environmental impacts the pipeline will have on millions of our members and supporters, as well as the sheer length of the DEIS itself, to ensure that all stakeholders have adequate time to assess the DEIS and respond accordingly. We understand that this request is being partially denied (allowing for only 15 additional days for comment instead of 45 additional days) for reasons that are not warranted. The apparent justification for the denial is that the EIS process must be finalized immediately upon the close of 90 day comment period for government agencies on the presidential permit application for the pipeline and that allowing public comments on the DEIS to also extend to ninety days would not allow the Department of State adequate time to finalize the EIS. NEPA regulations say that no decision on the proposed action shall be made until the later of the following dates: (1) ninety days after publication of the notice of availability of the DEIS; or (2) thirty days after publication of the notice of availability of the final EIS. 40 C.F.R. § 1506.10. Thus, NEPA does not prevent extending the comment period. Section 1(c) of the Executive Order governing presidential permits does require that agencies provide their comments on the presidential permit application within 90 days, but this provision applies to the permit application and NOT the NEPA process. Moreover, the EO effectively allows agencies additional time to comment on the presidential permit if extending the NEPA commenting period would deny them needed information to complete their comments on the presidential permit. Thus, the Department of State has both the ability and the obligation to grant a time extension of 45 additional commenting days. We again urgently request that the Department of State grant our original request to extend the total public comment period for the DEIS to ninety days. Nothing precludes the granting of this request and failing to grant the request would be contrary to the spirit of NEPA and this Administration's own commitment to open government and public participation. We again urgently request that the	Consolidated Response CMT-1 addresses issues related to the length of the comment period for the draft EIS and supplemental draft EIS.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					Department of State grant our original request to extend the total public comment period for the DEIS to ninety days. Nothing precludes the granting of this request and failing to grant the request would be contrary to the spirit of NEPA and this Administration's own commitment to open government and public participation.	
523	1	Serres	Andrew		The proposed pipeline, though transferring a needed resource, has a vast array of problems associated with its development. For example the pipeline would go directly through the Ogallala Aquifer, which supplies a large portion of the region's water supply. While TransCanada will put into place safety measures, these would not be enough to save the water supply if an accident occurred. Due to the porosity and transmissivity of the water system, any small leak would quickly spread throughout the aquifer. Pipelines considered unfailing in the past have met with demise. By building the pipeline we risk the livelihood of all people in this region.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
504	1	Severin	Irene		My family is opposed to the Keystone Pipeline. Of major concern is the possibility of contamination of the Ogallala Aquifer. The current crisis in the Gulf of Mexico from the BP oil drilling explosion cannot be contained and is proving near impossible to stop. How would you even begin to clean up an aquifer that supplies so many people with drinking water? No to the Keystone Pipeline - loud and clear!	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. As described in Consolidated Response GLF-1, the risks associated with the proposed Project are substantially different from those associated with the BP Deepwater Horizon Project.
511	1	Severin	Chuck		After the recent problem in the Gulf - we need to rethink the impact on this pipeline over the Nebraska ground water system when it finally has a leak.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. As described in Consolidated Response GLF-1, the risks associated with the proposed Project are substantially different from those associated with the BP Deepwater Horizon Project.
819	1	Shafer	Paula	Nebraskans for Peace	Please do not approve this pipeline, especially through the parks and recreational areas of Nebraska, like the Niobrara and the Sandhills. These areas contain some of the most beautiful recreational areas that we have here in our state and are important to us.	The impacts associated with implementation of the proposed Project are addressed in Section 3.0 of the EIS. As noted in that section, construction and normal operation the proposed Project would not result in significant environmental impacts. The crossing of the Niobrara River would be accomplished using the horizontal directional drilling method and would not disrupt use of the river during construction. Issues related to the Sand Hills area are addressed in Consolidated Response ERO-1.
819	2	Shafer	Paula	Nebraskans for Peace	In addition, the underground aquifer that exists beneath the Sandhills is an important source of water for irrigation of our agricultural industry. Pollution from a spill would surely impact our economy gravely, not to mention our health.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
52	1	Shaffer	Tria		Approving this pipeline for this most filthy energy source is absurd--we would be better shooting ourselves in the foot. Not only does this pollute water and cause deadly diseases for humans, it is slated to destroy a forest area the size of Florida. We cannot continue killing the planet at this rate in this manner. We MUST draw the line somewhere--here is the perfect place, now is the perfect time, to STOP THE MADNESS!	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information on current and future production. As noted in that Consolidated Response, without the proposed Project, oil sands development would continue at or above the current level until at least 2020, with or without the proposed Project.
1544	52	Shafto	Deborah	Houston Green Party	Oil and gas line companies do not enjoy a great reputation. Within the last two weeks, I have read two stories in the paper about sections that were ignored by pipelines and both had	The commenter's opinion is noted.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					disastrous results.	
1544	53	Shafto	Deborah	Houston Green Party	The monitoring and insistence on compliance with local laws has not been sufficient in Houston and its environments. There has been a great deal of trouble getting compliance. And when there is an inspection and a fine, it's just a slap on the wrist. We're talking about thousands of dollars for millions dollars of profit. The do not have a good track record.	Consolidated Response SAF-1 describes the regulatory requirements and Project-specific Special Conditions that Keystone would comply with to construct, operate, maintain, inspect, and monitor the proposed Project. It also describes the monitoring, inspections, and reviews of the proposed Project that the Pipeline and Hazardous Materials Safety Administration would conduct to ensure compliance with those regulatory requirements.
1544	56	Shafto	Deborah	Houston Green Party	I strongly urge this pipeline not be built.	Comment acknowledged.
186	1	Shaw	Anne		In my opinion, we need to cancel the proposed Keystone Pipeline in order to halt the destructive development of the Canadian oil tar sands in Alberta. The province is looking for a quick fix to their economic problems and are ignoring the devastating consequences of laying waste to hundreds (thousands?) of acres of pristine native lands.	Consolidated Response ENR-1 provides information on the Department of State's environmental review process, the National Interest Determination process, and the need to complete those reviews before approving or denying the Presidential permit for the proposed Project. Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including development of the oil sands without the proposed Project.
186	3	Shaw	Anne		In addition, the proposal to route the gigantic refining equipment needed through Idaho and Montana on narrow two-lane roads is ridiculous. In order for these monstrosities to pass through the canyons and over the Rocky Mountain Front, the road will have to be widened in many places and just the fact that Missoula has no by-pass already makes large trucks and equipment have to use the surface streets to get from Highway 13 to Interstate 90. What about the on-ramp to the freeway? None of those have enough room to be widened enough for the size of these huge loads.	DOS understands that refining equipment will be transported from the U.S. to Canada for use in the construction of pre-processing facilities associated with the production of crude oil from oil sands. Those facilities are not a part of the proposed Project and therefore DOS has not assessed the impact of transporting that equipment through Idaho, Montana, or elsewhere.
186	4	Shaw	Anne		The many questions about the entire operation lead to the conclusion that it would be best to cancel the whole project and to that end the United States, along with all the Native American Nations opposed, needs to say 'No' to the Keystone Pipeline.	Consolidated Response ENR-1 provides information on the Department of State's environmental review process, the National Interest Determination process, and the need to complete those reviews before approving or denying the Presidential permit for the proposed Project.
275	1	Shaw	Andrew	Canada American Business Council	On behalf of the Board of Directors of the Canadian Business Council (CABC), we would like to submit the Council of Foreign Relations' May 2009 report entitled "The Canadian Oil Sands: Energy Security vs. Climate Change" in support of the Keystone XL pipeline project.	Comment acknowledged.
920	1	Shaw	Sarah		I strongly oppose the building of the Keystone XL Pipeline.	Comment acknowledged.
920	2	Shaw	Sarah		The pipeline will transport the dirtiest type of oil for refinement in the United States which will create more pollution as well as threaten the world's largest aquifer in the state of Nebraska.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. Consolidated Response OIL-4 addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils.
1559	6	Shaw	Gregory		Landowners are being treated unfairly by TransCanada and UFS. Being threatened and bullied by the "Eminent Domain".	As noted in Consolidated Response EAS-2, state laws dictate under what circumstances eminent domain may be used and define the eminent domain process within the state. DOS has no legal authority in the easement negotiations or in eminent domain proceedings. As noted in that response, the Department of State does not have legal authority to intervene

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
						in those processes.
1559	7	Shaw	Gregory		Questions are not being answered, or are stonewalled, or put on the backburner.	Consolidated Response EAS-2 addresses issues related to easement negotiations and eminent domain. DOS has no legal authority in the easement negotiations or in eminent domain proceedings.
1559	8	Shaw	Gregory		No integrity, price offered by TransCanada was half the amount of what they offered to landowners across the street.	As noted in Consolidated Response EAS-2, state laws dictate under what circumstances eminent domain may be used and define the eminent domain process within the state. DOS has no legal authority in the easement negotiations or in eminent domain proceedings. As noted in that response, the Department of State does not have legal authority to intervene in those processes.
1559	7	Shaw	Gregory		Questions are not being answered, or are stonewalled, or put on the backburner.	The commenter's opinion is noted.
1219	1	Sheets	Carolyn		Please rethink the idea of a pipeline running through Nebraska. Our Sandhills are one of the most beautiful natural wonders in the United States. We must not destroy them.	Issues related to the Sand Hills area are addressed in Consolidated Response ERO-1.
1542	1	Sheffield	Quinton		I operate two businesses that have been owned and operated by my family for over 35 years. Both companies will be affected by the proposed route of the Keystone XL pipeline.	DOS is unable to respond to the commenter since it is not clear where the businesses are in relation to the proposed route or how they would be affected. However, as noted in Section 3.10 of the EIS, our assessment of socioeconomic impacts did not identify any businesses that would experience a significant adverse impact due to implementation of the proposed Project.
1542	2	Sheffield	Quinton		Will property and business owners be duly compensated for the loss of revenue, loss of property and business interruption due to construction of the proposed pipeline?	In general, and as indicated in Consolidated Response ECO-1 and Section 3.10.2.2, the proposed Project would have an overall economic benefit. Provisions to maintain access to area businesses, and to minimize the amount of time construction occurs in any one specific geographic area, should minimize the potential negative economic impacts to businesses.
1542	3	Sheffield	Quinton		At what cost must small businesses and property owners suffer to accommodate the profit margins and environmental impact of large pipelines and big oil in Southeast Texas?	Consolidated Response ECO-1 and Section 3.10.2.2 of the EIS address the potential socioeconomic impacts of the proposed Project. Provisions to maintain access to area businesses, and to minimize the amount of time construction occurs in any one specific geographic area, should minimize the potential negative economic impacts to businesses during construction.
1308	1	Shepherd	Janice		Thank you for the opportunity to comment on the Draft EIS on the Keystone XL pipeline. The DEIS does not adequately assess the damage and risk of contamination of water supplies and other parts of the environment from the risk of leaks and spills. On June 11, 2010 a quarter size hole in an underground pipeline owned by Chevron led to 33,000 gallons of crude oil to spew out into the environment.	Section 3.13 of the EIS addresses reliability and safety issues, including calculations of the probability of a spill from the Project and the potential environmental impacts associated with spills. The assessment includes potential impacts to surface water and groundwater. DOS considers this assessment to be in compliance with NEPA environmental review requirements.
1308	2	Shepherd	Janice		At least 10 birds have died because of that spill and 280 birds were removed for clean-up. What of the fish and other wildlife that rely on the contaminated creek for their existence.	The commenter is referring to a spill from a Chevron pipeline.
1308	3	Shepherd	Janice		The leak which took place near Salt Lake City occurred in a populated area and observant residents alerted the local authorities, who in turn alerted Chevron .Note that neither of two sensor systems that Chevron had in place detected the	As noted in Section 3.13.5 of the EIS and in Consolidated Response OIL-3, the pipeline leak detection system that Keystone would use is an up-to-date system that would meet all current industry standards and governmental regulatory

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					spill. What if the leak had occurred in an unpopulated area? Could the leak have continued for days or weeks without notice? We only need to look to the Gulf to see the incredible damage spewing oil can have. See http://www.sltrib.com/news/ci_15294714?source=rv for more information on the spill, including reaction from Senator Orrin Hatch . . . "Further investigation" is needed into the cause of this leak and the reasons why the monitoring systems failed before approval should proceed for the Keystone XL project.	requirements. The system is more sensitive, accurate, and precise than the older system that Chevron was using.
1308	4	Shepherd	Janice		Further investigation is needed into the cause of this leak and the reasons why the monitoring systems failed before approval should proceed on the Keystone XL project. Changes in the Keystone XL plan should be made to address issues raised by the investigation. Preliminary guesses on the cause of the leak was an underground arc between a fence post and the pipeline. If that was the cause then the Keystone XL pipeline should be insulated in appropriate manner when it must come close to such metal objects as fence posts. The onus for providing adequate insulation should be on TransCanada not on the land-owner (private or public) when it comes to existing or future fences (or other metal objects that are partially above and below ground). For future installations by land-owners, TransCanada should be required to retroactively apply the needed insulation.	The spill referred to by the commenter resulted from a third party improperly placing a fence post and was not a result of the pipeline operator's operations or maintenance. As described in Section 2.3.1 of the EIS, to avoid or minimize external corrosion, the entire pipeline would be coated pipe with a corrosion-protectant bond and the proposed Project would include a cathodic protection system. Keystone would conduct internal monitoring of the pipeline as a part of its Integrity Management Program and would replace sections of pipe that have unacceptable corrosion levels as defined by the Pipeline and Hazardous Materials Safety Administration regulations and Project-specific Special Conditions.
1308	5	Shepherd	Janice		I have the following further concerns: Why did the Chevron sensors fail? Will TransCanada be using the same sensors? If yes, then this is clearly not adequate. If no, then what kind of real-world testing has been done with the sensors to show they are more reliable than the ones Chevron was using? The pipeline planned is incredibly long covering vast amounts of land where visual detection of leaks cannot happen in a timely manner. Fully functioning sensors the whole length of the pipeline is crucial.	As noted in Section 3.13.5 of the EIS and in Consolidated Response OIL-3, the pipeline leak detection system that Keystone would use is an up-to-date system that would meet all current industry standards and governmental regulatory requirements. The system is more sensitive, accurate, and precise than the older system that Chevron was using.
1308	7	Shepherd	Janice		We've been told that the Exxon Valdez disaster might have been averted if the ship had been double-hulled. Why not apply the same concept to this pipeline? A pipe within a pipe. Water could then occasionally be run through the outer pipe to detect leaks in either the inner (water existing is tainted with oil) or outer pipe (the volume of water is less at exit).	Consolidated Response SAF-1 describes the regulatory requirements that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed proposed Project in a manner that protects the health and safety of the public and the environment. Those requirements do not include the use of double-walled pipe. Consolidated Response AQF-6 also addresses the potential for using double-walled or triple-walled pipe.
1308	8	Shepherd	Janice		In just the last week there have been two earthquakes near Oklahoma City and that is exactly near where this pipeline will travel. Is the pipeline earthquake proof?	Consolidated Response GEO-2 addresses potential seismic hazards.
1308	9	Shepherd	Janice		What is TransCanada's, emergency plan to deal with multiple breaks in the pipeline caused by a serious earthquake? Roads may be impassable and local emergency, personnel may be fully occupied with rescue's, It is my understanding that the TransCanada permit application contains no emergency plan. We see from the Gulf BP disaster an emergency plan should be evaluate prior to permits being issued. An emergency plan is needed to understand how TransCanada will stop a spill (which may come from many leaks alone) and that they have adequate resources so it will quickly deal with clean-up	Consolidated Response GEO-2 addresses potential seismic hazards. Consolidated Response RES-1 addresses issues related to preparation and review of emergency response plans for the proposed Project.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					without reliance on local emergency personnel who might be occupied elsewhere. The pipeline is going to be passing through the area known as tornado alley. Underground pipelines have spaced above ground sections for emergency turn-off valves. What if a tornado hits one of these above ground sections? Again evaluating TransCanada's emergency plan should take place prior to issuing a permit. We have learned from the BP disaster that the issue for evaluating an emergency plan is not the likeliness of a catastrophic spill but the adequateness of the plan to respond to such a spill in adverse circumstances (i.e. BP's plan to capture surface oil didn't work in the presence of 6 foot waves. Will TransCanada's emergency plan work when adverse weather such as a blizzard is also taking place).	
1308	10	Shepherd	Janice		Valves are sometimes known to fail if left unused for a long period of time. To prevent that problem and to ensure successful shut-down of each section, each section's valve should be closed once every 6 months. That way when a shut-off is needed in an emergency it will work. If only the BP shut-off valve had been properly tested or they had been required to install multiple shut-off valves to act as backups, we'd not be in the current crisis.	All issues related to design specifics and operation of the proposed pipeline system are under the jurisdiction of the Pipeline and Hazardous Materials Administration (PHMSA) as explained in Sections 2.3, 2.3.1, and 3.13.1 of the EIS. The proposed Project would be constructed and operated in compliance with the PHMSA requirements presented in 49 CFR 195, which includes requirements for valve operation and maintenance (see 49 CFR 195.420). Requirements for valves are also included in the PHMSA Special Condition 22 (see Appendix U of the EIS).
514	1	Sherrill	Aaron	UNO Student	As a geology major at UNO I understand the risks that are being taken by putting this pipeline through Nebraska or any other state. Pipelines are not safe and reliable ways of transporting oil over long distances. They, the pipelines, are too easily damaged and too difficult to repair. The worst risk is the contamination of the Ogallala Aquifer. This aquifer is detrimental to Nebraskans and their way of life. If the Ogallala Aquifer were to get contaminated there might not be a way to clean it. The water in the aquifer may travel at a very slow pace but it does so from Nebraska to Texas. If contaminated, the livelihood of millions of Americans will be at stake from the Midwest to the south. The aquifer comes in contact with many streams, creeks and, rivers and should not be risked no matter what a company thinks. The reasons that the Ogallala Aquifer is such a large, resourceful aquifer are the same ones that would make it easily contaminated and impossible to clean.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. As described in Consolidated Response GLF-1, the risks associated with the proposed Project are substantially different from those associated with the BP Deepwater Horizon Project.
563	1	Shipley	Sue		PLEASE! Keep this pipeline away from the Nebraska Sand Hills - or at least find a way to build it above ground where any leaks could be easily spotted and repaired.	Issues related to the Sand Hills area are addressed in Consolidated Response ERO-1. Issues related to an aboveground pipeline are addressed in Consolidated Response CST-1.
563	2	Shipley	Sue		Our ground water is a national resource and should not be compromised.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
1040	1	Shorney	Peggy		Based on the information from the newspaper articles and being a lifelong Nebraska resident who cares about the soil and the Ogallala Aquifer, I urge you not to allow this pipeline to be buried in Nebraska and go through our state. There is too much at risk for our water and for soil erosion to have this pipeline, especially the thickness of the pipeline that is proposed to be used for this project.	Issues related to the Sand Hills area are addressed in Consolidated Response ERO-1. Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. Keystone has withdrawn its application for a Special Permit as described in Consolidated Response REG-1.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
1040	2	Shorney	Peggy		There is too much at risk for our water and for soil erosion	Issues related to the potential for erosion adjacent to streambanks and private land area are addressed in Consolidated Response ERO-1. Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
169	1	Shrine	Linda		Considering the spill in the gulf, by BP who professed to have safety in place but cut corners and have caused an environment disaster for years to come, I wonder how anyone could even consider running a oil pipe line through our Nebraska aquifer. Promises, precautions etc, do not guarantee our water safety. Without clean water we cannot sustain life. Would we risk life for more money for big industry?	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. As described in Consolidated Response GLF-1, the risks associated with the proposed Project are substantially different from those associated with the BP Deepwater Horizon Project.
171	1	Sibbernson	Mark		I certainly hope that with our current oil disaster in the Gulf of Mexico, the pipeline leak in Utah, and especially the long term permanent effects of the Exxon Valdez spill in Alaska, that our people responsible for the approval and administration of such long term, potential environmentally toxic decisions will pause to reconsider the route of this proposed pipeline. It should be obvious to even the most unscientific, that you should not risk permanently contaminating the largest fresh water Aquifer in the US, the Ogallala. There are many options for a new route through a much less fragile ecosystem to the east. It might cause Trans Canada to spend slightly more money, but would be a much more practical, common sense, and better long term decision.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. Consolidated Response ALT-1 addresses potential alternative routes, including routes that would avoid much of the Northern High Plains Aquifer system. As described in Consolidated Response GLF-1, the risks associated with the proposed Project are substantially different from those associated with the BP Deepwater Horizon Project.
482	1	Sides	Robert		I oppose the project location coming through our state's Sandhills area. Any leakage could have a disastrous effect on our state's agriculture and drinking supplies. Another route needs to be found that avoids this critical vulnerable area.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. Consolidated Response ALT-1 addresses potential alternative routes, including routes that would avoid much of the Northern High Plains Aquifer system.
702	3	Sidwell	Sarah		No more tar sands and no more risky pipelines, please. Thank you,	Consolidated Response SAF-1 describes the regulatory requirements and Project-specific Special Conditions that Keystone would comply with to construct, operate, maintain, inspect, and monitor the proposed Project. It also describes the monitoring, inspections, and reviews of the proposed Project that the Pipeline and Hazardous Materials Safety Administration would conduct to ensure compliance with those regulatory requirements. Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information on current and future production. As noted in that Consolidated Response, without the proposed Project, oil sands development would continue at or above the current level until at least 2020, with or without the proposed Project.
50	1	Siefert	Linda		Please do not allow the Canadian tar sands oil pipe line to enter the U.S. Canada is being irresponsible to the environment, and we should not encourage it. Also, we do not need the extra air pollution this nasty stuff creates. Until we can wean ourselves off petroleum products, natural gas is a cleaner alternative, and we have an abundance in the U.S.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project. As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
445	1	Sifford	Sandra		I would like to voice my concern and objection to allowing Keystone XL to run the oil pipeline through or near the Ogallala Aquifer. Although it will increase the cost of the pipeline I think that they should pipe it around the aquifer. My reason for my objection is obvious.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. Consolidated Response ALT-1 addresses potential alternative routes, including routes that would avoid much of the Northern High Plains Aquifer system.
777	1	Sikorski	Wade	Northern Plains Resource Council	The Keystone pipeline will pass within a couple of miles of my family's ranch in Fallon County, MT.	Pipeline routing in Montana is addressed in Consolidated Response EAS-1.
777	2	Sikorski	Wade	Northern Plains Resource Council	...After the failure of regulatory supervision of British Petroleum in the gulf, I am very concerned that a repeat here is in the works...	As described in Consolidated Response GLF-1, the risks associated with the proposed Project are substantially different from those associated with the BP Deepwater Horizon Project.
777	3	Sikorski	Wade	Northern Plains Resource Council	...[Like BP,] Keystone says its pipe will never leak, that every thing is safe, that the technology is wonderfully advanced, and we have nothing to worry about.	Section 3.13 of the EIS addresses reliability and safety issues, including calculations of the probability of a spill from the Project. That section does not state that there would not be any leaks or spills over the life of the Project.
777	6	Sikorski	Wade	Northern Plains Resource Council	...The gulf disaster also shows us the need for an adequate emergency plan. The government must make sure that TransCanada has an adequate emergency response...	Consolidated Response RES-1 addresses issues related to preparation and review of emergency response plans for the proposed Project.
777	7	Sikorski	Wade	Northern Plains Resource Council	...I am deeply concerned about the impact that climate change will have on my family's farming operation. The pipeline will obviously take an enormous amount of energy to operate. Will this mean burning more coal?	Climate change is addressed in Section 3.14.3.14. As noted in that Section, implementation of the proposed Project is unlikely to result in a measureable climate change. Consolidated Response ELE-1 addresses issues regarding the potential need for additional energy sources to provide electrical power for the pump stations and mainline valves.
1365	1	Sikveland	Njidl	Mayor of Circle, MT	It is our understanding that a number of groups of sent letters seeking suspension of the permitting for the Keystone XL pipeline. We encourage you to reject the request and to continue to review the proposed project... The permitting processes in place are appropriate and should proceed so that a final determination can be made about the impacts of the project and whether it is in the best interest for our nation. Please allow the permitting and review process to continue for the Keystone Pipeline Project. Thank you.	Comment acknowledged.
1365	2	Sikveland	Njidl	Mayor of Circle, MT	Construction of this project stands to bring significant economic benefits to our area.	Comment acknowledged.
1365	1	Sikveland	Njidl	Mayor of Circle, MT	It is our understanding that a number of groups of sent letters seeking suspension of the permitting for the Keystone XL pipeline. We encourage you to reject the request and to continue to review the proposed project... The permitting processes in place are appropriate and should proceed so that a final determination can be made about the impacts of the project and whether it is in the best interest for our nation. Please allow the permitting and review process to continue for the Keystone Pipeline Project. Thank you.	Consolidated Response ENR-1 provides information on the Department of State's environmental review process, the National Interest Determination process, and the need to complete those reviews before approving or denying the Presidential permit for the proposed Project.
290	1	Simonson	Wanda		I believe constructing an oil pipeline across an area directly above the Ogallala Aquifer is a mistake that may cost dearly in the event the pipeline should develop a leak. The potential for polluting the Ogallala Aquifer is too great.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. Consolidated Response OIL-1 addresses the likelihood of spills from the Project.
664	1	Simpson	Glenn	Conoco Phillips	ConocoPhillips is writing in support of TransCanada's Keystone XL Pipeline, which will connect Alberta's growing crude oil production to refining markets on the U.S. Gulf Coast. This pipeline will play an important role in future U.S.	Comment acknowledged.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					energy security, providing a foundation for reliable energysupply and economic growth.The U.s. Department Of Transportation's EIA forecasts that crude oil and natural gas will supplyover 50 percent of the nation's energy needs for at least the next two decades. Given declines inexisting, mature North American crude oil basins and uncertainty caused by the current tragedy inthe Gulf of Mexico, diversifying our energy supply across North America is strategically important.This connection may be more vital in the coming decade as Asian demand for energy may redirectthe flow of Middle Eastern crude supply from markets on the Gulf Coast. In addition, supply fromtraditional suppliers in the Caribbean and South America are becoming less reliable or are forecastto decline.Canada is a dependable and valued trade partner with a long history of an effective workingpartnership with the U.S. In addition, we are aware that Keystone XL is working with crude oilproducers in Montana and North Dakota to establish a high capacity link between growing domesticresources in that region and the U.s. Gulf Coast.Pipelines are not only efficient, but are also the safest, least environmentally impactful way tottransport energy liquids over long distances. Construction of Keystone XL will also have a positiveeconomic impact along its route as it will create thousands of construction jobs as well as providingon-going local income through property taxes.We are aware that a number of advocacy groups have sent a letter to Secretary Clinton urging theDepartment of State to suspend the permitting process for this pipeline. We encourage theDepartment of State to complete its review of the project, given the importance of connecting energyresources in Canada and the U.S. northern tier to large Gulf Coast markets. This will helpconsumers and businesses across the U.S. for decades to come.	
1275	3	Simpson	Glenn	ConocoPhillips	The U.S. Department of Transportation's EIA forecasts that crude oil and natural gas will supply over 50 percent of the nation's energy needs for at least the next two decades. Given declines in existing, mature North American crude oil basins and uncertainty caused by the current tragedy in the Gulf of Mexico, diversifying our energy supply across North America is strategically important. This connection may be more vital in the coming decade as Asian demand for energy may redirect the flow of Middle Eastern crude supply from markets on the Gulf Coast.	Comment acknowledged.
1275	4	Simpson	Glenn	ConocoPhillips	Supply from traditional suppliers in the Caribbean and South America are becoming less reliable or are forecast to decline. Canada is a dependable and valued trade partner with a long history of an effective working partnership with the U.S.	Comment acknowledged.
1275	6	Simpson	Glenn	ConocoPhillips	Pipelines are not only efficient, but are also the safest, least environmentally impactful way to transport energy liquids over long distances.	Comment acknowledged.
1275	7	Simpson	Glenn	ConocoPhillips	Construction of Keystone XL will have a positive economic impact along its route as it will create thousands of construction jobs as well as providing on-going local income through property taxes.	Comment acknowledged.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
1275	8	Simpson	Glenn	ConocoPhillips	We are aware that a number of advocacy groups have sent a letter to Secretary Clinton urging the Department of State to suspend the permitting process for this pipeline. We encourage the Department of State to complete its review of the project, given the importance of connecting energy resources in Canada and the U.S. northern tier to large Gulf Coast markets. This will help consumers and businesses across the U.S. for decades to come.	Comment acknowledged.
1544	126	Singh	Peter	Rodero Shaw	Our company has worked with TransCanada for over 40 years. TransCanada is one of the most respected pipeline companies in the world.	Comment acknowledged.
1544	127	Singh	Peter	Rodero Shaw	TransCanada carries out their projects with the highest regard for safety, quality innovation and environment.	Comment acknowledged.
1544	128	Singh	Peter	Rodero Shaw	Myself and my company support this project as it means jobs for employees, especially in our plants in the Pearland area.	Comment acknowledged.
1544	129	Singh	Peter	Rodero Shaw	We urge that TransCanada be given the necessary permit to go ahead with this project.	Comment acknowledged.
485	1	Singleton	Pauline		I oppose the extension of the Keystone XL Pipeline to Texas for the purpose of delivering crude oil derived from Canadian tar sands. I have concerns about the impact on air quality of this high-sulfur crude on the air in the Gulf Coast area. Our air quality is already suffering.	As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries. Consolidated Response OIL-4 also addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils.
332	1	Sipe	Gene		I oppose the proposed route for Keystone XL Oil Pipeline across the Brown Ranch in northwestern McCone County, Montana. Construction and operation of a pipeline will destroy, beyond reclamation, features of the landscape, and perpetually disturb what is now a remote and tranquil environment. And, wildlife use along the route will be adversely affected. For many years I have hunted pronghorns on the Brown Ranch, which allows walk-in-only public hunting under guidelines established by Montana Fish, Wildlife and Parks' Block Management Program. The ranch provides hunting opportunities in an undisturbed setting, with emphasis on quality rather than quantity. Even on-site ranch operations are mostly accomplished without use of motor vehicles. This undisturbed feature is important since I hunt with a traditional muzzle loading rifle which has an effective range of about 100 yards. For me, there is no alternative. Comparable hunting opportunity does not exist elsewhere in the vicinity.	Appendix I addresses route variations in Montana and presents the preferred route as determined by MDEQ.
994	1	Sisel	Ron		This idea for an oil tar slurry hi-pressure pipeline through the water supply of North America's breadbasket could only have happened in the mind of a moron consumed by greed.	Consolidated Response OIL-4 addresses the composition of the Canadian crude oil that would be transported by the proposed Project, including concerns relative to the corrosivity and erosivity of the crude oil. As noted in that Consolidated Response, that crude oil is similar in composition and properties to other heavy crude oils that are currently transported within the U.S. pipeline system and similar in composition and properties to other heavy crude oils that are currently refined in PADD III. Issues related to aquifers along the proposed Project corridor

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
						are addressed in Consolidated Responses AQF-1 through AQF-4.
994	3	Sisel	Ron		There is no question it will fail, they just don't know how soon.	Comment acknowledged.
994	5	Sisel	Ron		If they want to save a real dollar, process this sludge at the site of origin.	Consolidated Response P&N-8 addresses issues related to shipping Canadian crude oil to refineries that are closer to the source of oil. Consolidated Response OIL-4 addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils.
994	6	Sisel	Ron		We can all live with less oil and excess money, but nothing can live without pure fresh water. Shoot down this idea now or shoot your own children instead. There is only one choice - no pipeline near the Ogallala Aquifer.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
993	1	Sitz	Ransom		The proposed pipeline would go right through the middle of the Sandhills, an ecologically sensitive that is responsible for recharging the Ogallala Aquifer (which covers the entire state of Nebraska). Should an oil leak occur here, who knows how much ground water would be contaminated? Keep the pipeline out of the Nebraska Sandhills.	Issues related to the Sand Hills area are addressed in Consolidated Response ERO-1. Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
156	1	Skillestad	Jim	Dawson County Commissioner	Dawson County is very concerned about the impact on our county roads and bridges. There is estimated to be over 900 loads of pipe in our county, plus the heavy equipment moving up and down the roads, especially in muddy and extreme conditions and during harvest. Will there be a flagman and safety precautions to prevent accidents, maybe even fatalities. Will there be bonds to assure that the road conditions will be back to at least what they were, or better.	Consolidated Response RDS-1 addresses concerns about the condition of roadways and roadway structures associated with construction and operation of the proposed Project as well as traffic safety measures that would be incorporated into the Project. Consolidated Response LIA-2 addresses the issue of bonding for the proposed Project.
156	2	Skillestad	Jim	Dawson County Commissioner	And also we would like to have a liaison between Keystone Pipeline and Dawson County to make sure that we have good communications to assure that these concerns that I mentioned will be taken care of and insure safety and public roads maintenance. We will appreciate the tax revenue that will greatly help the residents of Dawson County.	Consolidated Response SAF-1 describes the regulatory requirements and Project-specific Special Conditions that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project in a manner that protects the health and safety of the public and the environment. Consolidated Response RDS-1 addresses concerns about the condition of roadways and roadway structures associated with construction and operation of the proposed Project as well as traffic safety measures that would be incorporated into the Project.
1310	1	Skillestad	Jim	Dawson County Commissioner	My name is Jim Skillestad. I am here as a representative of Dawson County, MT. I am a County Commissioner and I am also a landowner as are many of my friends and neighbors. In the past two decades the population in Eastern Montana has slowly been declining. The majority of this area's economy revolves around agriculture. Due to the poor agricultural economy in our area, many young people have left to pursue jobs in other towns. The taxes generated by the Keystone XL Pipeline would greatly help our economy and would lower the property taxes for all landowners in Dawson County. It is the goal of our county that this additional revenue will be utilized to stimulate economic growth within and around our community.	Comment acknowledged.
1310	2	Skillestad	Jim	Dawson County	I support the Keystone XL Pipeline and I do not believe that it	Comment acknowledged.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
				Commissioner	would have any detrimental affect on the environment or our communities. My grandfather was one of the first homesteaders in Dawson County over 100 years ago. My family has always been good stewards of the environment. My sons and I are avid hunters and greatly respect our local wildlife and their habitat.	
1310	3	Skillestad	Jim	Dawson County Commissioner	The Dawson County Commissioners have been in contact with representatives of Keystone and they have assured us that our roads and lands will be left in as good, if not better, condition than they were prior to construction of this pipeline.	Consolidated Response RDS-1 addresses concerns about the condition of roadways and roadway structures associated with construction and operation of the proposed Project. As noted in that response, Keystone would be responsible for roadway improvements and restoration if damage occurs due to Project-related activities.
1310	4	Skillestad	Jim	Dawson County Commissioner	With that being said, I respectfully request that you grant Keystone the necessary permits to install the Keystone XL Pipeline.	Comment acknowledged.
1546	69	Skillestad	Jim	Dawson County, MT	The past two decades the population in Eastern MT has slowly been declining. The majority of this area economically revolves around agriculture, and due to the poor agriculture and the economy we have many young people who have left to pursue jobs in other towns. The taxes generated by the KXL pipeline would...lower property taxes for all landowners in Dawson County...and stimulate...economic growth.	Comment acknowledged.
1546	70	Skillestad	Jim	Dawson County Commissioners, MT	County Commissioners have been in contact with Keystone and have been assured roads and lands will be in as good, if not better, condition after construction.	Comment acknowledged.
1552	87	Skillestad	Jim	Dawson County Commissioner	Dawson County as a whole is very concerned about the impact on our county roads and bridges. There is estimated to be over 900 loads of pipe in our county, plus the heavy equipment moving up and down the roads, especially in muddy and extreme conditions and during harvest.	Consolidated Response RDS-1 addresses concerns about the condition of roadways and roadway structures associated with construction and operation of the proposed Project as well as traffic safety measures that would be incorporated into the Project.
1552	88	Skillestad	Jim	Dawson County Commissioner	Will there be flagmen and safety precautions to prevent accidents, maybe even fatalities?	Consolidated Response RDS-1 addresses traffic safety measures that would be incorporated into the proposed Project.
1552	89	Skillestad	Jim	Dawson County Commissioner	Will there be bonds to assure that the road conditions will be back to at least what they were or better?	Consolidated Response LIA-2 addresses the issue of bonding for the proposed Project.
1552	90	Skillestad	Jim	Dawson County Commissioner	We would like to have a liaison between the Keystone pipeline and Dawson County and the landowners to make sure that we have good communication to assure that these and other concerns will be taken care of, assuring safety and public roads maintenance.	Consolidated Response EAS-2 addresses issues related to easement negotiations and eminent domain. DOS has no legal authority in the easement negotiations or in eminent domain proceedings.
1552	91	Skillestad	Jim	Dawson County Commissioner	We will appreciate the tax revenue; that will greatly help Dawson County.	Comment acknowledged.
156	2	Skillestad	Jim	Dawson County Commissioner	And also we would like to have a liaison between Keystone Pipeline and Dawson County to make sure that we have good communications to assure that these concerns that I mentioned will be taken care of and insure safety and public roads maintenance. We will appreciate the tax revenue that will greatly help the residents of Dawson County.	Consolidated Response SAF-1 describes the regulatory requirements and Project-specific Special Conditions that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project in a manner that protects the health and safety of the public and the environment. Consolidated Response RDS-1 addresses concerns about the condition of roadways and roadway structures associated with construction and operation of the proposed Project as well as traffic safety measures that would be incorporated into the Project.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
1552	90	Skillestad	Jim	Dawson County Commissioner	We would like to have a liaison between the Keystone pipeline and Dawson County and the landowners to make sure that we have good communication to assure that these and other concerns will be taken care of, assuring safety and public roads maintenance.	Consolidated Response EAS-2 addresses issues related to easement negotiations. As noted in that Consolidated Response, DOS has no legal authority in the easement negotiation process. Consolidated Response RDS-1 addresses concerns about the condition of roadways and roadway structures associated with construction and operation of the proposed Project as well as traffic safety measures that would be incorporated into the Project.
1319	1	Skyberg	Paul	McCone City LLC	I write in support of TransCanada's Keystone XL crude oil pipeline project and urge the department to grant a permit for the pipeline.	Comment acknowledged.
1319	3	Skyberg	Paul	McCone City LLC	The environmental benefits of Keystone XL should not be overlooked. The current tragedy in the Gulf underscores the importance of a diverse portfolio of energy supplies. Within the spectrum of viable options, it is appropriate to seek a growing role for oil resources that are:• Land-based;• North American; and,• Transported by pipeline.This project meets each of these criteria.Securing stable and affordable energy from our North American allies through projects such as the Keystone pipeline is in the national interest. Considering the economic and energy security benefits of these vital resources, we should continue to expand America's access to safe, affordable energy to help ensure improved domestic and global energy security and stable prices for consumers.	As described in Consolidated Response GLF-1, the risks associated with the proposed Project are substantially different from those associated with the BP Deepwater Horizon Project.
1319	4	Skyberg	Paul	McCone City LLC	Pipelines are the safest, most reliable, economical and environmentally favorable way to transport oil and petroleum products, as well as other energy liquids, throughout the U.S. America depends on the more than 168,000 miles of liquid pipelines to move energy and raw materials our country relies on.	Comment acknowledged.
1319	5	Skyberg	Paul	McCone City LLC	Additional pipeline capacity will help consumers and businesses throughout the United States. This project also stands to provide a powerful private sector economic stimulus. During construction, Keystone XL will create more than 13,000 jobs funded with private investment. In addition, local governments will have a steady source of income from economic activity associated with construction	Consolidated Response ECO-1 and Section 3.10.2.2 of the EIS address the potential socioeconomic impacts of the proposed Project.
1319	6	Skyberg	Paul	McCone City LLC	and from property taxes the pipeline company will pay.	Comment acknowledged.
1319	7	Skyberg	Paul	McCone City LLC	Rejection of the permit or suspension of the review would sacrifice the significant economic benefits this project stands to deliver and force U.S. consumers to rely on other sources of crude oil not economically and politically allied with U.S. interests. This would be a mistake. I urge the granting of the permit. Thank you for the opportunity to comment.	Comment acknowledged.
1554	34	Skye	Scott	Pipeline Union member, Local 798	But the economy, I mean we've got to have these gas and oil lines, we've got have them. And Keystone uses good, skilled labor to build them, qualified labor. I think it will be a success. Our people watch the environment, I mean we want our environment to do good.	Comment acknowledged.
1024	1	sledge003@aol.com			I agree with the Senator, this must be thought and checked into most carefully. I dont trust this adminstration anymore and	Issues related to aquifers along the proposed Project corridor are addressed in Consolidated Responses AQF-1 through

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					I am beginning to believe more could be done with help from other countries to stop this oil leak. Why dont we use their suggestions or at least check into them. And now across NE.....	AQF-4. Consolidated Response ALT-1 addresses potential alternative routes, including routes that would avoid much of the Northern High Plains Aquifer system.
10	1	Smederovac	Gloria		I am writing because I'm very concerned about the increased importation of toxic tar-sand oil into the United States. A new pipeline, the Alberta Clipper, will soon be importing hundreds of thousands of barrels of toxic tar-sand oil into our country. Tar-sands contain more sulfur, nitrogen, mercury, lead, nickel, and arsenic than conventional oil. These pollutants are harmful to human health, causing lung and respiratory problems such as bronchitis, asthma, respiratory infections, and decreased lung function. They also cause acid rain, smog and haze. We need your help to protect our children, our water, and our air from polluting substances such as tar sands. The State Department is currently considering approving another tar-sands oil pipeline, Keystone XL. Please help us build a healthy world by contacting asking them to stop approving the importation of tar-sands oil.	Consolidated Response OIL-4 addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils. Consolidated Response P&N-1 addresses the need for the proposed Project. As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries.
503	1	Smidberg	E		Why do you have to endanger our water supply? This pipeline should not cross Nebraska. Process the stuff at it's original point.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. Consolidated Response ALT-1 addresses potential alternative routes, including routes that would avoid much of the Northern High Plains Aquifer system. Consolidated Response P&N-8 addresses issues related to shipping Canadian crude oil to refineries that are closer to the source of oil.
1269	3	Smillie	John	Western Organization of Resource Councils	We do not believe the DEIS is adequate to provide a basis for the State Department to decide if this pipeline is in the national interest or for the State of Montana to issue a certificate under the Major Facility Siting Act.	Consolidated Responses ENR-1 and P&N-9 provide information on the DOS environmental review process, the National Interest Determination process, and the need to complete those reviews before approving or denying the Presidential permit for the proposed Project. As noted in those responses, those are two separate processes and therefore some of the information considered in the determination of national interest is not included in the EIS. The Montana Department of Environmental Quality served as a cooperating agency in conducting the environmental review and preparing the EIS and considers the EIS to provide sufficient information to adequately review the application for a Certificate of Compliance under the Major Facility Siting Act.
1269	4	Smillie	John	Western Organization of Resource Councils	The DEIS is insufficient to justify construction of this huge pipeline, the taking of hundreds of miles of private land, the disruption of farming and ranching operations, damage to roads, damage and risk of contamination of water supplies, or the risk of leaks and spills on the environment.	As noted in Consolidated Response ENR-1, the environmental review, including preparation of this EIS, has been conducted consistent with the DOS regulations pertaining to NEPA (22 CFR Part 161) as well as the Council on Environmental Quality (CEQ) regulations for implementing NEPA (40 CFR Part 1500). As a result, DOS considers the EIS to be in full compliance with the requirements of a NEPA environmental review. However, as noted by the commenter, the Secretary of DOS may decide to deny the application for a Presidential Permit.
1269	5	Smillie	John	Western Organization of Resource Councils	The draft EIS glosses over the central question of whether the pipeline is really needed, and therefore in the national interest and the interests of the State of Montana.	As noted in Consolidated Response P&N-1, Sections 1.2 and 1.4 of the EIS present a thorough, complete, and unbiased assessment of need. Consolidated Response P&N-9 addresses the National Interest Determination process and

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
						Appendix I of the EIS addresses the Montana Department of Environmental Quality environmental review process.
1269	7	Smillie	John	Western Organization of Resource Councils	The DEIS does not disclose what areas are “High Consequence Areas” or what are the remaining, low consequence areas.	High consequence areas (HCAs) area defined by the Pipeline and Hazardous Materials Safety Administration (PHMSA) in 49 CFR 195.450 and are based on population levels and environmentally sensitive areas. Keystone submitted a list of HCAs along the proposed route to PHMSA. The Project would be constructed in accordance with PHMSA regulations and in accordance with the 57 Project-specific Special Conditions (see Appendix U of the EIS) developed by PHMSA and agreed to by Keystone. Incorporation of those conditions would result in a Project that would have a degree of safety over any other typically constructed domestic oil pipeline system under current code and a degree of safety along the entire length of the pipeline system similar to that which is required in HCAs.
1269	8	Smillie	John	Western Organization of Resource Councils	This DEIS should have analyzed the potential risks and impacts of a spill for High Consequence Areas, low consequence areas, and with whatever conditions or restrictions PHMSA plans to propose in exchange for granting a pressure waiver, before the Department of State decides the pipeline is in the national interest or the Montana DEQ decides that it deserves a Montana Major Facility Siting Act certificate.	Keystone has withdrawn its application for a Special Permit as described in Consolidated Response REG-1. The Project would be constructed in accordance with Pipeline and Hazardous Materials Safety Administration (PHMSA) regulations and in accordance with the 57 Project-specific Special Conditions (see Appendix U of the EIS) developed by PHMSA and agreed to by Keystone. Incorporation of those conditions would result in a Project that would have a degree of safety over any other typically constructed domestic oil pipeline system under current code and a degree of safety along the entire length of the pipeline system similar to that which is required in high consequence areas (HCAs) as defined in 49 CFR 195.450.
1269	10	Smillie	John	Western Organization of Resource Councils	The DEIS does not contain or evaluate TransCanada's emergency response plan, which the Department of Transportation must approve prior to pipeline operations.	Consolidated Response RES-1 addresses issues related to preparation and review of emergency response plans for the proposed Project.
1269	11	Smillie	John	Western Organization of Resource Councils	The largely volunteer emergency personnel, potentially affected property owners, and others who live near the pipeline deserve an opportunity to comment on TransCanada's emergency response plan prior to issuance of permits and approval of emergency response plans.	Consolidated Response RES-1 addresses issues related to preparation and review of emergency response plans for the proposed Project.
1269	13	Smillie	John	Western Organization of Resource Councils	This EIS fails to include even an inadequate emergency response plan. A leak of as much as 5% of the projected capacity of the pipeline – 45,000 barrels, or almost two million gallons – can leak from high pressure pipelines undetected for days or even weeks, if surface evidence of a spill does not appear.	Consolidated Response RES-1 addresses issues related to preparation and review of emergency response plans for the proposed Project.
1269	21	Smillie	John	Western Organization of Resource Councils	The U.S. Department of State should redraft or issue a supplement to this EIS, with a new public comment period, expanding the analysis in this EIS to include analysis of the impacts of alternative actions by the Department of Transportation on the special permit.	Keystone has withdrawn its application for a Special Permit as described in Consolidated Response REG-1.
1269	22	Smillie	John	Western Organization of Resource Councils	The U.S. Department of State should redraft or issue a supplement to this EIS, with a new public comment period, expanding the analysis in this EIS to include analysis of TransCanada's Emergency Response Plan, so that local first	Consolidated Response RES-1 addresses issues related to preparation and review of emergency response plans for the proposed Project. Additional information on emergency response plans was provided in the supplemental draft EIS,

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					responders, and landowners can know what the plans are for preventing and cleaning up leaks and spills that would directly affect them, and suggest improvements.	and the final EIS was also expanded to provide further information on emergency response plans and the role of the Pipeline and Hazardous Materials Safety Administration.
1269	23	Smillie	John	Western Organization of Resource Councils	The U.S. Department of State should redraft or issue a supplement to this EIS, with a new public comment period, expanding the analysis in this EIS to include a life-cycle analysis of tar sands, including the impacts on the climate and other impacts of producing the tar sands in Canada, using the Council on Environmental Quality guidelines for these analyses now under development.	Consolidated Response GHG-1 addresses the greenhouse gas life-cycle analyses presented in the revised EIS. Consolidated Response GHG-5 explains that the DOS assessment of GHG emissions was conducted in accordance with CEQ guidance. The analysis in Section 3.14.3.14 of the EIS was also circulated in a supplemental draft EIS for public review as described in Consolidated Response P&N-6.
1269	24	Smillie	John	Western Organization of Resource Councils	The U.S. Department of State should redraft or issue a supplement to this EIS, with a new public comment period, expanding the analysis in this EIS to include a thorough, independent, and detailed analysis of the need for the pipeline. Absent a clear, unambiguous showing that the pipeline is needed, is the best alternative to meet the nation's transportation energy needs, and is in the national interest, TransCanada should not have the right to condemn landowners for the right of way to construct the pipeline.	As noted in Consolidated Response P&N-1, Sections 1.2 and 1.4 of the EIS present a thorough, complete, and unbiased assessment of need. Consolidated Response P&N-6 addresses the need for a supplemental DEIS. DOS is conducting a NEPA environmental assessment of a private project and it is therefore not appropriate to address alternatives to "the nation's transportation energy needs" as a part of that environmental review. Section 4.0 addresses alternatives to the proposed Project, Consolidated Response P&N-9 addresses the National Interest Determination process, and Response EAS-2 addresses eminent domain.
1269	26	Smillie	John	Western Organization of Resource Councils	The U.S. Department of State should redraft or issue a supplement to this EIS, with a new public comment period, expanding the analysis in this EIS to include analysis of conditions that should be attached to any national interest determination or Montana Siting Act certificate for the Keystone XL Pipeline.	Consolidated Response P&N-6 addresses the need for a supplemental DEIS. Consolidated Responses ENR-1 and P&N-9 provide information on the DOS environmental review process and the National Interest Determination process. As noted in the response, those are two separate processes and therefore some of the information considered in the determination of national interest is not included in the EIS. Consolidated Response P&N-9 addresses the National Interest Determination process. The Montana Major Facility Siting Act (MFSA) review process is separate from the review processes for the Presidential permit and the National Interest Determination, is not on the same timeline as those two processes, and will not be concluded when the final EIS is issued. Appendix I, Attachment 1 provides the Environmental Specifications that would be required if a MFSA Certificate of Compliance is issued.
1269	27	Smillie	John	Western Organization of Resource Councils	The EIS does not adequately address issues raised in scoping.	The EIS addresses all substantive issues that relate to the NEPA environmental review process that were raised during the scoping process. Table 1.7.1-1 of the EIS lists the comments received and the sections of the EIS in which they area addressed.
1269	28	Smillie	John	Western Organization of Resource Councils	In our letter commenting on the scope of the EIS in April, 2009, we asked that the EIS provide and analyze information on several issues and questions. The draft EIS fails to address most of these issues or answer most of the questions adequately, if it addresses them at all. Accordingly, we request that the Department of State and the Montana Department of Environmental Quality revise the draft EIS to include information on the following issues and questions, so that residents along the proposed route, landowners who would be forced to host the pipeline through condemnation, and other interested persons can review and comment on information critical to the major federal actions facing the Departments of	DOS will address all substantive comments in the Final Environmental Impact Statement. The public will be able to comment on the final EIS prior to issuance of a Record of Decision.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					State, Transportation, and other federal agencies, and the Montana Department of Environmental Quality.	
1269	29	Smillie	John	Western Organization of Resource Councils	<p>In our scoping comments we asked that the EIS thoroughly evaluate and present information and analysis related to the need for, and alternatives to, constructing and operating the Keystone XL Pipeline. This information and analysis is important because the EIS is meant to inform the Department of State about whether the proposed pipeline is in the national interest, and to inform the Montana Department of Environmental Quality, Board of Environmental Review and other decision makers whether construction and operation of the pipeline will serve the public convenience and necessity. Should those and other necessary permits be issued, two thousand miles of pipe will be constructed and buried, after nearly as many miles of private land is condemned or acquired under threat of condemnation. Hundreds of thousands of barrels of oil per day will be pumped through the pipe under high pressure.</p> <p>The Department of State must decide whether the Keystone XL Pipeline is in the national interest before issuing a Presidential Permit. The Department should have, but did not, thoroughly evaluate the applicant's claims about the potential benefits of the oil that would flow through the pipeline, nor did it seriously evaluate alternative means of meeting the nation's energy needs, or consider alternative investments of the funds that would be needed to build the line.</p>	Consolidated Response P&N-1 and Sections 1.2 and 1.4 of the EIS address the need that the Project has been proposed to meet. Section 4.0 of the EIS has been updated to provide additional information on alternatives. Consolidated Responses ENR-1 and P&N-9 provides information on the DOS environmental review process, the National Interest Determination process, and the need to complete those reviews before approving or denying the Presidential permit for the proposed Project. As noted in those responses, those are two separate processes and therefore some of the information considered in the determination of national interest is not included in the EIS. Consolidated Response P&N-5 addresses issues related to investments in other technologies.
1269	32	Smillie	John	Western Organization of Resource Councils	The draft EIS did not analyze the negative impacts of the high level of greenhouse gas emissions over the life cycle of fuel made from tar sands.	Consolidated Response GHG-1 addresses the greenhouse gas life-cycle analyses presented in the revised EIS.
1269	33	Smillie	John	Western Organization of Resource Councils	For the Montana Department of Environmental Quality, questions related to the need for and alternatives to the pipeline, and whether the pipeline will serve the public convenience and necessity, were described in detail in the comments of the Northern Plains Resource Council, Western Organization of Resource Councils, the Sierra Club, and Plains Justice on the Major Facility Siting Act Application of TransCanada for the Keystone XL crude oil pipeline, dated March 6, 2009.	Consolidated Response P&N-1 addresses the need that the Project has been proposed to meet. Alternatives are addressed in Section 4.0 of the EIS and Section I-2.0 of Appendix I of the EIS. The Montana Department of Environmental Quality will determine whether or not the proposed Project will serve the public convenience and necessity as required by the Montana Major Facility Siting Act.
1269	34	Smillie	John	Western Organization of Resource Councils	The draft EIS fails to take a hard look at the need for the pipeline. There will be excess capacity in the Alberta Clipper, Keystone I and other pipelines for the foreseeable future, even taking the projections of the Canadian tar sands industry and the public statements of pipeline operators at face value. At a minimum, the State Department should consider the alternative of asking TransCanada to resubmit its application in seven to ten years, if U.S. demand and Canadian supply of tar sands do eventually warrant it.	Consolidated Response P&N-1 addresses the need that the Project has been proposed to meet. As noted in that response, the Project has been proposed to meet the heavy crude oil needs of refineries in the Gulf Coast area, not for the U.S. in general. In addition, the Alberta Clipper and existing Keystone pipeline projects serve other markets and do not meet the demands of the Gulf Coast refineries. Consolidated Responses ENR-1 and P&N-9 provide information on the DOS environmental review process, the National Interest Determination process, and the need to complete those reviews before approving or denying the Presidential permit for the proposed Project.
1269	36	Smillie	John	Western Organization of	The EIS dismisses viable alternatives to construction of the pipeline with the excuse that the no action alternative would	Consolidated Responses ENR-1 and P&N-9 provide information on the DOS environmental review process, the

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
				Resource Councils	not allow TransCanada to get tar sands oil from Alberta to the U.S. Gulf Coast. However, the national interest determination should not hinge on whether TransCanada can implement its business plan; there is no inherent national interest in enabling TransCanada to profit by gaining easier access to Gulf Coast markets. Rather, the national interest determination should be based on whether the proposed pipeline, or alternative means of meeting U.S. transportation needs, provides the most benefits with the least costs to society.	National Interest Determination process, and the need to complete those reviews before approving or denying the Presidential permit for the proposed Project.
1269	37	Smillie	John	Western Organization of Resource Councils	In our scoping comments, we said that the EIS “must evaluate the applicant’s claims that the pipeline is in the national interest, including analysis showing whether construction and operation of the proposed pipeline would have greater or lesser impacts on the physical and human environment than alternatives to construction of the pipeline.” This is explicitly required of the analysis that the Montana Department of Environmental Quality must perform under the Montana Major Facility Siting Act, which requires a balancing of the need for a proposed project against its impacts on the human environment.	Section 4.0 of the EIS provides an analysis of alternatives considered, as does Section I-2.0 of Appendix I to the EIS. Appendix I also describes the review process that the Montana Department of Environmental Quality is conducting. Consolidated Responses ENR-1 and P&N-9 provide information on the DOS environmental review process, the National Interest Determination process, and the need to complete those reviews before approving or denying the Presidential permit for the proposed Project. As noted in those responses, those are two separate processes and therefore some of the information considered in the determination of national interest is not included in the EIS.
1269	38	Smillie	John	Western Organization of Resource Councils	The EIS should have but does not enable the public, the State Department and DEQ to compare the impacts of the proposed project with the impacts of reasonable alternatives on the natural and human environment, because it arbitrarily dismisses all alternatives as unreasonable or impossible.	The alternatives analysis was initially conducted as a screening process that first identified potential alternatives to the proposed Project then screened out alternatives that were not judged to be reasonable. The screening decisions are explained in Section 4.0 of the EIS and in Section I-2.0 of Appendix I of the EIS.
1269	39	Smillie	John	Western Organization of Resource Councils	In scoping, we said that analysis of the no action alternative should include analysis of the environmental and economic impacts of “the most likely combination of alternative sources of liquid fuel, increased efficiency, and reduced domestic oil use that would replace the liquid fuel available in the U.S. from the proposed project, in the event the pipeline is not built.” The EIS did not do this, instead asserting that the U.S. would have to rely on oil imports from more unstable and less friendly countries, without analytic sophistication beyond the assertion that meeting U.S. transportation needs through increased energy efficiency or alternative fuels is “unlikely.”	Consolidated Response ALT-2 addresses the use of alternative technologies and alternative energy sources.
1269	40	Smillie	John	Western Organization of Resource Councils	The draft EIS fails to even mention the possibility of alternatives we suggested in scoping: “Displacing the oil to be transported by pipeline through investments equal to the planned cost of the pipeline in cheaper, faster, safer alternatives, such as biodiesel and other renewable fuels, plug-in hybrid vehicles powered by wind, more efficient vehicles and oil-consuming equipment and infrastructure, and increased passenger rail and other mass transit. This analysis should include an analysis of how much oil could be saved each year with investment of the billions of dollars that TransCanada proposes to sink into this pipeline, on top of the \$50-\$100 dollars per barrel cost of extracting the tar sands oil.”	Consolidated Response ALT-2 addresses the use of alternative technologies and alternative energy sources. Consolidated Response P&N-5 addresses issues related to investments in other technologies.
1269	41	Smillie	John	Western Organization of Resource	We said that “[t]he EIS must evaluate the claims made in the application that the supply of oil from Canadian tar sands will increase by 1.6 million barrels per day by 2017...” Instead, the	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information from a recent report prepared under contract to the

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
				Councils	EIS simply takes Canadian tar sands industry projections at face value, without independent evaluation of their assumptions and calculations.	US DOE regarding development of oil sands projects with and without the proposed Project.
1269	42	Smillie	John	Western Organization of Resource Councils	In our scoping comments, we expressed concern about the apparent lack of understanding or coordination between the Departments of State and Transportation. In those comments, in correspondence with PHMSA, and in meetings with both agencies, we have raised the apparent failure of the Department of Transportation to act as it should as a cooperating agency.	The Department of State has consulted extensively with PHMSA about pipeline safety issues, in particular in the development of 57 Project-specific Special Conditions regarding construction, operation, monitoring, and maintenance of the pipeline. Keystone has voluntarily agreed to incorporate these measures into the proposed Project if the Presidential Permit is granted, and will also incorporate them into its Operations and Maintenance Manual for the pipeline. PHMSA has the legal authority to inspect and enforce any items contained in a pipeline operator's operations, maintenance, and emergencies manual, and would therefore have the legal authority to inspect and enforce the 57 Special Conditions if the proposed Project is approved.
1269	43	Smillie	John	Western Organization of Resource Councils	We have argued that PHMSA should coordinate its permitting processes so that the State Department's EIS could inform its decisions (1) whether to approve, approve with conditions or reject TransCanada's application for a special permit waiving standard pipeline safety restrictions on operating pressure (and therefore pipe thickness), and (2) whether to approve, ask modifications to or reject TransCanada's emergency response plan.	Keystone has withdrawn its application for a Special Permit as described in Consolidated Response REG-1. As described in Consolidated Response SAF-1, the Pipeline and Hazardous Materials Safety Administration (PHMSA) has regulatory requirements that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project in a manner that protects the health and safety of the public and the environment. In addition, PHMSA developed 57 Project-specific Special Conditions that Keystone has agreed to implement. Incorporation of those conditions would result in a Project that would have a degree of safety over any other typically constructed domestic oil pipeline system under current code and a degree of safety along the entire length of the pipeline system similar to that which is required in HCAs as defined in 49 CFR 195.450. Consolidated Response RES-1 addresses issues related to preparation and review of emergency response plans for the proposed Project and the role of PHMSA.
1269	45	Smillie	John	Western Organization of Resource Councils	The EIS understates impacts on the environment, including farms and ranches. Our scoping comments urged analysis of these issues and impacts of construction and operation of the pipeline and associated facilities on the environment, which the draft EIS fails to analyze either adequately, or at all.	Consolidated Response FRM-1 addresses potential ranch of farmland impacts, and Consolidated Response FRM-2 addresses potential impacts to irrigated cropland.
1269	46	Smillie	John	Western Organization of Resource Councils	The draft EIS appears to list only the acreage directly removed from agricultural production, for construction or operation, but does not analyze the acreage lost from agricultural operations because of interruptions caused by changes to or lack of access to fields, equipment, farm roads, and farm buildings.	It is not possible to estimate losses each specific property along the 1,384-mile-long route in the U.S. due to the large number of variables such as extent of land out of production, type of crop, and the time of year of construction. However, the concern of the commenter is addressed in Section 2.5 of the Keystone Construction, Mitigation, and Reclamation Plan presented in Appendix B of the EIS: "Keystone shall reasonably compensate landowners for any construction-related damages caused by Keystone which occur on or off of the established pipeline construction right-of-way. Keystone shall reasonably compensate landowners for damages to private property caused by Keystone beyond the initial construction and reclamation of the pipeline, to include those damages caused by Keystone during future construction, operation, maintenance, and repairs relating to the pipeline."

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
						In addition, the EIS has been revised to acknowledge that some agricultural production may require more than 1 year to recover after completion of response and cleanup activities.
1269	47	Smillie	John	Western Organization of Resource Councils	The draft EIS makes no attempt to estimate the loss of agricultural production or the cost to farmers and ranchers caused by land put out of production, loss of access, dust, weeds, fire, or the use of hazardous materials, except to claim, erroneously, that land disturbed by construction or hazardous materials spills would be restored to full productivity within one year.	It is not possible to estimate losses each specific property along the 1,384-mile-long route in the U.S. due to the large number of variables such as extent of land out of production, type of crop, and the time of year of construction. However, the concern of the commenter is addressed in Section 2.5 of the Keystone Construction, Mitigation, and Reclamation Plan presented in Appendix B of the EIS: "Keystone shall reasonably compensate landowners for any construction-related damages caused by Keystone which occur on or off of the established pipeline construction right-of-way. Keystone shall reasonably compensate landowners for damages to private property caused by Keystone beyond the initial construction and reclamation of the pipeline, to include those damages caused by Keystone during future construction, operation, maintenance, and repairs relating to the pipeline." In addition, the EIS has been revised to acknowledge that some agricultural production may require more than 1 year to recover after completion of response and cleanup activities.
1269	48	Smillie	John	Western Organization of Resource Councils	The draft EIS fails to analyze the impacts of pipeline construction to streambeds and water-bearing underground, clay-bottomed gravel beds along intermittent streams with and without requirements to reconstruct these critical water sources, or to discuss potential mitigation such as reconstruction of shallow aquifers through selective removal and replacement of topsoil, subsoil, gravel and clay. The draft EIS at 3.3.2.4 appears to acknowledge that these aquifers will be disturbed by construction and not reconstructed. The final EIS should clarify this and estimate the impact of destroyed aquifers on farmers, ranchers, recreationists, and others who depend on those resources.	It is not anticipated that proposed construction and stream crossing activities will destroy or render shallow aquifers unusable. Reclamation activities are addressed in Consolidated Response SOI-2 and in the Keystone Construction, Mitigation, and Reclamation Plan presented in Appendix B of the EIS.
1269	49	Smillie	John	Western Organization of Resource Councils	The draft EIS fails to seriously analyze the potential damage to surface and groundwater from operation of the pipeline including leaks, spills, and accidents, because it did not analyze worst-case scenarios, such as a spill in the Ogallala aquifer, the increased risk of irremediable leaks because of the weight of tar sands compared to conventional oil, or the likelihood of leaks, spills and accidents of varying size and seriousness.	Section 3.13 of the EIS addresses reliability and safety issues, including calculations of the probability of a spill from the proposed Project and the potential environmental impacts associated with spills, including discussions of surface water and groundwater (see Sections 3.13.5.6 and 3.13.6). Those sections addresses the impacts of a maximum spill volume as well as other release volumes, from small to large. Consolidated Response OIL-2 addresses the maximum potential release volume. Issues related to the Northern High Plains Aquifer System are addressed in Consolidated Responses AQF-1 through AQF-4. Consolidated Response AQF-3 provides information on hypothetical spills from the proposed Project over two areas of the Northern High Plains Aquifer System. Consolidated Response OIL-4 addresses the composition of the Canadian crude oils that would be transported by the proposed Project. As noted in those responses, the Canadian crude oil that would be transported is similar in composition to other heavy crude oils. DOS considers this assessment to be in compliance with NEPA environmental review requirements.
1269	51	Smillie	John	Western	The EIS did not analyze the environmental impacts of	Responses related to taking the Project out of service at the

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
				Organization of Resource Councils	premature abandonment of the pipeline. The pipeline's economic viability is dependent on the volatile world price of oil, which has forced cancellation or indefinite delay of billions of dollars worth of investment in tar sands projects, and left the two largest pipelines carrying tar sands to the U.S. virtually empty. Premature abandonment of the pipeline would harm not just investors and shareholders, but could also harm affected landowners, nearby communities, and the natural environment.	end of the life of the Project are presented in Consolidated Response DEC-1. At the time this final EIS was prepared, production in the Canadian oil sands was at its highest level ever, and crude oil was being transported to markets in the U.S. and Canada (see Section 1.4.2 of the EIS). Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information on current and future production.
1269	53	Smillie	John	Western Organization of Resource Councils	The EIS does not describe what agency or agencies would be responsible to clean up, dig up pipe out of abandoned rights of way, and reclaim the right of way, if TransCanada defaults on its obligations.	Responses related to the life of the proposed Project and taking the proposed Project out of service are presented in Consolidated Response DEC-1. There is currently no mechanism in place to transfer decommissioning activities from Keystone to another entity. If Keystone defaults on its obligations, we anticipate the matter would be addressed by the courts.
1269	55	Smillie	John	Western Organization of Resource Councils	The EIS does not analyze whether the pipe would be a hazard in farming and ranching areas, as abandoned pipelines are in other parts of the country.	Responses related to taking the proposed Project out of service at the end of the life of the Project are presented in Consolidated Response DEC-1. Impacts associated with construction and normal operation of the proposed Project are presented in the resources sections of Section 3.0 of the EIS. As described in those sections, construction and normal operation of the proposed Project would not result in significant impacts.
1269	56	Smillie	John	Western Organization of Resource Councils	The draft EIS does not clarify who or what entity would be liable for the costs of clean up in the event any section of the pipeline caused contamination or posed an environmental hazard.	Consolidated Response LIA-1 addresses Keystone's liability if there is a spill of hazardous materials or fuel during construction or a spill of crude oil from the proposed Project.
1269	57	Smillie	John	Western Organization of Resource Councils	The EIS does not discuss whether any agency has authority to require, condition, or review plans for decommissioning, or to ensure that plans are carried out.	Responses related to the life of the proposed Project and taking the proposed Project out of service are presented in Consolidated Response DEC-1.
1269	61	Smillie	John	Western Organization of Resource Councils	The draft EIS failed to analyze the effect of adoption of carbon-control policies by the U.S. and Canadian governments on pipeline economics as well as on the decision whether the pipeline is in the national interest. Enactment of a carbon tax, carbon emissions limits, cap and trade bills, or other public policies designed to limit and/or economically penalize high-carbon fuels will adversely impact tar sands oil development and pipelines disproportionately, because tar sands fuel is a relatively high-carbon emitter over its full lifecycle (compared to conventional petroleum-derived fuel).	Consolidated Response ENR-1 provides information on the DOS environmental review process, the National Interest Determination process, and the need to complete those reviews before approving or denying the Presidential permit for the proposed Project. As noted in the response, those are two separate processes and therefore some of the information considered in the determination of national interest is not included in the EIS. At the time the EIS was prepared, there were no carbon taxes, carbon emission limits, or cap-and-trade bills applicable to the proposed Project.
1269	62	Smillie	John	Western Organization of Resource Councils	Public policy designed to curb greenhouse gas emissions could make operation of the pipeline uneconomical, by increasing the cost of tar sands delivered to Gulf Coast oil refineries relative to the cost of lower-carbon alternatives. Public policies to limit carbon emissions could also eliminate the demand (and need) for the oil to be transported through the pipeline, by reducing demand for crude oil and increasing demand for renewable fuel and more energy efficient vehicles.	The CEQ regulations for implementing NEPA do not require consideration of potential future plans, goals, or legislation. As a result, the EIS does not address issues as speculative as planned or potential national energy and climate goals. DOS only considered whether or not the Project would be in compliance with existing stated goals and policies.
1269	63	Smillie	John	Western Organization of Resource	The State Department and the Montana Department of Environmental Quality must consider the relative lifecycle emissions of climate change causing gases from the	Consolidated Response GHG-1 addresses the greenhouse gas life-cycle analyses presented in the revised EIS.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
				Councils	extraction, separation, transportation, refining and use of tar sands made possible by construction and operation of the proposed pipeline, compared to the full lifecycle emissions of alternatives to the pipeline, but have failed to so in the draft EIS. This analysis is critical in determining whether the pipeline is in the national interest and whether it serves the public interest in Montana.	
1269	64	Smillie	John	Western Organization of Resource Councils	The EIS fails to analyze the relative risks and the potential impacts of leaks and spills of alternative decisions by the Department of Transportation on granting the waiver for which TransCanada has applied from maximum operating pressure regulations. This analysis is particularly important for rural, low-population density areas of Montana and the Dakotas, since TransCanada is selectively applying for this permit in rural areas, as opposed to high population urban areas.	Keystone has withdrawn its application for a Special Permit as described in Consolidated Response REG-1. The Project would be constructed in accordance with Pipeline and Hazardous Materials Safety Administration (PHMSA) regulations and in accordance with the 57 Project-specific Special Conditions (see Appendix U of the EIS) developed by PHMSA and agreed to by Keystone. Incorporation of those conditions would result in a Project that would have a degree of safety over any other typically constructed domestic oil pipeline system under current code and a degree of safety along the entire length of the pipeline system similar to that which is required in high consequence areas (HCAs) as defined in 49 CFR 195.450.
1269	65	Smillie	John	Western Organization of Resource Councils	The EIS should have analyzed the impacts of operation of the pipeline under alternative scenarios, including different requirements by the Department of Transportation for pipeline thickness, operating pressure, and monitoring requirements. Different sets of standards and protocols for operation of the pipeline will yield different levels of risk, and thus different levels of impacts from pipeline leaks, spills, and other accidents. Oil pipeline leaks and spills, over time, are the rule, not the exception, as the recent catastrophic spill in Salt Lake City demonstrates.	Keystone has withdrawn its application for a Special Permit as described in Consolidated Response REG-1. As described in Consolidated Response SAF-1, the Pipeline and Hazardous Materials Safety Administration (PHMSA) has regulatory requirements that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project. In addition, PHMSA developed 57 Project-specific Special Conditions that Keystone has agreed to implement. Incorporation of those conditions would result in a Project that would have a degree of safety over any other typically constructed domestic oil pipeline system under current code and a degree of safety along the entire length of the pipeline system similar to that which is required in HCAs as defined in 49 CFR 195.450. The EIS has assessed impacts and conducted a risk assessment based on the proposed Project complying with PHMSA's regulatory requirements presented in 49 CFR 194 and 195. The probability of a spill presented in Section 3.13.4 is based on PHMSA incident data, and the impacts of a spill presented in Sections 3.13.5 and 3.13.6 describe what would likely occur if oil were to be released, irrespective of the reason for the release. In essence this section answers the question "what if" and does not rely on specific causes.
1269	66	Smillie	John	Western Organization of Resource Councils	The EIS fails to analyze the adequacy of the applicants' plans for response to accidents, spills, and other emergencies during operations – and, in fact, it doesn't include the details of Keystone's Emergency Response Plan, because TransCanada has not prepared one.	Consolidated Response RES-1 addresses issues related to preparation and review of emergency response plans for the proposed Project.
1269	67	Smillie	John	Western Organization of Resource Councils	The proposed pipeline would cross hundreds of miles of remote, often fragile areas. Finding and gaining access to sites of leaks and spills may be difficult or slow along much of the pipeline route, and personnel and equipment capable of cleaning up leaks and spills will be few and very far between.	Consolidated Response RES-1 addresses issues related to preparation and review of emergency response plans for the proposed Project. Section 3.13 of the EIS addresses reliability and safety issues, including calculations of the probability of a spill from the proposed Project and the potential environmental

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					The methods of cleanup for small leaks as compared to spills, for cleaning up spills affecting groundwater as opposed to surface water, and other information in the emergency response plan is necessary for an adequate analysis of the potential impacts of spills and leaks in the EIS.	impacts associated with spills.
1269	68	Smillie	John	Western Organization of Resource Councils	Failure to make the proposed Emergency Response Plan for this pipeline available with the EIS leaves landowners, emergency personnel, and local officials without any useful information about whether or how TransCanada will assist, equip, train, and fund local first responders to be ready and able to act in the event of accidents threatening the environment or public health.	Consolidated Response RES-1 addresses issues related to preparation and review of emergency response plans for the proposed Project.
1269	69	Smillie	John	Western Organization of Resource Councils	Failure to include this information in the EIS on emergency response plans prevents local citizens from making comments that could improve the plan, such as identifying roads that are impassable during summer storms or winter blizzards and should not be relied on for access to remote spills, or providing information about the number of volunteers and the equipment that may be available along the pipeline route.	Consolidated Response RES-1 addresses issues related to preparation and review of emergency response plans for the proposed Project.
1269	71	Smillie	John	Western Organization of Resource Councils	The EIS failed to analyze the impacts of manufacturing and transporting steel pipe. According to press reports, most of the pipe used in construction of the Keystone I Pipeline was manufactured in and imported from a facility in India. The energy consumption, emission of greenhouse gases, and other impacts of manufacturing sections of steel pipe in India and shipping them to the U.S. should have been compared to the impacts of manufacturing the pipe in the U.S.	Consolidated Response PIP-1 addresses the issue of purchasing pipe for the Project. As noted in that response, Keystone has stated that approximately 75 percent of the pipe for the U.S. portion of the proposed Project would be purchased from North American pipe manufacturing facilities.
1269	75	Smillie	John	Western Organization of Resource Councils	The defects in permitting processes and the draft EIS analysis should be corrected before permits are issued for the Keystone XL pipeline.	As noted in Consolidated Response REG-2, DOS considers the EIS to be in full compliance with the requirements of a NEPA environmental review. Except for the application for a Presidential Permit, all other permit applications will be reviewed by other federal, state, and local agencies.
1269	77	Smillie	John	Western Organization of Resource Councils	If a Presidential Permit or a certificate under Montana's Major Facility Siting Act is issued, such a permit should require: TransCanada must conduct radiological or ultrasonic inspection of all girth welds, and retain records of such inspections for the life of the pipeline.	All welds would be inspected using non-destructive radiographic, ultrasonic, or other PHMSA-approved methods. All aspects of welding, including reporting, would be conducted in compliance with the requirements of 49 CFR 195.228 and PHMSA Special Conditions 4, 5, 6, 12, 18, and 20 (see Appendix U). In addition, Special Condition 55 requires that Keystone maintain all records demonstrating compliance with all regulations and Special Conditions for the useful life of the pipeline.
1269	78	Smillie	John	Western Organization of Resource Councils	If a Presidential Permit or a certificate under Montana's Major Facility Siting Act is issued, such a permit should require: Temperature of tar sands oil or other product in the pipe should not exceed 150 degrees F.	PHMSA Special Condition 15 includes temperature limitations and related requirements similar to those requested by the commenter (see Appendix U). The temperature of the crude oil in the pipeline would be similar to that of crude oil transported by other pipelines
1269	79	Smillie	John	Western Organization of Resource Councils	If a Presidential Permit or a certificate under Montana's Major Facility Siting Act is issued, such a permit should require: All overpressure events must be reported and reports available for public inspection, regardless of whether they led to spills, leaks, or citations or penalties.	If the Project is implemented, Keystone would meet the reporting requirements of Pipeline and Hazardous Materials Safety Administration (PHMSA). PHMSA Special Condition 16 (see Appendix U of the EIS) addresses overpressure issues. The Department of State does not have the authority to impose additional technical or reporting requirements on Keystone. Requests for Project reporting beyond the existing

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
						federal regulatory requirements should be directed to PHMSA.
1269	80	Smillie	John	Western Organization of Resource Councils	If a Presidential Permit or a certificate under Montana's Major Facility Siting Act is issued, such a permit should require: The Emergency Response Plan submitted to DOT must be disclosed to and approved by landowners on and near the pipeline right of way, local emergency responders, and county commissioners or supervisors in each county crossed by the pipeline.	The requirements for emergency response plans are included the regulatory requirements presented in 49 CFR 194 and 49 CFR 195. DOS does not have the regulator authority to revise those regulations. Consolidated Response RES-1 addresses issues related to preparation and review of emergency response plans for the proposed Project.
1269	81	Smillie	John	Western Organization of Resource Councils	If a Presidential Permit or a certificate under Montana's Major Facility Siting Act is issued, such a permit should require: TransCanada should post a bond adequate to ensure reclamation of lands and water resources damaged during construction, and to ensure reclamation of the right of way upon abandonment.	Consolidated Response LIA-2 addresses the issue of bonding for the proposed Project.
1269	82	Smillie	John	Western Organization of Resource Councils	If a Presidential Permit or a certificate under Montana's Major Facility Siting Act is issued, such a permit should require: TransCanada should post and maintain a bond adequate to ensure clean up of a worst-case leak or spill, for as long as the pipeline is operating and through abandonment.	Consolidated Response LIA-2 addresses the issue of bonding for the proposed Project.
1269	83	Smillie	John	Western Organization of Resource Councils	If a Presidential Permit or a certificate under Montana's Major Facility Siting Act is issued, such a permit should require: TransCanada should post bonds adequate to ensure reclamation and/or rebuilding of all roads and bridges affected by construction and damaged by construction equipment traffic with the County Commission of each affected county, and with state highway authorities, as appropriate.	Consolidated Response LIA-2 addresses the issue of bonding for the proposed Project.
1269	86	Smillie	John	Western Organization of Resource Councils	Impact to members of Dakota Resource Council in North Dakota depends on the alternative routes, potential "on-ramps" to transport domestic oil from North Dakota and Montana to the pipeline.	Consolidated Response ALT-3 addresses issues related to transportation of crude oil from the Williston Basin.
1269	86	Smillie	John	Western Organization of Resource Councils	Impact to members of Dakota Resource Council in North Dakota depends on the alternative routes, potential "on-ramps" to transport domestic oil from North Dakota and Montana to the pipeline.	Consolidated Response ALT-1 addresses potential alternative routes and system alternatives, including rail and barge networks. Consolidated Response ALT-3 addresses issues related to transportation of crude oil from the Williston Basin.
76	1	Smith	Mercedes		Tar sands and Texas Tar Sands are dirty oil. Tar sands oil emits three times more greenhouse gases during production than conventional gasoline. About three barrels of water are polluted and dumped in toxic pools (called tailing ponds) for every barrel of oil produced. Tar sands extraction requires strip mining huge tracts of pristine forest. An area the size of Florida is slated for extraction. The project harms the lives and health of indigenous people living downstream from the tar sands operations and has been connected to high rates of rare cancers, renal failure, lupus, and hyperthyroidism in the area.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project. Consolidated Response GHG-1 addresses GHG life-cycle analyses.
76	2	Smith	Mercedes		The Keystone XL Pipeline is dirty for our environment and harmful for us. Producing the oil for this pipeline will emit 11 million tons of carbon dioxide into the atmosphere annually, even before it gets to the U.S. for refining. This equals the annual emissions of 2.7 million cars.	Consolidated Response GHG-1 addresses the greenhouse gas life-cycle analyses presented in the revised EIS. As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
						changed refinery emissions in Gulf Coast refineries.
76	4	Smith	Mercedes		The pipeline will travel more than 1,700 miles through fragile ecosystems, such as the Missouri River.	Consolidated Response ENV-1 addresses concerns related to sensitive and fragile environmental and ecosystems.
76	7	Smith	Mercedes		The company is seeking a special permit to operate at this pressure from the Pipeline and Hazardous Materials Safety Administration.	Keystone has withdrawn its application for a Special Permit as described in Consolidated Response REG-1.
76	8	Smith	Mercedes		By connecting tar sands oil to the Gulf Coast, the Keystone XL will make our nation's fuels dirtier and undermine the clean energy solutions we need to avert catastrophic climate change.	Consolidated Response P&N-1 addresses the need that the Project has been proposed to meet, including information on crude oil supply and demand from an analysis specific to the proposed Project. As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries. Consolidated Response OIL-4 also addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils.
76	9	Smith	Mercedes		We do NOT want this in Texas or anywhere else in the country.	The commenter's opinion is noted.
121	2	Smith	Brent		Right now there are approximately 200 jobs that have been created in Beaumont, TX, as a local engineering, procurement and construction firm works on a Canadian oil sands project. These are primarily engineering and technical jobs. This job creation is good news for United States, Texas and the City of Beaumont.	Consolidated Response ECO-1 addresses potential socioeconomic impacts associated with construction and normal operation of the proposed Project.
121	3	Smith	Brent		North America needs the oil sands and the wealth it creates for our economies. Many pumps, electrical equipment, pipe and other materials are sourced all over the United States to supply the oil sands.	Comment acknowledged.
192	1	Smith	Terry		As with all decisions the final one will be justified whether it's right or wrong. That decision like all the others anymore will be based on money..not on what is the wise prudent thing to do for the safety of this massive underground water supply. Money and shortcuts seem always trump sensibility and safety. You only have to look at all the disasters we are seeing in oil drilling to come to a half sensible conclusion.. Make them go around the aquifer and save both the Sandhills and the Ogallala Aquifer.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. Consolidated Response ALT-1 addresses potential alternative routes, including routes that would avoid much of the Northern High Plains Aquifer system. Issues related to the Sand Hills area are addressed in Consolidated Response ERO-1.
365	1	Smith	T.O.	MT Fish, Wildlife, and Parks	On September 16, 2009 MFWP communicated in writing with Mr. Michael J. Schmaltz of TransCanada and expressed concerns that collection of Sage Grouse information should adhere to standard survey protocols in order to ensure that there is a high level of confidence in the data that is collected. Likewise during a following conference call, MFWP made clear that additional surveys would be need to adequately address the mitigation needs for sage grouse and their habitat. MFWP continues to believe that additional and better quality sage grouse information is needed for the environmental review process, project planning, and post construction monitoring. The DEIS does recognize that	Additional sage-grouse surveys, discussions, route revisions, and additional mitigation negotiations within and between Keystone, U.S. Department of State; Montana Fish Wildlife and Parks; and Montana Department of Environmental Quality have occurred since this comment on the DEIS. Section 3.8.1.2 of the EIS provides further discussion on sage-grouse.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					<p>conservation of intact large tracts of sagebrush habitat are important to the biological needs of a diversity of native species including neo-tropical migrant birds, sage grouse, antelope, and mule deer. The DEIS also recognizes that key sage grouse habitat exists along at least three major portions of the route and disturbance of these areas will likely result in negative impacts to sage grouse populations. Although the timing and proximity of activities in sage grouse habitat will be scheduled to attempt to minimize the effects to sage grouse, there will inevitably be impacts to the population. The impacts that cannot be avoided or mitigated on-site will need to be compensated for through off-site mitigation. The State of Montana and it's citizens will ultimately incur the cost of managing and or recovering sage grouse should the species be listed in the future. As such and given the elevated status and annual review of the sage grouse, TransCanada should include a discussion of off-site mitigation options in the DEIS. MFWP recommends that approval of the project be contingent on the commitment for ensuring establishment of an off-site mitigation compensation trust in order to mitigate for unavoidable loss of sagebrush, to help ensure that sage grouse are not listed under the Federal Endangered Species Act, and to provide conservation for other sagebrush obligate wildlife species. MFWP recommends that the Trust should require a minimum of a 5-acre to 1-acre compensation for disturbance of core sage grouse habitat as defined by the 2010 MFWP core sage grouse habitat layer and a minimum 2-acre to 1-acre compensation for sage grouse lek habitat and other priority sagebrush habitat. Greater compensation is required in core sage grouse areas as a means of maintaining high priority habitats and with the recognition that grouse respond to infrastructure development well beyond the actual footprint of that development. Therefore, MFWP recommends that the department of State and or Montana Department of Environmental Quality (DEQ) require a mitigation trust be established by TransCanada to offer long-term protection and enhancement of sage grouse and sagebrush habitat that is indefinitely disturbed and impacted. MFWP recommends that the exact amount of the Trust be established by conducting a mean regional appraisal of unprotected sage-grouse core and sagebrush habitat and extrapolating the price per acre using the total core and non-core sagebrush habitat that will be permanently impacted by pipeline construction and maintenance. The amount of the Trust would be reduced by using of best technologies during construction that would help minimize the amount of acreage subject to permanent impacts. Such technologies include burying transmission lines in sagebrush habitat or employing brush beating or rolling of sagebrush instead of ground scalping during construction. Similar techniques have been used in the Jonah oil and gas field in Wyoming with good success. The trust could support actions to protect and enhance sagebrush habitats within the Northeast Region of Montana. The Trust could be administered with the benefit of oversight by a Steering Committee. The Steering Committee could establish and use</p>	

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					criteria to ensure that funding issued for acquisition, easement and enhancement projects would have the greatest benefit to sage grouse and sagebrush wildlife obligates. Earmarks should also be established for mitigation monitoring protocols.	
365	3	Smith	T.O.	MT Fish, Wildlife, and Parks	MFWP also recommends that other alternatives be explored and strongly considered for constructing a transmission line adjacent to the MFWP Area 8 Wildlife Management Area. This WMA is heavily used by Montana sportsmen and supports healthy populations of wildlife that would be impacted by the siting of this line. In the interest of protecting Montana's fish and wildlife resources for Montana's current and future sportsmen and outdoor enthusiasts, MFWP would prefer re-locating the line or burying the line.	This electrical distribution line has been re-routed to avoid the Milk River Wildlife Management Area.
365	4	Smith	T.O.	MT Fish, Wildlife, and Parks	Page 3.5-2 Table 3.5-1 - Under the Northern Great Plains there should be mention that intact sections of native prairie exist in MT and especially on land managed by the BLM.	Table 3.5-1 of the EIS was revised for Northwestern Great Plains to state "Native grasslands, largely replaced on level ground by winter and spring wheat and alfalfa, persist in rangeland areas on broken topography and on federal lands."
365	5	Smith	T.O.	MT Fish, Wildlife, and Parks	3.6.1.1 Big Game Animals - White-tailed deer and mule deer and lumped together to describe habitats and habitat use. While some overlap occurs between these two species, most of the habitats and use of these areas are different for each species. It should be noted that mule deer are more vulnerable to habitat changes and human activities.	Habitats used by white-tailed and by mule deer in presented in Table 3.6.1-1. General descriptions of responses to habitat impacts and disturbance are applicable to both species. Section 3.6.1 has been revised to state: "Mule deer are more vulnerable to habitat changes and disturbance than white-tailed deer."
365	6	Smith	T.O.	MT Fish, Wildlife, and Parks	Table 3.6.1-1 Great Plains prairie habitat is not adequately described for many species in this table, including mule deer, white-tailed deer, moose and bobcats.	Descriptions specific to Montana habitats are provided in Appendix I. Additional information relative to the approach for wildlife analyses are presented in Consolidated Response WIL-1.
365	7	Smith	T.O.	MT Fish, Wildlife, and Parks	Table 3.6.2-2 Habitat Types and Fragmentation Issues - fragmentation of Grassland/Prairie would also facilitate predator movements.	Predators would not be expected to have difficulty moving through grassland/prairie habitats; especially short and mixed-grass prairies in Montana. It is therefore not considered likely or identified in the cited review that fragmentation of grassland prairie habitats would contribute significantly to facilitation of predator movements..
365	8	Smith	T.O.	MT Fish, Wildlife, and Parks	Page 3.6-23 & 24 (text) & Table 3.6.2-3 Handling hibernating snakes is mentioned as mitigation; however, this is inadequate by itself. Disturbance to rocky outcroppings should be avoided during the construction phase. If a hibernacula is found within the right-of-way then a construction timing restriction between Oct 1 and May 1 should be used to prevent loss to a large number of individuals.	Appendix I includes the environmental specifications that would apply in Montana should MDEQ issue a certificate of compliance under the MFSA.
365	9	Smith	T.O.	MT Fish, Wildlife, and Parks	Page 3.6-23 & Table 3.6.2-3 For colonial nesting birds in rookeries, such as Great Blue Herons or Double Crested Cormorants disturbance within 500m should be avoided during the breeding season May 1-July 31	Appendix I includes the environmental specifications that would apply in Montana should MDEQ issue a certificate of compliance under the MFSA.
365	10	Smith	T.O.	MT Fish, Wildlife, and Parks	Page 3.6-25 Power line mitigation measures should include burying power lines over short segments when they cross known flight paths of birds, especially adjacent to wetland areas, and near grouse leks.	Appendix I includes the environmental specifications that would apply in Montana should MDEQ issue a certificate of compliance under the MFSA.
365	11	Smith	T.O.	MT Fish, Wildlife, and Parks	Page 3.8-41 Table 3.8.2-1 Prairie dogs Conservation values of black-tailed prairie dogs is not equal. Those in Valley and McCone counties approach the northern and eastern limits of the species distributions. All attempts should	Section 3.8 of the EIS was revised in response to the comment. Comments from Montana Department of Environmental Quality based on observations of previous pipelines indicate that ground squirrels and prairie dogs may

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					be made to avoid construction within prairie dog colonies in these two counties as revegetated right-of-way will not provide suitable forage and unconsolidated soils along the trench will not provide suitable substrate for burrows.	be attracted to or prefer the right-of-way for burrowing.
365	12	Smith	T.O.	MT Fish, Wildlife, and Parks	Page 3.8-57 There is a misleading statement that swift fox in Montana have not been reported within 5 miles of the project route. The project route cuts through the middle of occupied swift fox habitat in Montana and the occurrence of swift fox along the right-of-way north of the Missouri River is high. Swift fox are vulnerable to vehicle collision. Efforts should be made during the construction phase to reduce road speeds, especially during crepuscular hours.	This statement was based on location information from the Montana Natural Heritage Database, removed. Section 3.8.3.1 of the EIS was revised to include the recommended mitigation.
365	13	Smith	T.O.	MT Fish, Wildlife, and Parks	Pages 3.8-71 & 72 Mountain Plovers Mountain plovers are known to occur in suitable habitats, not associated with prairie dog towns. All prairie dog colonies that cannot be avoided should be surveyed for Mountain Plovers following USFWS survey guidelines. If Mountain Plovers are present, NSO between April 15 and Aug 1. Additional suitable Mountain Plover habitat likely exists along the right-of-way not associated with prairie dogs. Other habitats that support nesting mountain plovers in Montana that currently are not associated with prairie dogs are flat barren areas that are underlain with bentonite (Valley and Carbon Counties), gravel benches, ridges, and alluvial fans that are heavily grazed (Golden Valley, Musselshell, Meaghan, Judith Basin, Fergus, Wheatland, Yellowstone, Rosebud, Big Horn, Carter, and Treasure Counties).	Section 3.8 of the EIS was revised to include a description of additional suitable habitat for the mountain plover. This species is currently a proposed threatened species under the Endangered Species Act and the EIS was revised to provide information on this species in Section 3.8.1.2.
365	14	Smith	T.O.	MT Fish, Wildlife, and Parks	It should be emphasized throughout this document that new power line construction will almost certainly have the most long-term impacts to wildlife, thus it is crucial that native prairie habitats be avoided and especially large intact blocks of sagebrush grassland habitats.	Section 3.6.5 of the EIS addresses the potential impacts of the electrical distribution lines on wildlife species. Those facilities would be connected actions and are not part of the proposed action. In Montana, the Montana Department of Environmental Quality would be responsible for permitting the distribution lines, including consideration of alternative routes. In other states, the utilities proposing the distribution lines would have to obtain the necessary federal, state, and local permits, authorizations, and approvals for implementation of the distribution line projects.
365	18	Smith	T.O.	MT Fish, Wildlife, and Parks	All crossing activity should be timed such that activities do not influence migration of the diverse warm water species assemblage of prairie streams and rivers. If significant dewatering will be used during crossing at specific locations, mitigation of these impacts will need to be negotiated prior to permitting of crossing.	Consolidated Response WAT-1 and Section 3.3.2 address potential water quality impacts. Section 3.7.3 address potential impacts to fisheries resources. As noted in Section 2.3.3.2, dewatering methods would not be used for water crossings. Flows would be maintained by using either the flowing open-cut method, diverting flows from the construction area, or using the horizontal directional drilling method.
365	19	Smith	T.O.	MT Fish, Wildlife, and Parks	Open cut crossings at intermittent streams should be completed during low flow or no flow periods. Trenching during periods of high runoff will not be permitted. Reclamation of open trench crossings should be recovered to the original stream bed cross-sectional area and longitudinal gradient.	Consolidated Response WAT-1 and Section 3.3.2 address potential water quality impacts.
488	1	Smith	Terra	University of Oregon	Please don't keep investing in dirty energy!	Consolidated Response P&N-5 addresses issues related to investments in other technologies.
516	1	Smith	Julie		This is a very bad idea. There is no assurance the Ogallala	Issues related to the Northern High Plains Aquifer system are

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					Aquifer will be protected. Surely the Gulf oil catastrophe and the Salt Lake City oil spill are wake-up calls.	addressed in Consolidated Responses AQF-1 through AQF-4. As described in Consolidated Response GLF-1, the risks associated with the proposed Project are substantially different from those associated with the BP Deepwater Horizon Project.
607	1	Smith	Elaine		This pipeline should not be anywhere near the Ogallala Aquifer. The aquifer is too valuable a resource to risk in any way.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
607	2	Smith	Elaine		We have seen too many examples, including the recent disaster in the Gulf of Mexico, to trust the judgment of any oil company to accurately assess the possible risks. This company says "the chance of a spill occurring is very low". That is not good enough. We have seen with other pipelines just how easy spills can occur & how lax the detection efforts of oil companies can be. Leave the Nebraska Sand Hills out of the path of this pipeline.	As described in Consolidated Response GLF-1, the risks and cleanup requirements associated with the proposed Project are substantially different from those associated with the BP Deepwater Horizon Project. Consolidated Response ALT-1 addresses potential alternative routes, including routes that would avoid much of the Northern High Plains Aquifer System and the Sand Hills area. Consolidated Response OIL-1 addresses the likelihood of spills from the Project.
745	1	Smith	Jonathan		I oppose the permit...Government responsible to the public interest would have not issued the permit in the first place.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information on current and future production. As noted in that Consolidated Response, without the proposed Project, oil sands development would continue at or above the current level until at least 2020, with or without the proposed Project.
745	3	Smith	Jonathan		...the permit...encourages a market for oil from unconventional sources that highly pollutes our air ...	Consolidated Response P&N-1 addresses the need that the Project has been proposed to meet. As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries.
891	1	Smith	Robert		I'm opposed to this project. If there wasn't an effective plan in place to cope with deep water drilling disasters why would we proceed to threaten the groundwater of the Ogallala Aquifer with a pipeline?	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. As described in Consolidated Response GLF-1, the risks associated with the proposed Project are substantially different from those associated with the BP Deepwater Horizon Project.
1028	1	Smith	Paul	Progressive Swine Technology	Why build the pipeline that cannot be defended against attack?	Consolidated Response TER-1 addresses potential terrorism associated with the proposed Project.
1028	2	Smith	Paul	Progressive Swine Technology	Build a refinery where the oil is coming from then ship the finished product.	Consolidated Response P&N-8 addresses issues related to shipping Canadian crude oil to refineries that are closer to the source of oil.
1549	17	Smith	Stan		My concern is the fact that nobody knew this meeting was going on. I had no information of it.	Consolidated Response INT-1 addresses concerns related to the Notice of Intent (NOI) to prepare an EIS for the proposed Project. Consolidated Response CMT-2 addresses issues related to comment meetings on the draft EIS and requests for additional public involvement.
1028	2	Smith	Paul	Progressive Swine Technology	Build a refinery where the oil is coming from then ship the finished product.	Consolidated Response P&N-8 addresses issues related to shipping Canadian crude oil to refineries that are closer to the source of oil.
1549	17	Smith	Stan		My concern is the fact that nobody knew this meeting was going on. I had no information of it.	Consolidated Response INT-1 addresses concerns related to the Notice of Intent (NOI) to prepare an EIS for the proposed Project. Consolidated Response CMT-3 addresses the level of information provided to the public regarding the proposed Project and the draft EIS scoping meeting locations and

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
						schedules.
505	1	Smoot	Karyn	University of Oregon	I'm writing to express my profound disappointment in the actions of TransCanada in conjunction with the US Department of State. The Keystone XL Pipeline Project is an outstanding example of the hubris that policy-makers and energy companies approach their work with. Our country's excessive energy needs do not in any way justify the seizure of homes nor the destruction of thriving natural systems. For a country that claims to value its natural and human resources, we've proven to not only extract beyond our means, but also continue the oppression of working-class and minority peoples in the process. For environmentalists and land-owners alike, this pipeline would destroy any remaining faith in the power of the federal government to protect its people and the land we all depend on.	Consolidated Response ENR-1 provides information on the Department of State's environmental review process, the National Interest Determination process, and the need to complete those reviews before approving or denying the Presidential permit for the proposed Project.
926	1	Snider	Don	Kansas Wildlife Federation	The Kansas Wildlife Federation (KWF) is opposed to the State Department's issuance of any permit that will allow the construction of the 2,000-mile long Keystone XL tar sands pipeline that will cross Kansas.	The proposed Project would use the existing Keystone Cushing Extension portion of the route in Kansas. There would be no new pipeline construction in Kansas associated with the proposed Project.
926	3	Snider	Don	Kansas Wildlife Federation	KWF is always concerned about water resources and this pipeline crosses several important rivers and streams in the state. In Clay County, KS, the pipeline crosses the Milford Wildlife Area, which is a Corps of Engineers property managed by the Kansas Department of Wildlife and Parks (KDWP). There are newly constructed wetlands that could be impacted by construction or an accident.	The Keystone XL pipeline does not cross the Milford Wildlife Area and would not impact any newly constructed wetlands within the Milford Wildlife Area. The only components of the Keystone XL pipeline in Kansas are the addition of two proposed pump stations along the existing Cushing Extension of the Keystone pipeline.
926	4	Snider	Don	Kansas Wildlife Federation	The pipeline appears to run above the upper end of Lake Herrington, which is a nice community fishing lake in Dickinson County, KS. An accident during construction or operation of the pipeline could affect this recently renovated lake.	Section 3.13 of the EIS addresses reliability and safety issues, including calculations of the probability of a spill from the proposed Project and the potential environmental impacts associated with spills.
926	5	Snider	Don	Kansas Wildlife Federation	The pipeline will cross critically designated habitat for the federally threatened Topeka Shiner, <i>Notropis topeka</i> , on Cary Creek and West Branch of Lyon Creek and their tributaries, KS. The pipeline crossing of the Smoky Hill River is upstream of critically designated habitat for the federally threatened Piping Plover, <i>Charadrius melodus</i> , the federally endangered Least Tern, <i>Sterna antillarum</i> , and the threatened Sturgeon Chub, <i>Macrhybopsis gelida</i> . An accident during construction or operation of the pipeline can potentially affect these species.	The commenter is referring to the existing Cushing Extension of the Keystone Oil Pipeline System. As a result there would not be construction impacts at the stream crossings referred to in the comment. The only proposed Project components in Kansas are two additional pump stations along the existing Cushing Extension Segment of the Keystone Pipeline as described in Section 3.8.1.5. Section 3.13 of the EIS addresses reliability and safety issues, including calculations of the probability of a spill from the proposed Project and the potential environmental impacts associated with spills, including impacts to surface water quality and fisheries resources.
926	6	Snider	Don	Kansas Wildlife Federation	The pipeline crosses the Cottonwood River below Marion Reservoir in Marion County, KS. The pipeline may affect critically designated habitat for the federally threatened Topeka Shiner, <i>Notropis topeka</i> , on Mud Creek and Middle Creek and their tributaries. The pipeline crossing of the Cottonwood River is upstream of critically designated habitat for the federally threatened Neosho Madtom, <i>Noturus placidus</i> , the Kansas endangered Neosho Musket Mussel, <i>Lampsilis rafinesqueana</i> , and the Kansas threatened Ouachita Kidneyshell Mussel, <i>Ptychobranchus occidentalis</i> . An accident	The commenter is referring to the existing Cushing Extension of the Keystone Oil Pipeline System. As a result there would not be construction impacts at the stream crossings referred to in the comment. The only proposed Project components in Kansas are two additional pump stations along the existing Cushing Extension Segment of the Keystone Pipeline as described in Section 3.8.1.5. Section 3.13 of the EIS addresses reliability and safety issues, including calculations of the probability of a spill from the proposed Project and the potential environmental impacts associated with spills,

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					during construction or operation of the pipeline can potentially affect these species.	including impacts to surface water quality and fisheries resources.
926	7	Snider	Don	Kansas Wildlife Federation	The pipeline has raised economic concerns.	Consolidated Response ECO-1 addresses potential socioeconomic impacts associated with construction and normal operation of the proposed Project.
926	8	Snider	Don	Kansas Wildlife Federation	The pipeline runs along the Walnut and Whitewater Rivers and their tributaries in Butler County, potentially exposing them to contamination during a leak or accident. The Walnut River is a water supply source for the cities of Winfield, Arkansas City and several smaller communities along the way, as is the Whitewater River.	The commenter is referring to the existing Cushing Extension of the Keystone Oil Pipeline System. Section 3.13 of the EIS addresses reliability and safety issues, including calculations of the probability of a spill from the proposed Project and the potential environmental impacts associated with spills that reach surface or groundwater used for water sources by individuals, communities, industry, and businesses.
926	9	Snider	Don	Kansas Wildlife Federation	There are not adequate safety measures in place to protect the Ogallala Aquifer, the largest in the U.S. and the Lower Cretaceous aquifer in Clay and Washington Counties.	Consolidated Response SAF-1 describes the regulatory requirements and Project-specific Special Conditions that Keystone would comply with to construct, operate, maintain, inspect, and monitor the proposed Project. It also describes the monitoring, inspections, and reviews of the proposed Project that the Pipeline and Hazardous Materials Safety Administration would conduct to ensure compliance with those regulatory requirements. Concerns regarding potential risk to Northern High Plains Aquifer system and other aquifer systems are addressed in AQF-1.
926	10	Snider	Don	Kansas Wildlife Federation	The pipeline will cross the Arkansas River above the KAW Wildlife Area in Cowley County north of Arkansas City, KS. The Arkansas River is designated critical habitat for the federally threatened Arkansas River Shiner, <i>Notropis girardi</i> , the Kansas endangered Arkansas River Speckled Chub, <i>Macrhybopsis tetranema</i> , and the Kansas endangered Silver Chub, <i>Macrhybopsis storerian</i> . In addition the pipeline may cross perennial spring-fed reaches of named and unnamed streams south of the Arkansas River in Cowley County is designated critical habitat for the Kansas threatened Arkansas Darter, <i>Etheostoma cragini</i> .	The commenter is referring to the existing Cushing Extension of the Keystone Oil Pipeline System. As a result there would not be construction impacts at the stream crossings referred to in the comment. The only proposed Project components in Kansas are two additional pump stations along the existing Cushing Extension Segment of the Keystone Pipeline as described in Section 3.8.1.5. Section 3.13 of the EIS addresses reliability and safety issues, including calculations of the probability of a spill from the proposed Project and the potential environmental impacts associated with spills, including impacts to surface water quality and fisheries resources.
926	12	Snider	Don	Kansas Wildlife Federation	Waterfowl migration could be impacted at Milford Reservoir south of Green in Clay County and at Marion Reservoir in Marion County by the pipeline construction, as well as across the state of Kansas due to diminished waterfowl production in the boreal forest.	The proposed Project does not include pipeline construction through Clay and Marion counties in Kansas. Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project.
926	14	Snider	Don	Kansas Wildlife Federation	Keystone XL would lock the U.S. into a dependence on this dirty fuel and drive a massive expansion of the tar sands operations in Alberta, Canada. If expansion of tar sands goes unchecked, it will be impossible to reach our goals to reduce global warming pollution. In his 2006 State of the Union address, President George W. Bush said, "America is addicted to oil". The former Texas oilman acknowledged an imperative as important as any we can imagine for the nation's future: breaking that crude addiction. It is time to apply every ounce of American ingenuity to finding a technological path to a future that relies far less on fossil fuels and far more on sources of fuel that are renewable, sustainable, and clean. We urge the State Department to aid in breaking that addiction	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including an assessment of oil sands development with and without the proposed Project. Consolidated Responses ENR-1 and P&N-9 provide information on the DOS environmental review process, the National Interest Determination process, and the need to complete those reviews before approving or denying the Presidential permit for the proposed Project.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					and deny the permit for this massive 2,000-mile-long risky energy venture.	
1481	1	Snyder	Mark		I am writing to ask you not to approve the permits for the Keystone XL tar sands oil pipeline. Tar sands oil is among the dirtiest fuels on the planet, emitting 20% more global warming pollution than conventional oil and contributing to deforestation and causing severe air and water contamination.	Consolidated Response GHG-1 addresses GHG life-cycle analyses. Consolidated Response OIL-4 addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils. Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project.
1481	2	Snyder	Mark		Additionally, estimates for continued rising oil demand that supposedly justify this project are inaccurate. All major forecasts show US oil demand has peaked and policy efforts such as increasing vehicle mileage standards and encouraging transportation alternatives will only help US oil demand continue to fall. This project is not only incredibly damaging but completely unnecessary. Finally, continued reliance on oil, regardless of its source is not in our national security interests oil is a global commodity and we need to focus on continuing and we need to focus on continuing to reduce our reliance on oil and not contribute to propping up oil prices with our use of tar sands oil. Please deny the Keystone XL pipeline permit.	Consolidated Response P&N-1 addresses the need for the proposed Project. As noted in that response, the Project has been proposed to meet the heavy crude oil needs of refineries in the Gulf Coast area, not for the U.S. in general. Consolidated Response ALT-2 addresses the use of alternative technologies, alternative energy sources, and conservation of energy. Section 4.0 addresses alternatives to the proposed project including alternative energy sources and energy conservation (see Section 4.1). Consolidated Response P&N-9 addresses the National Interest Determination process.
1410	1	Sobeck	Randy	Local 400 Int'l Union of Operating Engineers	The International Union of Operating Engineers, Local #400, strongly supports TransCanada's Keystone XL crude oil pipeline project and urges the department to grant a permit for the pipeline... Our union strongly supports the construction of the Keystone XL pipeline... We encourage the department to issue the necessary permits without delay and in a timely manner.	Comment acknowledged.
1410	2	Sobeck	Randy	Local 400 Int'l Union of Operating Engineers	This project is important to Montana and the entire country. In Montana it will help stabilize our economy. The project will provide around 800 jobs during construction and many good paying permanent jobs when operational. In addition it will provide an important and much needed tax base for the rural counties it crosses. The Keystone project could also provide on ramp opportunities for the expanding domestic supplies of crude oil in Montana and North Dakota. We should continue to expand America's access to safe, affordable energy to help ensure improved domestic and global energy security and stable prices for consumers.	Consolidated Response ECO-1 addresses potential socioeconomic impacts, and Consolidated Response TAX-1 addresses concerns regarding taxes.
1410	4	Sobeck	Randy	Local 400 Int'l Union of Operating Engineers	We have trained workers that are ready to go to work and make sure this project is completed in the safest and most cost effective way possible.	Comment acknowledged.
1355	1	Solberg	Polly&Edward		I'm very tired no I'm sick of professional protesters - those who'll drive 300 plus miles across the state or several states protesting something that does not even pertain to them. Believing in the lie of global warming, preventing jobs in an area from developing. We for two would like to see Keystone XL develop the Pipeline Project.	The commenter's opinion is noted.
691	1	Soleil	Natalie	Northeast	I find it appalling that an environmental risk to our rapidly	Issues related to the Northern High Plains Aquifer system are

				Organic Farmer's Association	depleting water supply in the Midwest is being fast-tracked. Is this a deliberate attempt to accelerate the privatization of water in the U.S. by default? The next domination won't be fuel; it will be water, so maybe we're priming Canada for its time as a world leader. Do not let this pipeline happen at all. Think of your grandchildren.	addressed in Consolidated Responses AQF-1 through AQF-4.
776	1	Sorensen	Thomas		We don't want this here, or in this State... It's stupid. Just go away!	The commenter's opinion is noted.
776	2	Sorensen	Thomas		...Why should we have to take the chance of you polluting our water supplies...	Issues related to the Northern High Plains Aquifer System are addressed in Consolidated Responses AQF-1 through AQF-4. Consolidated Response AQF-3 provides information on hypothetical spills from the Project over two areas of the Northern High Plains Aquifer System and also addresses response actions.
781	2	Soriente	Susan		...Do not allow the Keystone xl pipeline to be laid across Nebraska there is too much to lose now and for our future...do not give them permission to do it.	Consolidated Response ALT-1 addresses potential alternative routes, including routes that would avoid much of the Northern High Plains Aquifer system and the Sand Hills area.
781	3	Soriente	Susan		A spill could contaminate the Midwest's Ogallala Aquifer water source for decades or forever.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
781	4	Soriente	Susan		...There is not a safe way to lay the pipeline...	Keystone has withdrawn its application for a Special Permit as described in Consolidated Response REG-1. As described in Consolidated Response SAF-1, the Pipeline and Hazardous Materials Safety Administration (PHMSA) has regulatory requirements that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project in a manner that protects the health and safety of the public and the environment. In addition, PHMSA developed 57 Project-specific Special Conditions that Keystone has agreed to implement. Incorporation of those conditions would result in a Project that would have a degree of safety over any other typically constructed domestic oil pipeline system under current code and a degree of safety along the entire length of the pipeline system similar to that which is required in HCAs as defined in 49 CFR 195.450.
406	2	Sorrell	Pamela		I am very much against allowing this expansion of the Keystone Pipeline. It would be reckless to let this thin-walled pipeline cross the very porous Sandhills region of Nebraska and our precious Ogallala Aquifer which will only grow more valuable when clean water becomes more scarce. We must protect precious resources like this. If it decided that a second pipeline must be built, it must not cross the aquifer! How many times do we have to see gas and oil company blunders before we wake up?	The pipeline would meet all safety standards. Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. Issues related to the Sand Hills area are addressed in Consolidated Response ERO-1. Consolidated Response ALT-1 addresses potential alternative routes, including routes that would avoid much of the Northern High Plains Aquifer system and the Sand Hills area. Keystone has withdrawn its application for a Special Permit as described in Consolidated Response REG-1. Keystone has withdrawn its application for a Special Permit as described in Consolidated Response REG-1. As described in Consolidated Response SAF-1, the Pipeline and Hazardous Materials Safety Administration (PHMSA) has regulatory requirements that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project in a manner that protects the health and safety of the public and the environment. In addition, PHMSA developed 57 Project-specific Special Conditions that Keystone has agreed to implement.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
406	3	Sorrell	Pamela		Our precious Ogallala Aquifer which will only grow more valuable when clean water becomes more scarce. We must protect precious resources like this. If it decided that a second pipeline must be built, it must not cross the aquifer! How many times do we have to see gas and oil company blunders before we wake up?	Consolidated Response ALT-1 addresses potential alternative routes, including routes that would avoid much of the Northern High Plains Aquifer system.
677	2	Soucek	Russell		I am also concerned that this type of oil, when burned, releases more green house carbon dioxide gas than, say, gulf oil. I have read the March 2009 article in National Geographic about the oil sands and am troubled by the fact that Canada allows such an environmentally damaging mining processes.	As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries. Consolidated Response OIL-4 addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils. Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project.
677	3	Soucek	Russell		I am concerned that they expect the U.S. government to be as unconcerned and so have proposed the pipeline through the Ogallala Aquifer. This groundwater source is very valuable and should not be placed at risk due to a leak from this pipeline. The groundwater rises to the surface in this environmentally fragile area at times and I am concerned that the pipeline, at a depth of four feet, will be submerged in the groundwater lending itself to corrosion and leakage.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. As described in Consolidated Response GLF-1, the risks associated with the proposed Project are substantially different from those associated with the BP Deepwater Horizon Project.
677	4	Soucek	Russell		Also the sand in this area is moved by the winds and I am concerned that over time the pipeline will be exposed at the surface.	Issues related to the Sand Hills area are addressed in Consolidated Response ERO-1.
677	6	Soucek	Russell		It is becoming less safe to extract these materials as seen in the deaths in the West Virginia coal mining accident last spring and the 11 deaths in the recent oil platform explosion in the gulf. The best place for fossil fuels is to leave them in the ground.	As described in Consolidated Response GLF-1, the risks associated with the proposed Project are substantially different from those associated with the BP Deepwater Horizon Project.
935	1	Spain	Steve		Please do NOT permit the TransCanada pipeline to be built.	Comment acknowledged.
935	2	Spain	Steve		Please replace the current pipeline at the same location with far better/safer pipeline made to last 500 years or more with automatic shut off valves every mile if an earthquake, weather system, or other (heaven forbid: a terrorist attack) causes damage.	The Department of State is reviewing the application for the Keystone XL proposed Project and is not addressing relocation of previously approved proposed Projects. As described in Consolidated Response SAF-1, the Pipeline and Hazardous Materials Safety Administration (PHMSA) has regulatory requirements that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project. In addition, PHMSA developed 57 proposed Project-specific Special Conditions that Keystone has agreed to implement. Special Condition 22 requires that valves be no more than 20 miles apart. Issues related to the life of the Project are presented in Consolidated Response DEC-1. Consolidated Response TER-1 addresses potential terrorism associated with the proposed Project.
935	3	Spain	Steve		PLEASE DEVELOP REAL CLEANUP PROCEDURES JUST IN CASE A DISASTER HAPPENS. WE CAN NOT ALLOW OUR UNDERGROUND WATER TO BE CONTAMINATED.	Consolidated Response RES-1 addresses issues related to preparation and review of the Emergency Response Plan for the proposed Project. As noted in the response, the plan

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					THIS MUST BE CLOSELY MONITORED BY THE GOVERNMENT, NOT BY THE OIL COMPANIES.	would be reviewed by the Pipeline and Hazardous Materials Safety Administration and the Incident Commander, who in most cases is from the U.S. Environmental Protection Agency, would be responsible for ensuring that the procedures of the plan are properly implemented if a spill occurs.
935	4	Spain	Steve		THE PIPELINE SHOULD BE OWNED AND OPERATED BY THE GOVERNMENT AND THE OIL THAT PASSES THROUGH IT SHOULD BE REGULATED AND THE COMPANIES THAT SEND THE OIL THROUGH THE PIPELINES SHOULD BE CHARGED A FEE BY THE GOVERNMENT FOR MAINTAINING THE PIPELINE AND TO PAY FOR ITS COST.	The proposed Project has been proposed by a private company, and the Department of State (DOS) is reviewing the application for a Presidential permit for the proposed Project. There is no legal mechanism for the government to take over the proposed Project. Keystone would have to comply with the tariffs on the oil that would be transported by the proposed Project, including terms and conditions of transport, as mandated by the Federal Energy Regulatory Commission.
193	1	Spangler	Larry		As a land owner in the general area of this proposed pipeline I am completely dumbfounded that this is even being considered. Trans Canada says it would be cost prohibitive to move it away from the Ogallala Reservoir. Of course it would, because this is some of the cheapest ground in Nebraska and I might say the most fragile, and not far off in the distant future this ground and its vast fresh water supply will become very, very, valuable. I am not concerned about TransCanada's bottom line and neither should anybody else. What I am concerned with is that an oil spill on the sand above or in the largest freshwater reservoir in the world. We already have on e disaster in our southern waters why risk another disaster when you can move this farther east onto more stable ground and away from the Ogallala reservoir. I urge you to look at the current flooding that is currently happening in this area and evaluate this a little more. To me it's all about TransCanada's money. Let's see how that plays out in the Gulf for B.P. You can't use dollar bills to soak up that oil.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. Consolidated Response ALT-1 addresses potential alternative routes, including routes that would avoid much of the Northern High Plains Aquifer system. As described in Consolidated Response GLF-1, the risks associated with the proposed Project are substantially different from those associated with the BP Deepwater Horizon Project.
1472	1	Speaks	Larry	Southeastern Electric Cooperative, Inc	As officials from the State of Oklahoma, we strongly encourage the U.S. Department of State to approve an energy infrastructure project that not only will strengthen long term energy security in the United States, but also will provide a powerful private sector economic stimulus to the mostly rural communities along the pipeline route during its construction at a time when our economy continues to struggle.	Comment acknowledged.
1472	2	Speaks	Larry	Southeastern Electric Cooperative, Inc	As we understand it, Keystone XL will create more than 13,000 high-wage construction and manufacturing jobs during the project's 2011-2012 construction schedule. Many of those jobs will be created in rural and in our districts, where too many of our residents continue to find it difficult to find good jobs. With Keystone XL, they will have an opportunity to work on the project or for businesses that provide supplies, goods and services for its construction and operation.	Consolidated Response ECO-1 and Section 3.10.2.2 of the EIS address potential socioeconomic impacts.
1472	3	Speaks	Larry	Southeastern Electric Cooperative, Inc	In addition to the jobs Keystone XL will create, the project will generate substantial economic benefits for the United States and in states and communities along the proposed route. Like our counties, in many cases these are areas where economic performance has stagnated or is shrinking. It is our understanding that TransCanada commissioned a study to measure the project's economic stimulus to the U.S. and the states along the route. The study found that in the U.S.,	Consolidated Response ECO-1 addresses potential socioeconomic impacts, and Consolidated Response TAX-1 addresses concerns regarding taxes.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					Keystone XL would generate \$20.9 billion in total expenditures, \$9.6 billion in output (gross product), personal income of \$6.5 billion and 118,935 person years of employment (jobs). In addition, the report concluded that during construction, Keystone XL would generate \$486.36 million in tax revenue for state governments along the route and \$99.1 million for local taxing entities where the pipeline is located. In Oklahoma, the study found Keystone XL expenditures during construction would total \$1.2 billion and generate an economic gross product of nearly \$1.1 billion. Keystone XL construction also would generate more than \$7.7 million in tax revenue for local government and \$31.4 million for state government.	
1472	4	Speaks	Larry	Southeastern Electric Cooperative, Inc	Furthermore, the delivery of secure and affordable supplies of Canadian energy to American consumers would have minimal impacts on the environment. This is avital project that will strengthen U.S. energy security and reduce our dependenceon unstable foreign sources of oil. Canada is already the largest supplier of energy to the United States, meeting 12 percent of current U.S. petroleum-consumption needs and representing 18 percent of U.S. petroleum imports. Canadian oil sands production is a growing source of reliable crude oil supply for the United States. Canada's 175 billion barrels of oil reserves is second only to Saudi Arabia. Oil sands account for morethan 97 percent of that vast reserve: 170 billion barrels of oil with the potential for more than 100 years of production.Canada has more than 50 percent of the non-state controlled reserves in the world. Long-term supply is critical in a world where supply risks are growing, whether due to declining production from a once-reliable source, an unstable geopolitical climate, or uncertainties in key oil producing regions. Construction of additional pipeline facilities such as the Keystone XL Project, to transport oil sands production to the vitally important Gulf Coast area is critical. These refineries also have excess capacity as a result of reduced production from Mexico, where heavy oil production is in steep decline, and Venezuela, which is moving to other markets. Turning to Canada for a secure oil supply is a logical step.	Comment acknowledged.
1472	5	Speaks	Larry	Southeastern Electric Cooperative, Inc	We enthusiastically support the Keystone XL Pipeline Project and encourage the Department of State to confirm the findings of the Draft Environmental Impact Statement, which found that the proposed Keystone XL Pipeline would have "limited adverse environmental impact during construction and operation."We look forward to the issuance of a Final Environmental Impact Statement followed by a Presidential Permit that allows the construction of Keystone XL and enables our districts, the State of Oklahoma, and the United States to collect the substantial economic benefits Keystone XL would create.	Comment acknowledged.
1556	39	Spears	Patrick	Inter Tribal Council on Utiity Policy	I'm here in support of the protection of the land and the water and the wildlife, the people and cultural resources also and some of the remains of our ancestors that are buried clear across this great plains, you know, and where this pipeline is	Consolidated Response CUL-1 and Section 3.11.1.2 of the EIS address properties of Religious and Cultural Significance to Indian tribes, including Traditional Cultural Properties.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					going to be running.... I have concerns also about the source of tar sands oil and the impact on the Cree Nation and all the wildlife up there and things that are happening already and the destruction it's terrible.	A Programmatic Agreement (PA) has been developed for the Project under Section 106 of the National Historic Preservation Act. The Programmatic Agreement includes a process for notifying consulting parties of unanticipated discoveries of significant material or remains during Project construction. Consolidated Response CAN -1 addresses issues related to development of the Canadian oil sands projects.
137	1	Speer	Greg		The intended route for the XL pipeline is through some of the least productive land in Montana. This pipeline is needed to get North American oil to the refineries. The one lady said the oil from Canada was dirty oil but that should not make difference on the pipeline being built or not. I am very much in favor of this project.	The commenter's opinion is noted.
137	2	Speer	Greg		It is time for Montana to get a project like this going for some growth.	The commenter's opinion is noted.
1081	1	Speidell	Joy		I believe this pipe line must be relocated far from the Ogallala Aquifer to protect the water supply thru the mid western tier of states.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. Consolidated Response ALT-1 addresses potential alternative routes, including routes that would avoid much of the Northern High Plains Aquifer system.
1151	1	Spellman	Warren		A oil pipe line across the Ogallala Aquifer should not be allowed	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
1151	2	Spellman	Warren		A oil pipe line across the Ogallala Aquifer should not be allowed for these reasons: (1)The Keystone XL company has not demonstrated that it has enough proven safety features onhand. (2) An oil leak of only an hours duration could do immeasurable harm over vast areas of central Nebraska and close off drinking supplies in many communities. (3)The protection of the precious Ogallala Aquifer is part of Nebraska's responsibility to all eight states served by the Aquifer.We would derelict in our responsibilities to let an oilpipe line with a yet unproven saftey record go across our state	As described in Consolidated Response SAF-1, the Pipeline and Hazardous Materials Safety Administration (PHMSA) has regulatory requirements that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project in a manner that protects the health and safety of the public and the environment. In addition, PHMSA developed 57 Project-specific Special Conditions that Keystone has agreed to implement. Incorporation of those conditions would result in a Project that would have a degree of safety over any other typically constructed domestic oil pipeline system under current code and a degree of safety along the entire length of the pipeline system similar to that which is required in HCAs as defined in 49 CFR 195.450. Section 3.13 of the EIS addresses reliability and safety issues, including calculations of the probability of a spill from the Project and the potential environmental impacts associated with spills, including discussions of surface water and groundwater. Issues related to the High Plains Aquifer System are addressed in Consolidated Responses AQF-1 through AQF-4. Consolidated Response OIL-3 addresses issues related to small leaks in the pipeline. Consolidated Response RES-1 addresses issues related to preparation and review of the emergency response plan for the proposed Project.
1151	3	Spellman	Warren		[A oil pipe line across the Ogallala Aquifer should not be allowed for these reasons. An oil leak of only an hours duration could do immeasurable harm over vast areas of	Section 3.13 of the EIS addresses reliability and safety issues, including calculations of the probability of a spill from the Project and the potential environmental impacts associated

					central Nebraska and close off drinking supplies in many communities.	with spills, including discussions of surface water and groundwater. Consolidated Response RES-1 addresses issues related to preparation and review of the Emergency Consolidated Response Plan for the proposed Project.
1151	4	Spellman	Warren		A oil pipe line across the Ogallala Aquifer should not be allowed for these reasons: (1)The Keystone XL company has not demonstrated that it has enough proven safety features on hand. (2) An oil leak of only an hours duration could do immeasurable harm over vast areas of central Nebraska and close off drinking supplies in many communities. (3)The protection of the precious Ogallala Aquifer is part of Nebraska's responsibility to all eight states served by the Aquifer. We would derelict in our responsibly to let an oil pipe line with a yet unproven safety record go across our state.	Consolidated Response SAF-1 describes the regulatory requirements that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project in a manner that protects the health and safety of the public and the environment. Issues related to the Northern High Plains Aquifer System are addressed in Consolidated Responses AQF-1 through AQF-4. Consolidated Response AQF-3 provides information on hypothetical spills from the Project over two areas of the Northern High Plains Aquifer System and also addresses response actions. Section 3.13 of the EIS addresses reliability and safety issues, including calculations of the probability of a spill from the proposed Project and the potential environmental impacts associated with spills, including discussions of surface water and groundwater impacts (see Sections 3.13.5.6 and 3.13.6). Consolidated Response RES-1 addresses issues related to preparation of an Emergency Response Plan for the proposed Project.
783	2	Spence	Patricia		...The Sandhills environment is just as fragile as the gulf was. Do not chance the ruination of the Sandhills.	Identification of sensitive environments crossed by the proposed Project is discussed in Consolidated Response ENV-1 and ENV-3. Additional discussions of comparison with the Gulf Oil spill are provided in Consolidated Response GLF-1.
11	1	Spivy	Dan		The information you sent to me about the Keystone Project is appreciated. The pipeline could be an Environmental disaster. The quantity of oil under high pressure in pipes that are too thin could cause an oil spill that would be monumental.	Keystone has withdrawn it request for a Special Permit as described in Consolidated Response REG-1. Consolidated Response SAF-1 describes the regulatory requirements that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project in a manner that protects the health and safety of the public and the environment. This includes the 57 Project-specific Special Conditions (see Appendix U of the EIS) developed by PHMSA and agreed to by Keystone. Incorporation of those conditions would result in a proposed Project that would have a degree of safety over any other typically constructed domestic oil pipeline system under current code and a degree of safety along the entire length of the pipeline system similar to that which is required in high consequence areas (HCAs) as defined in 49 CFR 195.450.
11	2	Spivy	Dan		The erosion that this pipeline will cause on my property also will be significant and harm the property.	Issues related to the potential for erosion adjacent to streambanks and private land area are addressed in Consolidated Response ERO-2.
11	3	Spivy	Dan		This project will absolutely ruin my land. Presently it is being used to grow pine trees in a plantation that is 14 years old. These immature trees will have to be cut and removed. In East Texas there will be approximately 1600 acres of forest acres that will be lost due to this project. This will have a significant environmental impact.	Keystone would compensate landowners for the loss of trees; and will leave all cut timber with the landowner, if desired, for the landowner's use or disposition. Trees would be allowed to naturally revegetate within the 110-foot-wide right-of-way, except within 10 to 15 feet of the pipeline. An estimated 1,840 acres of upland forest and 281 acres of forested wetlands would be affected by construction, of which 937 acres would be within maintained rights-of-way where trees would not be

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
						allowed to become re-established. Where the pipeline route follows an existing right-of-way in forested areas, Keystone attempted to route the pipeline as close as practical to the existing right-of-way to minimize impacts to forested lands. The construction right-of-way at timber shelterbelts in agricultural areas would be reduced to the minimum necessary to construct the pipeline. Mitigation measures designed to minimize impact on forested lands are described in Keystone's Construction Mitigation and Reclamation (CMR) Plan which is Appendix B of the EIS; this also includes a section on landowner complaint resolution procedures.
11	4	Spivy	Dan		There are now two pipelines that cross the property and each requires 50 feet of right-of-way. This easement will be adjacent and parallel to these pipeline easements. The Keystone project will require an additional 110 feet of right-of-way that will cause a huge loss of trees. The easement is forever and this land can never be used for forest or anything else. The land is location in the Jesus de la Garza Survey, Angelina County, Texas. The 160 acres tract is approximately five miles southwest of Wells, Texas.	The 110-foot-wide right-of-way (ROW) is for construction. The permanent ROW where there would be limitations to use, would be 50 feet wide. Keystone would compensate for the loss of commercial timber and other lost crops.
308	1	Splinter	Joe		The DEIS does not contain or evaluate a complete emergency response plan. This poses an unacceptable risk to Montana. The largely volunteer emergency personnel and potentially affected property owners and others who live near the pipeline deserve an opportunity to comment on TransCanada's emergency response plan prior to issuance of permits and approval of the plan. The disaster in the Gulf serves as a warning – if federal officials had paid more attention to the lack of a plan for dealing with a blow-out of BP's rig before the company was allowed to drill, we would have known before it was too late that there was no plan to contain a catastrophic spill.	Consolidated Response RES-1 addresses issues related to preparation and review of emergency response plans for the proposed Project.
308	3	Splinter	Joe		The Department of Transportation has said it will issue a separate Environmental Analysis and proposed special permit allowing a waiver for TransCanada to use thinner pipe outside of "High Consequence Areas," but this is too little and too late. The EIS should analyze the real potential risks and impacts of a spill under the waiver-granted scenario.	Keystone has withdrawn its application for a Special Permit as described in Consolidated Response REG-1, and the Pipeline and Hazardous Materials Safety Administration will not be preparing a separate analysis.
308	5	Splinter	Joe		The DEIS doesn't analyze the environmental effects of tar sands oil, which some say is the dirtiest form of energy available.	Section 3.13 of the EIS addresses reliability and safety issues, including calculations of the probability of a spill from the proposed Project and the potential environmental impacts associated with spills.
308	6	Splinter	Joe		The DEIS assumes there is a need for the Keystone XL pipeline but without doing a thorough, independent, and detailed analysis of the need for the pipeline. It glosses over the need and fails to analyze reasonable alternatives. If TransCanada is given a permit for this pipeline, the company will have the power to condemn landowners to build it. The company shouldn't get this power unless it is the best alternative to meet U.S. energy needs. The recently completed Alberta Clipper and Keystone I pipelines offer more than enough capacity for the most optimistic projections of tar sands production for many years, if not indefinitely. The DEIS ignores this existing overcapacity. The scoping summary	<p>Consolidated Response P&N-1 describes the need that the Project has been proposed to meet and provides an explanation of the thorough and independent analysis of need that was conducted for the EIS. As also noted in that response, the Project has been proposed to meet the heavy crude oil needs of refineries in the Gulf Coast area, not for the U.S. in general. The Alberta Clipper and existing Keystone pipeline projects serve other markets and do not meet the demands of the Gulf Coast refineries.</p> <p>The EIS addresses all substantive issues raised during the scoping process. Table 1.7.1-1 of the EIS lists the comments</p>

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					report clearly outlines the questions to be answered, and the DEIS fails to do so.	received and the sections of the EIS in which they area addressed.
308	8	Splinter	Joe		The DEIS severely underestimates the impact that this pipeline will have on agricultural land, particularly irrigated land. Farmers and ranchers need assurance from this governmental process that they will not be sacrificed in order to make way for this pipeline. These issues of vitally important to the lives every Montanan -- not just rural farmers and ranchers. This effects us all, and with the BP spill now is your opportunity to turn a new leaf. Be thorough, listen to what we have to say and incorporate it in your assessment.	Consolidated Response FRM-1 addresses potential ranch of farmland impacts, and Consolidated Response FRM-2 addresses potential impacts to irrigated cropland.
933	1	Sprague	Mena&Dave		We are opposed to the Keystone Pipeline.	Comment acknowledged.
933	2	Sprague	Mena&Dave		We live in Howard County which is adjacent to Greeley, Nance & Merrick Counties. Our water source is the Ogallala Aquifer. The thinner pipe planned for the pipeline, will be weakened by the sand. Our water will be destroyed.	Keystone has withdrawn its application for a Special Permit as described in Consolidated Response REG-1. Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
933	3	Sprague	Mena&Dave		We attended the York, NE hearing, all who spoke were against the pipeline except a welder who worked for Keystone. The similar pipeline in Minnesota formed a leak and the local firemen found it. This is not safe.	As described in Consolidated Response SAF-1, the Pipeline and Hazardous Materials Safety Administration (PHMSA) has regulatory requirements that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project in a manner that protects the health and safety of the public and the environment. In addition, PHMSA developed 57 Project-specific Special Conditions that Keystone has agreed to implement. Incorporation of those conditions would result in a Project that would have a degree of safety over any other typically constructed domestic oil pipeline system under current code and a degree of safety along the entire length of the pipeline system similar to that which is required in HCAs as defined in 49 CFR 195.450. Sections 2.4 and 3.13.5.5 of the EIS and Consolidated Response OIL-3 describe the systems that would be in place to detect leaks and to shut down the system.
1560	1	Sprague	Mena		Opposed to pipeline for many reasons.	Comment acknowledged.
1560	63	Sprague	Mena		Wants the tar sands oil refined in Canada and thus there is no need to build a pipeline.	Consolidated Response P&N-8 addresses issues related to shipping Canadian crude oil to refineries that are closer to the source of oil.
1370	1	Sprick	Robert	Gulf Interstate Engineering	I write in support of TransCanada's Keystone XL crude oil pipeline project and urge the department to grant a permit for the pipeline. I urge the granting of the permit. Thank you for the opportunity to comment. If you have any questions, please do not hesitate to ask.	Comment acknowledged.
1370	3	Sprick	Robert	Gulf Interstate Engineering	Considering the economic [and energy security] benefits of these vital resources, we should continue to expand America's access to safe, affordable energy to help ensure [improved domestic and global energy security and] stable prices for consumers... This project also stands to provide a powerful private sector economic stimulus. During construction, Keystone XL will create more than 13,000 jobs funded with private investment. Specifically, for Gulf Interstate Engineering, if we are awarded construction management services through TransCanada, our business and Houston's economy would benefit by generating much needed new jobs	Consolidated Response ECO-1 addresses potential socioeconomic impacts, and Consolidated Response TAX-1 addresses concerns regarding taxes.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					for our valued and dedicated employees. In addition, local governments will have a steady source of income from economic activity associated with construction and from property taxes the pipeline company will pay... Rejection of the permit or suspension of the review would sacrifice the significant economic benefits this project stands to deliver. This would be a mistake....	
1370	5	Sprick	Robert	Gulf Interstate Engineering	Pipelines are the safest, most reliable, economical and environmentally favorable way to transport oil and petroleum products, as well as other energy liquids, throughout the U.S. America depends on the more than 168,000 miles of liquid pipelines to move energy and raw materials our country relies on.	Comment acknowledged.
1370	6	Sprick	Robert	Gulf Interstate Engineering	Additional pipeline capacity will help consumers and businesses throughout the United States.	Comment acknowledged.
1398	1	Sprick	Robert	Gulf Interstate Engineering	Recently a number of advocacy groups sent a letter seeking suspension of the permitting of the Keystone XL pipeline. I encourage you to reject the request and to continue to review the proposed project. The permitting processes in place are appropriate and should proceed so that a final determination can be made about the impacts of the project and whether it is in the national interest. Please reject the request to suspend the process and continue with the review.	Comment acknowledged.
1398	3	Sprick	Robert	Gulf Interstate Engineering	ECO. At the same time, construction of this project stands to bring significant economic benefits to the areas where it will be built.	Comment acknowledged.
786	1	Spurgeon	Mary		I write in opposition to the permitting of this pipeline to travel through the delicate Sandhills region of Nebraska at any point! Nor do we need to threaten the fragile topography of the grasslands of the Sandhills by the process of laying of the pipeline. TransCanada has asked for this most direct route through the Sandhills to save money.	Identification of sensitive environments crossed by the proposed Project is discussed in Consolidated Response ENV-1 and ENV-3. Issues related to the Sand Hills area are addressed in Consolidated Response ERO-1. Consolidated Response ALT-1 addresses potential alternative routes, including routes that would avoid much of the Northern High Plains Aquifer system and the Sand Hills area.
786	3	Spurgeon	Mary		I write in opposition to the permitting of this pipeline to travel over the Ogallala Aquifer at any point! This raises concerns about the safety of doing this through and above a huge water resource that is crucial, not only to the people and creatures of Nebraska, but to all in the Great Plains Region of our nation. I am aware that one pipeline already exists above the aquifer, but we don't need to double our risk of catastrophe. If this pipeline must be built, it should be routed so it avoids all aquifers.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. Consolidated Response ALT-1 addresses potential alternative routes, including routes that would avoid much of the Northern High Plains Aquifer system.
786	5	Spurgeon	Mary		It's job of the "person" of a corporation to make the most money possible. It will never require water to drink or to bathe in, or to irrigate one of the important "gardens" on the planet. You, as an agent acting for the best interests of "we, the people" who actually require clean water to drink, and water in which to bathe, and who understands the needs of all creatures, animals and plants alike for uncontaminated water to live, have both the understanding and the vision to safeguard the common good, not only for us today, but for future generations.	The commenter's opinion is noted.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
786	6	Spurgeon	Mary		I urge you to safeguard the common good by opposing the Keystone XL Pipeline as it is currently proposed...Again, I beg you, please do not permit the construction of the Keystone XL Pipeline as it is currently routed and proposed.	The commenter's opinion is noted.
786	7	Spurgeon	Mary		[Building a pipeline that is safely routed, using pipe that is well within safety standards] will provide private sector jobs, aiding our exit from the economic recession without the use of government funds. It will thus contribute to the common good in more ways than one.	The commenter's opinion is noted.
1542	28	Stafford	Suzanne		I am opposed to the destruction of the forest lands, wild life and the people in Canada, to the building of more pipelines across private lands, wildlife preserves national forests, grassland and rivers. I am opposed to the importation of tar sands oil to the refineries in this area.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information on current and future production. As noted in that Consolidated Response, without the proposed Project, oil sands development would continue at or above the current level until at least 2020, with or without the proposed Project. As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries.
1542	29	Stafford	Suzanne		Recent events such as the coal mine explosion and the offshore drilling disaster have taught us that corporations in the energy business cannot be trusted to assure the safety of all their employees and other people.	As described in Consolidated Response SAF-1, the Pipeline and Hazardous Materials Safety Administration (PHMSA) has regulatory requirements that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project in a manner that protects the health and safety of the public and the environment. In addition, PHMSA developed 57 Project-specific Special Conditions that Keystone has agreed to implement. Incorporation of those conditions would result in a Project that would have a degree of safety over any other typically constructed domestic oil pipeline system under current code and a degree of safety along the entire length of the pipeline system similar to that which is required in HCAs as defined in 49 CFR 195.450. It also describes the inspections and reviews of the proposed Project that the Pipeline and Hazardous Materials Safety Administration would conduct to ensure compliance with those regulatory requirements.
1542	30	Stafford	Suzanne		We cannot trust the government's own regulatory agencies to enforce the measures that do exist to improve safety.	Consolidated Response SAF-1 describes the regulatory requirements and Project-specific Special Conditions that Keystone would comply with to construct, operate, maintain, inspect, and monitor the proposed Project. It also describes the monitoring, inspections, and reviews of the proposed Project that the Pipeline and Hazardous Materials Safety Administration would conduct to ensure compliance with those regulatory requirements.
1542	31	Stafford	Suzanne		The companies either don't use the available technology to ensure safety, or they don't have the technology to prevent or manage catastrophic events.	As described in Consolidated Response SAF-1, the Pipeline and Hazardous Materials Safety Administration (PHMSA) has regulatory requirements that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project in a manner that protects the health and safety of the public and the environment. In addition, PHMSA developed 57 Project-specific Special Conditions that Keystone has agreed to implement. Incorporation of those conditions would result in a Project that would have a degree

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
						of safety over any other typically constructed domestic oil pipeline system under current code and a degree of safety along the entire length of the pipeline system similar to that which is required in HCAs as defined in 49 CFR 195.450. It also describes the inspections and reviews of the proposed Project that PHMSA would conduct to ensure compliance with those regulatory requirements. Consolidated Response RES-1 addresses issues related to preparation and review of the emergency response plan for the proposed Project.
1542	33	Stafford	Suzanne		I'm sure there is not a person in this room who's family has not been touched by cancer resulting from exposure to carcinogens put into our air and water. That has been done by the same refineries which are now asking for the opportunity to refine even dirtier oil than they have in the past.	As discussed in the EnSys 2010 report, the quantity of crude oil refined in PADD III is driven by market conditions and is independent of the existence of the proposed Project. The proposed Project would provide access to WCSB crude oil in PADD III refineries that would supplant supplies from other sources, including Venezuela and Mexico. As discussed in Section 3.13.5.1 of the EIS and Consolidated Response OIL-4, the composition of WCSB crude oils that could be transported by the proposed Project is not dissimilar from other heavy crude oils currently refined in PADD III. There is therefore no credible evidence that implementation of the proposed Project would lead to disproportionate adverse impacts on minority and low income populations near PADD III refineries.
1542	34	Stafford	Suzanne		In this area we have already received our share of government waste, toxic poison gases from war efforts. It is inconceivable that we would agree to accept more filth in order to fuel the profits of these corporations which are producing dangerous, dirty, disastrous fuel.	Consolidated Response OIL-4 addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils.
928	1	Stamm	Alex		I do not want an oil pipeline traveling through my state, endangering my sources of food and water, and my home state's environment.	Comment acknowledged.
311	1	Standley	Nancy	Northern Plains Resource Council	In light of the oil rig fiasco, I do not think we can trust TransCanada to effectively respond, reassure, and repair, should an unforeseen accident happen along the pipeline. They must be made to PROVE they can handle any accidents and emergencies.	Consolidated Response RES-1 addresses issues related to preparation and review of emergency response plans for the proposed Project.
311	2	Standley	Nancy	Northern Plains Resource Council	Before allowing the permit, we need to require a dedicated account set up to pay in full for any accident, emergency or catastrophe no matter how large or how small.	Consolidated Response LIA-2 addresses the issue of bonding for the proposed Project.
1557	35	Stanley	Kevin		Not impressed with Keystone representatives. Wrote a letter in December and did not get a response until April. Within 1 week he had a letter from Keystone's attorney that they were going to start condemnation if he hadn't returned an answer by the end of April. But he's been told that Keystone can't legally do that until they have a permit. So he feels that Keystone is not honest. He suggests landowners look at the reclamation plan, study it, determine what they are going to do to your land and determine what you need to do to protect it.	Consolidated Response EAS-2 addresses issues related to easement negotiations and eminent domain. DOS has no legal authority in the easement negotiations or in eminent domain proceedings.
1557	36	Stanley	Kevin		Doesn't want pipeline to go through corrals.	Keystone would coordinate with landowners regarding potential minor reroutes such as this. However, if an agreement cannot be reached, after construction the land above the pipeline could continue to be used as a corral.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
1559	14	Stanley	Jim		We need this pipeline for national security. All our oil comes through the Strait of Hormuz with Iran on one side and the United Arab Emirates on the other. Not safe. If strait is lost, oil prices will sky rocket. Modern safeguards will be used for spill detection, leak detection, and there will be valves to shut it off unlike the Gulf. All concerns can be addressed, we need this pipeline.	Comment acknowledged.
1557	35	Stanley	Kevin		Not impressed with Keystone representatives. Wrote a letter in December and did not get a response until April. Within 1 week he had a letter from Keystone's attorney that they were going to start condemnation if he hadn't returned an answer by the end of April. But he's been told that Keystone can't legally do that until they have a permit. So he feels that Keystone is not honest. He suggests landowners look at the reclamation plan, study it, determine what they are going to do to your land and determine what you need to do to protect it.	Consolidated Response EAS-2 addresses issues related to easement negotiations and eminent domain. DOS has no legal authority in the easement negotiations or in eminent domain proceedings.
1554	9	Staples	Don		The first piece of property that it crosses that I am concerned with is the Lilly properties in Wakefield, Texas. It is a 300 acre tract that is prime woodlands. I have been working on the track for some 25 years as their consultant. The portion of it is wetlands, dedicated wetlands, portions of it possibly have, I have not proven it to my own self yet, but possibly has endangered species on it. The Red-cockaded woodpecker. We had a meeting with Keystone last week on the site, and our impression from working with Keystone is that they're not interested in listening to landowners about the environmental impact on their land....We have had discussions on 2 tracks, basically the money offered for the right-of-way is adequate, but when you get down to the contractual words for the right-of-way, they completely ignore the landowner's interests, and I find that to be a bit disturbing when you are talking about environmental impact.	As noted in Consolidated Response EAS-2, state laws dictate under what circumstances eminent domain may be used and define the eminent domain process within the state. DOS has no legal authority in the easement negotiations or in eminent domain proceedings.
1554	11	Staples	Don		they have in their contract requirements that allows them total access to the property rather than to the right-of-way, and they will not change that. And that's the, pardon the expression, the damning part of their contract. We don't want them on the rest of the property. We all have experiences in this part of Texas with pipeliners. You cannot depend on their good word. We had problems with access. One of my landowners has required that they stay strictly on the right-of-way, which was adjacent to an existing hundred foot wide pipeline, we told them they were restricted to that 100 foot pipeline and their 110 foot right-of-way that they are purchasing. And that there would be a penalty of \$500 per vehicle, per occurrence if we find them on adjacent properties. They rejected that out of hand. And the only reason we put it in there was that dealing with pipelines, they ignore the landowners and they come on the property. Apparently when they first came in, their surveyors came in and trespassed, since they used chainsaws, machetes and axes. It was criminal trespass, they had no permission to cross either of these properties.	State or local trespass and access laws are applicable along the entire route and therefore along each easement negotiated by Keystone. DOS has no legal authority over negotiating easement agreements, no legal status to enforce the conditions of an easement agreement, and no legal authority over Keystone representatives who gain access to private property. The commentor has the option to take up the matter with Keystone or local law enforcement officials, or initiate legal consultation.
1554	12	Staples	Don		The Vertrese property on the east side of Livingston, another 300 acre tract that cuts right down through the middle of it. It's adjacent to an existing pipeline that goes through another tract	As noted in Consolidated Response EAS-2, state laws dictate under what circumstances eminent domain may be used and define the eminent domain process within the state. DOS has

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					of woods that I have worked for the last 45 years. And they have offered adequate money for the timber, they have offered adequate money for the right-of-way, and they've ignored our requests regarding environmental impact. One of the things we told them is they will not bury their debris on the site, they will not pile their debris on the site. And they quickly ignored that, and told us they would do something, but didn't expand beyond that. But working on the contractual level, they have their contract and that's it. And their contract does not address the environment, or the landowners interest in maintaining their properties.	no legal authority in the easement negotiations or in eminent domain proceedings.
1006	1	Stark	Harold		I have never thought it was a safe idea to have an oil pipeline passing over the Ogallala Aquifer. It only seems more absurd now after the Gulf oil leak. Our water is a precious commodity that needs to be protected. Please cancel this project or bypass the Ogallala Aquifer.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. Consolidated Response ALT-1 addresses potential alternative routes, including routes that would avoid much of the Northern High Plains Aquifer system. As described in Consolidated Response GLF-1, the risks associated with the proposed Project are substantially different from those associated with the BP Deepwater Horizon Project.
724	1	Starkel	Allen		Keep this pipeline away from the Ogallala Aquifer and the Nebraska Sand Hills. Egyptian President, Anwar Sadat, the great leader and accomplished diplomat, while being interviewed by a world class journalist was quoted as saying the following: Journalist: There are countries who would like to dam and divert the Nile River. What is your take on that? Anwar Sadat: We would go to War with them. Journalist: You would go to War ? Sadat: Immediately! We would declare war! The Ogallala Aquifer is the "Nile River" of the upper and lower Great Plains of Nebraska., Kansas, Oklahoma, and Texas. Oil Conglomerates -- Stay Away from it!	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
834	1	Starkel	Ann		It was appalling to learn that the Keystone XL pipeline would extend through the Sand Hills, exposing the Ogallala Aquifer to contamination in the event of a leak. The aquifer is the main water source for domestic use, livestock, and irrigation in the High Plains, the economy of which is dependent on it. While we have been assured that a leak is highly unlikely and would be immediately detectable, let us hope that the Gulf oil spill has taught us how unreliable those assurances are. Our need for oil is real and seemingly limitless, but we cannot drink it or irrigate with it. Please avoid a catastrophe and keep the pipeline away from the Sand Hills.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. As described in Consolidated Response GLF-1, the risks associated with the proposed Project are substantially different from those associated with the BP Deepwater Horizon Project.
1544	217	Starns	Judy	Citizen of Channelview	Would you please explain the procedure of this operation from Canada to here?	Consolidated Response ENR-1 provides information on the Department of State's environmental review process, the National Interest Determination process, and the need to complete those reviews before approving or denying the Presidential permit for the proposed Project. Sections 1.0 and 2.0 of the EIS provide information on the review procedures and the proposed Project.
1544	218	Starns	Judy	Citizen of Channelview	Can you please explain how in the world the Channelview area was chosen as one of your sites?	DOS received requests for a meeting in the Houston area. Officials from the City of Houston assisted in acquiring the meeting site.
1544	219	Starns	Judy	Citizen of Channelview	Opposed to the project.	Comment acknowledged.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
312	1	Starshine	D.		Montana is TOO VALUABLE to risk a problem with the tar sands pipeline. Please get a detailed prevention and cleanup BEFORE allowing a permit.	Consolidated Response RES-1 addresses issues related to preparation and review of emergency response plans for the proposed Project.
675	1	Stastny	Jennifer		Haven't we learned anything about human fallibility? The oil pipeline should not be built anywhere near the aquifer on which so many people rely. There has to be a better solution.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
1215	1	Steele	Ed&Virginia		Please protect the Ogallala Aquifer. Underground water is Nebraska's greatest natural resource.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
545	1	Stefaniak	MaryHelen		Routing the oil pipeline over the Nebraskan Sandhills above the Ogallala Aquifer MUST be stopped! There has already been a leak in Montana. When one reads about sinkholes caused by 30-year-old sewer pipes, concern only grows. We will still need our water supply in 30 years. Where is the wisdom to understand this needs to be rerouted over safer land? This is our water supply. Have we learned nothing from the oil gushing into the Gulf of Mexico? Please don't let this happen!	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. Consolidated Response ALT-1 addresses potential alternative routes, including routes that would avoid much of the Northern High Plains Aquifer system. As described in Consolidated Response GLF-1, the risks associated with the proposed Project are substantially different from those associated with the BP Deepwater Horizon Project.
20	1	Steitz	Jim		I write to urge you to deny permits for the "Keystone XL" pipeline that the TransCanada company has proposed to build from Canada to the Texas Gulf Coast. This pipeline is irreconcilable with US policy on carbon dioxide pollution, and would help to foreclose the possibility of the US substantially shifting away from carbon-intensive transportation fuels. President Obama has stated to the international community that the US is recommitted to a robust international agreement on reducing carbon dioxide pollution. The construction of the Keystone pipeline and the commitment of America to several decades of Canadian tar sands oil consumption would substantially frustrate this goal the Administration has declared. The Keystone pipeline is especially inappropriate because the Canadian tar sands oil is far more carbon intensive than even conventional petroleum. The extraction of oil from the Canadian tar sands consumes a tremendous amount of energy, constituting a substantial portion of the energy recovered. Therefore, the extraction and burning of tar sands represents a backwards regression toward even greater emissions per unit energy produced exactly the opposite of the fuel source changes America must make. The facilitation of Canadian tar-sands mining is an overwhelming indirect impact that must be incorporated into the environmental impact analysis and provide a clear grounds for rejecting the permit application.	Consolidated Response GHG-2 addresses the potential causal connection of implementation of the proposed Project and expanded oil sands production in Canada and increases in refining. Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project. Consolidated Response GHG-3 addresses the decreased rate of GHG gas emissions from oil sands production in Canada.
20	2	Steitz	Jim		Moreover, the mining of tar sands is one of the most destructive forms of land use yet devised by humankind. The land-scalping operation now descending on the Canadian boreal forest is akin to the burning of the Amazon rainforest in its biological impacts and consequences for the stability of our planet's life-support system. In addition, the Canadian boreal forest is the primary breeding ground for most of the migratory songbirds that grace the American landscape. The Keystone pipeline would facilitate a trade of oxygen and songbirds for oil as Canada's export to the US, substantially depressing our quality or life and snuffing out the spring songbird chorus that makes the American spring special. This is not a fair trade.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project. Consolidated Response GHG-4 addresses concerns regarding the loss of boreal forest and peat bogs. Consolidated Response ENV-4 addresses issues related to oil sands production and migratory birds.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
20	3	Steitz	Jim		American policy calls for a reduction in gasoline consumption, and this reduction indeed is already underway for two consecutive years. Therefore, there is no purpose for the Keystone pipeline but to frustrate US energy policy. In the spectrum of possible transportation fuels and their impact on the atmosphere and other planetary life-support components, tar sands ranks near the very worst. Tar sands is a catastrophe that the US must not facilitate, and the State Department must reject this permit as contrary to US national security interests that depend on a stable atmosphere and stable North American ecosystems.	Consolidated Response P&N-1 addresses the need that the Project has been proposed to meet. Consolidated Responses OIL-4 and P&N-3 describe the composition of the Canadian crude oils that would be transported by the proposed Project. As noted in those responses, the Canadian crude oil that would be transported is similar in composition to other heavy crude oils.
1446	1	Stelmach	Ed	Premier of Alberta	The KXL pipeline has the potential to carry crude oil from a number of sources in both Canada and the U.S. When considered in the context of other leading suppliers of crude oil to the U.S., including the almost 50 per cent of U.S. oil imports sourced from members of OPEC, the security benefits of expanded access to Canadian and U.S. domestic production are clear.	Comment acknowledged.
1446	3	Stelmach	Ed	Premier of Alberta	As the Council on Foreign Relations has noted, U.S. purchases of oil sands from Canada, as opposed to overseas oil purchases, will deliver increased economic and security benefits to the U.S. In this regard, the Canadian Energy Research Institute recently forecast that, over the next five years, oil sands development will result in an additional 343,000 jobs in the U.S. and, over the next 15 years, an average annual increase in U.S. GDP of over \$30 billion.	Comment acknowledged.
910	1	Stenson	Marietta		The Ne. sandhills are such a precious commodity to not just Ne. but to many other areas. Unless a guarantee can be given that there is not a risk of a leak, I don't believe the risk should be taken. Sand shifts often and a lot and a chance of shifting the pipe under the sand would pose too much potential danger to our water reservoir. Please stop the progress of this plan. Thank you.	Issues related to the Sand Hills area are addressed in Consolidated Response ERO-1. Section 3.13 of the EIS addresses reliability and safety issues, including calculations of the probability of a spill from the proposed Project and the potential impacts of a spill. As noted in that section, the likelihood of a spill is low, but it is impossible to state that a spill would not happen.
1301	1	Sterling	Stephanie	Shell Canada Services Limited	I am writing to express my support for the development of new pipeline infrastructure such as the Keystone XL pipeline as a critical conduit for secure North American supplies of 2011. As you are aware, Canada's oil sands are one of the largest oil deposits on earth. Currently, Shell is Canada's third-largest oil sands operator with 155,000 barrels per day of current production and a 100,000 barrels per day... Regulatory applications are filed to increase production up to 770,000 barrels per day of bitumen over the long term. As oil sands production continues to grow to meet North American demand, projects like Keystone XL will help ensure a safe and secure supply of North American crude to US markets. Potentially, via connections to the US Gulf Coast, projects like Keystone could help divert non-North American sources of oil arriving via tanker thereby keeping more US dollars and economic opportunity associated with energy development onshore.	Comment acknowledged.
1301	2	Sterling	Stephanie	Shell Canada Services Limited	Much has been said about the environmental concerns of Canadian oil sands and by association, the role of Keystone XL in delivering oil sands into the United States. In particular, concerns have been raised about the greenhouse gas intensity	Comment acknowledged.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					of the oil sands relative to conventional crudes. While it is true that the oil sands are about 5 - 15% more CO2-intensive than conventional crude-based fuel on a wells to wheels basis, it is important to note that industry is taking considerable measures to reduce the greenhouse gas footprint of the oil sands by exploring non-fossil fuel-based sources of power such as wind as well as investing in carbon capture and sequestration (CCS) projects like Shell's Quest CCS project which will capture and store approximately 1.2 million tonnes of CO2 per year. Other environmental issues associated with the oil sands are also being addressed by the industry and local governments. For example, last year the Alberta government introduced Directive 74 to ensure faster reclamation of tailings ponds from oil sands mines and is developing the Land Use Framework which will establish criteria to assess the cumulative impacts of oil sands development. We hope you will consider these comments as you review the environmental impact statement of the KeystoneXL pipeline.	
359	1	Sterns	Judy		Please explain your process as what you are going to do from Canada till here.	Consolidated Response ENR-1 provides information on the Department of State's environmental review process, the National Interest Determination process, and the need to complete those reviews before approving or denying the Presidential permit for the proposed Project.
1336	1	Stevens	Richard	Triangle Communications	Triangle Communications (Triangle) prides itself in keeping Montanans connected to the world by providing comprehensive communication service within its 23,000 square mile service area in central Montana. This area includes the communities of Malta as well as almost all of Phillips County which are on the route of the proposed Keystone XL Pipeline. Triangle has actively followed the Proceedings of the Keystone project.	Comment acknowledged.
1336	2	Stevens	Richard	Triangle Communications	The independent economic study for the project notes that it should provide significant, positive contributions to the U.S. economy and notable a \$422 million total impact to the state of Montana during construction and development.	Consolidated Response ECO-1 and Section 3.10.2.2 of the EIS address the potential socioeconomic impacts of the proposed Project.
1336	3	Stevens	Richard	Triangle Communications	construction and development. Likewise, the local economies within the route will see increased economic vitality from new tax revenues and business activity associated with temporary construction work in the area. On a continuing basis local property taxes on the facilities will be assessed and provide an annual revenue stream for the area.	Comment acknowledged.
1336	4	Stevens	Richard	Triangle Communications	Triangle requests your ongoing efforts be continued to completed the permitting process and encourages favorable consideration of the Keystone XL Pipeline.	Comment acknowledged.
1205	1	Stewart	Jeanne		I wish I hadn't waited so long to express my concern, but I feel strongly enough about this to weigh in even at this late hour. While I realize there may be monetary benefits to expansion of the Keystone Pipeline, I fear the disadvantages may be greater.	Comment acknowledged.
1205	3	Stewart	Jeanne		At the end of the day, just because we can doesn't mean we should and I believe this pipeline is not in our best interest. There's already one in place – let's leave it at that please.	Consolidated Response P&N-1 addresses the need that the Project has been proposed to meet, including information on crude oil supply and demand from an analysis specific to the

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
						proposed Project.
1205	4	Stewart	Jeanne		Let's keep the beauty of the Sand Hills and the integrity of the Ogallala Aquifer intact.	Issues related to the Sand Hills area are addressed in Consolidated Response ERO-1. Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
989	1	Stillwell	Jason		This pipeline is a small economic recovery in itself for many, many workers. Please vote to support the Keystone XL expansion, and keep Americans working.	Comment acknowledged.
1208	1	Stilwell	Mary		I'm writing to oppose the west addition to the Keystone Oil Pipeline.	Consolidated Response ALT-1 and Section 4.3 of the EIS address potential alternative routes, including use of the existing Keystone Oil Pipeline System route.
1208	2	Stilwell	Mary		It is too great a risk to our aquifer and ecosystem.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
1117	1	Stivers	Ann		Senator, with all due respect, I am for the pipeline that is to run through Nebraska. I am a conservative citizen of the State of Nebraska.	Comment acknowledged.
333	1	Stolzenburg	Lucinda		I am solidly against this pipeline!	Comment acknowledged.
333	2	Stolzenburg	Lucinda		It appears that the Keystone XL pipeline will cross environmentally sensitive waterways – including the Ogallala Aquifer...	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
333	3	Stolzenburg	Lucinda		...This particular type of Canadian crude will emit 20% more greenhouse gases than conventional petroleum. I don't see why we would risk this sort of product and its delivery if we are serious about reducing greenhouse gases and protecting the environment. Let's work toward safe fuels, not allow more dangerous ones. Please! No!	Consolidated Response GHG-1 addresses the greenhouse gas life-cycle analyses presented in the revised EIS. Consolidated Response OIL-4 addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils.
913	1	Stone	Rachel	University of Texas School of Law	Please do not approve the safety waivers or the permitting of the Keystone XL pipeline. It will bring emissions to Texas that we cannot afford given our current air quality.	Keystone withdrew its request for a Special Permit. As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries. Consolidated Response OIL-4 also addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils.
1511	1	Stone	Betty	Cottonwood Inn and Suites	I was distressed to hear that a number of advocacy groups sent a letter seeking suspension of the permitting of the Keystone XI project. Please note that I live in Valley County, Montana. I am not part of an advocacy group, but I am a business owner/manager and I live in the area that this will impact. I have attended the public input meetings on this project and wholly support the project. It is an important part of the solution to dependence on foreign oil. And the construction of this project will economically benefit our rural area, an area that has been hit by low farm commodity prices, drought, dwindling population, and increased unemployment. Please reject the request to suspend the process and grant the permit. Thank you for your consideration.	Comment acknowledged.
380	1	Storck	Amanda	OK Office of the Secretary of	Please find the attached request for extension of the comment period for the Keystone XL pipeline project. If you have any	Consolidated Response CMT-1 addresses issues related to the length of the comment period for the draft EIS and

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
				Environment	questions, please contact me at the information below.	supplemental draft EIS.
779	1	Stratton	Sheila		I urge you to scrap this project. Please take the time to listen to the environmental concerns that plenty of experts are voicing. The pipeline is bad policy for so many reasons.....And the Ogallala Aquifer through which it would pass...I can't even begin to understand how that could be seen as a good idea! ...	Consolidated Response ENR-1 provides information on the Department of State's environmental review process, the National Interest Determination process, and the need to complete those reviews before approving or denying the Presidential permit for the proposed Project. The impacts associated with implementation of the proposed Project are addressed in Section 3.0 of the EIS. As noted in that section, construction and normal operation the proposed Project would not result in significant environmental impacts. Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
779	3	Stratton	Sheila		... Thank you for extending the public comment period.	Comment acknowledged.
368	1	Strong	J.D.	Secretary of Environment Oklahoma	<p>I am writing to request an extension of the comment period for the Draft Environmental Impact Statement on the Keystone XL pipeline. This extension is absolutely necessary in order for the State of Oklahoma and its citizens to submit effective comments on this important matter. More specifically, I respectfully urge an extension for the following reasons:</p> <ol style="list-style-type: none"> 1. The Draft EIS was made available on April 16, 2010 and includes over 2,000 pages and numerous maps. 2. Printed versions of the Draft EIS were sent only to rural libraries and not to any libraries or government records repositories in Oklahoma's capital city. 3. Ten business days after the release of the Draft EIS, the Department of State held only two meetings in Oklahoma - one in Durant on May 3 and one in Stroud on May 4, 2010. 4. The U.S. State Department's notice of these meetings was ineffective, as I was first made aware of the meeting by an Oklahoma citizen one day before the first meeting. I was able to arrange for an assistant attorney general to attend the meeting in Stroud, OK on May 4, 2010, but was not able to attend or prepare any comments myself. 5. The comment period encompassed the last 45 days of the Oklahoma Legislative session, which occupies significant resources of both legislative and executive branches of Oklahoma government. 6. While the government of Oklahoma lacks the resources needed to effectively comment by <p>June 16, 2010, the rural working citizens of Oklahoma most affected by this pipeline have far fewer resources to participate effectively during this brief comment period.</p> <p>Due to these circumstances and for the sake of effective state government and citizen participation in the Administration's decision-making process, it is absolutely necessary to extend</p>	Consolidated Response CMT-1 addresses issues related to the length of the comment period for the draft EIS and supplemental draft EIS. Consolidated Response CMT-2 addresses issues related to comment meetings on the draft EIS and requests for additional public involvement.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					the comment period for at least 60 days. Thank you for your consideration of this vital request.	
548	1	Stugelmeyer	Troy		Dear Ms. Orlando Recently a number of special interest groups have been asking to suspend the permit of the Keystone XL pipeline project. I ask that you deny the request and continue to review the proposed project. The project has the potential to deliver very secure energy benefits to the U.S. I feel that it would be MUCH better to do business with our northern neighbors, than to do business with someone in the Middle East who one day is holding us up for oil and the next day is shooting at some of our young men and women in uniform. Also, the tar sands oil deposits are land-based, with far less environmental impacts than any offshore projects. This pipeline could have a tremendous economic impact in the areas where it is to be built.	Comment acknowledged.
548	2	Stugelmeyer	Troy		It will have a large impact on Harding County SD, where my family lives. While under construction, it will impact all the local business, directly or indirectly. It promises to lower our property taxes, and have a tremendously positive impact on our local school and county budgets.	Comment acknowledged.
548	3	Stugelmeyer	Troy		Provided it has a limited impact on the environment, this project could be a very important part of our energy supplies. I feel that the permitting processes in place are more than adequate and should proceed so a final determinatin can be made about the impacts of the project and whether it is in our best interests. Please reject the requests to suspend the project and follow through with the review. Thank You.	Comment acknowledged.
190	1	Stutheit	Jennifer	North Star Math Teacher	I am strongly against TransCanada's proposed pipeline running through Nebraska. I think that it has clearly been shown that oil companies aren't to be trusted and the US government doesn't do a good job of regulating them. How many disasters do we need before Americans realize that?	Consolidated Response ALT-1 addresses potential alternative routes, including routes that would avoid much of the Northern High Plains Aquifer system and the Sand Hills area.
190	2	Stutheit	Jennifer	North Star Math Teacher	I think the public deserves to know the records of any lobbyists that TransCanada has and what relationships they have with US regulators.	That information is not a part of the NEPA environmental review process and will not be included in the EIS. That information can be obtained through requests for information in compliance with the Freedom of Information Act.
190	3	Stutheit	Jennifer	North Star Math Teacher	As a mother of two young children and a teacher of many young Nebraskans, I care about the environment. I would like to repair our planet to leave a bright future for our young people. It would just take one small leak to ruin the Ogallala Aquifer that our state depends on.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. Consolidated Response OIL-1 addresses the likelihood of spills from the Project.
190	4	Stutheit	Jennifer	North Star Math Teacher	At the very least, I would strongly encourage the Office of Pipeline and Hazardous Materials Safety Administration to REFUSE TransCanada's request for a thinner pipeline to go through the Ogallala Aquifer in Nebraska.	Keystone has withdrawn its application for a Special Permit as described in Consolidated Response REG-1. Issues related to the Northern High Plains Aquifer System are addressed in Consolidated Responses AQF-1 through AQF-4.
190	5	Stutheit	Jennifer	North Star Math Teacher	It is wrong to force ranchers to give up part of their land for this project.	Consolidated Response EAS-2 addresses issues related to easement negotiations and eminent domain. DOS has no legal authority in the easement negotiations or in eminent domain proceedings. If the proposed Project is approved and constructed, after construction most existing land use in the right-of-way could continue, including grazing.
383	1	Sullivan	Erin		I have just completed a bike ride across the state of Nebraska.	Issues related to the Sand Hills area are addressed in

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					My state is beautiful. The Nebraska Sand Hills are irreplaceable.	Consolidated Response ERO-1. Issues related to the High Plains Aquifer System are addressed in Consolidated Response AQF-1 and AQF-4. Section 3.13 of the EIS addresses reliability and safety issues, including calculations of the probability of a spill from the proposed Project and the potential environmental impacts associated with spills. Consolidated Response ALT-1 addresses potential alternative routes, including routes that would avoid much of the High Plains Aquifer System.
1101	1	Summers	Gary		I would like to inform you of my opposition to the newly proposed western route of the Keystone pipeline.	Consolidated Response ALT-1 addresses potential alternative routes, including routes that would avoid much of the Northern High Plains Aquifer system.
1101	2	Summers	Gary		Concern about disruption and destruction of the fragile sand hills ecosystem.	Identification of sensitive environments crossed by the proposed Project is discussed in Consolidated Response ENV-1 and ENV-3. Issues related to the Sand Hills area are addressed in Consolidated Response ERO-1.
1101	3	Summers	Gary		...and the potential oil spill that would create irreparable damage to the precious underground Ogallala Aquifer...	Issues related to the Northern High Plains Aquifer System are addressed in Consolidated Responses AQF-1 through AQF-4. Consolidated Response AQF-3 provides information on hypothetical spills from the Project over two areas of the Northern High Plains Aquifer System.
1101	4	Summers	Gary		The potential oil spill that would create irreparable damage to the precious underground Ogallala Aquifer.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
1101	5	Summers	Gary		Please place your moral obligations (to our environment) above your need for personal gain..."The earth does NOT belong to us. We belong to the earth."	Consolidated Response ENR-1 provides information on the Department of State (DOS) environmental review process, the National Interest Determination process, and the need to complete those reviews before approving or denying the Presidential permit for the proposed Project. As noted in that response, DOS is neither a proponent nor an opponent of the proposed Project.
980	1	Sunderman	Craig	Laborer's Local 1140	Just because we had a catastrophe in the Gulf of Mexico doesn't mean all unemployed people in Nebraska and other states should suffer the consequences. It is time for sweeping changes in the senate and congress. If they don't want to approve this pipeline, so nobody can go back to work, or won't extend unemployment benefits- maybe it's time to vote all of them out of office.	As described in Consolidated Response GLF-1, the risks associated with the proposed Project are substantially different from those associated with the BP Deepwater Horizon Project.
890	1	Sundstrom	Linea	American Rock Art Research Association	It appears that the cultural resources work on this project has not been completed. Letters of compliance from state historic preservation officers for many of the identified archaeological sites are listed as "pending." This suggests that the cultural resources inventories and evaluations were not adequate for informed decisions about these resources. My organization would urge Department of State to take another look at this aspect of the DEIS to ascertain that these irreplaceable aspects of our national heritage are well protected from potential damage caused by Canadian mining interests.	As noted in Consolidated Response CUL-1. a Programmatic Agreement (PA) has been developed for the Project under Section 106 of the National Historic Preservation Act. The PA includes mitigation measures for known adverse effects and provides a process for ongoing surveys to be conducted in areas where access was not granted during the EIS process. Please note that many of these "pending" notes in the various state tables have been updated for the FEIS. "Pending" should not necessarily be interpreted as indicating inadequacy, but rather an indication that consultation with the requisite SHPO was not completed when the table was prepared. Consultation with the applicable SHPO regarding sites noted as "pending" will be completed prior to construction consistent with the PA.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
1438	1	Sutherland	Mike	Missouri House of Representatives	This project is a vital link to secure energy supplies for the United States from Canada. Canada is a valued trading partner and the most reliable supplier of foreign-based crude oil.	Comment acknowledged.
1438	2	Sutherland	Mike	Missouri House of Representatives	The environmental benefits of Keystone XL should not be overlooked. The current tragedy in the Gulf underscores the importance of a diverse portfolio of energy supplies. Within the spectrum of viable options, it is appropriate to seek a growing role for oil resources that are: Land-based; North American; and, Transported by pipeline. TransCanada's Keystone XL project meets each of these criteria.	Comment acknowledged.
1438	3	Sutherland	Mike	Missouri House of Representatives	Securing stable and affordable energy from Canada through projects such as the Keystone pipeline will offer more stable prices for consumers as significant interruptions of pipeline operations are few and easily resolved. Pipelines are the safest, most reliable, economical and environmentally favorable way to transport oil and petroleum products, as well as other energy liquids, throughout the U.S. Canada and the U.S. depend on more than 175,000 miles of liquid pipelines to move energy and raw materials safely and reliably. Additional pipeline capacity will help consumers and businesses throughout the United States by providing the means to a dependable source of energy.	Comment acknowledged.
1438	4	Sutherland	Mike	Missouri House of Representatives	This project also stands to provide a powerful private sector economic stimulus. During construction, Keystone XL will create more than 13,000 jobs funded with private investment. In addition, local governments will have a steady source of income from economic activity associated with construction and from property tax revenues paid by the pipeline company.	Consolidated Response ECO-1 addresses potential socioeconomic impacts, and Consolidated Response TAX-1 addresses concerns regarding taxes.
557	1	Sutton	Richard		I am not in favor of the installation of the pipeline through Nebraska, because of the risk involved effecting the aquifer.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
636	1	Sutula	Jon		This pipeline should not be in the Nebraska Sand Hills. The Ogallala Aquifer is too important of a public resource to take the chance of being contaminated by a spill,	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
636	2	Sutula	Jon		and the oil industry track record on spills has not been good. The area is too remote to be accurately monitored.	As noted in Consolidated Response SAF-1, Keystone would be required to monitor the entire pipeline route 26 times per year, at intervals not to exceed 3 weeks. That monitoring plus the remote detection systems described in Consolidated Response OIL-3 and Section 3.13.5 would assist in identifying most leaks in a timely fashion.
955	1	Svoboda	Scott		This is sheer lunacy! There is no way to guarantee against spills in what is Nebraska's greatest natural resource and the largest water aquifer in No America. A "small" spill/rupture/terroristic act would cause instant and irreparable damage to a sponge-like water filter that spans across the state. No portion of this line carrying tar sands should come close to the Ogallala Aquifer, let alone the Sandhills!	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
115	1	Swanson	Debbie	Two Rivers Economic Growth, Inc.	Two Rivers Economic Growth, Inc. is the local development organization for Valley County, Montana. We would like to go on record in support of the Keystone XL Pipeline project.	Comment acknowledged.
115	2	Swanson	Debbie	Two Rivers Economic	The draft environmental impact statement indicates limited environmental impacts, which are greatly outweighed by the	Comment acknowledged.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
				Growth, Inc.	economic benefits of the project. In addition to pipeline construction jobs and related service industry jobs during the construction period, the ongoing pipeline maintenance jobs will provide an economic boost for rural communities along the pipeline route.	
115	3	Swanson	Debbie	Two Rivers Economic Growth, Inc.	Landowners along the route will also receive financial benefits for granting easements.	Comment acknowledged.
115	4	Swanson	Debbie	Two Rivers Economic Growth, Inc.	The increased tax base for affected counties will allow counties to finance essential services that are presently subject to reductions or elimination due to budget cuts.	Consolidated Response TAX-1 addresses concerns regarding taxes associated with implementation of the proposed Project.
115	5	Swanson	Debbie	Two Rivers Economic Growth, Inc.	We recognize the value of this project in our country's effort to gain independence from Middle East oil resources. The Keystone XL Pipeline project will be instrumental in providing energy security for our nation by reducing our dependence on foreign oil.	Comment acknowledged.
115	6	Swanson	Debbie	Two Rivers Economic Growth, Inc.	We are confident that the US Department of Transportation Office of Pipeline Safety will ensure that the Keystone XL Pipeline is constructed and maintained in a safe, reliable manner that will be environmentally sound and responsible.	Comment acknowledged.
322	1	Swanson	Marc	FARM EQUIPMENT SALES, INC.	I write in support of TransCanada's Keystone XL crude oil pipeline project and urge the department to grant a permit. Securing stable and affordable energy is in our national interest. This project would also provide many economic benefits for our local counties, State and Federal Government. Thank you for the opportunity to comment.	Comment acknowledged.
1537	1	Swanson	Jeff		Build the pipeline, it will be a very great asset to Vally County, MT.	Comment acknowledged.
1431	1	Sweeney	James	Int'l Union of Operating Engineers Local 150	The Iowa Building Trades Council urges the State Department to proceed without delay to provide the necessary approvals for the Keystone XL pipeline project This project is necessary for two primary reasons; First, in these difficult economic times, Keystone XL promises to create more than 13,000 high wage construction jobs. These jobs will likely be drawn from a broad pool of skilled craft workers located throughout the Midwest. It is important for Iowa's union workers.	Consolidated Response ECO-1 and Section 3.10.2.2 of the EIS address the potential socioeconomic impacts of the proposed Project.
1431	2	Sweeney	James	Int'l Union of Operating Engineers Local 150	Second, this project is critical to delivering North American crudc from Alberta's OilSands. It is an energy security issue.you to proceed in the interest of jobs and energy security.	Comment acknowledged.
12	1	Sweeney	Pat	Western Organization of Resource Councils	We are writing on behalf of the Western Organization of Resource Councils, Dakota Rural Action, and the Northern Plains Resource Council to request an extension of the comment period on the Draft Environmental Impact Statement from 45 to 120 days. WORC is a regional network of seven community organizations with 10,000 members in seven states, including Dakota Rural Action in South Dakota and the Northern Plains Resource Council in Montana... Forty-five days is a wholly inadequate time for our members to analyze the more than 700 pages of analysis and the additional 3000 pages of appendices and supporting information, and especially for farmers and ranchers in one of the busiest times	Consolidated Response CMT-1 addresses issues related to the length of the comment period for the draft EIS and supplemental draft EIS.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					of the year. The DEIS serves as a basis for decisions by several federal agencies and the Montana Department of Environmental Quality, and addresses complex, interrelated subjects including land use; reclamation of fragile ecosystems; groundwater flow, contamination, and cleanup; pipeline safety; and energy policy and climate change, to name just a few. It is not reasonable to impose the statutory minimum NEPA comment period, especially given the fact that other agencies will have at least 90 days to comment. We ask you to exercise your discretion as the lead agency to allow our members and all members of the general public 120 days to review and comment on the Keystone XL Pipeline DEIS.	
12	2	Sweeney	Pat	Western Organization of Resource Councils	The Keystone XL pipeline will have significant environmental impacts, and is of great interest to our members, many of whom are among those who will be the most directly and severely affected by the pipeline. Among our members are farmers and ranchers who face condemnation and the siting, construction, and operation of the pipeline on their land without their consent.	Section 3.0 of the EIS provides our assessment of the potential impacts of the proposed Project. As indicated in that section, implementation of the Project would not result in significant impacts. As noted in Consolidated Response EAS-2, state laws dictate under what circumstances eminent domain may be used and define the eminent domain process within the state. DOS has no legal authority or ability to intervene in the easement negotiations or in eminent domain proceedings.
12	3	Sweeney	Pat	Western Organization of Resource Councils	The Keystone XL pipeline will have significant environmental impacts, and is of great interest to our members, many of whom are among those who will be the most directly and severely affected by the pipeline. Among our members are local officials and first responders vitally concerned about the potential for leaks, spills, or other emergencies, and the plans for responding to them.	The impacts associated with implementation of the proposed Project are addressed in Section 3.0 of the EIS. As noted in that section, the proposed Project would not result in significant environmental impacts. Consolidated Response RES-1 addresses issues related to preparation and review of the Emergency Response Plan for the proposed Project. Spill Prevention, Control, and Countermeasure plans are addressed in Section 2.3 of the EIS and in the Construction, Mitigation, and Reclamation Plan presented in Appendix B of the EIS.
12	4	Sweeney	Pat	Western Organization of Resource Councils	The Keystone XL pipeline will have significant environmental impacts, and is of great interest to our members, many of whom are among those who will be the most directly and severely affected by the pipeline. Among our members are other residents of the communities directly affected by the pipeline and associated road construction and power lines. Our members have direct knowledge of the likely impacts of the pipeline on their farms and ranches and their communities.	The impacts associated with implementation of the proposed Project are addressed in Section 3.0 of the EIS. As noted in that section, construction and normal operation the proposed Project would not result in significant environmental impacts.
270	1	Switzer	Paul	International Alliance Group	Recently a number of advocacy groups sent a letter seeking suspension of the permitting of the Keystone XL pipeline. I encourage you to reject the request and to continue to review the proposed project.	Comment acknowledged.
270	3	Switzer	Paul	International Alliance Group	Construction of this project stands to bring significant economic benefits to the areas where it will be built.	Comment acknowledged.
270	5	Switzer	Paul	International Alliance Group	The permitting processes in place are appropriate and should proceed so that a final determination can be made about the impacts of the project and whether it is in the national interest.	Comment acknowledged.
270	6	Switzer	Paul	International Alliance Group	I write in support of TransCanada's Keystone XL crude oil pipeline project and urge the department to grant a permit for the pipeline.	Comment acknowledged.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
270	9	Switzer	Paul	International Alliance Group	The environmental benefits of Keystone XL should not be overlooked.	Comment acknowledged.
270	13	Switzer	Paul	International Alliance Group	Pipelines are the safest, most reliable, economical and environmentally favorable way to transport oil and petroleum products, as well as other energy liquids, throughout the U.S. America depends on the more than 168,000 miles of liquid pipelines to move energy and raw materials our country relies on.	Comment acknowledged.
270	14	Switzer	Paul	International Alliance Group	Additional pipeline capacity will help consumers and businesses throughout the United States.	Comment acknowledged.
270	15	Switzer	Paul	International Alliance Group	This project also stands to provide a powerful private sector economic stimulus. During construction, the initial Keystone pipeline project created more than 13,000 jobs funded with private investment.	Consolidated Response ECO-1 and Section 3.10.2.2 of the EIS address the potential socioeconomic impacts of the proposed Project.
270	16	Switzer	Paul	International Alliance Group	Local governments will have a steady source of income from economic activity associated with construction and from property taxes the pipeline company will pay.	Comment acknowledged.
1483	1	Tatro	Jessica		The Department of State should not give permits for pipelines importing the worlds dirtiest fuel while the rest of the country fights to prevent catastrophic climate change. Tar sands oil will increase our transportation emissions, increase global warming pollution, and continue our dependence on oil. After the BP disaster, we need to be looking at a better plan for our energy future. Please consider the true impact of this pipeline by including the devastating effects of mining, refining and burning this fuel when you make your decision. Please say no to tar sands and do not grant a presidential permit to the Keystone XL pipeline.	Consolidated Response OIL-4 also addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils being processed in Gulf Coast refineries. The transportation fuel (i.e., gasoline, diesel fuel, and jet fuel) obtained from processing the crude oil that would be transported by the proposed Project would be the same as transportation fuel currently produced and sold by the Gulf Coast refineries. As a result, combustion emissions from the use of the fuel refined from the crude oil that would be transported by the proposed Project would not be different from the combustion emissions of fuels currently derived from heavy crude oil processed in those refineries. Consolidated Response GHG-2 addresses the potential causal connection of implementation of the proposed Project and expanded oil sands production in Canada and increases in refining. Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project.
789	1	Taylor	Timothy		The proposed pipeline crosses several miles of my family's ranch land in the Nebraska Sandhills...	Issues related to the Sand Hills area are addressed in Consolidated Response ERO-1.
789	2	Taylor	Timothy		The Sandhills are a unique and environmentally sensitive area. For the sake of my land, my livelihood, and my children, I beg you to protect the Nebraska Sandhills from the Keystone XL pipeline.	Identification of sensitive environments crossed by the proposed Project is discussed in Consolidated Response ENV-1 and ENV-3. Issues related to the Sand Hills area are addressed in Consolidated Response ERO-1.
789	3	Taylor	Timothy		[The proposed pipeline crosses several miles of my family's ranch land in the Nebraska Sandhills.] Our soil is easily eroded if disturbed...	Issues related to the Sand Hills area are addressed in Consolidated Response ERO-1.
789	4	Taylor	Timothy		[The proposed pipeline crosses several miles of my family's ranch land in the Nebraska Sandhills.] Situated over the Ogallala Aquifer we are blessed with an abundant supply of clean groundwater right under our feet. The proposed pipeline endangers the special resources we have in the Sandhills.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
1448	2	Taylor	Willie	United States Department of the Interior	GENERAL COMMENTS Migratory Birds The DEIS (p. 5-13) states that a Migratory Bird Mitigation Plan will be developed in consultation with the FWS to avoid, minimize, and mitigate impacts to migratory birds and migratory bird habitats. The Migratory Bird Mitigation Plan with specific mitigation measures should be developed before the Keystone project construction activities are initiated. The FWS Migratory Bird Regional Offices and Field Offices will be able to recommend regional- and area specific mitigation needs and conservation opportunities. Please contact the following offices to participate in the Migratory Bird Mitigation Plan: FWS Ecological Services Field Offices Arlington, Texas; Tulsa, Oklahoma; Clear Lake Ecological Services Field Offices Grand Island, Nebraska Pierre, South Dakota Billings, Montana FWS Migratory Bird Offices Lakewood, Colorado Albuquerque, New Mexico The Migratory Bird Treaty Act (MBT A) has no provision to allow unauthorized take of migratory birds. The FWS recognizes, however, that some birds could be killed during construction and operation of energy infrastructure even if all known reasonable and effective measures to protect birds are used. The FWS's Office of Law Enforcement (OLE) carries out its mission to protect migratory birds through investigations and enforcement, as well as by fostering relationships with individuals, companies, and industries that have taken effective steps to avoid take of migratory birds and by encouraging others to implement measures to avoid take. It would not be possible to absolve individuals, companies, or agencies from liability even if they implement bird mortality avoidance or other similar protective measures. However, the OLE focuses its resources on investigating and prosecuting individuals and companies that take migratory birds without identifying and implementing all reasonable, prudent and effective measures to avoid take. We encourage companies to work closely with the FWS biologists to identify available protective measures when developing project plans and/or avian protection plans, and to implement those measures prior to and during construction, and similar operational activities.	Keystone is coordinating with U.S. Fish and Wildlife Service to minimize potential incidental take of migratory birds.
1448	3	Taylor	Willie	United States Department of the Interior	The FWS recommends the following conservation actions for the Keystone project to avoid impacts to migratory birds: 1. Take of migratory birds should be avoided, and loss, destruction, and degradation of migratory bird habitat should be minimized.	Keystone is coordinating with the U.S. Fish and Wildlife Service to minimize potential incidental take of migratory birds.
1448	4	Taylor	Willie	United States Department of the Interior	2. Avoid any habitat alteration, removal, or destruction during the primary nesting season for migratory birds. If there is reasonable likelihood that any project activities will take migratory birds, those activities should be performed during the time of year that the birds are not nesting. This includes vegetation clearing, cutting, and grubbing. The primary nesting season for migratory birds varies greatly between species and geographic location. Principally, nesting seasons extend from early April to mid-July, but the maximum period for the migratory bird nesting season can extend from early February through late August. Eagles and some owls may initiate nesting in late December in some geographic areas. Due to	Keystone is coordinating with the U.S. Fish and Wildlife Service to minimize potential incidental take of migratory birds.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					this variability, Project proponents should consult with the appropriate the FWS' s Regional Migratory Bird Program for specific nesting seasons of all protected species that may nest in the Project area. We recommend that Project proponents strive to complete all disruptive activities outside the migratory bird nesting season to the greatest extent possible. Vegetation clearing in the year prior to construction (but not within the nesting season) may help to discourage birds from attempting to nest in the proposed construction area, thereby decreasing the likelihood of take by construction activities.	
1448	5	Taylor	Willie	United States Department of the Interior	3. If the proposed project will potentially take migratory birds and/or result in loss or degradation of migratory bird habitat, and work cannot occur outside the migratory bird nesting season (either the primary or maximum nesting season), project proponents should provide the FWS with an explanation for why the work must occur during the nesting season. Further, in these cases, project proponents also must demonstrate that all efforts were made to complete work outside the migratory bird nesting season and the reasons for work during the nesting season are beyond the proponent's control. When project construction cannot occur outside the migratory bird nesting season, project proponents should survey those portions of the proposed project area during the nesting season prior to construction to determine if migratory birds are present and if nesting occurs in those areas. In addition to conducting surveys for nesting birds during the construction phase, project proponents may benefit from conducting surveys during the prior nesting season. Such surveys will assist the proponent in any decisions about the likely presence of nesting migratory birds or sensitive species in the proposed project or work area. Though individual migratory birds do not necessarily return to nest at the exact site as in previous years, a survey in the year before construction will familiarize the project proponent with the species and numbers present in the project construction area. Bird surveys should be completed during the nesting season in the best biological timeframe for detecting the presence of nesting migratory birds, using accepted bird survey protocols. The FWS's Migratory Bird offices or Ecological Services field offices can be contacted for recommendations on appropriate procedures. Project proponents also should be aware that results of migratory bird surveys are subject to spatial and temporal variability. If construction during the primary nesting season cannot be avoided and will impact habitats suitable for nesting birds, the project proponents also should conduct migratory bird surveys during the actual year of construction.	Keystone is coordinating with the U.S. Fish and Wildlife Service to minimize potential incidental take of migratory birds.
1448	6	Taylor	Willie	United States Department of the Interior	4. If no migratory birds are found nesting in the proposed project areas immediately prior to project construction and associated activities, project activity may proceed as planned.	Keystone is coordinating with the U.S. Fish and Wildlife Service to minimize potential incidental take of migratory birds.
1448	7	Taylor	Willie	United States Department of the Interior	5. If migratory birds are present and nesting in the proposed project area, officials of the Keystone project should contact the nearest FWS's Ecological Services field office and the FWS's Regional Migratory Bird Program for guidance on appropriate next steps to take to minimize impacts to	Keystone is coordinating with the U.S. Fish and Wildlife Service to minimize potential incidental take of migratory birds. Keystone and the U.S. Department of State consulted and developed conservation measures to avoid take of federally endangered, threatened or proposed plants and animals.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					migratory birds associated with the project. These proposed conservation actions assume that no federally endangered or threatened migratory bird species, or other listed animals or plants are present in that portion of the project area.	
1448	8	Taylor	Willie	United States Department of the Interior	If endangered or threatened species are present, or potentially present, and the proposed Project could affect these species, officials of the Keystone proposed Project should consult with the nearest FWS's Ecological Services field office before proceeding.	Conservation measures were developed during the Section 7 Endangered Species Act consultation process and are described in Section 3.8 of the EIS and in the Biological Assessment in Appendix T of the EIS.
1448	9	Taylor	Willie	United States Department of the Interior	The FWS is concerned about impacts to migratory birds caused by the construction of above-ground facilities such as meter stations, pump stations, connection stations, main line valve stations, and other facilities associated with the project. The locations of all above-ground facilities associated with the pipeline should be identified and depicted on a map to aid resource agency evaluation. All utility lines associated with this project should be included in the project description, and the DEIS should evaluate the impacts of these structures to bird habitat. The FWS recommends that any bright lighting associated with above-ground structures should be down-shielded to reduce disturbance to migratory birds. In addition, security lighting for on ground facilities and equipment should be down-shielded to keep the light within the boundaries of the site to reduce impacts to resident bird and wildlife species.	<p>Section 2.5 of the EIS describes the electrical distribution lines and the electrical transmission line are considered connected actions. The locations of those facilities are depicted on Figures 2.1.2 through 2.1.6 of the EIS. Photo alignment sheets of the entire route, including identification of the locations of aboveground facilities, are available on the Department of State web site for the Project at http://www.keystonepipeline-xl.state.gov/clientsite/keystonexl.nsf?Open Click on "Project Documents" and the maps are accessible under "Supplemental Filing." The impact analysis in Section 3.6 of the EIS includes consideration of birds.</p> <p>The design, construction, and operation of those connected actions are not part of the proposed action as described in Section 2.5 of the EIS. The utilities proposing the projects would have to obtain all appropriate federal, state, and local permits, authorizations, and approvals. The specific information requested by the commentor would be provided by the utilities as a part of the permit application process. DOS would not have any involvement in reviewing permit applications for those facilities or developing alternatives for those facilities. The potential impacts of the electrical distribution lines and the Lower Brule to Witten electrical transmission line are addressed in the resource sections of Section 3.6.5 of the EIS to the extent possible; however, those projects are in the development stage and not all project information is available. The potential impacts of those projects would be assessed in detail during the permitting process. Although the permit applications for the connected actions would be reviewed and acted on by other agencies, the potential impacts of these projects have been analyzed in the EIS based on currently available information. However, only limited information was available on the design, construction, and operation of the projects. Keystone has committed to using down-lighting at lighted aboveground facilities to minimize impacts to wildlife.</p>
1448	11	Taylor	Willie	United States Department of the Interior	The FWS recommends that all project activities along the Gulf coast be prohibited within 1,000 feet of active bird rookeries during their primary nesting season, February 15 to September 1. TransCanada Keystone XL Pipeline should develop a survey and monitoring plan to locate rookeries and to ensure they are not disturbed by construction activities.	Table 3.6.2-3.was revised to add the commenter's recommended buffer and timing.
1448	12	Taylor	Willie	United States Department of	Bald and Golden Eagle Protection Act Bald and golden eagles are protected under both the MBTA and the Bald and Golden	Keystone is currently consulting with the U.S. Fish and Wildlife Service Migratory Bird and Ecological Services divisions

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
				the Interior	Eagle Protection Act (BOEP A). The BOEP A prohibits the take, possession, sale, purchase, barter, offer to sell, purchase, or barter, transport, export or import, of any bald or golden eagle, alive or dead, including any part, nest, or egg, unless allowed by permit. Activities that would disturb bald or golden eagles also are prohibited under BOEP A. "Disturb" means to agitate or bother a bald or golden eagle to a degree that causes, or is likely to cause, based on the best available scientific information: (1) injury to an eagle, (2) a decrease in the eagles' productivity, by substantially interfering with normal breeding, feeding, or sheltering behavior, or (3) nest abandonment, by substantially interfering with normal breeding, feeding, or sheltering behavior. If a proposed project or action would occur in areas where nesting, feeding, or roosting eagles occur, you may need to take additional conservation measures to achieve compliance with BOEPA. New regulations (50 CFR § 22.26 and § 22.27) allow for the take of bald and golden eagles and their nests in certain circumstances. However, coordination with the Migratory Bird, Ecological Services, and OLE programs of the FWS will be required before a permit is issued.	concerning the Migratory Bird Treaty Act, Bald and Golden Eagle Protection Act, and Endangered Species Act.
1448	13	Taylor	Willie	United States Department of the Interior	Wetlands: The EIS should identify all wetlands existing within the temporary and permanent project right-of-ways (ROW) for both the proposed and alternative pipeline routes. For purposes of public disclosure of project impacts, maps depicting these wetlands should be developed to facilitate resource agency review and evaluation. Wetlands crossed by roads should have culverts or similar structures installed to ensure hydrology is maintained. Where wetlands and other water body crossings cannot be avoided, we recommend directional drilling be used to avoid and minimize impacts. The wetlands and other water bodies proposed for avoidance by directional drilling should be identified in the EIS, with input from the Department FWS and other state and Federal resource agencies.	The alternatives analysis was initially conducted as a screening process that first identified potential alternatives to the proposed Project then screened out alternatives that were not judged to be reasonable. As noted in Section 4.0, all major alternatives identified were screened out as not being reasonable and were not further evaluated. Therefore, DOS has not addressed specific wetlands along the alternative routes identified in the assessment. Overlay maps of the Keystone XL proposed Project have been provided to U.S. Fish and Wildlife Service offices involved in various consultations. These maps show locations of wetlands. Road crossings of wetlands would provide for maintenance of hydrology. Using Horizontal Directional Drilling (HDD) to cross all wetlands and waters would not be practical as described in general Consolidated Response ENV-5. There are currently no wetland areas that have been identified for crossing using HDD; although most HDD crossings of rivers and streams are designed to cross under riparian forests and riverine wetlands.
1448	14	Taylor	Willie	United States Department of the Interior	The impacts on wetlands from the project-related activities and auxiliary facilities such as project access roads, pipe storage yards, rail sidings, contractor's yards, and construction camps should be included in the EIS. Temporary loss of wetland function and values also should be addressed in the EIS. The temporary loss of wetland functions and values during, and immediately following, construction will be important in determining the total amount of wetlands affected by project activities and the mitigation necessary to offset wetland impacts. We recommend that a wetland mitigation plan be developed in consultation with state wildlife agencies and the FWS, with a goal of "no net loss" of in-kind wetlands. We recommend the DEIS address impacts to all wetland types, and that the wetland mitigation plan mitigate these impacts. Wetland mitigation planning should occur with input and review by the FWS and other Federal and state resource	Estimated impacts from ancillary facilities outside of the 110-foot ROW were added to the wetland analysis. Most ancillary facilities are sited outside of wetlands and away from streams and total impacts to wetlands from these facilities are estimated at less than 30 acres or temporary impact during construction and about 11 acres of permanent impact during operations (see added Tables 3.4.3-3 and 3.4.3-4.) Keystone is currently consulting with the State of Nebraska concerning permanent wetland impacts at Pump Station 22. Most wetlands would be restored after pipeline construction. Mitigation for wetland losses are negotiated during the permitting process as discussed in general Consolidated Response WAT-2.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					agencies, and mitigation of impacts should be determined by the Army Corps of Engineers (Corps) with input from the FWS, state, and other Federal resource agencies. A preliminary estimate of the proposed compensation and mitigation also should be disclosed within the EIS for public review and comment.	
1448	15	Taylor	Willie	United States Department of the Interior	Animal Passage and Aquatic Biota. The DEIS identifies several aquatic species potentially impacted by the proposed project activities, but the discussion of proposed mitigation activities to minimize, reduce, or prevent impacts on these species, especially for the Fisheries section of the DEIS is minimal. It would be a benefit to the public for the final EIS to include relevant scientific literature that discuss impacts associated with similar pipeline projects, assessments based on those findings, and proposed mitigation options to avoid, minimize, or reduce impacts on those species. Installed culverts, either as permanent or temporary crossings, should be constructed at elevations that do not impede movements of fish, amphibians, and other aquatic and semi-aquatic animals. FWS further recommends that the project proponent not alter or install culverts in any way that would reduce the present channel width. We have attached recommended best management practices for stream and rivers to minimize potential impacts to mussels, native fish and other aquatic resources (Attachment 2).	The extent and duration of potential Project-related impacts on aquatic and fish resources would depend on many site-specific factors including waterbody flow, species distribution, disturbed sediment particle size, implementation of BMPs, type of installation, and duration of instream disturbance. Section 3.7.3 of the EIS was revised to provide additional descriptions of construction-related impacts to fisheries resources, and avoidance, mitigation, and minimization measures.
1448	16	Taylor	Willie	United States Department of the Interior	Nuisance and Invasive Species Monitoring and Control Plan. A plan to monitor and control nuisance and invasive species should be developed and implemented throughout the life of pipeline project operations. This particularly applies to the vegetation and aquatic species. To reduce the distribution of invasive species, we recommend that all equipment be cleaned and/or treated before entering areas with sensitive habitats.	Keystone would implement measures to prevent the spread of noxious weeds and invasive aquatic animals as described in Sections 3.5.5.4 and 3.7.3.1 of the EIS. Section 3.7.3.1 of the EIS was revised to include additional measures Keystone would implement to prevent the spread of aquatic invasive species. The measures described were recommended by federal and state management agencies. Keystone will develop and implement weed control plans which includes identification of weed sources identified along the ROW that includes additional specific descriptions of methods for containment and control as part of its Construction, Mitigation, and Reclamation Plan, which is in Appendix B of the EIS.
1448	17	Taylor	Willie	United States Department of the Interior	Areas of Conservation Concern Pineywoods Mitigation Bank - The DEIS indicates the proposed pipeline will cross the Pineywoods Mitigation Bank (Bank). In order to minimize impacts to this sensitive area and reduce forest fragmentation in the Bank, we recommend moving the proposed pipeline to the existing pipeline corridor located to the east of this area.	Keystone has realigned a portion of the proposed route to avoid crossing the Pineywoods Mitigation Bank. The EIS was revised accordingly.
1448	18	Taylor	Willie	United States Department of the Interior	Trinity River National Wildlife Refuge - Pipeline alignment in relation to the boundaries of the FWS wildlife refuges should be clarified. Although the DEIS states that the pipeline crosses no Federal lands in Texas and Oklahoma, the small-scale maps in the DEIS make it difficult for reviewers to verify the proposed alignment in relation to refuge lands. Based on the maps provided, it appears the pipeline may cross Trinity River National Wildlife Refuge (NWR), located south of Liberty, Texas. We recommend that you contact the Trinity River NWR regarding the alignment and to identify any potential direct or indirect impacts that should be addressed.	The U.S. Department of State verified that the Houston Lateral Segment would cross the Trinity River National Wildlife Refuge within the Champion Lake Unit, in Liberty County, Texas between the Trinity River and Self Bayou from MP 18.9 to MP 22.4. This information was submitted to Keystone.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
1448	19	Taylor	Willie	United States Department of the Interior	In addition, the EIS should state that the pipeline alignment would cross two Priority One Bottomland Hardwood Forests in Texas. These two forested areas are the Demijohn Lake/Devers Canal (portions of which are now part of the Trinity River NWR) along the Trinity River south of Liberty, Texas, and the Middle Neches River. These sites were identified in the Texas Bottomland Hardwood Preservation Program Concept Plan (USFWS 1985). Alignment would cross Deep Fork Wildlife Management Area (WMA) in Texas. This should be corrected to indicate Deep Fork WMA is located in Oklahoma.	The revised alignment was compared to delineations for the Demijohn Lake/Devers Canal and the Middle Neches River Priority One Bottomland Hardwood Forests in Texas (USFWS 1985). The delineations represented in Figure 31 and Figure 33 of the Texas Bottomland Hardwood Preservation Program Final Concept Plan (USFWS 1985) were delineated on topographic maps and compared to the proposed Project's alignment. Note that the delineations are approximate due to the quality of the figures. Neither of the Priority One Bottomland Hardwood Forest areas are crossed by the proposed Project. The Gulf Coast segment encroaches on the Middle Neches River area near MP 349 to MP 350. The forests in the area, however, are under active silviculture including areas of forest plantation, clear cuts, and recent cuts. A portion of the proposed route of the Houston Lateral is near the Demijohn Lanke/Devers Canal area at MP 22 where the Houston Lateral crosses the Trinity River; the pipeline right-of-way does not cross or encroach on the area. The area surrounding the Houston Lateral crossing of the Trinity River is identified as a water oak - willow oak series community in the Texas Natural Diversity Database, and estimated impacts to this community are listed in Table 3.5.5-3 of the EIS. In addition, the EIS was revised to make the correction noted by the commenter.
1448	20	Taylor	Willie	United States Department of the Interior	Milk River Wildlife Management Area - A new power line to support a pipeline pump station is proposed to be located next to a large wetland at Montana's Milk River WMA (Area 8). The power line would run along the eastern boundary of the WMA and directly in the flight path of birds that use a large WMA wetland. The new power line would represent a new threat to birds using the WMA, as large numbers of waterbirds approach the wetlands from this direction. The FWS recommends that a 0.5-mile length of the power line bordering Area 8 (South Y, Section 20, R33/T32) be buried to avert bird collisions. Burial would be a more permanent and effective solution to migratory bird mortality than power line marking. Though line marking would diminish the impacts, the new marked line would nonetheless be a new and added source of migratory bird mortality and would require continued maintenance costs.	This transmission line has been re-routed to avoid the Milk River Wildlife Management Area.
1448	21	Taylor	Willie	United States Department of the Interior	Threatened and Endangered Species Please refer to the FWS letter to DOS pertaining to the proposed Project's draft Biological Assessment (DBA) for detailed comments and recommendations regarding threatened and endangered species. The FWS has indicated that the preferred Keystone XL pipeline route may affect and is likely to adversely affect the Whooping crane, least tern, piping plover, American burying beetle (ABB), and western prairie fringed orchid (WPFO). The FWS's conclusion is based in part on the inclusion of the new distribution lines that will be built to deliver power to the pipeline pumping stations. Under ESA consultation procedures, these new power lines are part of the proposed Project because, "but for" the construction of the proposed pipeline, the new power lines would not be necessary. Although the power lines are installed and	As discussed in the the Biological Assessment presented in Appendix T of the EIS and in Section 3.8.1.2, the power providers, not Keystone, would be responsible for construction and operation of the power distribution lines to the pump stations. A preliminary summary analysis of potential distribution line-related impacts to these species is provided in Sections 3.8.1.2 and 3.8.1.7 of the EIS and is also included within the Biological Assessment in Appendix T. The Biological Assessment also includes an appendix with letters from the responsible power providers to USFWS confirming their commitment to consult with the USFWS under the Endangered Species Act for construction and operation of the electrical distribution lines to the proposed pump stations.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					operated by local power providers, the effects of the new power lines on listed threatened and endangered species will need to be evaluated in the consultation for the Keystone XL pipeline, along with the direct effects of the pipeline and any associated other ancillary facilities such as roads and pump stations. Another factor in the FWS' s recommendation to conduct formal consultation for the above species is the need for species surveys to detect presence immediately prior and during construction activities. Species' surveys scheduled to occur as much as 2 weeks prior to construction activities would be inadequate to avoid adverse impacts to whooping cranes, least terns, and piping plovers that might be present in the area. (Thus, to minimize the potential impacts, the conservation measures described in the DEIS to avoid disturbance of these avian species should be revised.)The threatened and endangered species list presented in DEIS Section 3.8 should be updated. In November 2009, Texas Parks and Wildlife Department listed six species of mussels within the proposed Project area as threatened: Louisiana pig toe (<i>Pleurobema ridellii</i>), sandbank pocketbook(<i>Lamslilis satura</i>), southern hickorynut (Obvaria jacksoniana), Texas heelsplitter (potamilus amphichaenus) Texas pigtoe (<i>Fusconala askewi</i>), and the triangle pigtoe (<i>Fusconala lananensis</i>). In response to two petitions, the FWS is currently reviewing the status of the triangle pigtoe, southern hickorynut, Louisiana pigtoe, and the Texas heelsplitter to determine whether listing these species under the ESA may be warranted.	
1448	22	Taylor	Willie	United States Department of the Interior	Candidate Species The FWS recommends that the EIS assess proposed Project impacts on Neches River rose mallow and Louisiana pine snake. The habitats in the pipeline alignment in counties where these species occur should be evaluated to determine their suitability for these species.	The Louisiana pine snake is evaluated in Section 3.8.1.4 of the EIS and the Neches River rosemallow is evaluated in Section 3.8.1.7. No surveys or habitat evaluations were recommended by U.S. Fish and Wildlife Service during consultation. Evaluation of the March 2010 Candidate Review and information for surveys to identify potentially suitable red-cockaded woodpecker habitat indicate that the proposed Project would not impact the Louisiana pine snake or habitats suitable for the Louisiana pine snake. Review of the April 2010 Candidate Review and information for wetland habitats indicate that the proposed Project would not impact the Neches River rosemallow or habitats suitable for this plant.
1448	23	Taylor	Willie	United States Department of the Interior	Vegetation Communities. The DEIS discussion of the Cross Timbers vegetation type in Oklahoma does not mention significant blocks of old-growth habitat that occur within this area. The old-growth habitats areas should be mapped and should be avoided by the pipeline right-of-way. Dr. David Stahle, Professor of Geosciences at the University of Arkansas, has identified many ancient Cross Timber woodlands.	Maps of modeled areas of potential ancient Cross Timbers forests were obtained and the proposed pipeline route was evaluated for crossings. The EIS was revised to include relevant information regarding this. Most predicted occurrences of ancient Cross Timbers forests are located in areas where the proposed right-of-way would be adjacent or parallel to other pipeline rights-of-way.
1448	25	Taylor	Willie	United States Department of the Interior	The Department has a continuing interest in working with the U.S. Department of State (DOS) and the Keystone project proponent to address the impacts to resources of concern to the Department. We look forward to working closely with DOS and other cooperating agencies to address our comments as this project moves forward.	Comment acknowledged.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
1448	26	Taylor	Willie	United States Department of the Interior	Pages 2-2 to 2-26, Section 2.1.1: Steel City Segment, Above Ground Facilities and Construction Procedures. Comment: The total area either temporarily or permanently disturbed by the proposed Project, and that is located in potential ABB habitat, should be documented. This area should include all areas affected by construction activities, borrow sites, temporary and permanent above-ground facilities, pipe storage sites, contractor yards, railroad siding, pump stations, utility distribution line ROWs, and access roads. This information will be needed for formal consultation regarding the ABB. Similarly, information on the total proposed Project-disturbed area located in potential WPFO habitats will be needed for formal consultation on that species.	The revised assessment for the American burying beetle in the Biological Assessment presented in Appendix T of the EIS includes acres of habitat impacts for all temporary and permanent facilities for the formal consultation. Conservation measures were revised for the western prairie fringed orchid to include surveys and/or contribution to a conservation measure for potential Project-related impacts to unknown populations that may occur within potentially suitable habitats for which access for surveys was denied by the landowner. This is discussed in the Biological Assessment presented in Appendix T of the EIS as well as in Section 3.8.1.6 of the EIS.
1448	28	Taylor	Willie	United States Department of the Interior	Page 2-24, Section 2.3.2.6: "Hydrostatic test water ... discharged to a suitable upland area within the same water basin as the source waterbody." The EIS should indicate what order is the watershed.	As specified in Keystone's Construction, Mitigation, and Reclamation Plan in Appendix B of the EIS, selection of final test water sources and discharge locations would be determined based on site conditions at the time of construction and applicable permits.
1448	29	Taylor	Willie	United States Department of the Interior	Page 2-25, Section 2.3.2.9: "Reclamation on the ROW would be inspected after the first growing season to determine the success of revegetation and noxious weed control. Erosion would be repaired and areas that were unsuccessfully re-established would be revegetated by Keystone or by compensation of the landowner to reseed as necessary." Will erosion be repaired before the area is re-seeded?	Erosion would be repaired before an area is re-seeded as described in Section 3.2.2.1 of the EIS.
1448	30	Taylor	Willie	United States Department of the Interior	Section 2.3.3.3: What is "steep terrain"?	Steep terrain, as defined by USDA's Soil Survey Manual, are 20 to 60 percent slopes.
1448	31	Taylor	Willie	United States Department of the Interior	Page 2-30: No section addressing ephemeral drainages	Ephemeral streams are included in the intermittent waterbody crossing discussion presented in Section 3.3.1.2 of the EIS.
1448	36	Taylor	Willie	United States Department of the Interior	Page 3.1-13, Paleontology Portion of Section 3.1: The paleontology portion of Section 3.1 needs to incorporate the results of the paleontological inventories performed by SWCA on BLM lands for the Montana Segment of the Pipeline. If paleontological inventories for other sections of the pipeline have been completed, these also need to be included here.	Additional surveys were conducted after the draft EIS was published. The results of these studies are presented in the final EIS.
1448	37	Taylor	Willie	United States Department of the Interior	Page 3.1-14, 2nd Paragraph: The Paleontological Monitoring and Mitigation Plan will also need to be included in the plan of development (POD) submitted to the BLM. It should also be stated here.	The text of the EIS has been revised in response to this comment.
1448	38	Taylor	Willie	United States Department of the Interior	Page 3.1-14, 3rd Paragraph: The paragraph referring to the PA and 36 CFR 800 needs to be removed from this section. Fossils are not generally considered historic properties under NHPA. A separate document is needed to address unanticipated impacts to paleontological resources by the pipeline.	A Memorandum of Understanding is being developed to further the identification, evaluation, and protection of paleontological resources.
1448	39	Taylor	Willie	United States Department of the Interior	Page 3.1-21: "Implementation of temporary erosion control structures would reduce the likelihood of construction-triggered landslides." What type of structures would be used?	Temporary erosion control measures are described in Section 4.11.5 of Keystone's Construction, Mitigation, and Reclamation Plan, which is included as Appendix B to the EIS. Potential measures include trench breakers, slope breakers or water bars, erosion control matting and mulching.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
1448	40	Taylor	Willie	United States Department of the Interior	Page 3.2-1, Section 3.2.1: "Highly erodible soils" - How are these defined? Are these the same as the "Erosion Prone" listed in Appendix G, Table G-1? If so, state that here	As defined in Section 3.2.1 of the EIS, highly erodible soils are soils that are prone to high rates of erosion when exposed to wind or water by removal of vegetation. The Tables 3.2.1-1 and 3.2.1-2 of the EIS present are a summary of the highly erodible soils listed in Appendix G.
1448	41	Taylor	Willie	United States Department of the Interior	Page 3.2-5 and 3.2-6 Section 3.2.2.1: "Potential impacts could include ... permanent soil contamination." Include soil mixing. "Construction activities would be shut down during the winter months ... winter construction techniques." Page 2-19 states: "On the Steele City Segment, construction is planned to continue into the winter months for as long the weather permits." These say two different things. The word "heavy" needs to be removed from in front of construction vehicles and equipment." All vehicles are capable of causing soil compaction here would be Permanent "loss of topsoil" unless there are provisions to segregate it.	The EIS has been revised in response to this comment.
1448	42	Taylor	Willie	United States Department of the Interior	Pages 3.2-11 and 3.2-12, Section 3.2.2.2, Soil temperature Impacts: The DEIS language at the top of page 3.2-12 states: The study concluded that the pipeline does have some effect on the surrounding soil temperature; however, these effects occur primarily at the pipeline depth. Near-surface soil temperatures are influenced mainly by climate, with minimal effects from pipeline operations. Direct temperature effects on vegetation are expected to be minimal and vary seasonally. Comment: This language is not entirely consistent with language regarding soil temperature impacts to vegetation on page 3.5-31: Operation of the project would cause increases in soil temperatures at the soil surface (from 4 to 8°F) primarily during winter, and at depths of 6 inches (from 10 to 15°F), with the most notable increases during spring in the northern portion of the pipeline (Keystone, 2009c) (see Appendix L). While many plants would not produce root systems that would penetrate much below 6 inches, the root systems of some plants, notably native prairie grasses, trees, and shrubs; often penetrate well below 6 inches. Soil temperatures closer to burial depth of 6 feet could be as much as 40° F warmer than the surrounding soil temperatures (Appendix L). In general, increased soil temperatures during early spring would cause early germination and emergence ... in tall-grass prairie species (Appendix L). Increased soil temperature may lead to localized soil drying This apparent discrepancy should be corrected or clarified, and an explanation of the methodology and results should be provided in more detail. The effect of pipeline operation on soil temperature and moisture is also an issue that should be addressed in formal consultation on project impacts on the ABB. We recommend that information from Appendix L that addresses the affect of soil temperature on crops and vegetation also be applied to potential impacts to various stages of the ABB' s life cycle in Section 3.8.1.6.	Consolidated Response ENV-2 addresses concerns related to pipeline temperature effects. The potential effects of soil temperature increases on the American burying beetle were considered during the DOS consultation with the U.S. Fish and Wildlife Service and are addressed in the Biological Assessment presented in Appendix T.
1448	43	Taylor	Willie	United States Department of the Interior	Page ES-2, 1st Line: Last paragraph in ES.2.1: Add portions in red - The pipeline would require a 110-foot wide construction right-of-way (ROW), consisting of a 60-foot temporary easement/temporary use permit and a 50-foot permanent easement/ROW plus the ground occupied by the	The EIS has been revised to reflect the agency's permit requirements. However, the pipe and related facilities would be within the permanent easement/ROW.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					pipeline and related facilities.	
1448	46	Taylor	Willie	United States Department of the Interior	Page ES-3, Section ES-2.2, Last sentence: What does this sentence pertain to? Which alternatives?	Western identified two potential electrical transmission line corridors and several route options within each corridor for the Big Bendwer Brule to Witten transmission line. Those are the alternative transmission line corridors that would be assessed by Western. The environmental assessment of the Big Bend to Witten 230-kV Transmission line will be addressed in a separate environmental analysis conducted by RUS.
1448	49	Taylor	Willie	United States Department of the Interior	Page ES-17, Section ES.6.12, Air Quality and Noise: Pipeline construction activities in anyone area could last from 30 days to 7 weeks. Construction of all pump stations would take approximately 18 to 24 months, and construction of the Steele City tank farm would take approximately 15 to 18 months. Comment: Conservation measures to reduce potential impacts of noise from blasting and from operation of the pump stations should include measures to minimize harassment of migrating whooping cranes, nesting least terns, and piping plovers. If whooping cranes are present, construction activities should cease until the species' presence is reported to the nearest Ecological Services Field Office. The Field Office will then advise Keystone officials of measures to take before activities may resume.	Blasting is not being proposed for construction (see Section 3.2 of the EIS). The proposed tank farm locatoin was moved from Steele City, Nebraska to Cushing, Oklahoma and surveys indicate no Endangered Species Act protected species occur within the proposed tank farm area. Keystone and DOS consulted with the U.S. Fish and Wildlife Service. Section 3.8 of the EIS and the Biological Assessment were revised to include the following: "During spring and fall whooping crane migration periods Environmental Monitors would complete a brief survey of any wetland or riverine habitat areas potentially used by whooping cranes in the morning and afternoon before starting equipment; if whooping cranes are sighted the Environmental Monitor would contact the USFWS and equipment start would be delayed until whooping cranes leave the area by mid-morning. USFWS would notify Keystone if whooping cranes are within the construction area through information gathered from the whooping crane tracking program. Note that if whooping cranes land within an area where an HDD crossing is already in progress - this activity would be allowed to continue." Pre-construction surveys would be completed for nesting least terns and piping plovers and construction would be delayed if nesting pairs were within 0.25 mile of the construction area.
1448	50	Taylor	Willie	United States Department of the Interior	Page 3.3-21, Table 3.3.1.3-1: NRCS soil data should be incorporated	Comprehensive soil data for the entire proposed Project route is presented in Appendix G of the EIS.
1448	51	Taylor	Willie	United States Department of the Interior	Page 3.3-24, Section 3.3.2.1: What is the expected timeframe of construction impacts of increased surface water runoff and erosion and degradation of groundwater quality? What about changes in infiltration by vegetation removal, soil compaction?	See Consolidated Response ERO-2 for examples regarding how Keystone would mitigate these impacts. The expected timeframe would vary by location, based on when each segment of trench would be excavated and the pipeline placed.
1448	52	Taylor	Willie	United States Department of the Interior	Page 3.3-25, Section 3.3.2.2: What is the expected timeframe of construction impacts of changes in channel morphology and stability? What would be the increases in total dissolved solids (TDS), nutrients, metals, and total organic carbon? Would there be decreased streambed porosity? What effects would occur from removal of riparian vegetation and channel incision?	Construction across waterbodies is expected to be completed within 24 to 48 hours of initiation. Issues related to the potential for erosion adjacent to streambanks and private land area are addressed in Consolidated Response ERO-2. Consolidated Response WAT-1 addresses concerns regarding water quality. Estimating the increases in TDS, nutrients, metals, and total organic carbon due to construction of waterbody crossings cannot be estimated without the specific flow information and construction technique to be used at each crossing. The specific methods used will be determined by the U.S. Army Corps of Engineers in the Section 4.4 permit review process.
1448	53	Taylor	Willie	United States Department of	Page 3.3-27, Section 3.3.2.2: "Geomorphic assessment of water body crossings could provide significant cost savings	Consolidated Response WAT-1 addresses stream crossing methods and the associated potential water quality impacts.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
				the Interior	and environmental benefits." Will this be done? If so, where? What is the difference in impacts among the crossing methods? There should be a discussion of the impacts from each crossing method. Hydrostatic Testing section does not disclose any effects from withdrawal or discharge.	Geomorphic assessments would be accomplished where required by permitting agencies and where Keystone determines they would be appropriate for the design of the crossing. Keystone has committed that the proposed Project would not withdraw hydrostatic test water from any waterbody where such withdrawal would create adverse effects. Water withdrawal and discharge methods that would be implemented are described in Section 8.0 of Keystone's Construction, Mitigation, and Reclamation Plan in Appendix B of the EIS and in Section 3.3.2.2 of the EIS. As a result of the use of those methods, there would be, at most, a negligible impact to water quality.
1448	54	Taylor	Willie	United States Department of the Interior	Section 3.3: There is a general inconsistency throughout the document as to whether the crossing depth is maintained for least 15 feet beyond the designated lateral migration zone or 15 feet to either side of the edge of the waterbody or at least 15 feet beyond either side of the active stream channel.	The proposed Project would be installed at the design crossing depth for at least 15 feet beyond the design lateral migration zone, as determined by qualified personnel. Section 2.3.3.5 of the EIS discusses waterbody crossing during construction.
1448	55	Taylor	Willie	United States Department of the Interior	Page 3.3-28, Section 3.3.2.2: "Blasting has the potential to affect surface water resources." What would be the effects? "Channel migration or streambed degradation could potentially expose the pipeline, resulting in temporary short-term or long-term adverse impacts to water resources."What would be the effects? "Potential bank protection measures could include installing rock, wood, or other materials keyed into the bank to protect from further erosion, or provide protection for banks to reduce the bank slope. Disturbance associated with these maintenance activities may potentially create additional water quality impacts." What would be these impacts? The use of these measures has impacts as well. "Bank erosion rates could exceed several meters per year. Not maintaining an adequate burial depth for pipelines in a zone that extends at least 15 feet (5 meters) beyond either side of the active stream channel could necessitate bank protection measures that would increase both maintenance costs and environmental impacts." Crossings need to be "for least 15 feet beyond the designated lateral migration zone" or evaluated site-specifically. "In addition to the measures that Keystone has committed to use to protect water resources during operation, the following potential mitigation measures have been suggested by regulatory agencies:" Does this mean that these measures will be employed? If not, the document should explain why not.	As described in Section 2.3.3 of the EIS, blasting is no longer planned as part of installation activities for the proposed Project. In areas of shallow bedrock and cemented, dense soil, ripping will be employed. Consolidated Response WAT-1 and Sections 3.3.2.2 and 3.7.3 address the potential impacts to water quality and fisheries resources.
1448	56	Taylor	Willie	United States Department of the Interior	Page 3.3-29, Section 3.3.2.3: "Although two pump stations and 10 ML V s would be in the 100-year floodplain as currently proposed, the effect of those facilities on floodplain function would be minor." What would be the effects?	Water could locally pond or run over the ground surface during a 100-year event. That is the current condition during 100-year flows and that condition is not expected to change with implementation of the proposed Project. In addition, Section 3.3.2.3 of the EIS was revised to include the following statement: "These facilities would be constructed after consultation with the appropriate county agencies to design and to meet county requirements and to obtain the necessary permits associated with construction in the 100-year floodplain."
1448	57	Taylor	Willie	United States Department of	Page 3.4-4, paragraph 1: The summary of disturbed acres does not appear to include the acres of disturbance	Estimated impacts from ancillary facilities outside of the 110-foot ROW were added to the wetland analysis. Most ancillary

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
				the Interior	associated with pipe storage yards, rail sidings, contractor's yards, access roads, or construction camps and similar project-impacted areas. We recommend these disturbed acres be included.	facilities are sited outside of wetlands and away from streams and total impacts to wetlands from these facilities are estimated at less than 30 acres or temporary impact during construction and about 11 acres of permanent impact during operations (see added Tables 3.4.3-3 and 3.4.3-4.) Keystone is currently consulting with the State of Nebraska concerning permanent wetland impacts at Pump Station 22. Most wetlands would be restored after pipeline construction. Mitigation for wetland losses are negotiated during the permitting process as discussed in general Consolidated Response WAT-2.
1448	58	Taylor	Willie	United States Department of the Interior	Page 3.4-7, Section 3.4.2: The document, Keystone 2009c, states that it, "... does not include acres of disturbance associated with pipe storage yards, rail sidings, and contractor's yards for 1,261 acres in Oklahoma and Texas. Does not include acres of disturbance associated with access roads or construction camps". Why are these acres not included in the analysis?	Estimated impacts from ancillary facilities outside of the 110-foot ROW were added to the wetland analysis. Most ancillary facilities are sited outside of wetlands and away from streams and total impacts to wetlands from these facilities are estimated at less than 30 acres or temporary impact during construction and about 11 acres of permanent impact during operations (see added Tables 3.4.3-3 and 3.4.3-4.) Keystone is currently consulting with the State of Nebraska concerning permanent wetland impacts at Pump Station 22. Most wetlands would be restored after pipeline construction. Mitigation for wetland losses are negotiated during the permitting process as discussed in general Consolidated Response WAT-2.
1448	59	Taylor	Willie	United States Department of the Interior	Page 3.4-9 The DEIS states that, "Construction of the pipeline would affect wetlands and their functions primarily during and immediately following construction activities, but permanent changes also are possible." The final EIS should include a reference for this statement of fact.	Citation for this statement (FERC 2004) has been added to the EIS. "Federal Energy Regulatory Commission. 2004. Research of Wetland Construction and Mitigation Activities for Certificated Section 79 (c) Pipeline Projects. Final Report. March 2004. Office of Energy Projects, Washington, D.C."
1448	60	Taylor	Willie	United States Department of the Interior	Page 3.4-9: The DEIS states that, "... wetland vegetation community eventually would transition back into a community functionally similar to that of the wetland prior to construction, if preconstruction conditions such as elevation, grade, and soil structure are successfully restored." The final EIS should include a reference for this statement.	The EIS was revised to add the citation "(FERC 2004)" for this statement: "Federal Energy Regulatory Commission. 2004. Research of Wetland Construction and Mitigation Activities for Certificated Section 79 (c) Pipeline proposed Projects. Final Report. March 2004. Office of Energy proposed Projects, Washington, D.C."
1448	61	Taylor	Willie	United States Department of the Interior	Page 3.4-9: The DEIS states that, "In emergent wetlands, the herbaceous vegetation would regenerate quickly (typically within 3 to 5 years)." The final EIS should include a reference for this statement.	The EIS was revised to add the citation "(FERC 2004)" for this statement: "Federal Energy Regulatory Commission. 2004. Research of Wetland Construction and Mitigation Activities for Certificated Section 79 (c) Pipeline proposed Projects. Final Report. March 2004. Office of Energy proposed Projects, Washington, D.C."
1448	62	Taylor	Willie	United States Department of the Interior	Page 3.4-9: The DEIS states that "Following restoration and revegetation, there would be little permanent effects on emergent wetland vegetation because these areas naturally consist of, and would remain as, an herbaceous community." The final EIS should include a reference for this statement.	The EIS was revised to add the citation "(FERC 2004)" for this statement: "Federal Energy Regulatory Commission. 2004. Research of Wetland Construction and Mitigation Activities for Certificated Section 79 (c) Pipeline proposed Projects. Final Report. March 2004. Office of Energy proposed Projects, Washington, D.C."
1448	63	Taylor	Willie	United States Department of the Interior	Pages 3.4-10 to 3.4-12: The DEIS proposes to mitigate construction and operation activities in wetlands. Suggest that the final EIS include scientific studies that describe the methods used and success rates of wetland restorations from other pipeline construction projects. It would also be beneficial to the public for the final EIS to discuss any potential long-term	Leaks and failures are discussed in Section 3.13. Citation for this statement (FERC 2004) has been added to the EIS. "Federal Energy Regulatory Commission. 2004. Research of Wetland Construction and Mitigation Activities for Certificated Section 79 (c) Pipeline Projects. Final Report. March 2004. Office of Energy Projects, Washington, D.C." Surveys

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					impacts, such as leaks or catastrophic failures of the pipeline, and propose a plan to mitigate such potential impacts. The public should benefit from understanding that the effectiveness of wetland restoration is not well understood, and that procedures for restoration of wetlands have been primarily developed through trial and error (USGS, 2006). The final EIS should discuss available studies on this subject. (See USGS (2004) wetland restoration database).The DEIS makes reference to several surveys, but does not include citations. It would be a benefit to the public for the final EIS to include available supporting scientific references. In addition, the DEIS indicates that surveys will be conducted in the future. The final EIS should identify who is scheduled to conduct these surveys and the timeframe for conducting them.	conducted by the applicant are incorporated into the database used to complete the summary data listed in the EIS. Surveys, survey methods, and survey reports for wetlands were coordinated with the U.S. Army Corps of Engineers - not the U.S. Department of State.
1448	64	Taylor	Willie	United States Department of the Interior	Page 3.4-12, paragraph 10 - Wetland Mitigation Plan: We recommend that a wetland mitigation plan be developed in consultation with state wildlife agencies and the FWS, with a goal of "no net loss" of in-kind wetlands. (Please see our General Comments.)	Wetland construction mitigation is described in Keystone's Construction, Mitigation, and Reclamation Plan, which is included as Appendix B of the EIS. Keystone is continuing consultation with the U.S. Army Corps of Engineers to develop compensatory mitigation. Keystone is currently consulting with the State of Nebraska concerning permanent wetland impacts at Pump Station 22. Most wetlands would be restored after pipeline construction. Compensatory mitigation for wetland losses are negotiated during the permitting process as discussed in general Consolidated Response WAT-2.
1448	65	Taylor	Willie	United States Department of the Interior	Page 3.4-13, paragraphs 2 and 3: These paragraphs indicate power distribution lines associated with pumping substations could, in some areas, be constructed within and adjacent to wetland habitats. The DEIS states that impacts to wetlands would be avoided/minimized and unavoidable impacts to jurisdictional wetlands will be mitigated during the section 404permitting process. Because migratory birds and waterfowl are typically attracted to wetlands and riparian areas, the FWS is concerned with the documented problem of bird mortality from power lines collisions would not necessarily be offset by wetland mitigation. Avian collisions could be significant depending on the species involved and the particular placement of the power lines. For these reasons, we recommend that perch inhibitors and visual markers be installed on power lines near wetlands and at other locations in the ROW where collisions are likely to be significant. In addition, we recommend that power line burial be evaluated, case-by-case, when located in or adjacent to wetlands with significant bird use.	Power providers will consult with U.S. Fish and Wildlife Service concerning routing, marking, or burial of transmission lines to reduce collision mortality to federally protected and migratory birds.
1448	66	Taylor	Willie	United States Department of the Interior	Pages 3.5-27 to 3.5-44, Section 3.5.5: Potential Impacts and Mitigation. Comment: In addition to the summary tables of acres of vegetation communities, we recommend that the acres be summarized according to the quality of vegetation community affected, and according to temporary and permanent impacts. This will enable the FWS to consider the quality of the various communities impacted, and in turn, appropriate mitigation measures (per USFWS's Mitigation Policy, 46 FR 7656).	Acres of temporary and permanent impacts by vegetation community are presented in Tables 3.5.5-1 and 3.3.5-2. Temporary impacts occur during construction (third column in Tables) within the construction right-of-way and permanent impacts would continue through at least the life of the Project (fourth column in Tables) within the permanent right-of-way. Miles of right-of-way by vegetation communities of conservation concern are provided in Table 3.5.5-3. Quality of vegetation communities and quantities of temporary and permanent impacts as they pertain to habitat for the American Burying Beetle are addressed in the Biological Assessment in

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
						Appendix T of the EIS.K21
1448	67	Taylor	Willie	United States Department of the Interior	Page 3.6-1, paragraph 1: The DEIS uses the term “protected terrestrial wildlife.” This term should be clarified because most terrestrial wildlife species are protected under state or Federal wildlife laws and statutes.	Section 3.6 of the EIS was revised in response to this comment to remove the term “protected terrestrial wildlife” and state the following: “Wildlife that are considered conservation concerns including black-tailed prairie dogs (<i>Cynomys ludovicianus</i>), swift fox (<i>Vulpes velox</i>), bald eagle (<i>Haliaeetus leucocephalus</i>), greater prairie-chicken (<i>Tympanuchus cupido</i>), and greater sage-grouse (<i>Centrocercus urophasianus</i>) are discussed in Section 3.8 and aquatic wildlife are discussed in Section 3.7.”
1448	68	Taylor	Willie	United States Department of the Interior	Page 3.6-1, paragraph 3: Regarding the reference to, “game elk populations in Montana and South Dakota,” we request that the DEIS clarify what constitutes game elk populations	Section 3.6 of the EIS was revised in response to this comment to remove the term “game” from “elk populations” and state the following: “Translocation has been used to reestablish game elk populations in Montana and South Dakota and some small elk populations have been reestablished in areas crossed by the Project in Nebraska and eastern Texas.”
1448	69	Taylor	Willie	United States Department of the Interior	Page 3.6-1, Section 3.6.1.2 and Table 3.6.1-1: Although the swift fox is a special status species, it could still be mentioned briefly here with the other canids and furbearers as the reader could be looking for it in this section.	Paragraph 1 on page 3.6-1 directs readers to Section 3.8 for discussion of swift fox.
1448	70	Taylor	Willie	United States Department of the Interior	Page 3.6-8, Table 3.6.1-1: The term “Game Birds” in the Table and elsewhere in section 3.6 where this same reference occurs should be replaced with “Upland Game Birds.”	Because Wilson’s snipe and American woodcock are included in this in category in Table 3.6.1-1 “Upland Game Birds” is not technically a correct description for this grouping.
1448	71	Taylor	Willie	United States Department of the Interior	Page 3.6-13, Waterfowl and Game Birds section: If greater prairie chickens occur within the project area, this should be included in the discussion and added to Table 3.6.1-1. In regard to paragraph 2, sentence 1: although upland game birds are not protected under MBT A, they are protected, and their harvest regulated, under state wildlife laws and regulations. For purposes of the MBTA, “take” is defined as “to pursue, hunt, shoot, wound, kill, trap, capture, or collect, or attempt to pursue, hunt, shoot, wound, kill, trap, capture, or collect.” (50 CFR § 10.12). The MBTA applies to migratory birds identified in 50 CFR § 10.13 (defined hereafter as “migratory birds”).	Paragraph 1 on page 3.6-1 directs readers to Section 3.8 for a discussion of greater prairie chickens. Section EIS of the EIS was revised to add a citation for the definition of “migratory bird” and to clarify that upland game bird harvest is regulated under state wildlife laws and regulations.
1448	72	Taylor	Willie	United States Department of the Interior	Page 3.6-14, 3.6.2 Potential Impacts: The header is not accurate for this section. If this project goes to construction, then many of the impacts described in this section will not be “potential” but rather “actual” impacts. The header should be edited to reflect this.	At the time of preparation of the EIS, the impacts are potential, not actual.
1448	73	Taylor	Willie	United States Department of the Interior	Page 3.6-14, 3.6.2 Potential Impacts: A number of other factors could negatively impact wildlife from project construction. These factors should be included in this discussion. They include: fugitive dust, especially in regard to road construction and vehicular traffic; disrupted wildlife movements or use of movement corridors; wildlife displacement by the pipeline or associated power lines; increase in predation due to new predator travel lanes, and, in some areas, hunting perches on power lines; displacement of ground-nesting birds that avoid areas with tall structures; invasive plants; increase in risk of wildfire, especially in regard to power lines; increased off-road traffic on trails, including	Fugitive dust would be “habitat alteration” and is inclusive in habitat loss and alteration. Disruption of wildlife movements, use of the right-of-way as a movement corridor, and facilitate predator movements are discussed under habitat fragmentation. Wildlife displacement from construction areas is discussed in several sections. Power lines are discussed in Section 3.6.4, including displacement during construction, increased predation due to hunting perches, and impacts to ground-nesting birds. Unauthorized use of the pipeline right-of-way for access is discussed under fragmentation. Disturbance and habitat impacts from construction areas, access roads, and construction camps, including noise, are discussed for

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					unauthorized trail and road use; spills of hazardous materials; disturbance from helicopters or airplanes during construction or post-construction inspections. Finally, this section does not address the full extent of disturbance to wildlife that would occur, not just in active construction areas but also within the proximity to the pipeline roads and power lines.	both the proposed Project and associated power lines. Section 3.6 of the EIS was revised in response to this comment to add information on disturbance from aerial over flights. Section 3.13 of the EIS addresses reliability and safety issues, including calculations of the probability of a spill from the proposed Project and the potential environmental impacts associated with spills.
1448	74	Taylor	Willie	United States Department of the Interior	Page 3.6-14, paragraph 4: The DEIS indicates that 22,493 acres would be lost or altered through project construction, but does not account for the habitat types of 7,883 acres. We suggest a table be added that provides a breakdown of the total acres (22,493) expected to be impacted by major habitat type, and by permanent versus temporary impacts. Also with regard to the 22,493 acres, please clarify whether this includes all components of the proposed action. (i.e., Are footprints of all valve stations, communication sites, storage yards, construction worker camps, roads, power lines, and substations included? Are footprints of all interrelated components of this project included?) We recommend that acres presented in the EIS include estimates of both the total project footprint and the total area impacted.	Acres of temporary and permanent impacts by vegetation community are presented in Tables 3.5.5-1 and 3.3.5-2. Temporary impacts occur during construction (third column in Tables) within the construction right-of-way and permanent impacts would continue through at least the life of the Project (forth column in Tables) within the permanent right-of-way. All permanent habitat losses are included under the operations impact columns (forth columns of Table 3.5.5-1 and 3.3.5-2). The total proposed Project footprint includes both temporary and permanent impacts in these total acreages. The EIS was revised to provide acreages based on revisions to the alignments and additional detail for the proposed Project footprint area.
1448	75	Taylor	Willie	United States Department of the Interior	Page 3.6-14: The DEIS states that "Aerial stick nest surveys were conducted along the entire proposed Project ROW during spring 2008 and 2009 to identify large stick nest sites of raptors and herons in deciduous trees within from 0.25 to 1 mile from the proposed Project centerline (Keystone 2009b)." The reference is to a data request; the reference should be to the actual survey and electronic link, if available.	To protect the resource, migratory bird nest survey reports, which include nest and rookery locations, were withheld as confidential. All survey methods and reports were coordinated and submitted to the U.S. Fish and Wildlife Service for review and approval.
1448	76	Taylor	Willie	United States Department of the Interior	Page 3.6-14: The DEIS states that "Nesting habitats were not recorded during the Gulf Coast and Houston Lateral surveys (Keystone 2009b)." The reference is to a data request; the reference should be to the actual survey and electronic link, if available.	To protect the resource, migratory bird nest survey reports, which include nest and rookery locations, were withheld as confidential. All survey methods and reports were coordinated and submitted to the U.S. Fish and Wildlife Service for review and approval.
1448	77	Taylor	Willie	United States Department of the Interior	Page 3.6-19, last paragraph: The statement that, "Total habitat loss due to pipeline construction would be small in the context of available habitat both because of the lineal nature of the proposed Project and because restoration would follow pipeline construction," might be true, however, the DEIS should present the facts necessary to support this statement. We recommend that it be revised and qualified accordingly.	Habitat loss and alteration are quantified in Section 3.5 of the EIS and are summarized in Section 3.6.2. The cited statement is already qualified in this paragraph, "If disturbance involved important remnant habitat types, habitat loss could be locally significant."
1448	78	Taylor	Willie	United States Department of the Interior	Page 3.6-20, paragraph 1: The last sentence of this paragraph states that Keystone XL would consult with appropriate state wildlife management agencies. We recommend that this be clarified to indicate that consultation would occur with the FWS for post construction and maintenance activities that would impact migratory birds, and threatened and endangered species.	The sentence referred to by the commenter was revised in the EIS to include federal management agencies: "Keystone would consult with appropriate federal and state wildlife management agencies prior to initiation of maintenance activities beyond standard inspection procedures."
1448	79	Taylor	Willie	United States Department of the Interior	Page 3.6-20: The DEIS states that "Burrowing animals would be expected to return and recolonize the right-of-way after construction, although compacted areas such as temporary workspaces may become less suitable habitat." The final EIS should include a reference for this statement.	Section 3.6 of the EIS was revised in response to this comment and added the citation (Lauzon et al. 2002).
1448	80	Taylor	Willie	United States	Page 3.6-21, paragraph 4: The DEIS states that if suitable	This assessment is already qualified and the increased

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
				Department of the Interior	new nest trees are not available within their territories, new territories would be established. This may not occur if the other territories are already occupied. We recommend that this analysis be clarified accordingly.	energetic requirement and potential reproductive effects are described. In the revised EIS, the words "within unoccupied territories" have been added to the description. "If suitable new nest trees are not available within their established territory, new territories would need to be established within unoccupied territories. These processes would lead to increased energy demands during nesting and could lead to reduced or lost reproduction in subsequent years."
1448	81	Taylor	Willie	United States Department of the Interior	Page 3.6-21, Section 3.6.2.4: The use of nest-dragging surveys to determine the presence or absence of grassland ground-nesting bird nests on BLM land in Phillips County needs to be in the discussion, just in case construction should occur during the nesting season of April 15 to July 15.	Bureau of Land Management Sensitive Animals and Plants are discussed in Section 3.8.2. Measures for Baird's sparrow, bobolink, Brewer's sparrow, Chestnut-collared longspur, dickcissel, long-billed curlew, marbled godwit, McCown's longspur, sage thrasher, and Sprague's pipit have been added to the list in Section 3.6.3 and to Table 3.8.2-1 in the revised EIS. This measure has also been applied to the Candidate Sprague's pipit.
1448	82	Taylor	Willie	United States Department of the Interior	Page 3.6-22, last paragraph: Blasting and ripping for construction through rock outcrops (or cliffs) is not just a concern for snakes. Several species of migratory birds also use these features for nesting, foraging, and other activities. We recommend revisions, accordingly.	The EIS was revised to note that blasting would not be required for construction of the proposed Project and reference to blasting was removed from Section 3.6.2. The text "or nesting, perching or foraging habitats for birds" was added to the description to read: "Ripping for construction through rock outcrops which may provide hibernacula for snakes or nesting, perching, or foraging habitats for birds could destroy all or portions of these habitats."
1448	83	Taylor	Willie	United States Department of the Interior	Page 3.6-23, Mitigation section: This section should be expanded and improved with additional conservation measures. For eagles, we recommend that the following be added to the DEIS or included in a Migratory Bird Conservation Plan: 9• From January 1 to August 31, Keystone XL will adhere to minimal spatial buffers for active bald eagle nests (1.0 mile) and golden eagle nests (0.75 mile). However, depending on the physical location of the nest (e.g., whether there are any natural barriers between the nest and the proposed Project) and the type of disturbance activity, these buffers could either be decreased or increased in size. For instance, the FWS has greater concerns for actions that generate highdecibelleve1noise, such as blasting and helicopter use, than for operating heavy equipment or pipe welding. Hence, the FWS recommends that Keystone use 1.0-mile buffers (for both species) for actions like blasting unless local landscape features reduce blasting impacts. Keystone XL will coordinate with the FWS and other appropriate natural resource agencies regarding these site-specific variances. Generally, for nesting bald eagles, Keystone XL will follow the FWS National Bald Eagle Management Guidelines (USFWS 2007).• When active bald or golden eagle nests are located on or within 0.5 mile of the ROW, Keystone XL will coordinate with the FWS regarding appropriate measures to apply in conserving these species. Other mitigation measures we recommend be included are:• Whenever possible, Keystone XL will close all unnecessary roads after proposed Project construction is completed, and will revegetate these areas to restore the site to pre-construction habitat conditions. This is subject to approval from private landowners and affected land	Bald and golden eagles are addressed in Section 3.8 of the EIS. Keystone is developing a migratory bird conservation plan in consultation with the U.S. Fish and Wildlife Service that will include appropriate measures and applicable buffers for bald and golden eagles. Blasting would not be used for construction of the proposed Project. Previous U.S. Fish and Wildlife Service recommendations for bald eagles were to restrict activities within 0.5 mile of active nests or winter roost sites.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					management agencies. For any communication towers constructed as part of the proposed Project, Keystone will implement applicable conservation measures from the FWS Guidance on the Siting, Construction, Operation and Decommissioning of Communication Towers (USFWS 2000).	
1448	84	Taylor	Willie	United States Department of the Interior	Page 3.6-23: The DEIS states that, "If construction would occur during the raptor nesting season during January to August, pre-construction surveys would be completed to locate active nest sites to allow for appropriate construction scheduling." The final EIS should identify who will conduct the survey and provide a timeframe.	Keystone would hire qualified subcontractors to complete pre-construction aerial nest surveys. Surveys during 2008, 2009, and 2010 were completed during spring (February to May along the proposed Gulf Coast segment; March to April along the proposed Steele City segment).
1448	85	Taylor	Willie	United States Department of the Interior	Page 3.6-23, Section 3.6.3: The same nest-dragging stipulation needs to be added to the mitigation section for the period of April 15 to July 15 for nesting migratory birds.	Bureau of Land Management Sensitive Animals and Plants are discussed in Section 3.8.2. Measures for Baird's sparrow, bobolink, Brewer's sparrow, Chestnut-collared longspur, dickcissel, long-billed curlew, marbled godwit, McCown's longspur, sage thrasher, and Sprague's pipit were added to the list in revised Section 3.6.3 and Table 3.8.2-1 of the EIS. This measure has also been applied to the Candidate Sprague's pipit.
1448	88	Taylor	Willie	United States Department of the Interior	Page 3.6-25, paragraph 5: Language in this paragraph indicates measures would be taken to avoid collisions with power lines such as visually marking them with balls or flappers but does not state that wetland areas are a specific concern. Because waterfowl and other birds are especially vulnerable to power line collisions when using wetland areas during migration stopovers, we recommend that priority be given to marking (and in some cases, burying) power lines in these areas. The FWS recommends that an additional measure be added; that all power lines constructed as part of the proposed Project comply with applicable measures in the APLIC (1994) guidance document, "Mitigating Bird Collisions with Power Lines: The State of the Art in 1994."	Recommended mitigation measures for electrical distribution lines to the pump stations have been revised in the EIS to include routing, burial, and marking; and incorporation of avian-safe designs as recommended following Avian Power Line Interaction Committee (APLIC 2006) and APLIC and U.S. Fish and Wildlife Service (APLIC and USFWS 2005) guidance. Construction and operation of the electrical distribution lines to the pump stations would be completed by the power providers, not Keystone.
1448	89	Taylor	Willie	United States Department of the Interior	Page 3.7-1, Fisheries section: Many species of wildlife, including many discussed in the Wildlife section-3.6, rely on fish species and aquatic invertebrates as a key food resource. The EIS should discuss this relationship in the Fisheries section, including how project actions that impact fisheries will have indirect impacts on wildlife species that depend on this prey base.	Section 3.7 of the EIS was revised in response to this comment to add use of fish as prey for wildlife.
1448	91	Taylor	Willie	United States Department of the Interior	Page 3.8-1, Threatened and Endangered Species and Species of Conservation Concern section: This part of the DEIS presents a lot of good information about federally- and state listed species and other species of conservation concern. However, no references to State Wildlife Action Plans for any of the states crossed by the Keystone XL proposed Project are provided. State Wildlife Action Plans present the latest information for the states on species of conservation concern, threats, and management consideration. Omitting these Plans as a consideration seems like a significant shortcoming which should be corrected.	Section 3.8.4 of the EIS Animals and Plants of Conservation Concern. As stated in that section, the species analyzed are those specifically identified during consultations with resource agencies that are of conservation concern and that potentially occur along the proposed Project right-of-way. As it is expected that state resource agencies are aware of and implement their own State Wildlife Action Plans, citations for applicable plans have been added to the description of species of conservation concern at the beginning of revised Section 3.8.4 as follows: "The species of conservation concern have been identified and designated by federal and state wildlife management agencies after review of abundance, population trends, distribution, number of protected sites, degree of threat to survival, suitable habitat trends, degree of knowledge about the species, and species life history (MFWP

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
						2005 SDGFP 2006, Schneider et al. 2005, Wasson et al. 2005, ODWC 2005, Bender et al. 2005).
1448	92	Taylor	Willie	United States Department of the Interior	Page 3.8-2, paragraph 4: The DEIS states that candidate species are not federally protected. It is true that candidate species are not protected under the ESA. However, at least some candidate species are federally protected under the MBTA. This statement should be revised accordingly.	The EIS was revised in response to this comment and states the following: "Candidate species are not federally protected under the ESA but some candidate birds may be federally protected under the MBTA; because these species may become protected under the ESA within the life of the proposed Project, they are addressed in Section 3.8.1."
1448	93	Taylor	Willie	United States Department of the Interior	Page 3.8-2 The DEIS states that "the FWS-approved surveys were initiated in the summer and fall of 2008 and spring 2009 (Keystone 2009c)." The reference is to a supplemental filing; suggest the reference be to the actual survey, and electronic link, if available.	Data from the surveys were incorporated into the supplemental filing and the supplemental filing was used to prepare the EIS. Some reports were retained by Keystone as confidential as they include location information for sensitive species which could be misused. Available reports and data are provided on the U.S. Department of State's web site at: http://www.keystonepipeline-xl.state.gov/clientsite/keystonexl.nsf?Open . Reports of required surveys supporting the Biological Assessment were provided to U.S. Fish and Wildlife Service with the draft Biological Assessment.
1448	95	Taylor	Willie	United States Department of the Interior	Page 3.8-7, paragraph 5: The brown pelican has been delisted at the Federal level. So, although this species may be discussed as having some listed status at a state level or a species of conservation concern, it should not be discussed as a federally listed bird species nor included in Table 3.8.1-1.	The brown pelican discussion has been moved to the state-listed threatened and endangered species (Section 3.8.3) and has been removed from Table 3.8.1-1 in the EIS.
1448	96	Taylor	Willie	United States Department of the Interior	Page 3.8-8, paragraph 7: The DEIS text regarding greater sage-grouse should be updated with the following: "the FWS initiated a status review to reevaluate this finding and on March 23, 2010, announced that the listing of the greater sage-grouse (range wide) was warranted, but precluded by higher priority listing actions (FR 75,13910). As a result of the FWS's determination, the greater sage-grouse is a Federal candidate species."	The paragraph referred to was revised as suggested by the commenter.
1448	97	Taylor	Willie	United States Department of the Interior	Page 3.8-11: The DE IS states that "Sage-grouse chicks are precocious and capable of leaving the nest immediately after hatching, but they are not sufficiently mobile to avoid construction related impacts until after they can fly." The final EIS should include a reference for this statement of fact.	The sentence referred to by the commenter was revised in the EIS as follows: "Sage-grouse chicks are precocious and are capable of leaving the nest shortly after hatching, but they may not be sufficiently mobile to avoid construction related impacts until after they can fly." Juvenile sage-grouse are capable of weak flight within 10 days (Schroeder et al. 1999). That sage-grouse chicks are precocious is general knowledge.
1448	98	Taylor	Willie	United States Department of the Interior	Page 3.8-13, paragraph 2: We recommend the text be revised (in sentence 3) because least terns are considered waterbirds, not seabirds.	The EIS has been revised in response to this comment.
1448	99	Taylor	Willie	United States Department of the Interior	Page 3.8-13, paragraph 2: The DEIS states the nesting season for the interior least tern is from April 15 through September 15. Clarify that this is for the entire geographic nesting range of these birds and occurring later at more northern latitudes.	The sentence referred to by the commenter was revised in the EIS as follows: "Nesting season for interior least tern is from April 15 through September 15 throughout the breeding range, with nesting occurring later at more northern latitudes."
1448	100	Taylor	Willie	United States Department of the Interior	Page 3.8-14, paragraph 3: The DEIS states that no interior least terns were observed at the North Canadian or South Canadian rivers in Oklahoma, but foraging interior least terns were observed at the Red River on the Oklahoma and Texas border. The FWS believes the survey efforts were insufficient	Subsequent surveys were completed at the locations referred to by the commenter. Survey locations and methods were reviewed and approved by the U.S. Fish and Wildlife Service. Conservation measures for pre-construction surveys for the interior least tern were revised based on Section 7

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					to confirm the presence or absence of the tern within the proposed Project area, as each area was only sampled for part of a day.	consultation meetings.
1448	101	Taylor	Willie	United States Department of the Interior	Pages 3.8-15 and 3.8-19, Section 3.8.2.1; Tables 3.8.1-3 and 3.8.1-4: Survey results for potential nesting habitat for interior least terns and piping plovers. Comment: Interior least terns and piping plovers nest along river courses. Nesting habitat and nesting areas may change between and within breeding seasons, depending on river flow and renesting efforts. As noted in our general comments, surveys of potential nesting areas for presence of least terns and piping plovers 2 weeks prior to construction activities are insufficient to determine possible impacts from construction activities to the species. Surveys for presence of these species should be conducted whenever construction activities will take place within 0.25mile of nesting areas between April 1 and August 15. If these species are present, construction should cease until presence of interior least terns or piping plovers are reported to the nearest FWS Ecological Services Field Office. Coordination with the FWS should take place before construction is resumed. In addition to breeding on riverine sandbars and at sand/gravel mining operations, interior least terns and piping plovers migrate through the Great Plains during both the spring and fall and forage in rivers and associated wetlands. The species is susceptible to collision with power lines, and we recommend incorporating conservation measures to address potential adverse proposed Project impacts to these species. For example, power distribution lines may be marked with visual bird deflectors where they cross rivers (and within 0.25 mile of each side) and between rivers and sand and gravel mining areas to reduce potential for injury or mortality to interior least terns.	Subsequent surveys were completed at the locations referred to by the commenter. Survey locations and methods were reviewed and approved by the U.S. Fish and Wildlife Service. Conservation measures for pre-construction surveys for the interior least tern were revised based on Section 7 consultation meetings.
1448	102	Taylor	Willie	United States Department of the Interior	Page 3.8-16, paragraph 1: The DEIS states that limited vegetation clearing and limited human access would be required within the riparian areas: for the True Tracker Wire (3-foot wide, hand- cleared path) used during horizontal directional drilling (HDD), and for withdrawing water for hydrostatic testing. The FWS recommends a maximum 3-foot wide, hand-cleared path, and that no clearing be conducted during the interior least tern's breeding period (mid-April through mid-September). Installation and use of the True Tracker Wire and HDD should not be conducted during the interior least tern's nesting period.	Keystone is currently developing conservation measures for the interior least tern and critical habitat for the Arkansas River shiner in consultation with the U.S. Fish and Wildlife Service that will be included within the Biological Assessment. Further information about federally protected birds is provided in Section 3.8.1.2 of the EIS.
1448	103	Taylor	Willie	United States Department of the Interior	Page 3.8-18, paragraph 2: The DEIS states, "The FWS Tulsa Ecological Services field office recommended the identification of suitable migration stopover habitats for piping plovers that would potentially be crossed by the proposed Project. Suitable migration stopover habitats include sandy shorelines of lakes and rivers (Campbell 2003). Review of the Gulf Coast Segment in Oklahoma identified suitable migration habitats at crossings of the North Canadian River and the South Canadian River in Oklahoma; and the Red River at the Oklahoma and Texas border."Comment: The DEIS should note that the FWS further recommended, if suitable habitat	Subsequent surveys were completed at the locations referred to by the commenter. Survey locations and methods were reviewed and approved by the U.S. Fish and Wildlife Service. Conservation measures for pre-construction surveys for the interior least tern were revised based on Section 7 consultation meetings.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					was present and construction would occur during the spring and/or fall migration, surveys for the presence or absence of the plover in the river-crossing proposed Project be conducted immediately before(within 2 weeks) proposed Project construction is initiated.	
1448	104	Taylor	Willie	United States Department of the Interior	Page 3.8-20: The DEIS states that "Since piping plovers are highly mobile, it is anticipated that individuals would move to other suitable resting and foraging habitats within the project region." The final EIS should include a reference for this statement.	Section 3.8 of the EIS was revised in response to this comment to remove the statement from EIS. The revised text more clearly states that most suitable migration stopover habitats (large river crossings) would be protected by using the horizontal directional drilling (HDD) method and also states the following:"Piping plovers displaced from suitable resting and foraging habitats within the Project region during migration would likely use nearby suitable habitats. Based on the linear nature of the Project and protection of large river migration stopover habitat by using HDD crossings, potential impacts from encountering and flushing migrating piping plovers from the Project area would likely be negligible."
1448	105	Taylor	Willie	United States Department of the Interior	Page 3.8-22 and 3.8-23, Section 3.8.1.2: The DEIS discusses whooping crane distribution and migration habitat, potential impacts, and conservation measures. It discusses collision hazards associated with power lines in the whooping crane corridor, concluding with the statement that "there is no indication, however, that any of these locations have been or would be used by whooping cranes."Comment: In addition to riverine habitat, whooping cranes use palustrine and the edges of lacustrine wetlands and reservoirs throughout their migrational corridor. Whooping cranes are vulnerable to collision with any above-ground power lines in the vicinity of their roost sites, not just next to riverine roosts. We recommend that the end of the first paragraph in subsection 3.1.3.2 be changed to read:"Areas used for roosting by migrating whooping cranes include broad, shallow channels of major river systems and their associated wetlands, as well as seasonally or semi-permanently flooded palustrine wetlands and shallow areas of reservoirs and other lacustrine wetlands. Habitat areas such as these that exist along the pipeline alignment may be affected by the proposed Project."Where suitable whooping crane roost habitat exists in the vicinity of new power line construction and within the whooping crane migratory corridor, conservation measures to reduce the potential for collisions will need to be considered. Page 3.8-24: The DEIS states that "This species [green sea turtle] nests in tropical and subtropical waters worldwide and inhabits shallow waters inside reefs, bays, and inlets, except during migration." The final EIS should include a reference for this statement.	The EIS was revised in response to this comment.
1448	106	Taylor	Willie	United States Department of the Interior	Page 3.8-27, paragraph 5, Arkansas River Shiner: The DEIS states the Arkansas River shiner (shiner) is potentially present in the Cimarron River in Oklahoma. This should be corrected, as the shiner is known to be present in this location.	The EIS was revised in response to this comment.
1448	107	Taylor	Willie	United States Department of the Interior	Page 3.8-28, paragraph 2: The DEIS shows that the Proposed Project would cross the North and South Canadian Rivers, and states that the Arkansas River shiner is known to occur in the South Canadian River and potentially occurs in the North Canadian River. In addition, the Proposed Project would cross	Conservation measures including hand-clearing of vegetation for the horizontal directional drilling (HDD) crossing of the Canadian River were discussed with U.S. Fish and Wildlife Service during Section 7 consultation meetings. Conservation measures for the Arkansas River shiner have been revised as

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					designated critical habitat in the South Canadian River. The FWS did not recommend surveys for the shiner in the South Canadian and North Canadian Rivers in Oklahoma because the presence of this species at these crossings is assumed. The FWS does, however, recommend that a 300-foot buffer from bank-full width be maintained on each side of the South Canadian River and North Canadian River. This is especially important along the South Canadian River due to the critical habitat. The FWS also recommends that a maximum 3-foot-wide, hand-cleared, path be constructed, and that no clearing be done during the shiner's spawning season (main channels in June to July, and possibly into August.)	appropriate based on those conversations and reviews.
1448	108	Taylor	Willie	United States Department of the Interior	Page 3.8-29: The DIES states that "This [pallid] sturgeon is adapted to habitat conditions that existed in these large rivers prior to their wide-scale modification by dams, diversions, and flood control structures. Habitats required by pallid sturgeon are formed by floodplains, backwaters, chutes, sloughs, islands, sandbars, and main channel waters within large river ecosystems." The final EIS should include a reference for this statement.	This information is from the Pallid Sturgeon Recovery Plan which is cited multiple times in this paragraph (USFWS 1993).
1448	109	Taylor	Willie	United States Department of the Interior	Page 3.8-33, Table 3.8.1-5, Suitable American Burying Beetle Habitat column: The Table uses the following terms under the Suitable ABB (<i>Nicrophorus americanus</i>) Habitat column: extensive, limited, unknown, and unlikely. We recommend that definitions for these terms be provided. The DEIS also uses "historic, confirmed, and likely" for the Oklahoma portion of the proposed Project. We recommend the following definitions of these terms be included: 1 Historical Range - According to specimen records, the recovery plan and available life history information, this county is within the documented historical range of the ABB. 2 Non-Historical Range - This county is not within the documented historical range of the ABB. However, suitable habitat is present and this county is adjacent to at least one county with current positive findings, suggesting ABBs are likely to be present within this county. 3 Unconfirmed - Surveys within the last 15 years are lacking or insufficient to determine presence of the ABB. However, suitable habitat is present and this county is adjacent to at least one county with current positive findings. In some instances, occurrences of ABBs have been reported by reputable individuals, but identification has not been verified by a FWS biologist or trained entomologist. 4 Confirmed - Surveys within the last 15 years have documented the presence of the ABB within the county.	This information is covered in detail in survey reports and in the Biological Assessment presented in Appendix T of the EIS.
1448	110	Taylor	Willie	United States Department of the Interior	Page 3.8-33, paragraph 1: The DEIS states that construction would take place during the daylight hours and construction areas would not use artificial lighting, and concludes no impacts from artificial lighting during construction would therefore occur. This information should be reconciled with information provided in the DBA, stating that night construction might be necessary.	The evaluation of potential Project-related impacts to the American burying beetle was updated in the EIS to be consistent with the evaluation in the Biological Assessment presented in Appendix T of the EIS.
1448	111	Taylor	Willie	United States Department of the Interior	The DEIS also states soil heating associated with project operation could produce some increase in the activity period for the ABB, although the overall impacts of this increased	Consolidated Response ENV-2 addresses concerns related to pipeline temperature effects. The potential effects of soil temperature increases on the American burying beetle were

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					activity would likely be negligible because species survival is more closely linked to its access to carrion and the availability of whole vertebrate carcasses (USFWS 200Sc). Soil moisture is believed to be an important habitat factor. An increase in soil temperature will result in decreased soil moisture. Consequently, ABBs could be affected.	considered during the DOS consultation with the U.S. Fish and Wildlife Service and are addressed in the Biological Assessment presented in Appendix T.
1448	112	Taylor	Willie	United States Department of the Interior	Page 3.8-34, Section 3.8.1.6: The DEIS discusses conservation measures to avoid and minimize adverse impacts to the ABB, and states it is likely that all direct impacts to the ABB might not be avoided. However, the DEIS also states the proposed Project may affect, but is not likely to adversely affect, the ABB.	The EIS was revised to update the potential Project-related impacts to the American burying beetle to be consistent with the evaluation in the Biological Assessment presented in Appendix T of the EIS.
1448	113	Taylor	Willie	United States Department of the Interior	Comment: Conservation measures to avoid and minimize adverse Proposed Project effects to the species, and compensatory mitigation to offset some of the habitat losses, should be developed through further discussions with the FWS. It is the FWS' opinion that even if all the recommended conservation measures are implemented, take cannot be completely avoided. The FWS recommends that the DOS request initiation of formal consultation on the effects to ABB from the proposed Project.	The EIS was revised to update the conservation measures and anticipated incidental take for the American burying beetle to be consistent with the information in the Biological Assessment presented in Appendix T of the EIS.
1448	114	Taylor	Willie	United States Department of the Interior	Page 3.8 to 34, paragraphs 3 and 4: The DEIS provides a list of state-specific conservation measures for the endangered ABB "that have been recommended by respective FWS offices." This list includes the statement that if "route changes and future surveys indicate the presence of the ABB in Lamar County, Texas, bait away or trap and relocate efforts would be undertaken prior to construction activities."	The EIS was revised to update the conservation measures and anticipated incidental take for the American burying beetle to be consistent with the information in the Biological Assessment presented in Appendix T of the EIS.
1448	115	Taylor	Willie	United States Department of the Interior	Comment: The FWS Ecological Services field office does not recommend the use of these procedures as a means to avoid impacts to ABBs in Texas. Rather, if ABBs are known to be present in a proposed Project area, we would offer construction planning recommendations to avoid impacts or minimize them to the point of insignificance. If adverse impacts were unavoidable, we recommend formal consultation. Because AECOM Environment's 2009 surveys did not find ABBs along the proposed pipeline ROW in Lamar County, Texas, we do not believe that adverse impacts are likely for a period of at least 1 year post-survey.	The EIS was revised to update the conservation measures and anticipated incidental take for the American burying beetle to be consistent with the information in the Biological Assessment presented in Appendix T of the EIS.
1448	116	Taylor	Willie	United States Department of the Interior	Page 3.8-37 and 3.8-38, Section 3.8.1.7: The DEIS provides an evaluation of potential impacts to threatened WPFOs, and a finding of "may affect but is not likely to adversely affect" would be appropriate. Comment: The FWS does not concur with the DOS' "may affect but is not likely to adversely affect" determination. Interagency consultation, which is ongoing, will therefore need to be completed.	Consultation was completed for the western prairie fringed orchid and other Endangered Species Act protected animals and plants. These concerns are addressed in the Biological Assessment from the US Fish and Wildlife Service in Appendix T of the EIS.
1448	117	Taylor	Willie	United States Department of the Interior	The rationale for the FWS' non-concurrence is based on the permanent disruptions of the proposed project activities, the extent of high quality WPFO habitat within the project right-of-way, and the fact that a WPFO specimen has been found 85 feet from the proposed project right-of-way despite erratic flowering patterns and long dormancies which make detection difficult. Pages 3.8-41 to 3.8-43, and 3.8-56: The DEIS	The western prairie fringed orchid population identified during surveys was outside of the construction right-of-way, was located within a wetland habitat area that was also completely outside of the construction right-of-way, and impacts to this population would be avoided through marking and implementation of Keystone's Construction, Mitigation, and Reclamation Plan presented in Appendix B of the EIS.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					identifies several species of bats (Fringed myotis, Long-eared myotis, Northern myotis, Townsend's big-eared bat, Rafinesque's Big-Eared Bat) that could be encountered in the project area. Suggest the final EIS include information on population distributions, status, trends and a discussion of roosting, breeding, foraging, and migration patterns of the various species of bats that might be encountered along the project route. Much of this information is available in Ellison et al. 2003.	Additional information on fringed myotis, long-eared myotis, northern myotis, and Townsend's big-eared bat are provided in Appendix I of the EIS. Section 3.8.3.1 of the EIS was revised in to add information on the distribution, status, trend and roosting, breeding, foraging, and migration patterns for Rafinesque's big-eared bat.
1448	118	Taylor	Willie	United States Department of the Interior	Page 3.8-42, Table 3.8.2-1 in Section 3.8.2: The swift fox discussion in the table is inadequate. The swift fox occurs along the pipeline route in Phillips County. The statement of no observations within five miles of the project is inaccurate. The BLM provided information in 2008 that said that the swift fox was present along the proposed route in Phillips County.	Swift fox are discussed further in Section 3.8.3.1 which describes occurrence in Phillips County, Montana. Section 3.8 of the EIS was revised in to remove the statement noted by the commenter. That statement was based on information from the Montana Natural Heritage Database.
1448	119	Taylor	Willie	United States Department of the Interior	Page 3.8-56, State-Protected Animals and Plants section: Our earlier comment for page 3.8-1, regarding consideration of State Wildlife Action Plans applies to this section as well.	Species addressed in Section 3.8.4 are those animals and plants specifically identified by resource management agencies as a concern because of potential impacts from construction and operation of the proposed Project to the animal or plant. DOS considered that scoping and consultation with the cooperating agencies and state agencies with jurisdiction had identified plants and animals that would likely be impacted by the Project and that all relevant concerns were expressed by state wildlife management agencies.
1448	120	Taylor	Willie	United States Department of the Interior	Page 3.8-57, Section 3.8.3.1: The swift fox discussion is also inadequate in this section. The statement about the Montana Natural Heritage Program (MNHP) database showing no records is inaccurate. The discussion is inconsistent when it says that the project occurs within swift fox range in Phillips County, but then says there are no records within five miles of the Project. The MNHP database on 05 May 2010 shows observation records for the past five years throughout the Phillips County portion of the project as well as a "high relative density" rating (27-34) for observations. The density probably gets higher as the project approaches Canada due to the proposed line getting closer to the center of occupied swift fox range.	Section 3.8.3.1 of the EIS was revised in response to this comment.
1448	121	Taylor	Willie	United States Department of the Interior	Page 3.8-58, Section 3.8.3.1: The transmission line to PS-09 in Phillips County, Montana, goes through occupied swift fox habitat. This needs to be discussed and appropriate mitigation applied.	Section 3.8.3.1 of the EIS was revised in response to this comment to add information concerning power distribution lines and swift fox habitats in Montana and South Dakota.
1448	122	Taylor	Willie	United States Department of the Interior	Page 3.8-60, Table 3.8.3-1 in Section 3.8.3.1: Presence in Frenchman Creek in Phillips County, Montana, needs to be included in the Comments block in the Table for the Northern Redbelly Dace and Pearl Dace.	Table 3.8.3.1 of the EIS was revised to include the species presence information suggested by the commenter.
1448	123	Taylor	Willie	United States Department of the Interior	Page 3.8-76, Section 3.8.3.4: The Northern Redbelly Dace and Pearl Dace occur in Frenchman Creek on the border of Phillips and Valley Counties, Montana, which would be crossed by the proposed Project pipeline (USGS's GAP Analysis Bulletin No. 12). The analysis should contain effects of the pipeline crossings on private land on the two fish species. Although the crossing is not on BLM land, it is within a mile of a BLM portion of Frenchman Creek and habitat could	Section 3.8 of the EIS was revised to address the Montana distribution of the redbelly dace and pearl dace. Potential Project-related impacts associated with installation on private lands would be similar to those described in Section 3.8.3.4.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					be affected. Information on Northern Redbelly Dace was provided previously.	
1448	124	Taylor	Willie	United States Department of the Interior	Page 3.8-77: The DEIS states that" ... surveys have been recommended for the blacknose shiner, northern redbelly dace, and pearl dace in tributaries of the Keya Paha River ... surveys have been recommended for the blacknose shiner, northern redbelly dace, and finescale dace in tributaries of the Niobrara and South Fork Elkhorn rivers ... proposed Project." Suggest the final EIS identify who will conduct the surveys and provide timeframes.	Keystone completed special status fish surveys for blacknose shiner, northern redbelly dace, finescale dace, pearl dace, and plains topminnow at the identified proposed Project waterbody crossings in the fall of 2009. The survey results are summarized in Table 3.8.3-2 and in the appropriate species-specific discussions in Section 3.8 of the EIS.
1448	125	Taylor	Willie	United States Department of the Interior	Page 3.8-80, Animals and Plants of Conservation Concern: Our earlier comment for page 3.8-1, regarding consideration of State Wildlife Action Plans applies to this section as well.	Species addressed in Section 3.8.4 are those animals and plants specifically identified by resource management agencies as a concern because of potential impacts from construction and operation of the proposed Project to the animal or plant. DOS considered that scoping and consultation with the cooperating agencies and state agencies with jurisdiction had identified plants and animals that would likely be impacted by the Project and that all relevant concerns were expressed by state wildlife management agencies.
1448	127	Taylor	Willie	United States Department of the Interior	Page 3.9-16, Section 3.9.6, 1st Line: The project would require the acquisition of temporary easements/temporary use permits and permanent easements IROW with the landowners along the pipeline ROW.	The EIS has been revised in response to this comment.
1448	128	Taylor	Willie	United States Department of the Interior	Page 3.9-16, Section 3.9.6, 2nd Line: Pipeline construction would require temporary workspaces which would necessitate the negotiation of temporary ROW easements and BLM temporary use permits not to exceed three (3) years.	The EIS has been revised in response to this comment.
1448	129	Taylor	Willie	United States Department of the Interior	Page 3.9-16, Section 3.9.6, 3'd Line: Operation and Maintenance of the pipeline and ancillary facilities would require permanent ROW easements and permanent rights-of-way for the expected 50 year life of the project. However, BLM rights-of-way will only be isused for a term of30 years.	The EIS has been revised in response to this comment.
1448	130	Taylor	Willie	United States Department of the Interior	Page 3.9-16, Section 3.9.6, 4th Line: Keystone would provide monetary compensation to landowners who grant easements, ROW, and temporary use permits ... maintenance.	The EIS has been revised in response to this comment.
1448	133	Taylor	Willie	U.S. Department of the Interior	Page 3.11-1, 1st Paragraph Line 4: The word "American" should be replaced with "historic" so the text reads historic farmsteads. The term American seems to convey a sense that if the farmsteads were made by another ethnic group, it would not be considered a cultural resource.	The text of the EIS has been revised in response to this comment.
1448	134	Taylor	Willie	United States Department of the Interior	Pages 3.11-1- 3.11-4, Sections of Legislation: The detail on the various pieces of cultural resource legislation may not be appropriate for an EIS. It might prove more useful to put the details of the legislation into an Appendix, and more briefly summarize how the legislation is related to the present project in the text.	The text of the EIS has been revised and reorganized in response to this comment.
1448	135	Taylor	Willie	U.S. Department of the Interior	Line 9: tries should be tribes	The text of the EIS has been revised in response to this comment.
1448	136	Taylor	Willie	United States Department of the Interior	Section 3.11.1.2, National Register Line 13: Need to add that a cultural resource may be eligible if it is less than 50 years old and meets the exception criteria listed in 36 CFR 60.4	Criterion Consideration G has been added to the EIS.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
1448	139	Taylor	Willie	U.S. Department of the Interior	Page 3.11-6, Montana 1st Paragraph: If crossed in the Montana portion of the pipeline, the EIS needs to add lands managed by U.S. Army Corps of Engineers and Bureau of Reclamation.	The text of the EIS has been revised in response to this comment.
1448	140	Taylor	Willie	United States Department of the Interior	Page 3.11-7, File Search Results, Paragraphs 3-5 (distribution lines): BLM suspects that for many of the sites listed as not being eligible, (particularly the prehistoric sites), it is not that they are not eligible, but in many, if not most cases, the sites have never been formerly evaluated for National Register eligibility.	Keystone conducted a file search of previously recorded cultural resources of the proposed pipeline route, access roads, and electrical distribution line routes. The existing data did not contain formal evaluations of NRHP eligibility for the previously identified precontact sites. The text in the EIS has been revised to clarify this point.
1448	141	Taylor	Willie	United States Department of the Interior	Page 3.11-13: NRHP Eligibility, 3,d Paragraph, Line 3: Since DOS is preparing a Programmatic Agreement that addresses potential Adverse Effects to Historic Properties, an MOA addressing impacts to individual historic properties would seem to be unnecessary.	The text of the EIS has been revised in response to this comment. Treatment Plans will be developed for historic properties that are adversely affected by the Project as noted in Stipulation V.C. of the Programmatic Agreement.
1448	142	Taylor	Willie	United States Department of the Interior	Page 3.11-15, Section 3.11.3.1, 2nd Paragraph, lines 3-4: It needs to be explained why 21.36 miles of new pipeline corridor was examined when in the paragraph above it appeared that only 13.9 miles of the power line corridor remained to be examined. It would also be useful to know the acreage covered in the inventories of the 11 ancillary facilities mentioned in line 4 of the paragraph.	Keystone has provided the acreage covered in the inventories of the 11 ancillary facilities. Through July 2009 Keystone conducted pedestrian surveys of 270.4 miles of the total 284.3 miles of the "proposed pipeline", leaving 13.9 miles to be examined. Since the July 2009 report was submitted, additional surveys were conducted of 21.36 miles of "project route" alternatives, not of the proposed pipeline route.
1448	143	Taylor	Willie	United States Department of the Interior	Page 3.11-16, Archaeological Sites 1st full Paragraph, Line 4: Explain the use of phrase "detrimental impacts" to sites. Conventionally, this is usually phrased as avoiding any adverse impacts to the sites	The phrase has been changed to "adverse impacts" in the EIS.
1448	144	Taylor	Willie	U.S. Department of the Interior	Page 3.11-16, Historic Structures: It might be useful to note how the historic sites will be avoided (i.e. boring for canals and RRs).	Section 3.11.3 of the EIS deals with the avoidance of NRHP eligible aboveground resources, including the use of boring techniques or horizontal directional drilling methods to install the pipeline beneath the sites, fencing, monitoring and route redesign.
1448	145	Taylor	Willie	U.S. Department of the Interior	Page 3.11-16: Lewis and Clark National Historic Trail: The BLM manages the Lewis and Clark National Historic Trail as a Special Recreation Management Area (SRMA). It would be in the SRMA where the pipeline crosses the Missouri near Fort Peck. There are management prescriptions with SRMA to avoid impacting the trail. These are found in the ROD for the Big Dry RMP. These will need to be addressed.	The only reference in ROD for the Big Dry RMP to avoid impacting the Lewis and Clark National Historic Trail is in the Appendix for Area of Critical Environmental Concern (ACEC). It states that the cultural values of the trail on public lands can be enhanced and protected without special management attention. It was not recommended as an ACEC.
1448	146	Taylor	Willie	United States Department of the Interior	Page 3.11-16, Stone Circles: Again BLM would question the need for a Memorandum of Agreement (MOA) for stone circle site mitigation when this should be covered in the P A for the project.	The text of the EIS has been revised in response to this comment. Treatment Plans will be developed for historic properties that are adversely affected by the Project as noted in Stipulation V.C. of the Programmatic Agreement.
1448	147	Taylor	Willie	U.S. Department of the Interior	Page 3.11-16 – 3.11-27, Table 3.11.3-1: An additional column with surface ownership would be useful.	Comment acknowledged. All reports submitted to DOS contain information concerning surface ownership.
1448	148	Taylor	Willie	United States Department of the Interior	Page 3.11-27, 1st Paragraph, Does the 13.9 miles of pipeline remaining to be inventoried include the Montana DEQ's proposed route changes? If not, this data should also be included. Also, are there additional ancillary facilities in Montana requiring inventory?	Route variations under consideration in Montana were surveyed after the DEIS was issued. All facilities associated with the proposed Project in Montana would be within the proposed right-of-way, route variations, access roads, and ancillary facilities/pump stations. Cultural Resource reports have been prepared for ancillary facilities since the release of the DEIS. All future survey reports will be reviewed and

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
						submitted to the Montana SHPO, MDEQ and BLM for review.
1448	149	Taylor	Willie	United States Department of the Interior	Pages 3.11-49 - 3.11-50: Programmatic Agreement: Since the Programmatic Agreement will be the over ridding document for Section 106 Compliance for the project, we would suggest replacing MOAs in earlier sections with the PA. This is said to be Appendix S. We do not see an Appendix S.	Appendix S as well as all other appendices to the DEIS were provided on a CD that was included with the DEIS. A CD with the appendices will also be included with the final EIS. The EIS has been revised in response to this comment. Treatment Plans will be developed for historic properties that are adversely affected by the Project as noted in Stipulation V.C. of the Programmatic Agreement.
1448	150	Taylor	Willie	United States Department of the Interior	Page 3.11-50, Section 3.11.4.2, Federal and State Agency Consultation, 1st Paragraph: Should note BLM's role as cooperating agency in project. However, much of the consultation section for non-tribal entities roles is covered in Chapter One of the document and seems redundant here.	The text of Section 3.11.4.2 of the EIS has been revised in response to the comment. Section 1.5 of the EIS and the Programmatic Agreement provide additional information on the status of BLM as a cooperating agency.
1448	151	Taylor	Willie	United States Department of the Interior	Page 3.11-51, Indian Tribal Consultation: Suggest removing the word "Indian" from the subheading. It would read Tribal Consultation.	The EIS has been revised in response to this comment.
1448	154	Taylor	Willie	U.S. Department of the Interior	Page 3.11-57: Given the length of this section, there should be a section that summarizes the information present in the previous 56 pages.	Portions of the information in this section are summarized in Sections 1.7, 1.8, and 1.9 of the EIS. In addition, a summary of this section is provided in the Executive Summary of the EIS.
1448	155	Taylor	Willie	United States Department of the Interior	Page 3.14-10, Table 3.14.3-1: Is there a reason that cultural resources are not included in the cumulative affects table? The impacts would be similar to those identified for paleontology in the Geology Impacts. There would also be past actions since there are previous surveys and sites recorded in the project. There should not be any future effects since these would be addressed in the PA and the Unanticipated Discoveries Plan.	Potential cumulative impacts to cultural resources were included in Table 3.14.3-1 of the DEIS (Summary of Cumulative Impacts to Resources) and are included in that table in the final EIS.
1448	156	Taylor	Willie	United States Department of the Interior	Page 3.14-14, in Table 3.14.3-1: The statements made in this table for Wildlife resources are not sufficiently supported and do not adequately encompass the range of impacts to wildlife species associated with this project. Evidence should be provided to demonstrate that the proposed mitigation measures would minimize most long-term impacts on wildlife associated with this project. This statement should be revised and properly qualified to reflect the uncertainty of this outcome.	Table 3.14.3-1 was removed from the DEIS and did not appear in the SDEIS. See Section 3.14 of the DEIS. The approach for wildlife assessments is addressed in Consolidated Response WIL-1. Potential construction impacts to wildlife are addressed in Section 3.6, 3.7 and 3.8 of the EIS. Mitigation measures for construction impacts are also included in these sections.
1448	156	Taylor	Willie	United States Department of the Interior	Page 3.14-14, in Table 3.14.3-1: The statements made in this table for Wildlife resources are not sufficiently supported and do not adequately encompass the range of impacts to wildlife species associated with this project. Evidence should be provided to demonstrate that the proposed mitigation measures would minimize most long-term impacts on wildlife associated with this project. This statement should be revised and properly qualified to reflect the uncertainty of this outcome.	The approach for wildlife assessments is addressed in Consolidated Response WIL-1. Potential construction impacts to wildlife are addressed in Section 3.6, 3.7 and 3.8 of the EIS. Mitigation measures for construction impacts are also included in these sections.
1448	157	Taylor	Willie	United States Department of the Interior	Page 3.14-23, paragraph 4: Construction and operation of the project would not just result in long-term habitat modification, a certain amount of wildlife habitat will be permanently lost and/or degraded. This statement should be revised accordingly.	Consolidated Response WAT-2 addresses concerns regarding a compensatory mitigation plan for jurisdictional wetlands and potential impacts to non-jurisdictional wetlands.
1448	158	Taylor	Willie	United States	Page 3.14-23, paragraph 5: As mentioned previously, the	This comment refers to Section 3.14.3.6 of the DEIS. This

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
				Department of the Interior	statement in the last sentence of this paragraph regarding how mitigation measures would minimize most long-term cumulative impacts on wildlife is not accurate. No facts are provided to support this statement as written. This sentence should be rewritten and properly qualified to reflect the uncertainty. of this outcome.	section was revised and distributed in the SDEIS and the Administrative Review DEIS available for review the by U.S. Fish and Wildlife Service. The statement that “proposed mitigation measures would minimize most long-term impacts on wildlife” was removed. The approach for wildlife assessments is addressed in Consolidated Response WIL-1. Potential construction impacts to wildlife are addressed in Section 3.6, 3.7 and 3.8 of the EIS. Mitigation measures for construction impacts are also included in these sections.
1448	160	Taylor	Willie	United States Department of the Interior	Page 5-14, 5.6 Wildlife, 5.6.2 Planned Mitigation Measures: The FWS recommends that this section of the EIS reference measures that would be included in a Migratory Bird Mitigation Plan to protect rookeries along the Gulf Coast (see our General Comments, above).	Section 5.0 of the EIS has been deleted since it consisted of summary that was essentially the same as the Executive Summary. Mitigation measures are included in the resource portions of Section 3.0 of the EIS.
1448	162	Taylor	Willie	United States Department of the Interior	Page 5-15, 5.7 Fisheries, 5.7.2 Planned Mitigation Measures: The FWS is currently performing a status review of nine species of freshwater mussels to determine if listing under the ESA is warranted. Although these species are not yet listed, it would be prudent for the DEIS to evaluate direct and indirect impacts to the mussels at pipeline crossings of freshwater streams. The project crosses or would potentially affect river, stream or tributary aquatic habitats, and the FWS therefore recommends that Best Management Practices (see attachment) be implemented during and after construction to reduce potential impacts of the project on mussels.	Keystone would implement the measures in the CMR Plan (Appendix B) for waterbody crossings, hydrostatic water withdrawal and discharge, and upland and riparian restoration to minimize Project-related impacts to fisheries resources, including sensitive mussel species. Section 3.7.3 of the EIS was revised to provide additional of construction-related impacts to fisheries resources, and avoidance, mitigation, and minimization measures.
1448	164	Taylor	Willie	United States Department of the Interior	Section 1.0 - Introduction states: “The construction, mitigation, and reclamation requirements ... include the following: uplands...lands in public rights of way; and lands in private rights-of-way;” It must be clear that the all construction, mitigation, and reclamation requirements, where necessary, shall apply to all lands.	DOS could not find the quote provided by the commenter in Section 1.0 of the draft EIS. The resource portions of Section 3.0 address the specifics of reclamation requirements.
1448	167	Taylor	Willie	United States Department of the Interior	DEIS states, “Where standing surface water or high groundwater levels make trenching difficult, trench widths up to 35 feet are common.”Comment: We strongly recommend avoiding wetlands. Where avoidance is not feasible, we recommend directionally drilling under wetlands. The DEIS does not mention directionally drilling of wetlands as an option, we recommend this be included as an option in the FEIS. Directional drilling is especially important in wetlands that are unable to be crossed utilizing the “standard wetland crossing method” and potentially requiring a 35-foot trench width. We further recommend that a wetland mitigation plan be developed describing the different types, conditions, and sizes of wetlands that will be impacted and how these impacts will be mitigated. No net loss should be the goal of the wetland mitigation plan. This information should be part of the FEIS.	Currently no individual wetlands are scheduled to be crossed using the Horizontal Directional Drilling (HDD) method; although several riparian wetlands would be crossed using this method where they are associated with river crossings. HDD is not without impact as discussed in general Consolidated Response ENV-5. Compensatory mitigation for wetland losses are negotiated during the permitting process as discussed in general Consolidated Response WAT-2.
1448	168	Taylor	Willie	United States Department of the Interior	Appendix B, Section 7.2, Easement and Work Space: The DEIS states that the contractor shall locate all extra work areas (such as staging areas and additional spoil storage areas) at least10 feet from the water's edge if practicable ... the Contractor shall install flagging across the construction ROW at least 10 feet from the water's edge prior to clearing and ensure that riparian cover is maintained where practicable during construction. Comment: If wetland cannot be avoided	All wetlands will receive construction mitigations as described in Keystone's Construction, Mitigation, and Reclamation Plan (Appendix B of the DEIS) and any other applicable guidance from the U.S. Army Corps of Engineers. Keystone has committed to follow the same construction, mitigation, and reclamation plan for all wetland crossings regardless of whether the wetland qualifies as jurisdictional under the U.S. Army Corps of Engineer Section 404 permits. The only

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					altogether, buffer areas around wetlands should be a minimum of 100 feet to help maintain the buffering vegetation at the edge of the wetland. All wetland impacts should be mitigated, with specific mitigation measures to be coordinated with the FWS and the Corps.	difference would be the requirement for compensatory mitigation for permanent wetland losses. Most wetlands would be restored after pipeline construction. See additional discussion of this issue in Consolidated Response WAT-2.
1448	169	Taylor	Willie	United States Department of the Interior	Appendix B, page 62: The DEIS states that during hydrostatic test water withdrawals, the Contractor will maintain adequate flow rates in the water body to protect aquatic life and provide for downstream uses, in compliance with regulatory and permit requirements. The term "adequate flow" is ambiguous and subject to the aquatic life being considered. Consequently, water withdrawal location, timing, and quantity from the North Canadian, Canadian, and Red Rivers must be coordinated with and approved by the Oklahoma Ecological Services field office prior to implementation of hydrostatic testing. These rivers support the Arkansas River shiner and the interior least tern. It is important to maintain adequate flow for these species. We recommend that water not be withdrawn directly from these major rivers, but rather from an upstream tributary. The withdrawal site from the upstream tributary should be at least 0.25 mile from the main river.	Water withdrawal for hydrostatic testing would be accomplished in accordance with the state permitting agencies in each of the states traversed by the proposed route.
1448	170	Taylor	Willie	United States Department of the Interior	Appendix B, Section 4.11.1, Page 29: "The de-compacted construction right-of-way shall be tested in agricultural and residential areas." This shall also apply to USDI-BLM rangelands. Appendix B, Section 4.11.5.2, Page 32: Recommend a much tighter spacing. Slope (%) Spacing (feet) This is general guidance based on the short slope lengths with erodible soils within the proposed ROW on USDI-BLM lands. Some slopes will require an even tighter spacing to adequately control runoff and erosion.	Mitigation measures on BLM administered land have been developed by BLM as stipulations to the ROW agreement.
1448	171	Taylor	Willie	United States Department of the Interior	Appendix B, Section 4.11.5.4, Page 34: It is unclear where these will be installed (i.e. a particular slope percent). This information should be specified.	Mitigation measures on BLM administered land have been developed by BLM as stipulations to the ROW agreement.
1448	172	Taylor	Willie	United States Department of the Interior	Appendix B, Section 4.16, Page 42: "Post-construction ...If, after the first growing season, revegetation is successful and erosion is controlled, no additional monitoring shall be conducted." "In non-agricultural areas ... adjacent undisturbed land or NRCS Ecological Site Description, whichever is appropriate."	Mitigation measures on BLM administered land have been developed by BLM as stipulations to the ROW agreement.
1448	173	Taylor	Willie	United States Department of the Interior	Appendix H, Sandhills Native Rangelands: The DEIS states that a Best Management Practice would be to, "Attempt to locate the right-of-way in areas of higher soil moisture and greater soil structure while avoiding wetlands to the maximum extent possible." Comment: We appreciate the efforts and emphasize the need to avoid impacts to the Sandhills wetlands. Sandhills wetlands could include sensitive fens, bogs, and other unique wetlands with distinct assemblages of rare species. Restoration of such wetlands is difficult at best. We request that the FEIS commit to identifying wetland types, and that the project ROW avoid such wetlands.	Keystone identified wetlands along the Proposed Project in the Sand Hills and has developed construction mitigation specific to this area. Additional construction mitigation and reclamation information was added to Appendix H of the EIS.
1448	174	Taylor	Willie	United States Department of the Interior	Appendix I-78, Section 1-3.1.2-2: In Montana, low floodplain terraces occur at many stream crossings. For smaller intermittent and ephemeral drainages, these are typically	As noted by the reviewer, the statement in Appendix I includes the word "typically" to provide a description of the environmental conditions that prevail. The Montana

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					narrow and infrequently flooded. This may not be accurate. "Therefore, after construction the pipeline would not obstruct flows over designated floodplains. In addition, there would be no aboveground facilities (pump stations or valves) in floodplains in Montana. As a result, the project would not affect floodplains in Montana." This statement is incorrect suggested rewording "As a result, the project would not have permanent effects on floodplains in Montana." Additionally the impacts are not addressed.	Department of Environmental Quality (MDEQ) will address all stream crossing designs and associated floodplains issues prior to the construction of stream crossings. Specific requirements are included in MDEQ's Environmental Specifications for the proposed Project presented in Attachment 1 to Appendix I. The reclamation and restoration process for the proposed Project would include reestablishing pre-construction contours along the proposed right-of-way to reduce the potential for impacts, including impacts within floodplains areas.
1448	175	Taylor	Willie	United States Department of the Interior	Appendix J, Section J-19: Sources are missing and need to be updated. ND and SD have 3 newer 303 (d) lists (2006, 2008, 2010) than the 2004 list.	The EIS was revised in response to this comment.
1466	2	Taylor	Chad		Also, I'm concerned about the depth of the pipeline. I would like to see a construction and reclamation section of the EIS that outlines how to construct the pipeline to assure that our land remains in as good of condition after construction as it was before; the reclamation section should also assure that after the pipeline is deconstructed, the land is reclaimed to its original condition. Thank you for your time and for taking these concerns into account. I look forward to seeing future drafts of the EIS.	Keystone would bury the pipeline deeper than required by the Pipeline and Hazardous Materials Safety Administration (PHMSA) regulations. PHMSA Special Condition 19 addresses burial depth. Table 2.3.2-2 of the EIS lists the burial depths. Keystone's proposed reclamation procedures are described in Sections 2.3.2.8 and 2.3.2.9 of the EIS and in the individual resource portions of Section 3.0. Those procedures are also described in the Keystone Construction, Mitigation, and Reclamation Plan presented as Appendix B of the EIS. Information related to abandonment of the proposed Project is presented in Consolidated Response DEC-1.
1540	124	Taylor	Terry		A rancher's operation relies on the land and the water, and when either of them fails to produce, no matter how profitable an operation is, there is irreparable damage done. I feel that the Keystone XL Pipeline presents a real and present danger for damage to each of those two priceless commodities.	Keystone would reclaim all lands affected by construction to pre-construction to the extent practicable and described in Sections 2.3.2.8 and 2.3.2.9 of the EIS and in the Keystone Construction, Mitigation, and Reclamation Plan (presented in Appendix B of the EIS) unless the landowner and Keystone agree to an alternate restoration. The impacts associated with implementation of the proposed Project are addressed in Section 3.0 of the EIS. As noted in that section, construction and normal operation the proposed Project would not result in significant environmental impacts.
1540	126	Taylor	Terry		I beg you to use whatever resources you have at your disposal to protect us from that happening because what we have isn't just dirt and water. It is the heart and soul of the people who live here. It is the legacy that we hope to pass down to our children and our grandchildren, and we hope that it can stay intact so they can value it like we have.	Issues related to the High Plains Aquifer System are addressed in Consolidated Response AQF-1 through AQF-4. Consolidated Response AQF-3 provides information on hypothetical spills from the Project over two areas of the Northern High Plains Aquifer System. Consolidated Response RUR-1 addresses concerns regarding potential changes to rural lifestyles.
1540	127	Taylor	Terry		An ounce of prevention is worth a pound of cure. If it just takes one stipulation to prevent a tragedy from happening, then I would ask that you use that ounce of protection and protect what we have here in the heartland of Nebraska.	Consolidated Response SAF-1 describes the regulatory requirements and Project-specific Special Conditions that Keystone would comply with to construct, operate, maintain, inspect, and monitor the proposed Project. It also describes the monitoring, inspections, and reviews of the proposed Project that the Pipeline and Hazardous Materials Safety Administration would conduct to ensure compliance with those regulatory requirements.
1557	27	Teagarden	Amanda		Executive Director of OK-Safe. Deplores the lack of public	Consolidated Response CMT-1 addresses issues related to

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					notification about tonight's meeting. Not enough time to read 1600 pages.	the length of the comment period for the draft EIS and supplemental draft EIS. Consolidated Response CMT-2 addresses issues related to comment meetings on the draft EIS and requests for additional public involvement.
1557	28	Teagarden	Amanda		Who is in charge of upkeep, maintenance, and security along the pipeline?	As described in Consolidated Response SAF-1, the Pipeline and Hazardous Materials Safety Administration (PHMSA) has regulatory requirements that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project. In addition, PHMSA developed 57 Project-specific Special Conditions that Keystone has agreed to implement. Those conditions address inspection, monitoring, and maintenance and other aspects of the proposed Project. Consolidated Response SAF-1 also describes the inspections and reviews of the proposed Project that PHMSA would conduct to ensure compliance with the regulatory requirements and Special Conditions. Keystone would be responsible for the security of proposed Project facilities.
1557	29	Teagarden	Amanda		If there is a leak, who would resolve the issue? Would liability issues be resolved in Canadian regulations or American regulation, or Oklahoma regulations?	The U.S. portion of the proposed Project would be under the jurisdiction of U.S. federal and state agencies and would have not connection to Canadian governmental regulations. Consolidated Response LIA-1 addresses Keystone's liability if there is a spill of hazardous materials or fuel during construction or a spill of crude oil from the proposed Project.
1557	30	Teagarden	Amanda		Wants an expansion of the definition of an HCA, or high consequence area, to include ALL the land that the oil spills onto, not just part of it.	High consequence areas (HCAs) area defined by the Pipeline and Hazardous Materials Safety Administration (PHMSA) in 49 CFR 195.450 and are based on population levels and environmentally sensitive areas. Keystone submitted a list of HCAs along the proposed route to PHMSA. Keystone has withdrawn its application for a Special Permit as described in Consolidated Response REG-1. As described in Consolidated Response SAF-1, the PHMSA has regulatory requirements that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project. In addition, PHMSA developed 57 Project-specific Special Conditions (see Appendix U of the EIS) that Keystone has agreed to implement. Incorporation of those conditions would result in a proposed Project that would have a degree of safety over any other typically constructed domestic oil pipeline system under current code and a degree of safety along the entire length of the pipeline system similar to that which is required in HCAs.
1557	27	Teagarden	Amanda		Executive Director of OK-Safe. Deplores the lack of public notification about tonight's meeting. Not enough time to read 1600 pages.	Consolidated Response INT-1 addresses concerns related to the Notice of Intent (NOI) to prepare an EIS for the proposed Project. Consolidated Response CMT-2 addresses issues related to comment meetings on the draft EIS and requests for additional public involvement. Consolidated Response CMT-3 addresses the level of information provided to the public regarding the proposed Project and the draft EIS scoping meeting locations and schedules.
1544	137	Tejada	Matthew	Air Line Houston	I do not believe that the State Department has paid nearly enough attention or importance to the Environmental Justice impacts of this project. There is an absence of thought to the	Consolidated Response JUS-1 and Section 3.10.1.2 of the EIS describe the counties in the project area with higher populations of minority and low-income groups that may be

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					long term impacts that this project will have on the health and quality of life of so many residents, particularly in the Port Arthur and East Harris County areas.	<p>impacted by the project. This analysis is in accordance with Council on Environmental Quality guidance for analysis of potential environmental justice effects. As noted in Section 3.10 of the EIS, implementation of the proposed Project is not expected to result in adverse impacts that would fall disproportionately on minority or low-income populations located along the pipeline route. Moreover, project-related spending and tax revenues would result in substantial socioeconomic benefits in the region of influence, which may positively affect low-income and minority populations and Native American tribes through increased employment opportunities, income benefits, and improved public service levels.</p> <p>As discussed in the EnSys 2010 report, the quantity of crude oil refined in PADD III is driven by market conditions and is independent of the existence of the proposed Project. The proposed Project would provide access to WCSB crude oil in PADD III refineries that would supplant supplies from other sources, including Venezuela and Mexico. As discussed in Section 3.13.5.1 of the EIS and Consolidated Response OIL-4, the composition of WCSB crude oils that could be transported by the proposed Project is not dissimilar from other heavy crude oils currently refined in PADD III. There is therefore no credible evidence that implementation of the proposed Project would lead to disproportionate adverse impacts on minority and low income populations near PADD III refineries.</p>
1544	139	Tejada	Matthew	Air Line Houston	We are already refining much of this dirty fuel here. We do not need to increase our capacity to bring in even more that much easier, that much cheaper, that much more attractive for major corporations to earn more money on the backs of people who have been bearing this burden for decades.	As noted in Consolidated Response P&N-1, the Project has been proposed to meet the heavy crude oil needs of refineries in the Gulf Coast area that are experiencing dwindling supplies from current sources. As discussed in the EnSys 2010 report, the quantity of crude oil refined in PADD III is driven by market conditions and is independent of the existence of the proposed Project. The proposed Project would provide access to WCSB crude oil in PADD III refineries that would supplant supplies from other sources, including Venezuela and Mexico. As discussed in Section 3.13.5.1 of the EIS and Consolidated Response OIL-4, the composition of WCSB crude oils that could be transported by the proposed Project is not dissimilar from other heavy crude oils currently refined in PADD III. There is therefore no credible evidence that implementation of the proposed Project would lead to disproportionate adverse impacts on minority and low income populations near PADD III refineries.
1544	140	Tejada	Matthew	Air Line Houston	Any statements in the draft EIS or in the response to our comments will be embarrassingly lacking if they do not dwell on the Environmental Justice impacts of this project for residents of East Harris County and the Port Arthur areas.	As discussed in the EnSys 2010 report, the quantity of crude oil refined in PADD III is driven by market conditions and is independent of the existence of the proposed Project. The proposed Project would provide access to WCSB crude oil in PADD III refineries that would supplant supplies from other sources, including Venezuela and Mexico. As discussed in Section 3.13.5.1 of the EIS and Consolidated Response OIL-4, the composition of WCSB crude oils that could be transported by the proposed Project is not dissimilar from other heavy crude oils currently refined in PADD III. There is

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
						<p>therefore no credible evidence that implementation of the proposed Project would lead to disproportionate adverse impacts on minority and low income populations near PADD III refineries.</p> <p>Consolidated Response JUS-1 and Section 3.10.1.2 of the EIS describe the counties in the project area with higher populations of minority and low-income groups that may be impacted by the project. 567	1	Tesar	William		I oppose the pipeline through Nebraska.	Comment acknowledged.
567	2	Tesar	William		To assume that the pipeline will not damage the Sandhills environment or the Ogallala Aquifer is very naive.	Issues related to the Sand Hills area are addressed in Consolidated Response ERO-1. Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
567	3	Tesar	William		The past oil spill in Alaska years ago, or the more recent Gulf oil catastrophe should be an indicator to those who would permit such an action!	As described in Consolidated Response GLF-1, the risks associated with the proposed Project are substantially different from those associated with the BP Deepwater Horizon Project. The spill in Alaska was from a marine tank ship and occurred in Prince William Sound. The risks and potential impacts of the proposed Project are substantially different from those of that incident.
939	1	Testi	Francesca		The Sandhills are too fragile an ecosystem to take the stress of any leaks that will happen here.	Issues related to the Sand Hills area are addressed in Consolidated Response ERO-1. Issues related to the Northern High Plains Aquifer System are addressed in Consolidated Responses AQF-1 through AQF-4.
939	2	Testi	Francesca		The Ogallala's water is too precious a resource, in this day's dwindling water supplies, to expose to any leaks that will happen here.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
939	3	Testi	Francesca		Agriculture already pulls more water out of the Ogallala aquifer than is recharged by rainfall and runoff.	Operation of the proposed Project will not extract or use any water from the aquifer.
939	4	Testi	Francesca		The Ogallala is already being toxified by Uranium tailings from Cameco's Crow Butte operations; it should not be allowed that oil from yet another carbon-polluting player seep into it as well.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
939	5	Testi	Francesca		Their plan indicates that the pipeline will be buried, thus almost guaranteeing that any leaks will remain so for too long, thereby contaminating the Ogallala aquifer before a fix happens.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
939	8	Testi	Francesca		The presumed need for this extra oil is false. Much greater emphasis on end-use efficiency measures offsets such need, as well as offsets the ongoing carbon-loading into the	Consolidated Response P&N-1 addresses the need that the Project has been proposed to meet. Consolidated Response ALT-2 addresses the use of alternative technologies and

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					atmosphere propagated by such pipeline plans. Our National Security would be better served by pushing for end-use, radical efficiency measures and sustainably produced, renewable energy sources, than continuing the inane, "Drill, Baby, Drill!" mentality which has led us to our current Gulf oilwell blowout.	alternative energy sources.
939	11	Testi	Francesca		Refining tar sands crude here in Houston will contribute to our already dire problem with air pollution.	As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries. Consolidated Response OIL-4 also addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils.
939	12	Testi	Francesca		The promise of jobs that will disappear once the pipeline is in place is outweighed by the loss of jobs connected to oil shipping in our port and to the environmental damage to our air quality.	Consolidated Response ECO-1 addresses potential socioeconomic impacts, and Consolidated Response TAX-1 addresses concerns regarding taxes. As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries.
1226	2	Thayer	Mary		We need oil and we have enough here without purchasing from Arab countries. Please stand against the Union bill to force people to join and pay dues to unions against their will. I don't envy you, your position. Please stand up for Nebraskans and remember our children and grandchildren will pay the bill for our mistakes. Thanks for standing strong.	Comment acknowledged.
640	1	Theer	Trisha		I believe that placing this propose pipeline over the Ogallala Aquifer would be an environmental disaster. Should there be a leak, not only will our nation be reminded that we need to find something to replace oil as our primary source of energy, but we will also have to find something to replace the water we drink that gives us life. The risk is not worth it. Please, for once, do the environmentally responsible thing.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
1035	1	Thelander	Ruby		I am greatly concerned about the pipeline that will cut through the Ogallala Aquifer to bring tar sands oil to the south. Please see that it is moved east of the planned route to miss the aquifer. Or, perhaps it can be put above ground? Do something to be sure that there is no danger to our fresh water supply in Nebraska!	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. Consolidated Response ALT-1 addresses potential alternative routes, including routes that would avoid much of the Northern High Plains Aquifer system. Issues related to an aboveground pipeline are addressed in Consolidated Response CST-1.
1541	1	Thielen	Missy		Landowners in Montana and their children need extra protection upon the decommissioning of the Keystone XL Pipeline, an act that could happen over 50 years from now.	Responses related to the life of the Project and taking the Project out of service at the end of the life of the Project are presented in Consolidated Response DEC-1.
1541	4	Thielen	Missy		Allowing a pipeline to be placed on their property puts the landowners in Montana at a severe disadvantage. While TransCanada stands to earn billions of dollars from placing the pipeline in the landowner's lands, these landowners have the potential to lose everything.	The impacts associated with implementation of the proposed Project are addressed in Section 3.0 of the EIS. As noted in that section, construction and normal operation the proposed Project would not result in significant environmental impacts. Section 3.13 of the EIS addresses reliability and safety issues, including calculations of the probability of a spill from the proposed Project and the potential environmental impacts associated with spills. Consolidated Response LIA-1

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
						addresses Keystone's liability if there is a spill of hazardous materials or fuel during construction and from a spill of crude oil from the Project.
1541	9	Thielen	Missy		Any cleanup costs of the Keystone XL pipeline should be borne solely by TransCanada, who stands to profit billions of dollars; not by the states or landowners, who unfortunately only share in the risk, not in the profits.	Consolidated Response LIA-1 addresses Keystone's liability if there is a spill of hazardous materials or fuel during construction or a spill of crude oil from the proposed Project.
1541	10	Thielen	Missy		With the US still in economic dismay, we should put our steel workers back to work. The pipe should be specified as USA-made, not foreign made, in order to help boost the economy.	Consolidated Response PIP-1 addresses the issue of purchasing pipe for the Project.
1541	12	Thielen	Missy		We need to remember that our, and our children's protection is the most important part of the project.	Consolidated Response SAF-1 describes the regulatory requirements and Project-specific Special Conditions that Keystone would comply with to construct, operate, maintain, inspect, and monitor the proposed Project. It also describes the monitoring, inspections, and reviews of the proposed Project that the Pipeline and Hazardous Materials Safety Administration would conduct to ensure compliance with those regulatory requirements.
1541	13	Thielen	Missy		In Appendix 1b, under 3.3 Monitoring, it says upon notice by the owner, the state inspector will schedule initial post-construction field inspections following cleanup and road closure. Then under 4.6 Monitoring, DEQ may continue to monitor operations and maintenance activities for the life of the project, in order to ensure compliance with specifications in this section. 4.6.2 says DEQ may require the owner to fund additional monitoring efforts to resolve problems which develop after release of the bonds described in section 0.7. Such efforts would be limited to compliance with these specifications and other conditions adopted by DEQ. This is of utmost importance to landowners. If this was in place, it would put value on our land because future owners will have some form of insurance that issues with the pipeline will be resolved. If continual monitoring is required in the operation and maintenance activities for the life of the project, then we as landowners will also have the understanding that our health, safety and welfare is being protected.	The Montana DEQ has revised Attachment 1 to Appendix I of the EIS in response to this comment.
1541	14	Thielen	Missy		In one place it says that all water wells developed by the owner shall be conveyed or transferred to the landowner upon decommissioning of the pipeline. If that well is drilled on landowner property to water livestock while they're being cut off from their natural source of water, and TransCanada keeps the rights to that well until their pipeline is decommissioned, what are the landowner's rights to use that well? Why would it have to belong to TransCanada until decommissioning? Shouldn't it be turned over when the project is done, and they're done using it for whatever purpose?	Keystone has stated that is would not drill wells as a part of construction of the proposed Project.
1067	1	Thom	Lois		I am extremely concerned about the new Keystone Pipeline that is scheduled to run through the Ogallala Aquifer. How can we be sure the best expertise available is being used to ensure the safety of our precious water? I simply don't trust that the greatest natural resource in our state will be protected properly.	As described in Consolidated Response GLF-1, the risks associated with the proposed Project are substantially different from those associated with the BP Deepwater Horizon Project. Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
1067	2	Thom	Lois		I am especially concerned, now that we know the Federal	The Department of State (DOS) does not have regulatory

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					Government's oversight of the regulations on offshore drilling was partially to blame for the Gulf Oil spill this year. The Federal State Dept. has the regulatory authority over this pipeline.	control over the proposed Project. As described in Consolidated Response ENR-1, DOS is responsible for the review of Keystone's application of a Presidential permit and is the lead federal agency for the NEPA review of the proposed Project. The proposed Project would be under the regulatory jurisdiction of the Pipeline and Hazardous Materials Safety Administration (PHMSA). Consolidated Response SAF-1 describes the regulatory requirements of PHMSA that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project. It also describes the inspections and reviews of the proposed Project that PHMSA would conduct to ensure compliance with those regulatory requirements.
82	1	Thomas	Mike		I have 50 acres in Hudson, Texas. I bought this property 25 years ago. It had one pipeline running through it at the time. Since then there has been two more added. As you know this makes for lots off un-usable property. You do not have permission to access my property or cross it. I am not going to lose any more land and have four pipelines across my land.	DOS is conducting the environmental review of the proposed Project and is not involved in obtaining easements along the proposed route. Consolidated Response EAS-2 addresses issues related to easement negotiations. As noted in that response, DOS has no legal authority in the easement negotiation process. Consolidated Response PVT-1 addresses concerns regarding the cumulative effects of the proposed Project and other pipeline projects in the vicinity of the proposed route.
689	1	Thomas	Lee		I am adamantly opposed to routing the Keystone Pipeline through any part of the Sandhills of Nebraska. Any kind of oil spill would have disastrous consequences for the Ogallala Aquifer, which supports agriculture and populations in the central U.S. We have ample evidence that the oil industry cannot guarantee that no such spill will occur, and the notion of playing "probabilities" of such a spill simply does not cut it when the stakes are this high.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. Consolidated Response OIL-1 addresses the likelihood of spills from the Project.
1540	74	Thomas	Adam	Indigenous Environment Network	It crosses thousands of streams and rivers, and if an oil spill happens to take place it would destroy all our salmon stocks.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1. The location and extent of a spill from the proposed Project would affect the resources affected and the magnitude and duration of the impacts. Section 3.13 of the EIS addresses reliability and safety issues, including calculations of the probability of a spill from the proposed Project and the potential environmental impacts associated with spills. The waterbodies crossed by the proposed route in the U.S. do not support salmon runs.
1540	75	Thomas	Adam	Indigenous Environment Network	If an oil spill happens to take place it would destroy all our salmon stocks and destroy our way of life.	The location and extent of a spill from the proposed Project would affect the impacts. Section 3.13 of the EIS addresses reliability and safety issues, including calculations of the probability of a spill from the proposed Project and the potential environmental impacts associated with spills. The waterbodies crossed by the proposed route in the U.S. do not support salmon runs.
1556	55	Thomas	Adam	Indigenous Environmental Network; (unnamed First Nation) Tribal Council	I'm here with the Indigenous Environmental Network fighting off pipelines. I don't want you guys water to go contaminated.	Consolidated Response WAT-1 addresses concerns regarding potential water quality impacts.
224	1	Thompson	Randy		So now we want to build an oil pipeline across the aquifer in	See Consolidated Response AQF-2 As described in

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					Nebraska. In many places the pipe will actually be submerged in the groundwater. Have we learned anything from the Gulf Coast disaster?	Consolidated Response GLF-1, the risks associated with the proposed Project are substantially different from those associated with the BP Deepwater Horizon Project.
388	1	Thompson	RuthAnn		I drive a car, farm, and use electricity - I consume oil. I will gladly pay more for it now if you don't put this pipeline through the Oglala Aquifer. The largest fresh water storage area in the Western hemisphere (and naturally maintained at little tax payer expense) could be irreparably damaged by even a small leak in this pipeline.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
1324	1	Thompson	John		As county officials from the State of Texas, we strongly encourage the U.S. Department of State to approve an energy infrastructure project that not only will strengthen longterm energy security in the United States, but also will provide a powerful private sector economic stimulus to the communities along the pipeline route during its construction at a time when our economy continues to struggle..	Comment acknowledged.
1324	2	Thompson	John		As we understand it, Keystone XL will directly create more than 13,000 high-wage construction and manufacturing jobs during the project's 2011-2012 construction schedule. Many of those jobs will be created in Texas and in our counties, where too many of our residents continue to find it difficult to find good jobs. With Keystone XL, they will have an opportunity to work on the project or for businesses that provide supplies, goods and services for its construction and operation, . . .	Consolidated Response ECO-1 and Section 3.10.2.2 of the EIS address the potential socioeconomic impacts of the proposed Project.
1324	3	Thompson	John		In addition to the jobs Keystone XL will create, the project will generate substantial economic benefits for the United States and in states and communities along the proposed route. Like our counties, in many cases these are areas where economic performance has stagnated or is shrinking. It is our understanding that TransCanada commissioned a study to measure the project's economic stimulus to the U.S. and the states along the route. The study found that in the U.S., Keystone XL would generate \$20.9 billion in total expenditures, \$9.6 billion in output (gross product), personal income of \$6.5 billion and 118,935 person years of employment (jobs).	Consolidated Response ECO-1 and Section 3.10.2.2 of the EIS address the potential socioeconomic impacts of the proposed Project.
1324	4	Thompson	John		In addition, the report concluded that during construction, Keystone XL would generate \$486.36 million in tax revenue for state governments along the route and \$99.1 million for local taxing entities where the pipeline is located.	Consolidated Response TAX-1 and revisions to Section 3.10.2.4 of the EIS address concerns regarding taxes associated with implementation of the proposed Project.
1324	5	Thompson	John		Moreover, in addition to the construction and manufacturing jobs Keystone XL will create during construction, the economic stimulus provided by the pipeline's construction and development will lead to the creation of more than 100,000 additional jobs in the economy. In Texas, the study found Keystone XL expenditures during construction would total \$5.4 billion and generate an economic gross product of nearly \$2.86 billion.	Consolidated Response ECO-1 and Section 3.10.2.2 of the EIS address the potential socioeconomic impacts of the proposed Project.
1324	6	Thompson	John		Keystone XL construction also would generate more than \$64.5 million in tax revenue for local government and \$152 million for state government.	Consolidated Response TAX-1 and revisions to Section 3.10.2.4 of the EIS address concerns regarding taxes associated with implementation of the proposed Project.
1324	7	Thompson	John		Furthermore, the delivery of secure and affordable supplies of	Comment acknowledged.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					Canadian energy to American consumers would have minimal impacts on the environment. This is a vital project that will strengthen U.S. energy security and reduce our dependence on unstable foreign sources of oil.	
1324	8	Thompson	John		The Perryman study concluded that the long-term increase in stable oil supplies will add at least 250,000 permanent jobs to the U.S. economy, and add \$29 billion to the nation's gross annual product, conservatively estimated.	Consolidated Response ECO-1 and Section 3.10.2.2 of the EIS address the potential socioeconomic impacts of the proposed Project.
1324	9	Thompson	John		Canada is already the largest supplier of energy to the United States, meeting 12 percent of current U.S. petroleum-consumption needs and representing 18 percent of U.S. petroleum imports. Canadian oil sands production is a growing source of reliable crude oil supply for the United States. Canada's 175 billion barrels of oil reserves is second only to Saudi Arabia. Oil sands account for more than 97 percent of that vast reserve: 170 billion barrels of oil with the potential for more than 100 years of production. Canada has more than 50 percent of the non-state controlled reserves in the world. Long-term supply is critical in a world where supply risks are growing, whether due to declining production from a once-reliable source, an unstable geo-political climate, or uncertainties in key oil producing regions. Construction of additional pipeline facilities such as the Keystone XL Project, to transport oil sands production to the vitally important Gulf Coast area is critical. These refineries also have excess capacity as a result of reduced production from Mexico, where heavy oil production is in steep decline, and Venezuela, which is moving to other markets. Timing to Canada for a secure oil supply is a logical step.	Comment acknowledged.
1324	10	Thompson	John		We enthusiastically support the Keystone XL Pipeline Project and encourage the Department of State to continue the findings of the Draft Environmental Impact Statement, which found that the proposed Keystone XL Pipeline would have "limited adverse environmental impact during construction and operation." We look forward to the issuance of a Final Environmental Impact Statement followed by a Presidential Permit that allows the construction of Keystone XL and enables our counties, the State of Texas, and the United States to collect the substantial economic benefits Keystone XL would create.	Comment acknowledged.
1560	1	Thompson	Randy		General environmental concerns: have streams that use to water cattle and oil will spread quickly if there's a leak because have sandy soil.	If there is a spill from the proposed Project, Keystone or the incident response team would inform all landowners in the vicinity of the spill that the release had occurred and advise the landowners of the appropriate precautions. Keystone would be liable for all costs associated with cleanup and restoration as well as other compensations, as noted in Consolidated Response LIA-1. If a source of water is affected, Keystone would provide water until the water source is proven to be acceptable for use.
1560	25	Thompson	Randy		Concerned about the pipeline going right through the aquifer.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
1560	66	Thompson	Randy		Concerned about pipeline crossing through middle of pasture.	Keystone would reclaim all lands affected by construction to pre-construction to the extent practicable and described in

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
						Sections 2.3.2.8 and 2.3.2.9 of the EIS and in the Keystone Construction, Mitigation, and Reclamation Plan (presented in Appendix B of the EIS) unless the landowner and Keystone agree to an alternate restoration. Consolidated Response FRM-1 addresses potential ranch of farmland impacts, including compensation for lost crops. As noted in the EIS, after construction is complete, farming can continue over the pipeline. Keystone would coordinate with landowners regarding issues such as minor realignments to avoid springs, provided the realignment meets all permit requirements of federal, state, and local agencies.
1560	67	Thompson	Randy		Concerned about the length of time it will take to reestablish the native grasses is greater than the 2 years stated by Keystone.	The length of time to reestablish native prairie grasses would depend on several factors as discussed in Section 3.5.5.2 of the EIS. The EIS identifies that short-grass prairie and mixed-grass prairie may take 5 to 8 or more years to reestablish due to poor soil conditions and low moisture levels. Tall-grass prairie sod may require more than a 100 years for recovery. Grazing by both wildlife and livestock would also lengthen the recovery period as would invasion of exotic grasses and weeds.
1540	76	Thornton	Mel		I am concerned about the environmental impact of this whole process and of building a pipeline at all, and specifically building it across our area of Nebraska.	The impacts associated with implementation of the proposed Project are addressed in Section 3.0 of the EIS. As noted in that section, construction and normal operation the proposed Project would not result in significant environmental impacts. Identification of sensitive environments crossed by the proposed Project is discussed in Consolidated Response ENV-1 and ENV-3. Issues related to the Sand Hills area are addressed in Consolidated Response ERO-1. Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
1540	77	Thornton	Mel		What is the safety record so far for these pipelines? According to previous speakers, it's frightening.	Previous incidents for hazardous liquid pipelines and for the existing Keystone Oil Pipeline Project are included in Section 3.13.4.2 of the EIS.
1540	78	Thornton	Mel		To gain some more information, I went online and found just two pages of information from the National Wildlife Federation. After reading that carefully, I have decided that I think building this pipeline would be wrong policy, very unsafe.	Consolidated Response SAF-1 describes the regulatory requirements that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project in a manner that protects the health and safety of the public and the environment. It also describes the inspections and reviews of the proposed Project that the Pipeline and Hazardous Materials Safety Administration would conduct to ensure compliance with those regulatory requirements.
1540	79	Thornton	Mel		The pipeline will leave us, eventually, worse off than we are now as far as the environment is concerned.	Identification of sensitive environments crossed by the proposed Project is discussed in Consolidated Response ENV-1 and ENV-3. Issues related to the Sand Hills area are addressed in Consolidated Response ERO-1. The impacts associated with implementation of the proposed Project are addressed in Section 3.0 of the EIS. As noted in that section, construction and normal operation the proposed Project would not result in significant environmental impacts. Section 3.13 of the EIS addresses reliability and safety issues, including calculations of the probability of a spill from the proposed Project and the potential environmental impacts associated with spills.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
1540	81	Thornton	Mel		The process of refining the tar sands is going to release at least three times as much global warming pollution as normal petroleum would, and it makes the pollution much worse at the refineries.	Consolidated Response OIL-4 also addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils being processed in Gulf Coast refineries. As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries.
1540	82	Thornton	Mel		We need cleaner energy, not dirty tar sands oil.	As noted in Consolidated Response OIL-4, the composition of crude oil that would be transported by the proposed Project would be essentially the same as that of other heavy crude oils refined in the U.S. Also see Consolidated Response CAN-1.
1540	84	Thornton	Mel		All the requests for waiving safety regulations is very worrisome.	Keystone has withdrawn its application for a Special Permit as described in Consolidated Response REG-1. As described in Consolidated Response SAF-1, the Pipeline and Hazardous Materials Safety Administration (PHMSA) has regulatory requirements that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project in a manner that protects the health and safety of the public and the environment. In addition, PHMSA developed 57 Project-specific Special Conditions that Keystone has agreed to implement. Incorporation of those conditions would result in a Project that would have a degree of safety over any other typically constructed domestic oil pipeline system under current code and a degree of safety along the entire length of the pipeline system similar to that which is required in HCAs as defined in 49 CFR 195.450.
1540	85	Thornton	Mel		Just recently there was an earthquake just a couple miles northwest of Springview, Keya Paha County. Is the possibility of earthquakes addressed in the draft environmental statement?	Section 3.2 of the EIS and Consolidated Response GEO-2 address seismicity and the potential for earthquakes in the vicinity of the proposed Project.
1540	88	Thornton	Mel		You can see some of the very polluted ponds used to process the tar sand from space they're so large. They ripped up the whole countryside around there.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information on current and future production. As noted in that Consolidated Response, without the proposed Project, oil sands development would continue at or above the current level until at least 2020, with or without the proposed Project.
1540	90	Thornton	Mel		This pipeline would more than double the amount of tar sands oil that would be coming into the United States. I really think that's the wrong direction we want to move, not only for us but for our children and our grandchildren. Even if this thing is built, our grandchildren are going to have to worry about getting rid of it. Those are the kinds of problems we don't really need.	Consolidated Response P&N-1 addresses the need for the proposed Project. Consolidated Response DEC-1 deals with the decommissioning of the proposed Project.
122	1	Thorogood	John		You must be crazy to lay a crude oil pipe line in Nebraska, the nation's riches provider of fresh water. Fresh water is much more precious than crude oil and the god almighty dollar. Get your heads screwed on correctly and remember once the ground water of Nebraska is contaminated where will everyone get their water from? Another dumb idea coming out	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					of Washington DC.	
122	2	Thorogood	John		If a pipe line disaster or worst yet a terrorist attack way out in the middle of rural Nebraska we would have TWO that's right TWO disasters. With the oil line broken and fresh water becoming contaminated for decades to come.	Consolidated Response TER-1 addresses potential terrorism associated with the proposed Project. Issues related to the High Plains Aquifer System are addressed in Consolidated Response AQF-1 through AQF-4. Consolidated Response AQF-3 provides information on hypothetical spills from the Project over two areas of the Northern High Plains Aquifer System. Section 3.13.6.3 addresses the potential impacts associated with an accidental or deliberate spill of crude oil over the Northern High Plains Aquifer System.
1141	1	Tietjen	Don&Mary		We share your concern about our most important resource, water. Please continue to work to protect our state.	Consolidated Response ENR-1 provides information on the Department of State's environmental review process, the National Interest Determination process, and the need to complete those reviews before approving or denying the Presidential permit for the proposed Project.
625	1	Tigges	Karen	Sierra Club	As a former resident of Nebraska, I object to the XL pipeline that would go through the sandhills and Niobrara River valley. These are sensitive areas where a pipeline spill would be disastrous.	Issues related to the Sand Hills area are addressed in Consolidated Response ERO-1. The Niobrara River would be crossed using the horizontal directional drilling method which would avoid impacts to the river.
625	2	Tigges	Karen	Sierra Club	It also covers the Ogallala Aquifer, which is a vital water supply for ranches and communities in the area. Please do not allow the pipeline to be built.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
571	1	Tilden	Janet	Executive Rewrites	I am not reassured by empty promises and contrived statistics.	The commenter's opinion is noted.
571	2	Tilden	Janet	Executive Rewrites	We should not run the risk of contaminating the Ogallala Aquifer with an oil leak.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
571	3	Tilden	Janet	Executive Rewrites	The Keystone Pipeline is a terrible idea that should be abandoned.	The commenter's opinion is noted.
1546	164	Todaro	Matthew	U.S. Climate Action Network	Tar sands production is dirty, destructive to forest landscapes, energy intensive, and will increase greenhouse gas emissions and take us down the wrong path for the 21st century.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information on current and future production. As noted in that Consolidated Response, without the proposed Project, oil sands development would continue at or above the current level until at least 2020, with or without the proposed Project. Consolidated Response GHG-4 addresses concerns regarding the loss of boreal forest and peat bogs.
1546	167	Todaro	Matthew	U.S. Climate Action Network	Canadian policy goals are similar to those of the U.S. We shouldn't assume that not allowing the pipeline to run to the U.S. would mean that they export the oil to China.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project. Section 4.1 of the EIS addresses other potential exportation routes from the Western Canadian Sedimentary Basin.
784	1	Tomjack	Leanna		The Sandhills of Nebraska are a fragile ecosystem. This pipeline should not run through the Nebraska Sandhills.	Identification of sensitive environments crossed by the proposed Project is discussed in Consolidated Response ENV-1 and ENV-3. Issues related to the Sand Hills area are addressed in Consolidated Response ERO-1. Consolidated Response ALT-1 addresses potential alternative routes, including routes that would avoid much of the Northern High Plains Aquifer system and the Sand Hills area.
784	2	Tomjack	Leanna		[The Sandhills of Nebraska are a fragile ecosystem.] A spill from a pipeline running through them would not only affect the	Issues related to the Sand Hills area are addressed in Consolidated Response ERO-1. Issues related to the

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					people there but also [the underlying Ogallala aquifer for generations.] ...	Northern High Plains Aquifer System are addressed in Consolidated Responses AQF-1 through AQF-4.
784	3	Tomjack	Leanna		[A spill] would not only affect the people there but also the underlying Ogallala Aquifer for generations.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
1345	1	Toups	Stephen	Turner Industries Group, LLC	Recently a number of advocacy groups sent a letter seeking suspension of the permitting of the Keystone XL pipeline. I encourage you to reject the request and to continue to review the proposed project.	Comment acknowledged.
1345	3	Toups	Stephen	Turner Industries Group, LLC	At the same time, construction of this project stands to bring significant economic benefits to the areas where it will be built	Comment acknowledged.
1345	4	Toups	Stephen	Turner Industries Group, LLC	Provided it has limited impact on the environment, this project could be an important part of the solution to our energy supplies. The permitting processes in place are appropriate and should proceed so that a final determination can be made about the impacts of the project and whether it is in the national interest. Please reject the request to suspend the process and continue with the review.	Comment acknowledged.
1347	1	Toups	Stephen	Turner Industries Group LLC	I write in support of TransCanada's Keystone XL crude oil pipeline project and urge the department to grant a permit for the pipeline.	Comment acknowledged.
1347	3	Toups	Stephen	Turner Industries Group LLC	The environmental benefits of Keystone XL should not be overlooked. The current tragedy in the Gulf underscores the importance of a diverse portfolio of energy supplies. Within the spectrum of viable options, it is appropriate to seek a growing role for oil resources that are: • landbased • North American; and, Transported by pipeline. This project meets each of these criteria. Securing stable and affordable energy from our North American allies through projects such as the Keystone pipeline is in the national interest. Considering the economic and energy security benefits of these vital resources, we should continue to expand America's access to safe, affordable energy to help ensure improved domestic and global energy security and stable prices for consumers.	Comment acknowledged.
1347	4	Toups	Stephen	Turner Industries Group LLC	Pipelines are the safest, most reliable, economical and environmentally favorable way to transport oil and petroleum products, as well as other energy liquids, throughout the U.S. America depends on the more than 168,000 miles of liquid pipelines to move energy and raw materials our country relies on.	Comment acknowledged.
1347	5	Toups	Stephen	Turner Industries Group LLC	Additional pipeline capacity will help consumers and businesses throughout the United States. This project also stands to provide a powerful private sector economic stimulus. During construction, Keystone XL will create more than 13,000 jobs funded with private investment. In addition, local governments will have a steady source of income from economic activity associated with construction	Consolidated Response ECO-1 and Section 3.10.2.2 of the EIS address the potential socioeconomic impacts of the proposed Project.
1347	6	Toups	Stephen	Turner Industries Group LLC	and from property taxes the pipeline company will pay. Thank you for the opportunity to comment.	Comment acknowledged.
1515	1	Towe	Thomas	Towe Farms, Inc	The Keystone Pipeline is proposed to run through almost a mile of land owned by Towe Farms, Inc. I am extremely	Section 3.13 of the EIS addresses reliability and safety issues, including calculations of the probability of a spill from the

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					<p>concerned about the possibility of a leak or burst from the pipeline and the environmental impact it will have on the surrounding area. I further urge you to carefully review the letter submitted by Wesley P. James of Bigfork, Montana. Wesley is a retired engineering professor at Texas A & M, and I respect this technical comments. He states that the EIS lacks critical data regarding the viscosity of the oil, specific gravity, modulus of elasticity of the oil, pump characteristics, and other matters necessary to evaluate the serious potential from a pipe breakage or leak. I am particularly concerned about his conclusion that at the high pressure end with the assumptions that are already outlined in the EIS; the extremely high pressure necessary for transporting tar sands could cause a discharge from a pipeline break to reach 600 feet in the air and spray oil on a distance of 2400 feet from the break point. This is very alarming and the damage to the environment needs to be carefully evaluated. The cost of Cleanup is quite substantial if these facts are true, With the focus on the BP oil spill in the Gulf and the more recent oil pipeline break near Salt Lake City, these are not idle threats and need to be fully considered. I believe the EIS is deficient for failing to adequately consider these matters.</p>	<p>Project and the potential environmental impacts associated with spills. DOS considers this assessment to be in compliance with NEPA environmental review requirements.</p> <p>All issues related to design specifics and operation of the proposed pipeline system are under the jurisdiction of the Pipeline and Hazardous Materials Safety Administration (PHMSA), as explained in Sections 2.3, 2.3.1, and 3.13.1 of the EIS and in Consolidated Response SAF-1. The EIS describes the basic elements of design, construction, and operation that need to be considered in assessments of the potential impacts of construction and normal operation. As a result, not all equipment that would be installed if the Project is approved is listed and not all operating conditions are listed. The probability of a spill presented in Sections 3.13.2 and 3.13.3 are based on PHMSA incident data, and the impacts of a spill presented in Sections 3.13.5 and 3.13.6 describe what would likely occur if oil were to be released, irrespective of the reason for the release. In essence this section answers the question "what if" and does not rely on specific causes.</p> <p>Keystone has withdrawn its application for a Special Permit as described in Consolidated Response REG-1. The maximum operating pressure would be lower than the pressure assessed by Mr. James. In a submittal to the PHMSA that responded to the issue of the distance of oil ejected from the pipeline, Keystone provided the following statement: "Industry experience demonstrates that oil flowing through a pipeline buried at this depth would simply pool on the surface in the immediate area of the release. The Keystone XL pipeline will be buried to a depth of 4 feet. The anticipated worst case spray zone for an exposed or above ground pipeline is anticipated to be consistent with industry experience, i.e., in the 75 to 394 foot range." PHMSA concurred with that analysis.</p> <p>Consolidated Response RES-1 addresses issues related to preparation and review of the emergency response plan for the proposed Project. Consolidated Response LIA-1 addresses Keystone's liability if there is a spill of hazardous materials or fuel during construction and from a spill of crude oil from the Project.</p>
770	1	Townsend	Katherine		Please do not grant a permit for the Keystone XL Pipeline. The risk of environmental disaster is too great...	Section 3 of the EIS addresses the impacts of construction and operation of the proposed Project. Section 3.13 of the EIS addresses the risk and environmental impacts of a crude oil spill from the proposed Project.
770	2	Townsend	Katherine		Polluting the Ogallala Aquifer which provides clean water to eight states, in addition to numerous other valid environmental concerns, is unthinkable.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
770	3	Townsend	Katherine		...It is folly to believe that leaks and accidents won't happen...	Section 3.13 of the EIS addresses reliability and safety issues, including calculations of the probability of a spill from the Project. That section does not state that there would not be any leaks or spills over the life of the Project.
770	4	Townsend	Katherine		...Refining and using this dirty fuel will only increase the rate of	As described in Consolidated Responses P&N-1, P&N-3, and

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					climate change.	OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries. Consolidated Response OIL-4 also addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils. Climate change is addressed in Section 3.14.3.14. As noted in that Section, implementation of the proposed Project is unlikely to result in a measureable climate change.
1566	2	TransCanada		TransCanada	Second paragraph deleted: The need for the Project is dictated by: <#> Supply of heavy crude oil from the WCSB; <#> Demand for heavy crude oil in PADD III; <#> Transport of crude oil from the WCSB to PADD III; and Future crude oil supply and demand scen	Section 1.0 of the EIS was reorganized to move the “need” portion (Section 1.2.2 of the draft EIS) to a new Section 1.4 (Overview of the Crude Oil Market). That section was substantially revised and includes changes similar to those requested by the commenter.
1566	3	TransCanada		TransCanada	Deleted from paragraph 1, line 2: The increasing demand for crude oil in the U.S. cannot be entirely met by efforts to conserve use of refined petroleum products or the increased use of renewable energy. As crude oil demand increases, the overall domest	Section 1.0 of the EIS was reorganized to move the “need” portion (Section 1.2.2 of the draft EIS) to a new Section 1.4 (Overview of the Crude Oil Market). That section was substantially revised and includes changes similar to those requested by the commenter.
1566	4	TransCanada		TransCanada	Paragraph 1, line 2: “increasing” deleted, “need to replace declining domestic crude oil supplies and less reliable and diminishing supply sources, and the steady” inserted.	Section 1.0 of the EIS was reorganized to move the “need” portion (Section 1.2.2 of the draft EIS) to a new Section 1.4 (Overview of the Crude Oil Market). That section was substantially revised and includes changes similar to those requested by the commenter.
1566	5	TransCanada		TransCanada	Paragraph 1, line 4: “particularly the increasing demand for heavy crude in PADD III” inserted.	Section 1.0 of the EIS was reorganized to move the “need” portion (Section 1.2.2 of the draft EIS) to a new Section 1.4 (Overview of the Crude Oil Market). That section was substantially revised and includes changes similar to those requested by the commenter.
1566	6	TransCanada		TransCanada	Paragraph 2, line 5 text inserted: For example, proposals are now being developed that would involve construction of a pipeline from the WSCB region to Canada’s Pacific Coast where this oil could be shipped to China.	Section 1.0 of the EIS was reorganized to move the “need” portion (Section 1.2.2 of the draft EIS) to a new Section 1.4 (Overview of the Crude Oil Market). That section was substantially revised and includes changes similar to those requested by the commenter.
1566	7	TransCanada		TransCanada	Comment: Does “Lower Brule” (Paragraph 1, line 6) mean the substation or the reservation?	The proposed 230-kV transmission line is now called the Big Bend to Witten Transmission Line.
1566	8	TransCanada		TransCanada	Keystone’s blasting plan would include provisions to avoid impacts to groundwater and to incorporate post blasting testing for surface water and water wells within 150 feet of the centerline to ensure that water reso	Keystone reports that there would be no blasting required along the proposed Project corridor.
1566	9	TransCanada		TransCanada	A portion of the forested wetlands in Texas are managed pine stands that are clear cut by the pulp and paper industry.	Section 3.4 of the EIS addresses bottomland hardwood forest wetlands.
1566	10	TransCanada		TransCanada	Blasting can cause both short term disturbance, in the form of increased noise, dust, and vibration, and permanent habitat modification. The severity of the effects of blasting on wildlife would primarily depend on timi	Keystone reports that there would be no blasting required along the proposed Project corridor.
1566	11	TransCanada		TransCanada	However, it is the slowest of the open cut construction methods available.	Comment acknowledged.
1566	16	TransCanada		TransCanada	However, as both the NEPA and NEB processes proceed”	Consolidated Responses GHG-1 through GHG-5 address

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					"Recent studies suggest, however, that the overall well-to-wheels life cycle GHG emissions of oil sands production are comparable to conventional oil. As the NEPA process	concerns related to greenhouse gas, climate change, alternative energy considerations, and approach to assessment of GHG emissions.
1566	27	TransCanada		TransCanada	Depending upon final construction spread configuration and construction schedule, additional or larger camps could be required.	Comment acknowledged.
1566	29	TransCanada		TransCanada	widening of roads is also required in some areas.	Consolidated Response RDS-1 addresses concerns about the condition of roadways and roadway structures associated with construction and operation of the proposed Project as well as traffic safety measures that would be incorporated into the Project.
1566	32	TransCanada		TransCanada	Final spread configurations and construction schedule may result in additional or fewer shorter or longer spreads.	Comment acknowledged.
1566	37	TransCanada		TransCanada	Landowners would be informed of all work anticipated during monitoring.	Comment acknowledged.
1559	83	Treadwell	Marshall		Very satisfied with his dealings with Keystone, has been compensated very fairly. Has several pipelines on his property already without much trouble, so is not worried about a new one. Have agreed to bore under the Angelina River bottom and the wetlands in the Angelina River bottom.	Comment acknowledged.
1177	1	Trout	Wesley		To whom it may concern: I am dismayed and outraged at the lack of intelligent thought being put into this project. How many million gallons of spilled oil does it take before we as a nation and/or state stop putting our thirst for oil above all other priorities? I am fully aware that a shortage of oil in the US will cause many hardships but I am not willing to sacrifice our state's long term natural resources simply to avoid short term hardships. I will be watching this issue very closely and any politicians who back this pipeline running over our greatest fresh ground water resource will not only not get MY vote but I vow to actively campaign against them to whatever extent I am capable.	Consolidated Response P&N-1 addresses the need that the Project has been proposed to meet. Consolidated Response ALT-2 addresses the use of alternative technologies, alternative energy sources, and conservation of energy. Consolidated Response P&N-5 addresses issues related to investments in other technologies.
286	1	Trumbull	Jacqueline		The location of the proposed pipeline along the eastern edge of the Ogallala Aquifer concerns me. This vast underground lake supplies the water to most of the Great Plains region. The danger of contaminating this water supply from potential leaks in the Keystone Pipeline is too great to risk having a large crude oil pipeline located in this area.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
1558	61	Truscott	Larry		Initially, your company had surveyors and others running across the pastures and wheat fields, and the property owners were told that they would be reimbursed for any damages that they made walking through wheat and driving through different things when the project was completed. But things have changed. There have been three changes made in the route of the pipeline, and the people that were affected by the first survey are still holding an empty bag. In my mind, that's not right. There should be some way that, when they do this kind of stuff, they ought to go ahead and pay up front so since they decide to change the route on it again, the people that have already had damage done will be paid.	The commenter is directing his comment to Keystone, not DOS. State or local trespass and access laws are applicable along the entire route and therefore along each easement negotiated by Keystone. DOS has no legal authority over negotiating easement agreements, no legal status to enforce the conditions of an easement agreement, and no legal authority over Keystone representatives who gain access to private property. The commenter has the option to take up the matter with Keystone or local law enforcement officials, or initiate legal consultation.
236	1	Tucker	N.B.		The proposed route of the XL Pipeline will cross about 1.5 miles of property I own in Haakon County, South Dakota.	The Department of State has no authority to intervene in issues under the jurisdiction of commissions and agencies in

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					Keystone recently requested of the South Dakota PUC modifications of Keystone's responsibilities in South Dakota in the event of an accident causing environmental damage and/or the discovery along the route of fossil remains. The intent of the requested modifications is to shift the cost of remediation to the landowner rather than being born by Keystone, as originally ordered by the PUC. Is this ex post facto modification a responsible corporate request?	South Dakota. Consolidated Response LIA-1 addresses Keystone's liability under federal law if there is a spill of hazardous materials or fuel during construction or a spill of crude oil from the proposed Project.
236	2	Tucker	N.B.		The pipeline route in South Dakota covers about 313 miles. The proposed right-of-way payment to all landowners using Keystone's formula would be about \$1 million (\$3000 per mile). The total cost of the project is estimated at about \$1 billion and the annual tax revenues to various state entities in South Dakota is forecast at \$14 million. In this context, is a \$1 million total payment fair or reasonable compensation to South Dakota landowners, whose operations will be significantly disrupted, whose property will be permanently devalued and without whose land the pipeline could not be built? I ask that the U S State Department use its influence and oversight of environmental matters to cause a more reasonable sharing of costs and benefits by Keystone with affected private landowners.	Consolidated Response ECO-1 addresses potential socioeconomic impacts, and Consolidated Response TAX-1 addresses concerns regarding taxes. Consolidated Response EAS-2 addresses issues related to easement negotiations. As noted in that response, DOS has no legal authority in the easement negotiation process and has no legal status to enforce the conditions of an easement agreement.
1045	1	Tuner	Todd		My family is admittedly opposed to this project. There are too many dangers to the environment.	Section 3 of the EIS addresses the impacts of construction and operation of the proposed Project. Section 3.13 of the EIS addresses the risk and environmental impacts of a crude oil spill from the proposed Project.
688	1	Turille	Melinda		Considering the oil release in the Gulf, the many oil pipeline failures in the last months, allowing a pipeline across our Sand Hills in Nebraska is outrageous. Our aquifer lies beneath those hills and it is precious water for not only our state but for other states around us. If it were to be contaminated much of Nebraska agriculture would be lost. This is a vital water supply to our state, and no one, no one, can believe the pipeline will not leak. Over and over this industry has fouled our environment, contaminated our air and water. For God's sake please defeat this pipeline and save our water.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. As described in Consolidated Response GLF-1, the risks associated with the proposed Project are substantially different from those associated with the BP Deepwater Horizon Project.
761	1	Turille	Elise		I am firmly against the construction of the pipeline... a firm decision against this project would help prolong the safety of U.S. citizens in the area rather than bowing down to big business yet again...THE PIPELINE IS NOT SUPPORTED BY ME OR MY FAMILY! AS A US CITIZEN WHOS INTERESTS ARE MORE IMPORTANT THAN THAT OF A COMPANY< PLEASE SAY NO!!!! TO THIS PIPELINE OR MOVE THE DIRECTION OF ITS PATH! ... a firm decision against this project would help prolong the safety of U.S. citizens in the area...	The commenter's opinion is noted.
761	2	Turille	Elise		The proposed pipeline goes directly over the Ogallala Aquifer, the aquifer is the only source of pure drinking water for this part of our country and the risk of leaks into this are not worth the big dollars made from the pipeline.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
761	3	Turille	Elise		The proposed pipeline goes directly through the Sandhills.	Identification of sensitive environments crossed by the proposed Project is discussed in Consolidated Response ENV-1 and ENV-3. Issues related to the Sand Hills area are

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
						addressed in Consolidated Response ERO-1.
761	4	Turille	Elise		...the risk of leaks into this are not worth the big dollars made from the pipeline... The risk of a leak into our water system is not worth it!! ...	Consolidated Response P&N-1 addresses the need for the proposed Project. Section 3.13 of the EIS addresses reliability and safety issues, including calculations of the probability of a spill from the Project and the potential environmental impacts associated with spills. Issues related to the Northern High Plains Aquifer System are addressed in Consolidated Responses AQF-1 through AQF-4.
761	5	Turille	Elise		...Our health and safety is not on the table for discussion ...	The commenter's opinion is noted.
182	1	Turner	Linda		This is a project without logic. The deliberate destruction of more of our planet for such short-term rewards goes against any rational argument. Money can't buy back an extinct species, or remove all the oil spilled into the rivers and oceans, and it certainly can't revive an empty wasteland where a life-giving forest once stood. People won't stop depending on oil until there isn't any, or until the price goes so high they are forced to seek alternative energy sources. Who will force this change if not you? Who will take a stand for the generations to follow? Who will say, "That's enough. No more will we take the easy way out"? This is a chance to take an important step towards preserving our children's planet. Please stop this pipeline now--for us all.	Consolidated Response ENR-1 provides information on the Department of State's environmental review process, the National Interest Determination process, and the need to complete those reviews before approving or denying the Presidential permit for the proposed Project.
1234	1	Uran	Laura		I appreciate your taking steps to protect the Ogallala Aquifer.	Issues related to aquifers along the proposed Project corridor are addressed in Consolidated Responses AQF-1 through AQF-4.
1076	1	VanBuskirk	Michael		To whom it may concern, The keystone oil pipeline needs to be managed closely in our State. We all know what a poor job the US government usually does with their oversight role. We have observed many of the environmental consequences with BP and the US government in the Gulf with the oil travesty. Both entities are to blame for this poor management mess.	Consolidated Response SAF-1 describes the regulatory requirements of the Pipeline and Hazardous Materials Safety Administration (PHMSA) that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project. It also describes the inspections and reviews of the proposed Project that PHMSA would conduct to ensure compliance with those regulatory requirements.
1076	2	VanBuskirk	Michael		I am not a "green" person or advocate normally, but under the circumstances of what we have observed in Gulf of Mexico, we need to manage this matter closely as the tremendous aquifer under Western Nebraska is critical to our States Agriculture Based Economy (which accounts for over half of our State's Economy).	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. As described in Consolidated Response GLF-1, the risks associated with the proposed Project are substantially different from those associated with the BP Deepwater Horizon Project.
1076	3	VanBuskirk	Michael		I stand with the majority of Nebraskan's on this issue. I would appreciate your leadership adhering to what the majority of Nebraskan's want rather than what some of you think is best as in the case of Healthcare reform.	Consolidated Response ENR-1 provides information on the Department of State's environmental review process, the National Interest Determination process, and the need to complete those reviews before approving or denying the Presidential permit for the proposed Project.
43	1	VanCoppenolle	Loretta		I am writing to oppose the Keystone XL Pipeline Project which would carry Canadian tar sand oil through Texas to the Gulf coast. Tar sand oil is dirtier than conventional oil and emits 3 times the greenhouse gases during its production. Its production is also highly water intensive. We do not need tar sand oil and we do not need the environmental threat posed by this pipeline at a time when the current BP disaster in the Gulf of Mexico all too painfully reminds us of the risks of oil production. We need to grow a green energy economy to	Consolidated Response OIL-4 addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils. Consolidated Response GHG-2 addresses the potential causal connection of implementation of the proposed Project and expanded oil sands production in Canada and increases in refining. Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					replace dirty oil, not encourage and augment the latter. Please deny a permit to the Keystone pipeline as environmentally unsound.	information regarding development of oil sands projects with and without the proposed Project. Consolidated Response GHG-3 addresses the decreased rate of GHG gas emissions from oil sands production in Canada. Consolidated Response P&N-1 addresses the need that the Project has been proposed to meet.
914	1	VanDenNoort	Jeff		Please take the time to make the EIS for the Keystone XL tar sands pipeline complete. The current version does not fully document all of the potential harm that this pipeline would create for the people of Montana.	The EIS addresses potential impacts consistent accordance with the requirements of the National Environmental Policy Act (NEPA) and the Council on Environmental Quality regulations to implement NEPA (40 CFR 1500). It also addresses impacts consistent with the requirements of the Montana Environmental Policy Act (see Appendix I of the EIS).
914	3	VanDenNoort	Jeff		These pipelines are very vulnerable from vandals and terrorists and it seems certain that there will some leaks over the years.	Consolidated Response TER-1 addresses potential terrorism associated with the proposed Project. Section 3.13 of the EIS addresses the potential for an accidental spill from the proposed Project.
914	4	VanDenNoort	Jeff		Personally, I think the biggest impact is that this pipeline will facilitate the development of these tar sands. The carbon released from the extraction, processing, transportation and burning of the tar sands oil far exceeds the carbon released from other fossil fuels and we can not contribute this project. We must start considering the carbon released from each alternative source of energy.	Consolidated Response GHG-2 addresses the potential causal connection of implementation of the proposed Project and expanded oil sands production in Canada and increases in refining. Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project.
914	7	VanDenNoort	Jeff		The pipeline is not needed. It would be a reckless use of government power to force landowners to accept this project that will not benefit the people of Montana.	Consolidated Response P&N-1 addresses the need that the Project has been proposed to meet. As noted in that Consolidated Response, the Project has been proposed to meet the heavy crude oil needs of refineries in the Gulf Coast area, not for the U.S. in general. In addition, the Alberta Clipper and existing Keystone pipeline projects serve other markets and do not meet the demands of the Gulf Coast refineries.
1558	15	VanderValk	Bob		I have some concerns about what positive effects this particular project would bring to the local economy. There are long term opportunities for workers residing in Prairie County or Glendive in Dawson County, and the proposed O'Fallon substation location and the pumping station that's going to be built to pump the crude oil.	Consolidated Response ECO-1 and Section 3.10.2.2 of the EIS address potential socioeconomic impacts.
1558	18	VanderValk	Bob		We have been given an opportunity, apparently -- this is not part of my [written] comments, to also ramp up with our Bakken oil shale crude oil to be pumped into that. That has to be part of this project, or else the support of this part of the country should go away, especially with what's going on in the Gulf of Mexico. We're going to depend on that crude oil.;	Consolidated Response ALT-3 addresses issues related to a potential pipeline connection to the proposed Project in Montana that would transport crude oil produced in Montana and North Dakota.
1558	19	VanderValk	Bob		The contract says that 100 percent of the labor used has to be union. And if it can be, then at least 50 percent will have to qualify. In order to do that they have to work 80 days, with all sorts of caveats and ways to do it.	Consolidated Response ECO-1 and Section 3.10.2.2 of the EIS address potential socioeconomic impacts.
1558	20	VanderValk	Bob		I want to be able to have it in some sort of writing that the union, in this case Pipeliner's Union 7898 in Tulsa, Oklahoma, that it will take the initial shot. This would create at least 20 permanent jobs.	Consolidated Response ECO-1 and Section 3.10.2.2 of the EIS address potential socioeconomic impacts.
1558	22	VanderValk	Bob		We want those jobs to be 8 to 5 or ten hour days so that	As noted in Section 3.10 of the EIS, the jobs that would be

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					people will reside here, will buy homes here, will buy properties, and we'll get this Eastern Montana economy going to where it should have been all along.	required to construct the proposed Project would be temporary, and operation of the proposed Project is expected to require an additional 20 permanent jobs.
1558	23	VanderValk	Bob		I am in support of the project.	Comment acknowledged.
1408	1	VanHorn	Della		I write in support of TransCanada's Keystone XL crude oil pipeline project and urge the department to grant a permit for the pipeline... I urge the granting of the permit. Thank you for the opportunity to comment.	Comment acknowledged.
1408	2	VanHorn	Della		I work in a small school district in eastern Montana that has seen a decline in enrollment as well in the taxable valuation. Families and businesses are struggling financially. Rejection of the permit or suspension of the review would sacrifice the significant economic benefits this project stands to deliver and force U.S. consumers to rely on other sources of crude oil not economically and politically allied with US interests. This would be a mistake.	Comment acknowledged.
42	1	VanLe	Luan		Stop the import of DIRTY OIL! I oppose the TransCanada Keystone XL pipeline project, which will carry Canadian tar sands oil to the Gulf Coast. This pipeline would carry the dirtiest fuel sources from Canada through the Dakotas, Kansas, Oklahoma and Texas. Tar sands oil emits three times more greenhouse gases during production than conventional gasoline. It requires clear-cutting ancient forests and will also suck up water supplies and leave behind massive toxic lakes. This pipeline threatens our country's burgeoning clean energy economy and represents a return to our highly destructive and damaging addiction to fossil fuels. Please do not let this happen.	Consolidated Response OIL-4 addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils. Consolidated Response GHG-2 addresses the potential causal connection of implementation of the proposed Project and expanded oil sands production in Canada and increases in refining. Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project. Consolidated Response GHG-3 addresses the decreased rate of GHG gas emissions from oil sands production in Canada. Consolidated Response GHG-4 addresses potential loss of boreal forests and peat bogs.
220	1	Vansickel	Nina		I am strongly opposed to this pipeline. I believe there are other ways to ship oil. I am a landowner and this pipe will cover about 2 miles on my land. I have been offered a pittance and a one time pittance. I might add the powers that be seem to making a lot off this deal – but it isn't on their land is it!	Consolidated Response EAS-2 addresses issues related to easement negotiations. As noted in that response, DOS has no legal authority in the easement negotiation process.
1380	1	Vansickel	Nina		Addressing the oil situation - It seems you should be able to find a safer way to drill and ship.	The proposed Project would be an oil transportation system and does not include drilling for oil. Consolidated Response SAF-1 describes the regulatory requirements that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project in a manner that protects the health and safety of the public and the environment. It also describes the inspections and reviews of the proposed Project that the Pipeline and Hazardous Materials Safety Administration would conduct to ensure compliance with those regulatory requirements.
1380	2	Vansickel	Nina		Be accountable and responsible for the decisions you make. Maybe someday when no food is grown and there's no water that's drinkable, you'll be remembering that almighty buck. Perspectively thinking; it maybe too little too late....	The commenter's opinion is noted.
1340	1	VanWyk	William	Interstate Hydrocarbon	I am a small business owner and founder, of Interstate Hydrocarbon LLC ("IH"). IH trades and transports crude oil	Consolidated Response ALT-3 addresses issues related to transportation of crude oil from the Williston Basin.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
				LLC	throughout the United States. IH is particularly active in moving light, sweet crude oil from the Bakken formation in Montana and North Dakota to markets centers in other parts of the country. IH supports the Keystone XL ("KXL") pipeline project, KXL is the largest project to date capable of moving hydrocarbons via pipeline from Western Canada to the U.S. Gulf Coast.	
1340	2	VanWyk	William	Interstate Hydrocarbon LLC	KXL will offer safe, reliable, and environmentally responsible means of transporting Canadian hydrocarbons to U.S. refineries which will ultimately benefit U.S. consumers, workers, and businesses by ensuring additional availability of petroleum products.	Comment acknowledged.
1340	3	VanWyk	William	Interstate Hydrocarbon LLC	Moreover, KXL is considering a project to receive U.S. Bakken production along the way which would directly benefit it and other small businesses that are involved in the development of this important domestic source of oil.	Consolidated Response ALT-3 addresses issues related to transportation of crude oil from the Williston Basin.
1340	4	VanWyk	William	Interstate Hydrocarbon LLC	IH believes that KXL is in the national interest, since interior pipeline routes offer the most secure means of transport. KXL links us to a stable ally on our northern border with reserves that rival the largest members of OPEC. Furthermore, KXL offers a geographic alternative to waterborne delivery via the Gulf of Mexico. Given the recent disasters there, can we afford not to embrace the KXL project? Our nation has relied upon interior pipelines in past times of difficulty. According to the online encyclopedia Wikipedia as of July 2, 2010: The Big Inch and its companion project, the Little Big Inch were petroleum pipelines constructed during 1942 and 1943 as an emergency war measure from Texas to New Jersey. Until World War II, petroleum products had been transported from the oil fields of Texas to the northeastern United States by oil tanker. With the entry of the United States into the war, this vital link was attacked by U-boats, threatening both the supplies to the eastern United States and onward transshipment to Great Britain. The Inch pipelines were conceived as a way to transport increased quantities of petroleum by a secure, interior route, with the additional benefit of freeing tankers for other tasks. At the time of their construction, they were the longest petroleum pipelines ever built.	Comment acknowledged.
1340	6	VanWyk	William	Interstate Hydrocarbon LLC	IH understands that there has been considerable opposition to KXL on the basis that its approval would lead to the delivery to U.S. refineries of Canadian hydrocarbons that, when produced, would lead to higher rates of greenhouse gas emissions, which in turn would lead to global warming. It appears that these concerns are outside the scope of this permitting process.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project. Consolidated Response GHG-1 addresses GHG life-cycle analyses.
1340	8	VanWyk	William	Interstate Hydrocarbon LLC	The existence of KXL would not have an appreciable impact on global warming. If KXL were not built, Canadian hydrocarbons are more likely to be transported to countries other than the U.S. So, not only would the U.S. be deprived of an efficient alternative supply source, Canadian hydrocarbons would still be produced. For any remaining Canadian hydrocarbons that may nonetheless reach the U.S. by tanker via the Gulf of Mexico, there would likely be higher transportation inefficiencies at higher environmental risk.	Comment Acknowledged

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
1340	9	VanWyk	William	Interstate Hydrocarbon LLC	In short, the approval of KXL will not impact the production of these Canadian hydrocarbons such that the only result of denial of this project would be to deny the benefits of the pipeline project to U.S. consumers, workers, and businesses, including small businesses such as IH. As a U.S. small business, IH urges you to move forward with issuing a permit to KXL.	Comment acknowledged.
918	1	Varas	Alberto	Building Bright Futures	As a lifelong educator and learner I recognize the great risks that are present in this pipeline project. There is no way we should put a tar sand oil pipeline through the largest underground freshwater reserve (Ogallala Aquifer). The risk is too great to even chance.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
918	4	Varas	Alberto	Building Bright Futures	Avoid contaminating our drinking water.	Consolidated Response WAT-1 addresses concerns regarding potential water quality impacts.
78	1	Vassilakidis	Sophia		I urge you to stop the Keystone XL pipeline expansion.	Consolidated Response ENR-1 provides information on the Department of State's environmental review process, the National Interest Determination process, and the need to complete those reviews before approving or denying the Presidential permit for the proposed Project.
78	2	Vassilakidis	Sophia		In addition to emitting three times more greenhouse gases during production than conventional gasoline, about three barrels of water are polluted and dumped in toxic pools (called tailing ponds) for every barrel of oil produced from tar sand extraction, and it requires strip mining huge tracts of pristine forest. An area the size of Florida is slated for extraction. Furthermore, the project harms the lives and health of indigenous people living downstream from the tar sands operations and has been connected to high rates of rare cancers, renal failure, lupus, and hyperthyroidism in the area.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information on current and future production. As noted in that Consolidated Response, without the proposed Project, oil sands development would continue at or above the current level until at least 2020, with or without the proposed Project. Consolidated Responses GHG-1 through GHG-5 address concerns related to greenhouse gas, climate change, alternative energy considerations, and approach to assessment of GHG emissions.
78	2	Vassilakidis	Sophia		In addition to emitting three times more greenhouse gases during production than conventional gasoline, about three barrels of water are polluted and dumped in toxic pools (called tailing ponds) for every barrel of oil produced from tar sand extraction, and it requires strip mining huge tracts of pristine forest. An area the size of Florida is slated for extraction. Furthermore, the project harms the lives and health of indigenous people living downstream from the tar sands operations and has been connected to high rates of rare cancers, renal failure, lupus, and hyperthyroidism in the area.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project. Consolidated Response GHG-1 addresses GHG life-cycle analyses.
78	3	Vassilakidis	Sophia		Producing the oil for the Keystone XL pipeline will emit 11 million tons of carbon dioxide into the atmosphere annually, even before it gets to the U.S. for refining. This equals the annual emissions of 2.7 million cars.	Consolidated Response GHG-1 addresses the greenhouse gas life-cycle analyses presented in the revised EIS. As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries.
78	6	Vassilakidis	Sophia		The company is seeking a special permit to operate at this pressure from the Pipeline and Hazardous Materials Safety Administration.	Keystone has withdrawn its application for a Special Permit as described in Consolidated Response REG-1.
78	7	Vassilakidis	Sophia		By connecting tar sands oil to the Gulf Coast, the Keystone XL will make our nation's fuels dirtier and undermine the clean energy solutions we need to avert catastrophic climate	Consolidated Response P&N-1 addresses the need that the Project has been proposed to meet, including information on crude oil supply and demand from an analysis specific to the

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					change.	proposed Project. As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries. Consolidated Response OIL-4 also addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils.
1544	220	Vaulk	Lisa	Resident of Spring, Texas	Can someone please define "limited impact"? Who defines what increase in cancer rates is acceptable? Who defines what collateral damage is Ok?	Impacts that generally range from minor to moderate in magnitude and from temporary to short-term are considered limited. The impacts associated with implementation of the proposed Project are addressed in Section 3.0 of the EIS. As noted in that section, construction and normal operation the proposed Project would not result in significant environmental impacts. There are no potential impacts to human health, such as cancer, expected due to construction and operation of the proposed Project.
1544	221	Vaulk	Lisa	Resident of Spring, Texas	Would like to know how many people who spoke in favor of the project had their houses financed by the oil industry?	That information is not a part of the NEPA environmental review and DOS has no access to that information.
1544	222	Vaulk	Lisa	Resident of Spring, Texas	Energy companies self-report to the EPA. Do we honestly expect TransCanada to be honest with us and tell us if they have a leak? And if the leak happens, are they going to be truthful with us and tell us how much was released and the impact that it's going to have on our community?	Keystone must report accidental releases to the National Response Center and with the Pipeline and Hazardous Materials Safety Administration in accordance with 49 CFR 195.50 as soon as practicable but not more than 30 days after discovery of the accident. If releases are not reported, the operator can be fined.
1544	227	Vaulk	Lisa	Resident of Spring, Texas	I thought about it today, I've been living on top of pipelines for 20 years. I can guarantee you, no one's ever come out to check them and make sure they were safe. We didn't even know they were there.	Pipeline corridor inspections are generally conducted by aerial patrols and by using internal inspection devices (pigs). As a result, it is unlikely that the inspections would be observed by landowners along a pipeline route.
1544	228	Vaulk	Lisa	Resident of Spring, Texas	We import more oil from Canada than any other nation, Mexico is second. The other countries we buy oil from are not going to be eliminated by this pipeline project and retrieving more oil from Canada.	Comment acknowledged.
1544	230	Vaulk	Lisa	Resident of Spring, Texas	There are fault lines in Texas that pose a safety risk to buried pipelines.	Section 3.2 of the EIS addresses seismic issues along the proposed route.
1544	231	Vaulk	Lisa	Resident of Spring, Texas	Pipeline not meeting industry safety standards.	Keystone has withdrawn its application for a Special Permit as described in Consolidated Response REG-1. As described in Consolidated Response SAF-1, the Pipeline and Hazardous Materials Safety Administration (PHMSA) has regulatory requirements that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project in a manner that protects the health and safety of the public and the environment. In addition, PHMSA developed 57 Project-specific Special Conditions that Keystone has agreed to implement. Incorporation of those conditions would result in a Project that would have a degree of safety over any other typically constructed domestic oil pipeline system under current code and a degree of safety along the entire length of the pipeline system similar to that which is required in HCAs as defined in 49 CFR 195.450.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
1544	232	Vaulk	Lisa	Resident of Spring, Texas	Buried pipeline can leak without our knowledge, contaminate groundwater.	Consolidated Response OIL-3 and Section 3.13.5 of the EIS describe the leak detection system for the Project. Consolidated Response AQF-3 provides information on hypothetical spills from the Project over two areas of the Northern High Plains Aquifer System and also addresses response actions.
1544	233	Vaulk	Lisa	Resident of Spring, Texas	How are they going to fix our air once they realize they made a mistake.	Section 3.14.3.14 indicates that, "While the refineries that could receive crude oil are not part of the Project, refinery operations could potentially result in cumulative impacts to air quality in the general Project area or beyond if changes in the type or quantity of emissions occurred in the future." It also reiterates that state permitting processes for existing, upgraded or new refining facilities are designed to avoid significant cumulative impacts to regional air quality associated with emissions. Based on the nonattainment status of Texas counties in which the pipeline will pass, a General Conformity analysis was prepared (see Section 3.12.1.3). It was determined that construction emissions for the Project would be accounted for in the SIP emissions budget and the proposed activity within the Houston-Galveston-Brazoria nonattainment area was presumed to conform to the SIP. Table 3.12.1-11 showed that NOx and VOC emissions for operation in the Houston-Galveston-Brazoria 8-hour ozone nonattainment area would be below the General Conformity significance thresholds of 25 tons per year, and therefore the General Conformity Rule does not apply to these operational activities. Finally, it should be noted, as discussed in Section 3.14.3.14 that since light crude supplies are decreasing, refinery upgrades and expansions that allow for the refining of heavy crude oil, especially along the Gulf Coast, are occurring and would continue to occur whether or not the Project is constructed. If the Project is not constructed, shipment of heavy crude oil to the region could occur through other pipelines or through tanker shipments from other oil producing areas. If the Project is constructed, it is likely that some oil transported by the Project could be transported to expanded or upgraded refineries."
272	1	Vest	Craig	ek Pass Inc.	Recently a number of advocacy groups sent a letter seeking suspension of the permitting of the Keystone XL pipeline. I encourage you to reject the request and to continue to review the proposed project.	Comment acknowledged.
272	3	Vest	Craig	ek Pass Inc.	Construction of this project stands to bring significant economic benefits to the areas where it will be built.	Comment acknowledged.
272	4	Vest	Craig	ek Pass Inc.	Provided it has limited impact on the environment, this project could be an important part of the solution to our energy supplies. The limited impact has been proven on the initial Keystone phase.	Comment acknowledged.
272	5	Vest	Craig	ek Pass Inc.	The permitting processes in place are appropriate and should proceed so that a final determination can be made about the impacts of the project and whether it is in the national interest.	Comment acknowledged.
272	6	Vest	Craig	ek Pass Inc.	Our firm is involved in the ongoing safety and quality assurance process being undertaken by TransCanada as part of this project, and we provide assistance to them in that	Comment acknowledged.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					regard. This work is important to us.	
272	7	Vest	Craig	ek Pass Inc.	I write in support of TransCanada's Keystone XL crude oil pipeline project and urge the department to grant a permit for the pipeline. Please reject the request to suspend the process and continue with the review.	Comment acknowledged.
272	10	Vest	Craig	ek Pass Inc.	The environmental benefits of Keystone XL should not be overlooked.	Comment acknowledged.
272	14	Vest	Craig	ek Pass Inc.	Pipelines are the safest, most reliable, economical and environmentally favorable way to transport oil and petroleum products, as well as other energy liquids, throughout the U.S. America depends on the more than 168,000 miles of liquid pipelines to move energy and raw materials our country relies on. Additional pipeline capacity will help consumers and businesses throughout the United States.	Comment acknowledged.
272	15	Vest	Craig	ek Pass Inc.	This project also stands to provide a powerful private sector economic stimulus. During construction, the initial Keystone pipeline project created more than 13,000 jobs funded with private investment.	Consolidated Response ECO-1 and Section 3.10.2.2 of the EIS address the potential socioeconomic impacts of the proposed Project.
272	16	Vest	Craig	ek Pass Inc.	Local governments will have a steady source of income from economic activity associated with construction and from property taxes the pipeline company will pay for.	Comment acknowledged.
109	1	Vickers	Richard		I own property in the immediate area through which the pipeline will pass. At present there are approximately eight pipelines crossing my property. During the 70 plus years I have been associated with this location, I have never seen any kind of an environmental incident involving these pipelines. I am highly in favor of the Keystone Project proceeding as proposed.	Comment acknowledged.
1544	199	Villarreal	Anthony	Citizen of La Porte	What sort of long-term testing has been performed on the pipelines which are being proposed to be laid out? What were the results of those testings and what corrective action has been taken to address the negative results of those tests? What is the estimated life of the pipelines?	As described in Consolidated Response SAF-1, the Pipeline and Hazardous Materials Safety Administration (PHMSA) has regulatory requirements that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project. Those regulations and PHMSA's Project-specific Special Conditions address pipe manufacturing requirements and quality control testing of pipe.
1544	200	Villarreal	Anthony	Citizen of La Porte	Have the health affects of people been considered, and if so, what is the expected increase of negative health affects on our people and more so on the economy as people go into hospitals because they have problems like leukemia, cancer, other health problems like COPD, and things like that that studies show...are caused by pollution?	Section 3.12.1.3 of the EIS describes the potential impacts associated with emissions from construction and normal operation of the proposed Project. As discussed in the EnSys 2010 report, the quantity of crude oil refined in PADD III is driven by market conditions and is independent of the existence of the proposed Project. The proposed Project would provide access to WCSB crude oil in PADD III refineries that would supplant supplies from other sources, including Venezuela and Mexico. As discussed in Section 3.13.5.1 of the EIS and Consolidated Response OIL-4, the composition of WCSB crude oils that could be transported by the proposed Project is not dissimilar from other heavy crude oils currently refined in PADD III. There is therefore no credible evidence that implementation of the proposed Project would lead to disproportionate adverse impacts on minority and low income populations near PADD III refineries.
1544	202	Villarreal	Anthony	Citizen of La	We already have problems with the recent BP explosion and	As described in Consolidated Response GLF-1, the risks

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
				Porte	the leak that can't be resolved, how are we going to be able to go underground and fix pollution in this aquifer if that happened?	associated with the proposed Project are substantially different from those associated with the BP Deepwater Horizon Project. If there is a spill from the Project, Keystone would implement the procedures of either its Emergency Response Plan (ERP) or its relevant Spill Prevention, Control, and Countermeasure Plan (SPCC), depending on the location of the release. The response plans would address responses to spills that reach groundwater or surface water. Consolidated Response RES-1 addresses issues related to preparation and review of the ERP for the proposed Project. SPCC plans are addressed in Sections 2.3 and 3.13.5 of the EIS and in the Construction, Mitigation, and Reclamation Plan presented in Appendix B of the EIS. In addition, Consolidated Response AQF-3 provides information on hypothetical spills from the Project over two areas of the Northern High Plains Aquifer System and also addresses response actions.
1021	1	Villars	Charlene		I am greatly opposed to the placement of the Keystone oil pipeline that crosses Nebraska from the northern border to the southern border. Since there is a danger of the pipe developing a leak that would cause oil to flow into the Ogallala Aquifer, it is senseless to take this risk. That aquifer is so important to the welfare of thousands of people in many states, and no government officials should have the power to put it in jeopardy. I strongly oppose this project and think it should be stopped.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
24	1	Visclosky	Peter	House 1st District Indiana	I would appreciate your addressing her concerns and making her correspondence part of the official documents you receive for the proposed regulation. Thank you in advance for your serious consideration of this matter. Do not hesitate to let me know if you have any questions or need additional information.	Comment acknowledged.
323	1	Vogel	MaryCharlene		As a native of Nebraska and former resident until two years ago, I am definitely against this TransCanada pipeline.	Comment acknowledged.
323	2	Vogel	MaryCharlene		According to information I have gleaned from the Lincoln Journal Star and the Heritage League, there is an application by TransCanada for exemption from current federal standards regulating pipeline thickness and pressure at which the pipe operates. It is requesting to use thinner pipe in rural areas where it claims there is a low risk of accidental puncture.	Keystone has withdrawn its application for a Special Permit as described in Consolidated Response REG-1.
323	3	Vogel	MaryCharlene		This pipeline is going right through the water of the Ogallala Aquifer, not above it, not under it, but actual in it. This is the major source of water and is rechargeable only by rain and snow melt. Nebraska covers 2/3 of this eight state source of water. If it becomes contaminated it will destroy the "bread basket" of the country and the source of living for Nebraskans.	See Consolidated Response Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
324	1	Vogel	James		I am not for this TransCanada pipeline because it goes through Nebraska's Ogallala Aquifer which is 2/3 of Nebraska's drinking water and water for crop lands which is part of the food basket of this nation. You try drinking water with oil in it, please and then see if you would be for it.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
499	2	Vogel	Catherine		I feel that this tar sand pipeline will be a potential ecological disaster through contamination of the soil and pollution of the	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					ground water.	
499	3	Vogel	Catherine		Erosion of the Nebraska Sandhills is another thing to consider.	Issues related to the Sand Hills area are addressed in Consolidated Response ERO-1.
1403	1	Vogel	MaryCharlene		June 16 is the final date for comments on the TransCanada pipeline construction which will pump crude oil over 2000 miles and pass over or through (both comments have been made in different newspapers) the Ogallala Aquifer. This aquifer is a major source of water for eight states. Nebraska covers two-thirds of it. It is rechargeable only by rainwater or snow meet... I object very strongly to allowing this pipeline to be constructed for three reasons: 1) 85% of Nebraskans get their water from the Ogallala Aquifer. If it is contaminated by a leak (very possible) it will affect the "bread basket" of the country and destroy the economic livelihood and health of our families.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
1403	2	Vogel	MaryCharlene		I OBJECT VERY STRONGLY to allowing this pipeline to be constructed ... DO NOT ALLOW THIS PIPELINE TO BE BUILT AND PROTECT NEBRASKA'S ECONOMY AND FAMILIES. Thank you.	Comment acknowledged.
1403	4	Vogel	MaryCharlene		I OBJECT VERY STRONGLY to allowing this pipeline to be constructed for three reasons: ...3) This area supports many migratory birds and species of wildlife. We have an obligation as a citizen of the world to protect them also.	Sensitive habitats crossed by the proposed Project are discussed in Consolidated Responses ENV-1 and ENV-3.
1403	5	Vogel	MaryCharlene		We have seen the result of government regulation and their overseeing of big business in the devastation of the livelihood of families and the destruction of wildlife species in the present Gulf Coast nightmare. We don't need another such.	Consolidated Response SAF-1 describes the regulatory requirements and Project-specific Special Conditions that Keystone would comply with to construct, operate, maintain, inspect, and monitor the proposed Project. It also describes the monitoring, inspections, and reviews of the proposed Project that the Pipeline and Hazardous Materials Safety Administration would conduct to ensure compliance with those regulatory requirements. As described in Consolidated Response GLF-1, the risks associated with the proposed Project are substantially different from those associated with the BP Deepwater Horizon Project.
1453	1	Vogel	Catherine		This letter is in opposition to the proposed Keystone XL tar sands pipeline which is to be installed through Nebraska. As a resident of Nebraska I am totally against the proposition. I have read that the steel pipeline will be manufactured in China and that thinner pipe will be allowed for use through the rural areas. There is already a TransCanada pipeline through the state carrying oil. I feel both of these pipelines are and will be a potential ecological disaster for our state through contamination of our soil and pollution of our groundwater	Consolidated Response PIP-1 addresses the issue of purchasing pipe for the Project. Keystone has withdrawn its application for a Special Permit as described in Consolidated Response REG-1. Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
1453	2	Vogel	Catherine		The erosion that will take place when disturbing the Sandhills is another thing to consider.	Issues related to the Sand Hills area are addressed in Consolidated Response ERO-1.
1008	1	Vogt	Mary		Dear Senator Johanns, I agree-- the Oil Pipeline should not go through the Sandhills and Ogallala Aquifer. In your future time I hope you continue to vote for the people of Nebraska rather than huge companies.	Issues related to the Sand Hills area are addressed in Consolidated Response ERO-1. Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
71	1	Volk	Leonard		We do not protect or improve our environment by making it worse. I oppose using tar sands oil and its pipeline.	The commenter's opinion is noted.
519	2	VonKampen	Jonathan		The XL pipeline as proposed would run through the fragile	Issues related to the Northern High Plains Aquifer system are

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					Nebraska Sand Hills, and in a breach, which could remain undetected for an extended period of time, oil could leach into the Ogallala Aquifer, which is of critical importance to the agriculture-based economy and groundwater supplies of Nebraska and surrounding states.	addressed in Consolidated Responses AQF-1 through AQF-4. Consolidated Response OIL-1 addresses the likelihood of spills from the Project.
519	3	VonKampen	Jonathan		Finally, although oil companies are turning large profits from oil sands extraction operations, not only is the impact on the environment high at the time of extraction (thanks to strip mining techniques on a wide scale in an important forest ecosystem), but land reclamation is an involved process taking decades of expensive effort, and water used in the process and tailings are dumped en masse where it will take years or decades to reclaim the majority of the water and ensure the pollutants do not leach into the local water supply or damage the recovering fauna.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information on current and future production. As noted in that Consolidated Response, without the proposed Project, oil sands development would continue at or above the current level until at least 2020, with or without the proposed Project.
519	4	VonKampen	Jonathan		Until the environmental impact of oil sands extraction is significantly minimized, it is unwise to encourage the increase of the pace of extraction beyond present levels.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project.
519	5	VonKampen	Jonathan		It is important to consider that it is in the interest of shareholders of TransCanada and other companies involved in oil sands extraction and transport, if those companies make all efforts and exploit all possible loopholes to minimize their legal and financial liabilities from the mining process and any unforeseen resultant consequences. The governments of the United States and Canada may have to shoulder a large financial burden to do what these corporations will not, which at the very least will be a political blow to whoever approves this pipeline or is present when it fails. For these reasons I do not support the pipeline without significantly improved regulation of its construction, route, and the oil sands extraction operations that encourage its construction.	As described in Consolidated Response SAF-1, the Pipeline and Hazardous Materials Safety Administration (PHMSA) has regulatory requirements that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project in a manner that protects the health and safety of the public and the environment. In additions to its regulations in 49 CFR Parts 194 and 195, PHMSA developed 57 Project-specific Special Conditions that Keystone has agreed to implement and to incorporate into its manual for operations, maintenance, and emergencies that is required by 49 CFR 195.402. Incorporation of those conditions would result in a Project that would have a degree of safety over any other typically constructed domestic oil pipeline system under current code and a degree of safety along the entire length of the pipeline system similar to that which is required in HCAs as defined in 49 CFR 195.450. Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project.
519	3	VonKampen	Jonathan		Finally, although oil companies are turning large profits from oil sands extraction operations, not only is the impact on the environment high at the time of extraction (thanks to strip mining techniques on a wide scale in an important forest ecosystem), but land reclamation is an involved process taking decades of expensive effort, and water used in the process and tailings are dumped en masse where it will take years or decades to reclaim the majority of the water and ensure the pollutants do not leach into the local water supply or damage the recovering fauna.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information on current and future production. As noted in that Consolidated Response, without the proposed Project, oil sands development would continue at or above the current level until at least 2020, with or without the proposed Project.
616	1	Voss	Kendra		Please do not build the Keystone Pipeline through the Nebraska Sand Hills.	Identification of sensitive environments crossed by the proposed Project is discussed in Consolidated Response ENV-1 and ENV-3. Issues related to the Sand Hills area are addressed in Consolidated Response ERO-1.

1544	31	Vrstratd	AJ		The Keystone Pipeline Project supports jobs within the United States.	Comment acknowledged.
1544	32	Vrstratd	AJ		We have engineers here in Houston that support the project, as well as factories in Ohio, Indiana, Oregon that are all making equipment for this pipeline.	Comment acknowledged.
1544	33	Vrstratd	AJ		Each one of these pieces of equipment made for the pipeline will bring in sales tax revenue to the regions where the equipment will reside. As it sits on the ground, it will then create property tax revenue as well.	Comment acknowledged.
1544	34	Vrstratd	AJ		In the long term, the equipment will need to be maintained, providing jobs up and down the line for a long time.	Comment acknowledged.
1544	35	Vrstratd	AJ		Dealing with Canada, our largest neighbor and land sharer, is a much more stable region to get our resources from until we can come up with a responsible energy policy.	Comment acknowledged.
443	1	Wadas	Katherine		To Whom It May Concern, Climate scientists have made it quite clear that if we do not rapidly move off fossil fuels such that our economy is virtually decarbonized in 40 years we run unimaginable risks that include threatening global food and water security, the devastation of major cities and coastlines around the world (including Miami, New York, New Orleans, and Boston), and mass migrations of people that will most likely lead to conflict (as it has in the case of Darfur). The tar sands project is accelerating us into the climate catastrophe because extracting oil from the tar sands produces 2 to 3 times more carbon dioxide pollution than conventional oil and part of the process involves clear cutting of sections of the boreal forest. In this context, supporting the Tar Sands project by building a pipeline from the Canadian Tar Sands through the United States would be terribly destructive. I hope you will reconsider the pipeline.	Consolidated Response GHG-1 addresses the greenhouse gas life-cycle analyses presented in the revised EIS. Climate change is addressed in Section 3.14.3.14. As noted in that Section, implementation of the proposed Project is unlikely to result in a measureable climate change. Consolidated Response GHG-2 addresses the potential causal connection of implementation of the proposed Project and expanded oil sands production in Canada.
443	3	Wadas	Katherine		The tar sands project is accelerating us into the climate catastrophe because extracting oil from the tar sands produces 2 to 3 times more carbon dioxide pollution than conventional oil and part of the process involves clear cutting of sections of the boreal forest. In this context, supporting the Tar Sands project by building a pipeline from the Canadian Tar Sands through the United States would be terribly destructive. I hope you will reconsider the pipeline.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project. Consolidated Response GHG-1 addresses GHG life-cycle analyses. Consolidated Response GHG-2 addresses the potential causal connection of implementation of the proposed Project and expanded oil sands production in Alberta and increases in refining.
1093	1	Waggoner	Joseph		Since I do not know and can only assume that the State Department had regulatory control over the Alaskan pipeline being built. In doing so and having worked on the Alaskan pipeline when it was being built for a short time I can only offer you a comparison. There were naysayers to the Alaskan pipeline also even though the line was installed with a special absorbant around it. I would think the same procedure would be followed in the case of the Keystone pipeline due to our cold winters. I have read where a "thinner" wall thickness of pipe would be used and the oil pumped at higher pressure. This itself does not constitute a danger if considering the many types of high-strength carbon steels available. Even at that it would be fool-hardy to use a thinner pipe than prescribe by safety codes. The welding together of the pipe would be done by tested and certified welders and 100% of the welds on the	<p>The Department of State was not the lead federal agency for the Trans Alaska Pipeline System since it did propose to cross the U.S. border. That pipeline was constructed above ground to avoid damage to permafrost. The proposed proposed Project would be buried.</p> <p>Keystone has withdrawn its application for a Special Permit as described in Consolidated Response REG-1. As described in Consolidated Response SAF-1, the Pipeline and Hazardous Materials Safety Administration (PHMSA) has regulatory requirements that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project. In addition, PHMSA developed 57 Project-specific Special Conditions that Keystone has agreed to implement. Incorporation of those conditions would result in a Project that</p>

					pipe would be X-rayed for any defects as was done during the installation of the Alaskan pipeline.	would have a degree of safety over any other typically constructed domestic oil pipeline system under current code and a degree of safety along the entire length of the pipeline system similar to that which is required in HCAs as defined in 49 CFR 195.450. As noted in Section 2.3.2.4, all welds would be accomplished and inspected in accordance with PHMSA requirements in 49 CFR 195.214 through 195.234 and with the applicable Special Conditions (see Appendix U).
1093	2	Waggoner	Joseph		I understand the full implications and the impact to the Ogallala Aquifer should the Keystone pipeline be installed and there be a leak in the pipeline. I urge you to use caution but to keep an open mind to the Keystone pipeline, of all the years the Alaskan has been in operation I've not heard of one leak and I know the main stream media and the "I told you so's" would be all over that.	Consolidated Response SAF-1 describes the regulatory requirements and Project-specific Special Conditions that Keystone would comply with to construct, operate, maintain, inspect, and monitor the proposed Project. It also describes the monitoring, inspections, and reviews of the proposed Project that the Pipeline and Hazardous Materials Safety Administration would conduct to ensure compliance with those regulatory requirements.
465	1	Wahl	Ann		I have delayed sending you my comments because I cannot believe you would really go ahead with running an oil pipeline through Nebraska's precious Ogallala Aquifer! If this "dirty" (to Canada) oil must pass through Nebraska, for heaven's sake don't route it through a primary and pristine water source for the entire area. Have we learned nothing from the BP debacle? And don't run it under ground where a leak would do significant and irrevocable damage before discovery. Please, do not approve this project as it stands.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. Consolidated Response ALT-1 addresses potential alternative routes, including routes that would avoid much of the Northern High Plains Aquifer system. As described in Consolidated Response GLF-1, the risks associated with the proposed Project are substantially different from those associated with the BP Deepwater Horizon Project. Issues related to an aboveground pipeline are addressed in Consolidated Response CST-1.
1227	1	Wakeman	Richard		Thank you for looking into the TransCanada Keystone project and finding out everything you can about the safety etc. as far as the aquifer goes. The powers that be always say something is safe when they have only some assurance that something is safe. Nothing is absolute. Look at the Pharma industry. Many approved drugs have proved to be unsafe and an inspected bridge in Minn. collapsed, and cars accelerate unexpectedly and on and on. But they said it was safe!	Consolidated Response SAF-1 describes the regulatory requirements and Project-specific Special Conditions that Keystone would comply with to construct, operate, maintain, inspect, and monitor the proposed Project. It also describes the monitoring, inspections, and reviews of the proposed Project that the Pipeline and Hazardous Materials Safety Administration would conduct to ensure compliance with those regulatory requirements.
1227	2	Wakeman	Richard		Why even pipe oil over the aquifer at all, then it would be protected if the oil never came near the aquifer at all. What a stupid idea. Pipe it down a different safer route. That is what I would do. The BP situation in the gulf is a prime example. Which I know you brought up. Safe is when there is no oil going over the aquifer.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. Consolidated Response ALT-1 addresses potential alternative routes, including routes that would avoid much of the Northern High Plains Aquifer system.
247	1	Walker	Ronald	Jefferson County Courthouse	As County Judge of Jefferson County, Texas, I strongly encourage the U.S. Department of State to approve an energy infrastructure project that not only will Strengthen long-term energy security in the United States, but also will provide a powerful private sector economic stimulus to the communities along the pipeline route during its construction at a time when our economy continues to struggle.	Comment acknowledged.
247	2	Walker	Ronald	Jefferson County Courthouse	As I understand it, Keystone XL will create more than 13,000 high-wage construction and manufacturing jobs during the project's 2011-2012 construction schedule. Many of those jobs will be created in Texas and in our county, where too many of our residents continue to find it difficult to find good jobs. Additionally, the Keystone XL project will benefit businesses	Consolidated Response ECO-1 and Section 3.10.2.2 of the EIS address the potential socioeconomic impacts of the proposed Project.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					that provide supplies, goods and services for its construction and operation.	
247	3	Walker	Ronald	Jefferson County Courthouse	In addition to the jobs Keystone XL will create, the project will generate substantial economic benefits for the United States and in states and communities along the proposed route. Like our counties, in many cases these are areas where economic performance has stagnated or is shrinking. It is our understanding that TransCanada commissioned a study to measure the project's economic stimulus to the U.S. and the states along the route. The study found that in the U.S., Keystone XL would generate \$20.9 billion in total expenditures, \$9.6 billion in output of (gross product), personal income of \$6.5 billion and 118,935 person years of employment (jobs).	Consolidated Response ECO-1 addresses potential socioeconomic impacts, and Consolidated Response TAX-1 addresses concerns regarding taxes.
247	4	Walker	Ronald	Jefferson County Courthouse	In addition, the report concluded that during construction Keystone XL would generate \$486.36 million in tax revenue for state governments along the route and \$99.1 million for local taxing entities where the pipeline is located.	Consolidated Response TAX-1 and revisions to Section 3.10.2.4 of the EIS address concerns regarding taxes associated with implementation of the proposed Project.
247	5	Walker	Ronald	Jefferson County Courthouse	In Texas, the study found Keystone XL expenditures during construction would total \$5.4 billion and generate an economic gross product of nearly \$2.86 billion. Keystone XL construction also would generate more than \$64.5 million in tax revenue for local government and \$152 million for state government.	Consolidated Responses TAX-1 and ECO-1 address the estimated increases in the tax base and the jobs generated by the proposed Project. Also see the revisions to Sections 3.10.2.3 and 3.10.2.4 of the EIS.
247	9	Walker	Ronald	Jefferson County Courthouse	We enthusiastically support the Keystone XL Pipeline Project and encourage the Department of State to confirm the findings of the Draft Environmental Impact Statement, which found that the proposed Keystone XL Pipeline would have "limited adverse environmental impact during construction and operation."	Comment acknowledged.
247	10	Walker	Ronald	Jefferson County Courthouse	We look forward to the issuance of a Final Environmentally Impact Statement followed by a Presidential Permit that allows the construction of Keystone XL and enables our counties, the State of Texas, and the United States to collect the substantial economic benefits Keystone XL would create.	Comment acknowledged.
1032	1	Walker	Janice		Please do what you can to stop this!!	Consolidated Response ENR-1 provides information on the Department of State's environmental review process, the National Interest Determination process, and the need to complete those reviews before approving or denying the Presidential permit for the proposed Project.
1358	1	Walker	R.J.&Bernice		I am writing in response to the DEIS on the Keystone XL pipeline. I have some concerns that need to be addressed in future drafts of the EIS. My concerns are in regards to the proposed thinner pipe in "low consequence areas," abandonment of the pipeline, and contract.	Keystone has withdrawn its application for a Special Permit as described in Consolidated Response REG-1. Issues related to the life of the Project and taking the Project out of service are presented in Consolidated Response DEC-1.
1358	2	Walker	R.J.&Bernice		The proposed thinner pipe concerns me because the DEIS does not analyze the risks or potential impacts of spills of alterative thicknesses of pipe,	Keystone has withdrawn its application for a Special Permit as described in Consolidated Response REG-1. The Project would be constructed in accordance with PHMSA regulations and in accordance with the 57 Project-specific Special Conditions (see Appendix U of the EIS) developed by PHMSA and agreed to by Keystone. Incorporation of those conditions would result in a Project that would have a degree of safety over any other typically constructed domestic oil pipeline

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
						system under current code and a degree of safety along the entire length of the pipeline system similar to that which is required in high consequence areas (HCAs) as defined in 49 CFR 195.450.
1358	3	Walker	R.J.&Bernice		The proposed thinner pipe concerns me because the DEIS does not analyze the risks or potential impacts of spills of alterative thicknesses of pipe, or disclose what areas are "high consequence areas" and what affected lands are the remaining "low consequence areas."	Keystone has withdrawn the Special Permit application as described in Consolidated Response REG-1. As described in Consolidated Response SAF-1, the Pipeline and Hazardous Materials Safety Administration (PHMSA) has regulatory requirements that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project. In addition, PHMSA developed 57 Project-specific Special Conditions (see Appendix U of the EIS) that Keystone has agreed to implement. Incorporation of those conditions would result in a proposed Project that would have a degree of safety over any other typically constructed domestic oil pipeline system under current code and a degree of safety along the entire length of the pipeline system similar to that which is required in high consequence areas (HCAs) as defined in 49 CFR 195.450.
1358	4	Walker	R.J.&Bernice		The Department of Transportation has said that it will issue a separate Environmental Analysis and proposed special permit allowing a waiver for TransCanada to use thinner pipe outside of "high consequence areas." The DEIS should have analyzed the real potential risks and impacts of a spill under the waiver-granted scenario.	Keystone has withdrawn its application for a Special Permit as described in Consolidated Response REG-1, and the Pipeline and Hazardous Materials Safety Administration will not be preparing a separate analysis. The Project would be constructed in accordance with PHMSA regulations and in accordance with the 57 Project-specific Special Conditions (see Appendix U of the EIS) developed by PHMSA and agreed to by Keystone. Incorporation of those conditions would result in a Project that would have a degree of safety over any other typically constructed domestic oil pipeline system under current code and a degree of safety along the entire length of the pipeline system similar to that which is required in high consequence areas (HCAs) as defined in 49 CFR 195.450.
1358	6	Walker	R.J.&Bernice		Lastly, I am unhappy with the contract that TransCanada has been offering people on the proposed route. I was on the original route, and my sister is on the currently proposed route. Those of us whose land would be used for this pipeline need to be adequately compensated for our land. It is our livelihood!	Consolidated Response VAL-1 addresses concerns regarding property values. Consolidated Response EAS-2 addresses issues related to easement negotiations. As noted in that response, DOS has no legal authority in the easement negotiation process.
1358	7	Walker	R.J.&Bernice		Also, there needs to be emergency response plans in place BEFORE the pipeline is built. The disaster in the Gulf serves as a warning - if federal officials had paid more attention to the lack of a plan for dealing with a blow-out of BP's rig before the company was allowed to drill, we would have known before it was too late that there was no plan to contain a catastrophic spill. Thank you for your time and for taking these concerns into account. I look forward to seeing future drafts of the EIS.	Consolidated Response RES-1 addresses issues related to preparation and review of emergency response plans for the proposed Project.
1542	86	Walker	Bruce	Golden Triangle Group Sierra Club	We are opposed to this pipeline.	Comment acknowledged.
1542	87	Walker	Bruce	Golden Triangle Group Sierra Club	We are opposed to the destruction of the habitat in Canada.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information on current and future production. As noted in that

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
						Consolidated Response, without the proposed Project, oil sands development would continue at or above the current level until at least 2020, with or without the proposed Project.
1542	89	Walker	Bruce	Golden Triangle Group Sierra Club	The Golden Triangle Sierra Club, Lone Star Chapter, is in opposition of this pipeline.	Comment acknowledged.
1540	45	Wallace	Phillip		TransCanada's choice of contractors is the very value in the pipeline industry. They do not always award the jobs to the lowest bidder. Their environmental and safety program is second to no other oil or gas company in the world. Contractors that bid the Keystone work have to meet the environmental and safety requirements before they're allowed on the bid list. The environment and safety are the most important subjects in the TransCanada Project. Some contractors won't even try to do TransCanada's work because their stipulations are so strict, and that's a good thing.	Comment acknowledged.
1540	46	Wallace	Phillip		Piping Canadian oil will help the US become less dependent on foreign oil from unfriendly countries such as Mexico, Nigeria, Saudi Arabia, Russia, and Venezuela. Keystone is a vital link to a secure, reliable source of crude oil for the U.S.	Comment acknowledged.
1540	47	Wallace	Phillip		The Keystone XL is an enormous economic stimulus project representing billions of dollars in capital investment. They will pay millions in the tax revenue for state and local governments, and create thousands of jobs.	Consolidated Response ECO-1 addresses potential socioeconomic impacts, and Consolidated Response TAX-1 addresses concerns regarding taxes.
1543	2	Wallace	Philip		Keystone has some of the toughest standards required to qualify for the bid list. Some of our contractors don't qualify due to their environmental and safety program requirements. They choose the best quality contractors and the best value contractors, not by the lowest bid.	Comment acknowledged.
1543	3	Wallace	Philip		The welding procedures used are set according to the DOT's regulations. The procedures we have to follow are extensive, and cover not just the welding but the coating and anything we do with that pipe.	Consolidated Response SAF-1 describes the regulatory requirements and Project-specific Special Conditions that Keystone would comply with to construct, operate, maintain, inspect, and monitor the proposed Project. It also describes the monitoring, inspections, and reviews of the proposed Project that the Pipeline and Hazardous Materials Safety Administration would conduct to ensure compliance with those regulatory requirements.
1543	4	Wallace	Philip		The Keystone XL Pipeline is the next leg of moving the crude oil to the refineries in Houston. And those refineries have upgraded their equipment to handle this crude.	Comment acknowledged.
1543	5	Wallace	Philip		When we put the pipe together it's going to be put together the best it can be because every weld is x-rayed here in Mitchell. The crew from last year did an excellent job. They had less than a 2% repair rate, meaning that two out of one hundred wells had a small defect, which we then fix. When we're done there are no defects in those welds.	Comment acknowledged.
1543	6	Wallace	Philip		We've got to satisfy the DOT people that look at us. We've got third party inspectors out there, inspectors inspecting our inspectors. We've got people watching us from every angle and we like that. We want to be watched.	Consolidated Response SAF-1 describes the regulatory requirements and Project-specific Special Conditions that Keystone would comply with to construct, operate, maintain, inspect, and monitor the proposed Project. It also describes the monitoring, inspections, and reviews of the proposed Project that the Pipeline and Hazardous Materials Safety

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
						Administration would conduct to ensure compliance with those regulatory requirements.
1543	7	Wallace	Philip		The XL pipeline is very important to this country.	Comment acknowledged.
1543	9	Wallace	Philip		After the pipeline goes in the ground, then we hydro test to check for leaks. We fill it up with water and run the pressure up. I'm guessing around 22 or 2300 pounds of pressure is used to pre-test the pipeline.	Comment acknowledged.
1550	9	Wallace	Philip	Pipeline welder	Welder discussing that TransCanada has exacting safety standards that all of the welders are required to uphold. Providing reassurance that welds will be done accurately and correctly.	Comment acknowledged.
1550	10	Wallace	Philip	Pipeline welder	But this pipeline is very important to this country...But now TransCanada has brought this oil to us and they're our friends the way I see it... I think we need this Canadian crude to go to our American refineries to refine the products that we need in this country.	Comment acknowledged.
1550	11	Wallace	Philip	Pipeline welder	The tax revenues this project will in the next three years it will create over 15,000 jobs. The jobs that we need in every state that we go through, and when this pipeline is laid someone is going to be maintaining and operating it in these pump stations and operating this pipeline for years to come.	Consolidated Response ECO-1 addresses potential socioeconomic impacts, and Consolidated Response TAX-1 addresses concerns regarding taxes.
1556	43	Wallace	Phillip		In support of getting oil from Canada as opposed to other foreign sources such as Mexico.	Comment acknowledged.
1560	1	Wallace	Phillip		Welder for pipelines and thinks that Keystone's environmental program is second to none. Welds are all done to standards and beyond.	Comment acknowledged.
1560	24	Wallace	Phillip		We need this crude oil. We currently buy millions of barrels of oil/month from countries that don't like us. Canada is our ally and we should support this project.	Comment acknowledged.
690	1	Wallwork	Kelsey	sustain utah	I find this project disturbing and inappropriate. Not only will this be dangerous to nature but to the people and animals.	The impacts associated with implementation of the proposed Project are addressed in Section 3.0 of the EIS. As noted in that section, construction and normal operation the proposed Project would not result in significant environmental impacts. Section 3.13 of the EIS addresses reliability and safety issues, including calculations of the probability of a spill from the proposed Project and the potential environmental impacts associated with spills.
226	1	Walsh	Brian	SD Department of Environment and Natural Resources	The department concurs with the overall conclusions and recommendations presented in the Draft EIS and expects TransCanada to implement those recommendations as they apply to South Dakota.	Comment acknowledged.
226	2	Walsh	Brian	SD Department of Environment and Natural Resources	2. Section 1.8 Permits, Approvals, and Regulatory Requirements In Table 1.8-1 on page 1-22 under South Dakota/ Department of Environment and Natural Resources, include a reference to SDCL 34A-18. This law requires crude oil pipeline operators to submit their oil spill response plans to the department for review and approval.	The EIS was revised in response to this comment.
226	3	Walsh	Brian	SD Department of Environment and Natural	Section 2.2.704 Construction Camps: The wastewater flows from the worker camp(s) may be substantial and must be properly managed. As soon as possible, TransCanada needs	Keystone will work with appropriate agencies to determine the necessary permits and approvals required for wastewater management at the work camps in South Dakota. As

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
				Resources	to notify the department of their plans for managing the wastewater. The time needed to obtain the necessary approvals and permits can vary substantially depending on the final waste management designs. The department's Surface Water Quality Program will work with TransCanada to determine the necessary permits and approvals required for wastewater management at the work camps in South Dakota.	described in Section 2.2.7.4 of the EIS, a self-contained wastewater treatment facility would be included in each camp except where it is practicable to use a licensed and permitted publicly owned treatment works (POTW). Wastewater treated on site would undergo primary, secondary, and tertiary treatment consisting of solids removal, bioreactor treatment, membrane filtration, and ultraviolet exposure. Final effluent discharge would be in compliance with all applicable regulatory requirements. If a POTW is used, Keystone would either pipe or truck wastewater to the treatment facility. .
226	4	Walsh	Brian	SD Department of Environment and Natural Resources	4. Section 2.2.7.4 Construction Camps In Table 2.2.7-3 on page 2-15, replace "South Dakota Department of Environment and Natural Resources Office of Drinking Water and Waste Water" with "South Dakota Department of Environment and Natural Resources Drinking Water Program and Surface Water Quality Program"	The EIS was revised in response to this comment.
226	5	Walsh	Brian	SD Department of Environment and Natural Resources	5. Section 3.3.1.1 Groundwater On page 3.3-8 under the sub-heading "Wells" the DEIS states, "The Project would pass through the Colome SWPA in Tripp County." It is the department's understanding, based on TransCanada's application to the South Dakota Public Utilities Commission (PUC) and testimony presented during the PUC's formal hearing process in November 2009, the proposed pipeline has been re-routed (Colome Reroute) and no longer passes through Colome's SWPA.	Comment acknowledged.
226	6	Walsh	Brian	SD Department of Environment and Natural Resources	6. Section 3.3.1.2 Surface Water On page 3.3-13 under the sub-heading "Waterbodies Crossed" the DEIS states, "Of the 354 crossings 14 are perennial streams ... " However, on page 3.7-12 under the sub-heading "South Dakota" it states there are 10 perennial streams..." However, on page 3.7-12 under the sub-heading "South Dakota" it states there are 10 perennial streams crossed in South Dakota. Please correct this discrepancy.	The EIS was revised in response to this comment.
226	7	Walsh	Brian	SD Department of Environment and Natural Resources	Section 3.13 Oil Spill Risk Assessment and Environmental Consequence Analysis. This section needs to address the disposal of crude oil and crude oil contaminated soil in the event of a pipeline release. The discussion should include information on possible disposal options (i.e., land farming or disposal at a permitted facility) and the potential environmental impacts of those options.	The Emergency Response Plan would address the potential disposal options for materials contaminated by a spill from the Project. All such disposal would have to be in compliance with existing regulatory requirements for disposal of crude oil and materials contaminated by crude oil. Further, during most cleanup operations of oil spills, the selection of a disposal option is decided by the Incident Commander, who is typically from the U.S. Environmental Protection Agency, at the time of a spill response. Consolidated Response RES-1 addresses issues related to preparation and review of the Emergency Response Plan for the proposed Project.
226	8	Walsh	Brian	SD Department of Environment and Natural Resources	8. Appendix P Risk Assessment The fifth full paragraph on page 4-4 states the soil cleanup levels for benzene in South Dakota is 17 parts per million (ppm). This is incorrect. In South Dakota, the Tier 1 action level for benzene in soil is 0.2 ppm. If contamination levels exceed 0.2 ppm, additional investigation is required and a final benzene cleanup level will be determined based on risk.	Appendix P includes the risk assessment prepared by Keystone. If a spill occurs in South Dakota, cleanup would be to the levels dictated by the state, irrespective of statements in the risk assessment.
474	1	Walsh	Thomas		I am writing to express my opposition to the routing of the Keystone XL pipeline. As currently proposed the route will	Consolidated Response ALT-1 addresses potential alternative routes, including routes that would avoid much of the Northern

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					cross a highly delicate area in the Sandhills of Nebraska. I strongly oppose this route for the following reasons: 1. Sandhill soil is highly erodible. It will be virtually impossible to prevent blowouts along the pipeline route.	High Plains Aquifer system and the Sand Hills area. See Consolidated Response ERO-1.
474	3	Walsh	Thomas		The proposed route does traverse areas covering the Ogallala Aquifer. The aquifer is a critical resource for people living in the Great Plains area. Any oil leak has the potential of contaminating an irreplaceable resource. This country cannot risk putting such a resource at risk. The recent spill in the Gulf of Mexico and the recent oil spill in Utah are sufficient evidence that risk does exist in any such undertaking.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. As described in Consolidated Response GLF-1, the risks associated with the proposed Project are substantially different from those associated with the BP Deepwater Horizon Project.
587	1	Warner	Karen		The Nebraska Sandhills are one of Nebraska's biggest assets. It is a unique area in the country and pristine. We need to keep it that way. With the current history of pipeline disasters, we must, WE MUST, keep the pipeline away from the Nebraska Sandhills. In fact, we need to stop all drilling for the present and spend more resources on alternative fuels! If we can go to the moon, we can lick our dependence on oil!	Issues related to the Sand Hills area are addressed in Consolidated Response ERO-1. Consolidated Response ALT-1 addresses potential alternative routes, including routes that would avoid much of the High Plains Aquifer System. The proposed Project does not involve drilling. Consolidated Response P&N-5 addresses issues related to investments in other technologies.
757	1	Warsocki	Stephan	Kuhl Clothing	Please rethink this. The last thing we need is another energy disaster with the Keystone XL Pipeline running thru the Ogallala Aquifer. Our water resources are far too important.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
497	1	Wassenberg	Lee		Please do not cross the Ogallala Aquifer. Find a different route	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. Consolidated Response ALT-1 addresses potential alternative routes, including routes that would avoid much of the Northern High Plains Aquifer system.
469	1	Wasser	Peggy		In lieu of the recent BP oil spill in the Gulf of Mexico and the Salt Lake City oil spill, I am opposed to the Keystone XL Pipeline Project running through the State of Nebraska where another oil spill can endanger the Ogallala Aquifer.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
453	1	Wasson	David		I oppose the Keystone XL Pipeline Project. The risk of leak in the Ogallala aquifer is too high.	Consolidated Response OIL-1 addresses the likelihood of spills from the Project.
423	1	Watchorn	Sara		Utah, in particular the Salt Lake Valley, is already threatened by the pollution created from mineral mining. Sludge is watered 24 hours a day in an attempt to prevent the nervous disorder and cancer causing particles from circulating in the air. Half of the mountain is dead and the Great Salt Lake polluted. Many "downwinders," an entire street in fact, in Moab are battling cancer. We just suffered and oil leak that wreaked havoc on the animals and ecosystem. Please do not bring this toxic material to Utah. Please get rid of this toxic material all together and find safe, sustainable and green means!	The proposed Project does not extend through Utah.
1161	1	Waterman	Martin		To Whom it May Concern; As concerned citizens and native Nebraskans, we are very apprehensive of the proposed pipeline project slated to cross the state of Nebraska. Especially after the oil spill in the gulf... Please act responsibly, with the best interests of the land in mind, when making your final decision on this issue. What we do now, will be done forever, without recourse in the future!	As described in Consolidated Response GLF-1, the risks associated with the proposed Project are substantially different from those associated with the BP Deepwater Horizon Project.
1161	2	Waterman	Martin		This state is historically known as the Great American Desert and would be irreparably destroyed by any accident that this	Issues related to the Northern High Plains Aquifer System are addressed in Consolidated Responses AQF-1 through AQF-4.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					project could inflict upon the land.	Consolidated Response AQF-3 provides information on hypothetical spills from the Project over two areas of the Northern High Plains Aquifer System. Consolidated Response OIL-3 addresses the detection of small leaks. As noted in those responses, Nebraska would not be devastated if a spill from the Project entered the aquifer.
1161	3	Waterman	Martin		The Ogallala Aquifer is a rare and much needed resource for Nebraska. We should do everything we can possibly do to protect these irreplaceable natural resources! No amount of money can replace these resources nor reverse any potential damage that this pipeline could cause; to the aquifer or the land itself.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
378	1	Watkins	Ron	Canadian Steel Producers Association	The Canadian Steel Producers Association (CSP A) wishes to express its support for the Keystone XL pipeline project currently being proposed by TransCanada, as well as the Draft Environmental Impact Statement and the thorough review process underway in the United States since 2008.	Comment acknowledged.
378	2	Watkins	Ron	Canadian Steel Producers Association	The economic relationship between Canada and the United States is larger than that of any other international trading partners. With close to \$2 billion in daily trade across the border, the economic well-being of our countries and their residents are highly interdependent. The continued growth of both economies depends in a large way on the reliable supply of energy to fuel manufacturing, transportation, infrastructure development, and power generation. For the United States, this means a growing need to access Canadian oil. For Canada, this means continued investment in the development of the Alberta oil sands, the world's second largest oil reserves after Saudi Arabia, and investment in the infrastructure required to deliver this energy to the United States. Canada supplies more oil to the U.S. than any other country. It accounts for 12 percent of current U.S. petroleum-consumption needs and represents 18 percent of U.S. petroleum imports. By transporting Canadian heavy crude to the U.S. refineries on the Gulf Coast, Keystone XL will help to assure energy security in the United States for many years. Conversely, failure to proceed with Keystone XL would require the United States to increase energy imports from other sources.	Comment acknowledged.
378	3	Watkins	Ron	Canadian Steel Producers Association	North American energy projects such as Keystone XL also represent a significant opportunity to positively impact a host of sectors in both economies. The Keystone XL pipeline is a major economic development project that represents billions of dollars in capital investment, millions of dollars in tax revenue for state and local governments, and thousands of jobs. Oil sands development has proven to offer direct economic benefits to both Canada and the U.S. The Canadian Energy Research Institute has found that the economic impact of oil sands development is expected to lead to the creation of more than 342,000 new U.S. jobs between 2011 and 2015.	Consolidated Response ECO-1 addresses potential socioeconomic impacts, and Consolidated Response TAX-1 addresses concerns regarding taxes.
378	6	Watkins	Ron	Canadian Steel Producers Association	Efficient and prudent permitting processes for projects like Keystone XL can enable such projects to serve the energy needs of North America. We urge the Department of State to allow the continuation of the comprehensive regulatory review	Comment acknowledged.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					processes currently underway and not to unduly delay or restrict progress on this critical continental energy project.	
1254	1	Waxman	Henry	Congress, CA Representative	The State Department's decision on whether to permit this pipeline represents a critical choice about America's energy future.	Consolidated Responses ENR-1 and P&R-9 provide information on the DOS environmental review process, the National Interest Determination process, and the need to complete those reviews before approving or denying the Presidential permit for the proposed Project. As noted in that response, our review will be based on the assessments specific to the proposed Project, not on future energy policy.
1254	5	Waxman	Henry	Congress, CA Representative	This pipeline would roughly double the quantity of tar sands fuel currently being imported, and in conjunction with two previously permitted tar sands pipelines that are not yet in full operation-Keystone and Alberta Clipper-would more than triple the quantity of tar sands fuel imported to the United States. The cumulative effect of the three tar sands pipelines would be to increase tar sands imports to over 3 million barrels per day. To process this large increase in tar sands imports, U.S. refineries will invest billions of dollars more in refinery upgrades.	The existing Keystone Oil Pipeline System and the Alberta Clipper Project provide crude oil to refineries in the Midwest; the majority of those refineries are configured to refine heavy crude oil, including the Canadian crude oil transported by those projects. Our response to Comment Letter 1254, Comment 19 addresses the issue of the potential need for refinery upgrades in PADD III.
1254	6	Waxman	Henry	Congress, CA Representative	My concern is that this project would have a major adverse impact on the carbon intensity of U.S. transportation fuel. The problem is that oil can be extracted from the tar sands only by using three times the energy required to produce a barrel of conventional oil.	Consolidated Response GHG-1 addresses the greenhouse gas life-cycle analyses presented in the revised EIS. Consolidated Response OIL-4 addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils.
1254	7	Waxman	Henry	Congress, CA Representative	Studies estimate that shifting to tar sands fuel increases lifecycle greenhouse gas emissions by up to 37% compared to the baseline fuel supply.	Consolidated Response GHG-1 addresses the greenhouse gas life-cycle analyses presented in the revised EIS.
1254	8	Waxman	Henry	Congress, CA Representative	Based on a mid-range estimate of the impacts, increasing the use of tar sands fuel to over 3 million barrels per day would increase lifecycle greenhouse gas emissions for transportation in the United States by an amount roughly equivalent to adding 18 million passenger vehicles to the roads.	Consolidated Response GHG-1 addresses the greenhouse gas life-cycle analyses presented in the revised EIS.
1254	9	Waxman	Henry	Congress, CA Representative	The combined effect of the three tar sands pipelines would be to erase roughly two-thirds of the global warming pollution reductions that the Administration's historic motor vehicle standards would achieve in 2020.	Consolidated Response GHG-1 addresses the greenhouse gas life-cycle analyses presented in the revised EIS. Climate change is addressed in Section 3.14.3.14. As noted in that Section, implementation of the proposed Project is unlikely to result in a measureable climate change.
1254	10	Waxman	Henry	Congress, CA Representative	I am concerned that the EIS for this project fails to discuss global warming impacts, which are the most significant environmental problem associated with the project.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project. Climate change is addressed in Section 3.14.3.14. As noted in that Section, implementation of the proposed Project is unlikely to result in a measureable climate change.
1254	11	Waxman	Henry	Congress, CA Representative	The State Department's position that it need not consider global warming impacts is contrary to longstanding guidance from the Council on Environmental Quality, as well as a recent district court decision. As a matter of good government, it makes little sense to prepare an EIS, which has the sole purpose of ensuring that the government understands the environmental impacts of a proposed action, that excludes	DOS will consider the potential global warming impacts in its review of the application for a Presidential Permit for the proposed Project. Consolidated Response GHG-1 addresses the greenhouse gas life-cycle analyses presented in the revised EIS. Climate change is addressed in Section 3.14.3.14. As noted in that Section, implementation of the proposed Project is unlikely to result in a measureable climate

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					consideration of the primary environmental impact.	change.
1254	12	Waxman	Henry	Congress, CA Representative	I urge the Department to prepare a supplemental EIS that addresses the full environmental impacts of the Keystone XL pipeline, using a lifecycle greenhouse gas emissions analysis prepared by the Environmental Protection Agency and the Department of Energy and allow for public comment on that supplemental EIS.	Consolidated Response P&N-6 addresses requests for a supplemental draft EIS. Consolidated Response GHG-1 addresses the greenhouse gas life-cycle analyses presented in the EIS.
1254	13	Waxman	Henry	Congress, CA Representative	I am troubled by the process that the State Department appears to be following for the national interest determination. E.O. 13337 recognizes that these complex decisions involve matters within the expertise of multiple federal agencies, and it provides specified federal agencies 90 days to comment on the application. But in this proceeding, the State Department started the clock for agency comments on June 16, 2010. This means that agencies must provide views on whether the project is in the national interest without the information on the project's environmental impacts that should be discussed in the final EIS.	As noted in Consolidated Response P&N-9 and in Section 1.3 of the EIS, DOS will provide agencies with a 90-day review period after the final EIS is issued as a part of the national interest determination process.
1254	14	Waxman	Henry	Congress, CA Representative	The State Department should comply with the purpose and process requirements of E.O. 13337 and NEPA by providing agencies 90 days to comment after the supplemental EIS is final.	As noted in Consolidated Response P&N-9 and in Section 1.3 of the EIS, DOS will provide agencies with a 90-day review period after the final EIS is issued as a part of the national interest determination process.
1254	15	Waxman	Henry	Congress, CA Representative	I urge the Department to develop criteria for determining whether this project is in the national interest and to make those criteria public.	Consolidated Response P&N-9 addresses issues related to the National Interest Determination.
1254	16	Waxman	Henry	Congress, CA Representative	The EIS does address the much smaller quantity of greenhouse gas emissions associated with constructing and operating the pipeline, and briefly and inadequately considers the additional greenhouse gas emissions that may result from refinery operations in the United States, but excludes all greenhouse gas emissions that will occur in Canada as a result of increased production of tar sands for export through the pipeline.	Consolidated Response GHG-1 addresses the greenhouse gas life-cycle analyses presented in the revised EIS.
1254	19	Waxman	Henry	Congress, CA Representative	The cumulative effect of the three tar sands pipelines would be to increase tar sands imports to over 3 million barrels per day. U.S. refineries will invest billions of dollars more in refinery upgrades and expansions to process the bitumen transported by the pipeline.	As stated in the EnSys (2010) report commissioned by the Department of Energy and referenced in the EIS, market forces would likely lead to other transportation pathways that would allow WCSB heavy crude oils to reach the Gulf Coast refineries with or without the proposed Project. The EnSys (2010) study included projections of refinery investments and expansions in PADD III. These projections showed no significant change in refinery investments among all scenarios other than the No Expansion scenario. These scenarios included a wide projection of the amount of oil sands crudes in PADD III ranging from 500,000 bpd to 1.5 million bpd. Extensive analysis of crude-oil market dynamics and several modes of bulk transportation indicate that a "No Expansion" scenario where all modes of bulk transport for crude oil out of the WCSB remain at 2010 levels through 2030 is highly implausible.
1254	20	Waxman	Henry	Congress, CA Representative	Producing fuel from tar sands causes significant environmental harm. Extracting tar sands bitumen and upgrading it to synthetic crude oil produces roughly three times greater greenhouse gas emissions than producing	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project. Consolidated Response

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					conventional oil on a per unit basis.	GHG-1 addresses the greenhouse gas life-cycle analyses presented in the revised EIS.
1254	22	Waxman	Henry	Congress, CA Representative	The draft EIS for the Keystone XL decision fails to consider the primary environmental concern associated with the project. The draft EIS contains no analysis of the potential greenhouse gas impacts of the pipeline due to increased development of the tar sands.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project. As noted in that response, the proposed Project would not increase the development of oil sands production. Consolidated Response GHG-1 addresses the greenhouse gas life-cycle analyses presented in the revised EIS.
1254	28	Waxman	Henry	Congress, CA Representative	Studies estimate that shifting to tar sands fuel increases lifecycle greenhouse gas emissions by up to 37% compared to the 2005 baseline fuel supply, depending in part on the extraction method used.	Consolidated Response GHG-1 addresses the greenhouse gas life-cycle analyses presented in the revised EIS.
1254	32	Waxman	Henry	Congress, CA Representative	In its approval of the Alberta Clipper tar sands pipeline, the State Department dismissed concerns about increased greenhouse gas emissions from tar sands on the basis that they "are best addressed in the context of the overall set of domestic policies that Canada and the United States will take to address their respective greenhouse emissions." In effect, the Department argued that emissions that occur in Canada are not our concern except in the context of international treaty negotiations to address the global problem of climate change. This position ignores the realities of the situation. Rapidly growing tar sands development is making it increasingly difficult for Canada to address its greenhouse gas emissions either through domestic regulation or international commitments.	Consolidated Response GHG-1 addresses the greenhouse gas life-cycle analyses presented in the revised EIS. Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project. As noted in those responses, implementation of the proposed Project would not have an effect on oil sands production in the near term.
1254	36	Waxman	Henry	Congress, CA Representative	Canada faces a serious challenge in addressing its greenhouse gas emissions, and tar sands are the single biggest part of the problem going forward. There is little basis for assuming that this problem will be effectively addressed while the United States supports increased production by further expanding market access for tar sands fuel. In fact, by approving this pipeline at this time, the State Department would be giving up leverage to encourage Canada to adopt policies to reduce greenhouse gas emissions and implement technologies to reduce emissions from tar sands production.	As stated in the EnSys (2010) report commissioned by the Department of Energy and referenced in the EIS, market forces would likely lead to other transportation pathways that would allow WCSB heavy crude oils to reach the Gulf Coast refineries with or without the proposed Project.
1254	37	Waxman	Henry	Congress, CA Representative	The draft EIS does not address Canada's GHG emissions concerns. In the document, the State Department asserts that when evaluating activities that occur within the United States, it is not required by law to consider any effect of such U.S. activities that occurs outside of the United States, termed "transboundary effects". This position is contrary to longstanding NEPA guidance issued by the Council on Environmental Quality (CEQ), which is responsible for overseeing NEPA, as well as a recent district court decision CEQ's 1997 guidance on trans boundary effects discusses NEPA's purpose, requirements and relevant case law, and concludes: "[i]n sum, based on legal and policy considerations, CEQ has determined that agencies must include analysis of reasonably foreseeable trans boundary effects of proposed actions in their analysis of proposed actions in the United States."	Consolidated Response GHG-1 addresses the greenhouse gas life-cycle analyses presented in the revised EIS. Section 3.14.3.14 addresses the cumulative effects of greenhouse gases and climate change. That section also addresses other extraterritorial issues.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
1254	38	Waxman	Henry	Congress, CA Representative	In the EIS for the Alberta Clipper pipeline, the State Department similarly took the position that it was not legally required to consider transboundary effects. CEQ formally objected to the State Department's failure to consider such effects in a letter to Deputy Secretary Steinberg, which specifically cited the environmental impacts of tar sands production and the greenhouse gas emissions associated with production, transport and use of tar sands oil. A federal court recently upheld CEQ's legal views, finding that "NEPA requires agencies to consider reasonably foreseeable transboundary effects resulting from a major federal action taken within the United States". However, the Department disregarded CEQ's objection in Alberta Clipper proceeding without explanation and reasserted its position in the Keystone XL draft EIS.	Consolidated Response GHG-1 addresses the greenhouse gas life-cycle analyses presented in the revised EIS. Section 3.14.3.14 addresses the cumulative effects of greenhouse gases and climate change. That section also addresses other extraterritorial issues.
1254	39	Waxman	Henry	Congress, CA Representative	The State Department's position is legally highly vulnerable and it does not make sense. NEPA is a procedural statute that imposes no substantive requirements. As the Supreme Court has stated, the "twin aims" of NEPA are to oblige agencies "to consider every significant aspect of the environmental impact of a proposed action," and to "ensure that the agency will inform the public that it has indeed considered environmental concerns in its decision making process". The whole purpose of NEPA is to ensure that federal agencies understand the potential environmental consequences of a proposed government action and consider alternatives that would avoid or minimize such consequences. That purpose cannot be fulfilled here absent a detailed analysis of the full global warming impacts of the Keystone XL project.	Consolidated Response GHG-1 addresses the greenhouse gas life-cycle analyses presented in the revised EIS. Section 3.14.3.14 addresses the cumulative effects of greenhouse gases and climate change.
1254	40	Waxman	Henry	Congress, CA Representative	The failure to address global warming issues cannot be corrected simply by adding information on the potential greenhouse gas emissions effects in the final EIS. That approach would effectively deny the opportunity for public comment on the analysis of the primary environmental concern associated with the project. The State Department should ask EPA, in consultation with the Department of Energy, to provide an estimate for lifecycle emissions for tar sands.	Consolidated Responses GHG-1 through GHG-5 address concerns related to greenhouse gas, climate change, alternative energy considerations, and approach to assessment of GHG emissions. The scope of the GHG analysis for the proposed Project was developed in consultation with EPA and DOE and the results have been reviewed by EPA and DOE.
1254	41	Waxman	Henry	Congress, CA Representative	The State Department should issue a supplement to the draft EIS that would allow for public comment on the estimate and an associated analysis of the full transboundary environmental effects of the Keystone XL project.	Consolidated Response P&N-6 addresses requests for a supplemental draft EIS. The EIS has been revised to include additional information on transboundary issues.
1254	42	Waxman	Henry	Congress, CA Representative	The discussion of global warming impacts in the supplemental draft EIS should be informed by and consistent with final CEQ guidance on addressing climate change under NEPA.	Consolidated Response GHG-5 explains that the DOS assessment of GHG emissions was conducted in accordance with CEQ guidance.
1254	43	Waxman	Henry	Congress, CA Representative	The draft EIS provides no analysis of the economic or legal viability of the alternative scenarios (described in the draft EIS if the pipeline were not built) and no support for its assertions (e.g. the tar sands will be developed with or without the pipeline; the tar sands bitumen will likely be moved to market other ways, and if the U.S. market is not available, it will be sold to countries other than the United States, such as China).	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1 and Section 1.4.2, both of which provide additional information relative to the development of oil sands projects with and without the proposed Project.
1254	44	Waxman	Henry	Congress, CA	The draft adds that if no Canadian port currently has sufficient	Section 4 of the EIS addresses alternative transportation

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
				Representative	capacity to handle the crude, a port would be expanded or built. In fact, there currently is no available means of transporting large additional quantities of tar sands crude to the Canadian coast.	methods and alternative potential delivery points for WCSB crude oil with or without the proposed Project.
1254	45	Waxman	Henry	Congress, CA Representative	While the industry is interested in building a pipeline, it must cross lands held by First Nations peoples who have announced their opposition to the pipeline. First Nations in British Columbia and a majority of the residents of British Columbia also strongly oppose opening the coast of British Columbia to oil tanker traffic. Such opposition is likely to produce substantial delay, at a minimum, and may well block the pipeline altogether.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1. Both the EnSys (2010) report and the EIS acknowledge opposition to, and regulatory obstacles faced by, the proposed pipeline projects to the Canadian West Coast. The EnSys report made conservative assumptions about the availability of additional transport capacity to the Canadian West Coast in light of those obstacles. Commenters state that in summary, "none of the proposed alternatives to Keystone XL are 'likely' to move forward, and if any did proceed, they would most likely be a long-term option (10+ years)." As noted in the Pembina Report, Exhibit O to the Sierra Club et al. comment letter, "Substantial growth in exports to Asian markets is unlikely as a short-term option (1-5 years); possible as a mid-term option (5-10 years), but only if certain issues are overcome; and most likely as a long-term option (10+ years)." These statements match the approach taken by EnSys in its analysis. In pipeline construction scenarios that included additional capacity to the Canadian West Coast, the EnSys modeling made the TMX 2&3 capacity available only in 2020, the Northern Gateway capacity available only in 2025, and the Northern Leg capacity available only in 2030.
1254	46	Waxman	Henry	Congress, CA Representative	Moreover, it is widely recognized that the pace and extent of tar sands development is affected by the price of oil and the costs of extracting, transporting, and upgrading tar sands bitumen. In the absence of the Keystone XL pipeline, there are no currently available alternatives for moving this large additional quantity of production to market, and at a minimum any such alternatives would be expected to have higher costs.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information from a recent report prepared under contract to the US DOE regarding development of oil sands projects with and without the proposed Project. Rather than assessing the likelihood of particular pipeline projects, the EnSys report assessed market forces and concluded that market forces are present that would encourage expansion of pipeline capacity generally. Developments since publication of the EnSys (2010) report are consistent with this assessment. For example, the number of potential transportation projects that would move WCSB crude oil from PADD II to PADD III has increased and several are closer to implementation (EnSys 2011). See Appendix V of the EIS for EnSys reports 2010 and 2011.
1254	47	Waxman	Henry	Congress, CA Representative	The assumption in the draft EIS that tar sands production rates will be unaffected by the cost and availability of transport to market violates fundamental economic principles, and they are simply not credible.	The EIS relies on analyses using the WORLD model that are included within the EnSys (2010) report. The WORLD model is not designed to simulate the details of upstream oil production economics. Rather, the production level of any particular crude oil is an input parameter in the model, which then assesses the downstream refining and oil market impacts. However, the model used world crude oil prices taken from the EIA 2010 AEO. For all horizons, these prices were of the order of \$100 per barrel in constant dollar terms. They were therefore well above the range of production costs for WCSB and other crude oils that could be transported on the proposed Project. Consequently, the limited variations from case to case in WCSB crude oil prices were not enough to

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
						have had any material impact on projected WCSB production levels. Under the No Expansion scenarios the absolute transportation constraints that were assumed resulted in reduced projections for WCSB production. The No Expansion scenario also resulted in reduced prices for WCSB crude oils but those prices remained above likely production costs. The WORLD model is a commonly used tool for U.S. and global market based analyses and EnSys was specifically selected by DOE to perform market-based projections partially because of their acknowledged expertise in this area. Section 4.1 of the EIS includes information from the IEA World Energy Outlook 2010 (IEA 2010) concerning projected impacts on WCSB production under different policy (and price) scenarios.
1254	48	Waxman	Henry	Congress, CA Representative	There is substantial evidence that the pipeline may produce excess capacity, at least for a period of time until production is increased to utilize the available transport. Several oil companies operating in the tar sands oppose the Keystone XL proposal on the grounds that it will result in pipeline overcapacity for tar sands exports, raising the costs for transport on existing pipelines (this is due to the structure of existing contracts, which guarantee pipeline operators certain rates of return independent of the quantities being transported).	Consolidated Response P&N-1 addresses the need that the Project has been proposed to meet. As noted in that Consolidated Response, the Project has been proposed to meet the heavy crude oil needs of refineries in the Gulf Coast area, not for the U.S. in general. In addition, the Alberta Clipper and existing Keystone pipeline projects serve other markets and do not meet the demands of the Gulf Coast refineries.
1254	49	Waxman	Henry	Congress, CA Representative	It is critical that the State Department carefully and critically examine claims of need for this quantity of additional capacity at this time. The Department should consider, in particular, the effect of recent approvals of two pipelines that provide 1.4 million bpd of new capacity and are just starting operations.	Consolidated Response P&N-1 addresses the need that the Project has been proposed to meet. As noted in that response, the Project has been proposed to meet the heavy crude oil needs of refineries in the Gulf Coast area, not for the U.S. in general. In addition, the Alberta Clipper and existing Keystone pipeline projects serve other markets and do not meet the demands of the Gulf Coast refineries.
1254	50	Waxman	Henry	Congress, CA Representative	The Department must fundamentally reevaluate assumptions in the draft EIS about U.S. oil demand in light of recent policy changes and updated EIA forecasts. The draft EIS states, without support, that "U.S. demand for petroleum products has increased and is likely to continue increasing for the foreseeable future". In fact, U.S. petroleum demand fell in 2008 and 2009, and EIA now projects that, absent further changes in fuel economy standards, demand is projected to grow by only 1.2% total over the next 25 years.	The analysis in the EIS was expanded to include clean energy and low petroleum demand scenarios. That analysis partially relies on the EnSys Report which specifically addresses lower petroleum demand. EnSys states that "A second 'Low Demand' outlook was also applied to each of the seven pipeline availability cases to assess the impacts of reduced consumption of transport fuels in the U.S. This outlook was based on a February/March 2010 study by the EPA which examined 'more aggressive fuel economy standards and policies to address vehicle miles traveled'. Projections were used from the EPA's Scenario A, leading to reductions in U.S. petroleum product consumption versus the AEO 2010 outlook starting post 2015 and reaching 1.2 mbd by 2020 and 4.0 mbd by 2030." (EnSys 2010). Additionally, the SDEIS and EIS assess crude oil composition independent of the Clean Air Act and Clean Water Act permitting processes. See Sections 3.13 and 3.14 of the EIS, and Consolidated Responses GHG-2 and P&N-3
1254	51	Waxman	Henry	Congress, CA Representative	Assuming that further improvements in fuel economy standards are adopted, as President Obama recently announced, EIA projects that U.S. petroleum demand in 2035 will actually be 1.4% below 2008 levels.	The analysis in the SDEIS was expanded to include clean energy and low petroleum demand scenarios. That analysis partially relies on the EnSys Report which specifically addresses lower petroleum demand. EnSys states that "A second 'Low Demand' outlook was also applied to each of the seven pipeline availability cases to assess the impacts of

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
						reduced consumption of transport fuels in the U.S. This outlook was based on a February/March 2010 study by the EPA which examined 'more aggressive fuel economy standards and policies to address vehicle miles traveled'. Projections were used from the EPA's Scenario A, leading to reductions in U.S. petroleum product consumption versus the AEO 2010 outlook starting post 2015 and reaching 1.2 mbd by 2020 and 4.0 mbd by 2030." (EnSys 2010). Additionally, the SDEIS and EIS assess crude oil composition independent of the Clean Air Act and Clean Water Act permitting processes. See Sections 3.13 and 3.14 of the EIS, and Consolidated Responses GHG-2 and P&N-3
1254	52	Waxman	Henry	Congress, CA Representative	While considerations related to changing sources of supply are valid, it is not correct to assume that overall demand is increasing and that there is no alternative to this pipeline for meeting such demand. To the contrary, recent modeling by EPA shows that adoption of clean energy policies for the transportation sector could allow significant further reductions in future U.S. demand for oil in the range of 25-40 percent by 2030. Yet the draft EIS provides no analysis of demand-side alternatives that could address our transportation needs and enhance our national security at a net savings to consumers.	The analysis in the SDEIS was expanded to include clean energy and low petroleum demand scenarios. That analysis partially relies on the EnSys Report which specifically addresses lower petroleum demand. EnSys states that "A second 'Low Demand' outlook was also applied to each of the seven pipeline availability cases to assess the impacts of reduced consumption of transport fuels in the U.S. This outlook was based on a February/March 2010 study by the EPA which examined 'more aggressive fuel economy standards and policies to address vehicle miles traveled'. Projections were used from the EPA's Scenario A, leading to reductions in U.S. petroleum product consumption versus the AEO 2010 outlook starting post 2015 and reaching 1.2 mbd by 2020 and 4.0 mbd by 2030." (EnSys 2010). Additionally, the SDEIS and EIS assess crude oil composition independent of the Clean Air Act and Clean Water Act permitting processes. See Sections 3.13 and 3.14 of the EIS, and Consolidated Responses GHG-2 and P&N-3
1254	53	Waxman	Henry	Congress, CA Representative	In weighing needs for domestic U.S. consumption, the Department should analyze to what extent Gulf Coast refineries may export refined tar sands products to other countries.	According to a DOE (2011) report provided to DOS, the International Energy Agency expects that increases in OPEC production will not keep up with increases in oil demand and non-OPEC investment will be needed to meet new demand, especially in nonconventional oil. Middle Eastern producers will not have any trouble finding takers for their crude. Even if Saudi Arabia makes price concessions to maintain 700 thousand barrels per day of exports to PADD III, PADD III refiners import between 5-6 million barrels/day of crude oil. PADD III crude imports from its largest suppliers (1.2 million barrels/day from Mexico and 0.9 million barrels/day from Venezuela) are declining. Several PADD III refineries are configured to process oil from Mexico and Venezuela. With these supplies in decline, there is a significant market opportunity for competitively-priced Canadian dilbit to offset lost heavy oil supplies. There is no reason to believe that PADD III refiners would not use the Canadian oil shipped in the Keystone XL pipeline (450-630 thousand barrels/day). As mentioned above, TransCanada has already secured contracts for 380 thousand barrels/day, leaving only 70-250 thousand barrels/day of Keystone XL capacity that has not yet found buyers. The Gulf Coast appetite for Canadian oil sands in PADD III will be much higher than can be supplied by just the Keystone XL pipeline. Refinery modeling analysis shows that PADD III imports of Canadian oil sands could rise to 1.8

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
						million barrels per day by 2030 (using a modeling scenario that assumes no additional oil sands pipelines to the British Columbia coast)."
1254	54	Waxman	Henry	Congress, CA Representative	I urge the Department to address these concerns by issuing a supplemental EIS that addresses all the significant environmental impacts of this project and viable alternatives, and by allowing an adequate time for public comment on the supplemental EIS.	Consolidated Response P&N-6 addresses requests for a supplemental draft EIS. Consolidated Response CMT-1 addresses issues related to the length of the comment period for the draft EIS and supplemental draft EIS.
1468	1	Waxman	Henry	US Congress, Committee on Energy and Commerce	I am writing to convey my strong concerns about the draft environmental impact statement for the Keystone XL tar sands pipeline, released April 16, 2010. Under separate cover, I have written to express my concerns related to the State Department's broader determination of whether permitting this pipeline is in the national interest. This pipeline is a multi-billion dollar investment to expand our reliance on the dirtiest source of transportation fuel currently available. As a consequence it would have a critical impact on our nation's energy supplies and the environment. Yet the State Department has failed to analyze the most significant environmental impacts of this decision, as required by law.	Consolidated Response OIL-4 addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils. The impacts associated with implementation of the proposed Project are addressed in Section 3.0 of the EIS. As noted in that section, construction and normal operation the proposed Project would not result in significant environmental impacts. Section 3.13 of the EIS addresses reliability and safety issues, including calculations of the probability of a spill from the proposed Project and the potential environmental impacts associated with spills. As noted in Consolidated Response REG-2, DOS considers the EIS to be in full compliance with the requirements of a NEPA environmental review.
1468	3	Waxman	Henry	US Congress, Committee on Energy and Commerce	Keystone XL is a \$7 billion pipeline that would transport up to 900,000 barrels/day (bpd) of tar sands bitumen almost 2,000 miles from Alberta to refineries in the Gulf Coast. ³ [3 TransCanada Keystone Pipeline, LP., Application of TransCanada Keystone Pipeline, L. P. for a Presidential Permit Authorizing the Construction, Operation, and Maintenance of Pipeline Facilities/or the Importation of Crude Oil to be Located at the United States-Canada Border, 7-9 (Sept. 19,2008). "Bitumen" is the oil extracted from tar sands deposits, which is defined as "a naturally occurring viscous mixture, mainly of hydrocarbons heavier than pentane, that may contain sulphur compounds and that, in its natural occurring viscous state, is not recoverable at a commercial rate through a well." Energy Information Administration, online at: http://www.eia.doe.gov/glossary/glossarLb.htm .] This pipeline would roughly double the quantity of tar sands fuel currently being imported, and in conjunction with two previously permitted tar sands pipelines that are not yet in full operation-Keystone and Alberta Clipper-would more than triple the quantity of tar sands fuel imported to the United States. ⁴ [4 In 2009, the United States imported approximately 950,000 bpd of tar sands oil. CERA, The Role of Canadian Oil Sands in US Oil Supply, 9 (2010). Keystone will carry up to 590,000 bpd of bitumen, and Alberta Clipper will carry up to 800,000 bpd. Department of State, Keystone Pipeline Project (online at: http://www.keystonepipeline.state.gov/clientsite/keystone.nsf?Open); Enbridge, Alberta Clipper, online at: http://www.enbridge-expansion.com/expansion/main.aspx?id=1218 .] The cumulative effect of the three tar sands pipelines would be to increase tar sands imports to over 3 million barrels per day. U.S. refineries will invest billions of dollars	See Consolidated Responses P&N-1, GHG-2, and P&N-3.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					more in refinery upgrades and expansions to process the bitumen transported by the pipeline. ⁵ [5 E.g., the Motiva refinery, owned by Royal Dutch Shell and Saudi Aramco, is undertaking a \$7 billion project to double capacity to 600,000 bpd and allow processing of heavier crudes. In Texas. Oil Sands Firms Fight for Their Share, The Globe and Mail (Nov. 6,2009): The draft EIS cites multiple planned refinery expansions'and upgrades in the Gulf Coastto increase bitumen and heavy oil refining capacity. Dept. of State, DEIS at 1-6.] From the Gulf Coast, the refined product could be marketed throughout the United States.	
1468	4	Waxman	Henry	US Congress, Committee on Energy and Commerce	Producing fuel from tar sands causes significant environmental harm. Extracting tar sands bitumen and upgrading it to synthetic crude oil produces roughly three times greater greenhouse gas emissions than producing conventional oil on a per unit basis. ⁶ [6 Woyndlowicz et al., Oil Sands Fever, Pembina Institute, 22 (Nov. 2005).] Tar sands development also has devastating effects on boreal forests and wetlands, wildlife habitat, migratory bird species, water quality, and air quality. ⁷ [7 Id. at :36-52.] Yet the draft EIS for the Keystone XL decision fails to consider the primary environmental concern associated with the project. The draft EIS contains no analysis of the potential greenhouse gas impacts of the pipeline due to increased development of the tar sands. Nor does it address any of the other significant environmental effects from tar sands development that occur in Canada, such as destruction of the boreal forest ecosystem, extensive water pollution, air pollution, habitat loss, and effects on species, including migratory birds.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project. Consolidated Response ENV-4 addresses issues related to oil sands production and migratory birds. Consolidated Response GHG-1 addresses GHG life-cycle analyses. Consolidated Response GHG-2 addresses the potential causal connection of implementation of the proposed Project and expanded oil sands production in Alberta and increases in refining.
1468	6	Waxman	Henry	US Congress, Committee on Energy and Commerce	I am concerned that this project would undermine the Administration's energy policy for America. President Obama has announced a "broader strategy that will move us from an economy that runs on fossil fuels and foreign oil to one that relies more on homegrown fuels and clean energy," and he has stated that "for the sake of our planet and our energy independence, we need to begin the transition to cleaner fuels now.,,16 [16President Obama, Remarks by The President on Energy Security at Andrews Air Force Base (March 31, 2010).] Yet this project would drive massive new investments in infrastructure to supply energy that is dirtier than what we use now. The combined effect of the three tar sands pipelines would be to erase roughly twothirds of the global warming pollution reductions that the Administration's historic motor vehicle standards would achieve in 2020. ¹⁷ [17 See Environmental Protection Agency and Dept. of Transportation, Light-Duty Vehicle Greenhouse Gas Emission Standards and Corporate Average Fuel Economy Standards; Final Rule, Table III.F.1-1, (May 7 2010) (online at www.epa.gov/otaq/climate/regulations.htm).]	Consolidated Response OIL-4 addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils. Consolidated Response GHG-1 addresses the greenhouse gas life-cycle analyses presented in the revised EIS
1468	12	Waxman	Henry	US Congress, Committee on Energy and Commerce	Canada faces a serious challenge in addressing its greenhouse gas emissions, and tar sands are the single biggest part of the problem going forward. There is little basis for assuming that this problem will be effectively addressed while the United States supports increased production by	Consolidated Response GHG-2 addresses the potential causal connection of implementation of the proposed Project and expanded oil sands production in Canada and increases in refining. Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1,

					further expanding market access for tar sands fuel. In fact, by approving this pipeline at this time, the State Department would be giving up leverage to encourage Canada to adopt policies to reduce greenhouse gas emissions and implement technologies to reduce emissions from tar sands production.	including information regarding development of oil sands projects with and without the proposed Project.
1468	15	Waxman	Henry	US Congress, Committee on Energy and Commerce	The State Department's position is legally highly vulnerable and it does not make sense. NEP A is a procedural statute that imposes no substantive requirements. As the Supreme Court has stated, the "twin aims" of NEPA are to oblige agencies "to consider every significant aspect of the environmental impact of a proposed action," and to "ensure that the agency will inform the public that it has indeed considered environmental concerns in its decision making process. [32 Bait. Gas & Elec. Co. v. Natural Res. Def. Council, Inc., 462 U.S. 87, 97, 103 S.Ct. 2246 (1983) (quoting Vt. Yankee Nuclear Power Corp. v. Natural Res. Def. Council, Inc., 435 U.S. 519,553,98 S.Ct. 1197 (1978).] The whole purpose of NEPA is to ensure that federal agencies understand the potential environmental consequences of a proposed government action and consider alternatives that would avoid or minimize such consequences. That purpose cannot be fulfilled here absent a detailed analysis of the full global warming impacts of the Keystone XL project.	Consolidated Response GHG-1 addresses the greenhouse gas life-cycle analyses presented in the revised EIS.
1468	16	Waxman	Henry	US Congress, Committee on Energy and Commerce	In addition, this failure cannot be corrected simply by adding information on the potential greenhouse gas emissions effects in the final EIS. That approach would effectively deny the opportunity for public comment on the analysis of the primary environmental concern associated with the project. The State Department should ask EPA, in consultation with the Department of Energy, to provide an estimate for lifecycle emissions for tar sands. The State Department should then issue a supplement to the draft EIS that would allow for public comment on the estimate and an associated analysis of the full trans boundary environmental effects of the Keystone XL project. The discussion of global warming impacts in the supplemental draft EIS should also be informed by and consistent with final CEQ guidance on addressing climate change under NEP A. 33 [33• CEQ has issued draft guidance for considering the effects of climate change under NEP A, but has not yet finalized that guidance. Nancy H. Subtly, Chair, CEQ, Memorandum for Heads of Federal Departments and Agencies; Draft NEP A Guidance on Consideration of the Effects of Climate Change and Greenhouse Gas Emissions (Feb. 18,2010).]	Consolidated Response GHG-1 addresses the greenhouse gas life-cycle analyses presented in the revised EIS. Consolidated Response GHG-5 explains that the DOS assessment of GHG emissions was conducted in accordance with CEQ guidance.
1468	17	Waxman	Henry	US Congress, Committee on Energy and Commerce	The draft EIS also asserts that the Keystone XL project will not have any emissions effects associated with tar sands development because the tar sands will be developed (apparently to the same extent and within the same timeframe) with or without the pipeline. ³⁴ [34 See Dept. of State, DEIS at 3.14-41, 4-2 to 4-4.] The draft EIS states that if the pipeline is not available, the tar sands bitumen will likely be moved to market other ways, and if the U.S. market is not available, it will be sold to countries other than the United States, such as China. The draft states that the oil would be	Section 4.1 of the EIS and the report by EnSys Energy & Systems, Inc. presented in Appendix V of the EIS provide information on projects that have been proposed, announced, or are likely to be proposed in the future to transport crude oil or raw bitumen from the oil sands area of Canada. The proponents of those potential projects have apparently determined that the projects would be both economically and legally viable.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					transported by a pipeline, which would have to be built, to a port on the Canadian coast and then moved by tanker. ³⁵ [35 Id. at 4-4.] The draft adds that if no Canadian port currently has sufficient capacity to handle the crude, a port would be expanded or built. ³⁶ [36 Id.] The draft EIS provides no analysis of the economic or legal viability of these scenarios and no support for its assertions.	
1468	19	Waxman	Henry	US Congress, Committee on Energy and Commerce	Moreover, it is widely recognized that the pace and extent of tar sands development is affected by the price of oil and the costs of extracting, transporting, and upgrading tar sands bitumen. In the absence of the Keystone XL pipeline, there are no currently available alternatives for moving this large additional quantity of production to market, and at a minimum any such alternatives would be expected to have higher costs. The assumption in the draft EIS that tar sands production rates will be unaffected by the cost and availability of transport to market violates fundamental economic principles, and they are simply not credible.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information on current and future production.
1468	20	Waxman	Henry	US Congress, Committee on Energy and Commerce	There also is substantial evidence that the pipeline may produce excess capacity, at least for a period of time until production is increased to utilize the available transport. Several oil companies operating in the tar sands oppose the Keystone XL proposal on the grounds that it will result in pipeline overcapacity for tar sands exports, raising the costs for transport on existing pipelines (this is due to the structure of existing contracts, which guarantee pipeline operators certain rates of return independent of the quantities being transported). ³⁹ [39 See Enbridge warns o/pipeline overcapacity, Globe and Mail (Dec. 18, 2009); Oil sands awash in excess pipeline capacity, Globe and Mail (Apr. 23, 2010); Pipeline/ees revolt widens, Globe and Mail (Apr. 27, 2010); National Energy Board, Reasons/or Decision In the Matter of TransCanada Keystone Pipeline Ltd., 27-28 (Mar. 2010).] It is critical that the State Department carefully and critically examine claims of need for this quantity of additional capacity at this time. The Department should consider, in particular, the effect of recent approvals of two pipelines that provide 1.4 million bpd of new capacity and are just starting operations.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information on current and future production.
1468	21	Waxman	Henry	US Congress, Committee on Energy and Commerce	The Department must also fundamentally reevaluate assumptions in the draft EIS about U.S. oil demand in light of recent policy changes and updated EIA forecasts. The draft EIS states, without support, that "U.S. demand for petroleum products has increased and is likely to continue increasing for the foreseeable future... ⁴⁰ [40 Dept. of State, D EIS at 4-2.] In fact, U.S. petroleum demand fell in 2008 and 2009, and EIA now projects that, absent further changes in fuel economy standards, demand is projected to grow by only 1.2% total over the next 25 years. ⁴¹ [41 Relative to 2008 levels. Energy Information Agency, Annual Energy Outlook 2010 (May 11, 2010) (online at www.eia.doe.gov/oiaf/aero/index.html)] Assuming that further improvements in fuel economy standards are adopted, as President Obama recently announced, EIA projects that U.S. petroleum demand in 2035	Consolidated Response P&N-1 addresses the need for the proposed Project. As noted in that response, the Project has been proposed to meet the heavy crude oil needs of refineries in the Gulf Coast area, not for the U.S. in general. In addition, the response provides information from a report prepared under contract to the US DOE regarding development of oil sands projects with and without the proposed Project, including consideration of EPA policy changes and alternative energy sources. Consolidated Response ALT-2 addresses the use of alternative technologies, alternative energy sources, and conservation of energy. Section 4.0 addresses alternatives to the proposed project including alternative energy sources and energy conservation (see Section 4.1).

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					will actually be 1.4% below 2008 levels. ⁴² [42 See id. and President Obama Directs Administration to Create First-Ever National Efficiency and Emissions Standards/or Medium- and Heavy-Duty Trucks (May 21, 2010) (online at www.whitehouse.gov/the-press-office/president-obama-directs-administrationcreate-first-ever-national-efficiency-and-em)] While considerations related to changing sources of supply are valid, it is not correct to assume that overall demand is increasing and that there is no alternative to this pipeline for meeting such demand. To the contrary, recent modeling by EPA shows that adoption of clean energy policies for the transportation sector could allow significant further reductions in future U.S. demand for oil in the range of 25-40 percent by 2030. ⁴³ [43 Environmental Protection Agency, EPA Analysis of the Transportation Sector: Greenhouse Gas and Oil Reduction Scenarios (Feb. 10, 2010) (online at: http://www.epa.gov/oms/climate/GHGtransportation-analysis03-18-2010.pdf)] Yet the draft EIS provides no analysis of demand-side alternatives that could address our transportation needs and enhance our national security at a net savings to consumers.	
1468	22	Waxman	Henry	US Congress, Committee on Energy and Commerce	In addition, in weighing needs for domestic U.S. consumption, the Department should analyze to what extent Gulf Coast refineries may export refined tar sands products to other countries. I urge the Department to address these concerns by issuing a supplemental EIS that addresses all the significant environmental impacts of this project and viable alternatives, and by allowing an adequate time for public comment on the supplemental EIS. At a time when another federal agency is being publicly excoriated for short changing the NEP A process in a rush to permit oil wells, it would be unfortunate for the State Department not to consider fully the ramifications of this project on our country's energy and environmental future. Thank you for your consideration of these comments.	Consolidated Response P&N-1 addresses the need that the Project has been proposed to meet, including information on crude oil supply and demand from an analysis specific to the proposed Project. Consolidated Response P&N-2 provides information on the export of refined product from Gulf Coast refineries as well as exporting WCSB crude oil from the Gulf Coast. Consolidated Response P&N-6 addresses requests for a supplemental draft EIS.
188	1	Weber	Chuck	SPX Corporation	As General Manager of a US-company and supplier to the oil and gas industry, I am writing in support of TransCanada's Keystone XL crude oil pipeline project and urge the department to continue processing this application and to grant a permit for the pipeline.	Comment acknowledged.
188	2	Weber	Chuck	SPX Corporation	Pipelines are a safe, reliable, economical and environmentally favorable way to transport oil and petroleum products, as well as other energy liquids, throughout the U.S. America depends on the more than 168,000 miles of liquid pipelines to move energy and raw materials and most of the US and Canada pipelines have M&J gate valves manufactured in Houston, Texas, an SPX company.	Comment acknowledged.
188	3	Weber	Chuck	SPX Corporation	This project stands to provide a powerful private sector economic stimulus. During construction, Keystone XL will create more than 13,000 jobs funded with private investment. In addition, local governments will have a steady source of income from economic activity associated with construction and from property taxes the pipeline company will pay. SPX is an important supplier to Keystone XL of pipeline gate valves and control skid systems. We have worked with TransCanada	Consolidated Response ECO-1 addresses potential socioeconomic impacts, and Consolidated Response TAX-1 addresses concerns regarding taxes.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					on similar projects over the years and are confident of not only the quality and safety of our products but also the quality and safety of pipelines built and managed by TransCanada.	
188	4	Weber	Chuck	SPX Corporation	Further delays would sacrifice the significant economic benefits this project stands to deliver and force U.S. consumers to rely on other sources of crude oil not economically and politically allied with U.S. interests. I believe this would be a mistake and I urge the continued processing and granting of the permit. Thank you for the opportunity to comment.	Consolidated Response ECO-1 addresses potential socioeconomic impacts associated with construction and normal operation of the proposed Project.
417	1	Webster	Terry		We need this pipeline and the process should be expedited.	Consolidated Response ENR-1 provides information on the Department of State's environmental review process, the National Interest Determination process, and the need to complete those reviews before approving or denying the Presidential permit for the proposed Project.
1191	1	Webster	James		I am in total support of strict and comprehensive safety regulations be put in place related to this new pipeline, but also other existing ones.	As described in Consolidated Response SAF-1, the Pipeline and Hazardous Materials Safety Administration (PHMSA) has regulatory requirements that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project in a manner that protects the health and safety of the public and the environment. In addition, PHMSA developed 57 Project-specific Special Conditions that Keystone has agreed to implement. Incorporation of those conditions would result in a Project that would have a degree of safety over any other typically constructed domestic oil pipeline system under current code and a degree of safety along the entire length of the pipeline system similar to that which is required in HCAs as defined in 49 CFR 195.450.
1191	2	Webster	James		As evidenced by the gulf spill, tragedy can strike at any time and we now know there are not sufficient safeguards in place to protect our resources, due to lack oversight in the past. Please get tough on these oil company developments.	Consolidated Response SAF-1 describes the regulatory requirements that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project. It also describes the inspections and reviews of the proposed Project that the Pipeline and Hazardous Materials Safety Administration would conduct to ensure compliance with those regulatory requirements.
718	2	Wegner	Jaime		I do not want to face the possibility of an oil spill tainting our aquifer.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
1108	1	Wegnergrand@aol.com			I hope you will back up your "Concern" with action. Do not make this into an anti administration issue. This is about the oil industry getting everything it wants from a series of republicans as well as democrats. This is a chance for common sense bipartisanship.	The commenter's opinion is noted.
1108	2	Wegnergrand@aol.com			The Ogallala Aquifer is Nebraska's greatest blessing and needs to be protected. In the future clean water is much more valuable than any amount of oil.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
164	1	Weihe	Phyllis		This is perhaps the STUPIDOUS thing our "wonderful" government has come up with EVER!!!! Do the so-called powers that be have any idea of what the Sandhills land is like??? Do they really give a damn except at voting time??? This monstrosity will damage the aquifer for centuries, if not forever, period. DOES OUR WONDERFUL GOVERNMENT	DOS is not the proponent of the proposed Project. As noted in Consolidated Response ENR-1, DOS is conducting an environmental review of the proposed Project and will make a determination of national interest regarding the proposed Project. Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					<p>GIVE A DAMN???? ARE YOU SO STUPID THAT YOU TRUST THE OIL COMPANIES???? HASN'T THE GULF DISASTER TAUGHT YOU ANYTHING WHATSOEVER???? YOU - THE PRESENT ADMINISTRATION - WILL GO DOWN IN HISTORY JUST LIKE THE MAN THAT SHOT LINCOLN, LIKE LEE HARVEY OSWALD, ETC. YOU WILL LOOK LIKE A POOR EXCUSE FOR A SO-CALLED "GOVERNMENT SERVANT" - SOMEONE PAID BY THE TAXPAYERS TO DO GOOD, NOT GARBAGE!!!!</p> <p>GET THE MESSAGE?????</p> <p>I am afraid this country is going to Hell in a handbasket. There is stpidity and greed everywhere. What a world we are handing to our children and grandchildren. Right now I'm sorry I ever had children to live in this world. Think about it!!!!!!!</p> <p>Angry and Disappointed Taxpayer</p>	Issues related to the Sand Hills area are addressed in Consolidated Response ERO-1.
942	1	Weinberg	Candace		Please deny the Presidential Permit to pipe toxic TAR SANDS from Canada to Texas. Thank you.	Consolidated Response OIL-4 addresses the composition of the Canadian crude oil that would be transported by the proposed Project, including concerns relative to the corrosivity and erosivity of the crude oil. As noted in that Consolidated Response, that crude oil is similar in composition and properties to other heavy crude oils that are currently transported within the U.S. pipeline system and similar in composition and properties to other heavy crude oils that are currently refined in PADD III.
371	1	Welch	Rae		Are you serious? In your wildeyed grab for money at any cost to the general population for decades to come, you would really risk destroying the Nebraska ranchlands, sandhills and the Ogallala aquifer that provides water to other states as well?	Consolidated Response ENR-1 provides information on the Department of State (DOS) environmental review process, the National Interest Determination process, and the need to complete those reviews before approving or denying the Presidential permit for the proposed Project. As noted in that response, DOS is neither a proponent nor an opponent of the proposed Project.
371	2	Welch	Rae		Can you imagine the lawsuits by these other states if there is oil in their water? Have the Canadian Oil Barons perhaps filled some campaign coffers as other oil companies did with MMS?	Consolidated Response LIA-1 addresses Keystone's liability if there is a spill of hazardous materials or fuel during construction or a spill of crude oil from the proposed Project.
371	5	Welch	Rae		Don't point fingers at someone else, the ball is in your court. You were voted in to be a steward of your state and to protect it's citizens from such mindless projects as this. Do your job.	Consolidated Response ENR-1 provides information on the Department of State (DOS) environmental review process, the National Interest Determination process, and the need to complete those reviews before approving or denying the Presidential permit for the proposed Project. As noted in that response, DOS is neither a proponent nor an opponent of the proposed Project.
1544	147	Wells	Charlotte	Water Keeper Alliance	Concern about the tar sands projects.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project.
1544	148	Wells	Charlotte	Water Keeper Alliance	Concern about wetland loss relating to the project.	Keystone will follow the Construction, Mitigation, and Reclamation Plan (Appendix B of the EIS) for construction through wetlands under a U.S. Army Corps of Engineers (USACE) Section 404 Nationwide Permit. Keystone has used the cited guidelines to avoid and minimize Proposed Project impacts to wetlands. Keystone will follow any conditions for

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
						monitoring and compensatory mitigation issued with the Nationwide Permits issued by each USACE District Office.
1544	149	Wells	Charlotte	Water Keeper Alliance	Concern about water quality along the pipeline route, in Canada and in Houston.	Water quality issues along the proposed route in the U.S. are addressed in Section 3.3 of the EIS. Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project.
1544	150	Wells	Charlotte	Water Keeper Alliance	Concern about clean drinking water.	Water quality issues along the proposed route in the U.S. are addressed in Section 3.3 of the EIS.
1544	151	Wells	Charlotte	Water Keeper Alliance	I am opposed to this project.	Comment acknowledged.
1544	153	Wells	Charlotte	Water Keeper Alliance	The public is not truly involved in the process of the EIS. The people that will be impacted by this pipeline are mostly unaware of the project. They aren't concerned and they won't be concerned until we have a disaster like in the Gulf, or their drinking water is affected. We have to figure out a way to get the public involved in these kinds of projects, so that they know and they can comment.	Consolidated Response CMT-3 discusses how DOS conducted an extensive public scoping and comment process that included public meetings, opportunities to provide comment at public meetings or in writing by letter, fax, email or on a website.
1544	154	Wells	Charlotte	Water Keeper Alliance	Concern over the submitted public comments not being properly addressed in final documents in projects such as Keystone XL.	Each of the substantive comments received by DOS will be responded to in the final EIS and the EIS will be revised in response to comments where appropriate.
1544	156	Wells	Charlotte	Water Keeper Alliance	There are too few people and too many projects for effective enforcement. We must have enforcement of these projects.	Consolidated Response SAF-1 describes the regulatory requirements that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project. It also describes the inspections and reviews of the proposed Project that the Pipeline and Hazardous Materials Safety Administration would conduct to ensure compliance with those regulatory requirements.
1544	157	Wells	Charlotte	Water Keeper Alliance	We need to wait and not permit things like this until we have made sure they are safe for our communities.	As described in Consolidated Response SAF-1, the Pipeline and Hazardous Materials Safety Administration (PHMSA) has regulatory requirements that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project. In addition, PHMSA developed 57 Project-specific Special Conditions that Keystone has agreed to implement. Incorporation of those conditions would result in a Project that would have a degree of safety over any other typically constructed domestic oil pipeline system under current code and a degree of safety along the entire length of the pipeline system similar to that which is required in HCAs as defined in 49 CFR 195.450. Consolidated Response SAF-1 also describes the inspections and reviews of the proposed Project that PHMSA would conduct to ensure compliance with those regulatory requirements.
589	1	Welsch	Mark		Please do not allow this pipeline to be built through the largest amount of fresh water in the United States, the Ogallala Aquifer. I have read that it will leak, it is just a question of where, when and how much. When this pipe leaks it is likely to contaminate a large amount of fresh water that is used for agriculture and people's drinking water.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. Consolidated Response OIL-1 addresses the likelihood of spills from the Project.
589	3	Welsch	Mark		We should not allow it to be built because the source of the oil to be in the pipe is from tar sands in Canada. There is only	Consolidated Response OIL-4 addresses the composition of the Canadian crude oil that would be transported by the

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					dirty energy in the world that tar sands, and that is coal. The tar sands should be stopped to protect our environment. More time, energy and money should be spent on renewable energy sources.	proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils. Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project. Consolidated Response P&N-5 addresses issues related to investments in other technologies.
467	1	Wertz	Sarah		While energy is a very important concern to our country's security and well-being, I am against the Keystone XL pipeline expansion, proposed to be built across one of America's greatest underground treasures -- the clean groundwater of the Ogallala Aquifer, as well as the unimaginable beauty of the Nebraska Sandhills. My ancestors emigrated from small German towns in Russia in the early 20th century to make Lincoln, Nebraska their home. As an elementary student in Lincoln, almost 100 years after my ancestors arrived, I vividly remember attending the Children's Groundwater Festival in Grand Island, an educational event dedicated to promoting stewardship of resources among the next generation. Learning about this precious resource when I was a fourth grader is an opportunity I want all Nebraska elementary students to have. When a situation as unexpected and utterly dire as the Gulf Oil Spill happens in the Nebraska Sandhills, how do you tell a fourth grade student that the nation's largest source of clean groundwater is now contaminated by petroleum products? Do you explain that this spill is due to their parent's generation's lust for energy and unwillingness to find clean energy alternatives? Do you take them out to the Sandhills to tell them what beautiful and ecologically valuable landscape was, before their parents willingly sacrificed it for a giant industrial footprint and contaminated soil? Our nation's current human and capital resources would be better spent finding alternative, renewable, energy sources so that we may give what is left of Earth's generous gifts to our children. I strongly urge you to stop the proposed Keystone XL Pipeline, and promote stewardship of America's greatest resource, clean groundwater. Thank You for taking my stance into serious consideration. I know many more fellow Nebraskans who feel as strongly as I on this issue.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. Issues related to the Sand Hills area are addressed in Consolidated Response ERO-1.
988	3	Wertz	Tom		If going the cheaper route of using thin pipe and high pressures turns out to be a bad decision, then how is the aquifer going to be cleaned? It will not. Let's stop cutting corners now just to put more money in the hands of big oil!	Keystone has withdrawn its application for a Special Permit as described in Consolidated Response REG-1. Consolidated Response AQF-3 provides information on hypothetical spills from the Project over two areas of the Northern High Plains Aquifer System and also addresses response actions.
1510	1	Wesen	Darcel&Curtis		We support TransCanada's Keystone XL crude oil pipeline project and urge the Department to grant a permit for the pipeline. This project is a vital link to secure energy supplies for the United States. According to the U.S. Energy Information Administration, oil and natural gas will continue to supply over 50 percent of U.S. energy needs in 2030. Canada is a valued trading partner, neighbor to Montana and our most reliable supplier of foreign-based crude oil. The Keystone project will have the added benefit of potential links to growing	Comment acknowledged.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					domestic supplies of crude oil in Montana and North and South Dakota. The environmental benefits of Keystone XL should not be overlooked. The current tragedy in the Gulf underscores the importance of a diverse portfolio of energy supplies. Within the spectrum of viable options, it is appropriate to seek a growing role for oil resources that are:• land-based;• North American; and,• Transported by pipeline:This project meets each of these criteria.Securing stable and affordable energy from our North American allies through projects such as the Keystone pipeline is in the national interest. Considering the economic and energy security benefits of these vital resource we should continue to expand America's access to safe, affordable energy to help ensure improved domestic and global energy security and stable prices for consumers.	
1510	2	Wesen	Darcel&Curtis		This project can provide a powerful private sector economic stimulus for Eastern Montana and other areas it will pass through. During construction, Keystone XL will create more than 13,000 jobs funded with private investment. In addition, local governments will have a steady source of income from economic activity associated with construction and from property taxes the pipeline company will pay. Rejection of the permit or suspension of the review would sacrifice the significant economic benefits this project stands to deliver and force U.S. consumers to rely on other sources of crude oil not economically and politically allied with U.S. interests. This would be a mistake. We urge the granting of the permit. Thank you for the opportunity to comment.	Consolidated Response ECO-1 addresses potential socioeconomic impacts, and Consolidated Response TAX-1 addresses concerns regarding taxes.
1546	147	Whatley	Michael	Consumer Energy Alliance	Pipeline will create hundreds of high paying jobs.	Consolidated Response ECO-1 and Section 3.10.2.2 of the EIS address the potential socioeconomic impacts of the proposed Project.
1546	149	Whatley	Michael	Consumer Energy Alliance	Agrees with the State Dept. that the environmental analysis for the pipeline should not include life cycle GHG analysis of the fuels that it will move.	Consolidated Response GHG-1 addresses the greenhouse gas life-cycle analyses presented in the revised EIS.
1546	150	Whatley	Michael	Consumer Energy Alliance	Despite efforts to develop alternatives, crude oil will remain a critical component of meeting America's energy needs for the foreseeable future. Ensuring access to an affordable, reliable energy...provides an economic and energy security benefit and should be a national priority.	Consolidated Response ALT-2 addresses the use of alternative technologies, alternative energy sources, and conservation of energy.
594	1	White	Debbi		The Ogallala Aquifer is too valuable a resource and too vital to the Midwest to take chances such as this pipeline. Keep this pipeline away from the Nebraska Sand Hills. Oil companies may tout safe and clean technologies but the record reflects much different results.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
1277	1	White	Jerry		I recognize the need for our nations oil supply, however I strongly feel that the Proposed Keystone XL project be delayed until strict regulations are enacted to ensure long term protection in event a leak occurs.	The Project need is described in Consolidated Response P&N-1. Regulations are in place for oil pipelines, including for response plans for spills. Consolidated Response SAF-1 describes the regulatory requirements that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project in a manner that protects the health and safety of the public and the environment. Consolidated Response RES-1 addresses issues related to preparation and review of the Emergency Response Plan for

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
						the proposed Project.
1277	2	White	Jerry		Deny all waivers to operate Pipeline & Hazardous Materials Safety Administration (PHMSA is a part of U. S. Department of Transportation) requirement that transporting oil not operate at more than 72% of Maximum Operating Pressure. The waiver allows the use of thinner steel resulting in 80% of Maximum Operating Pressure thus increasing likely hood of possible leakage. This recommendation was included in Northern Plains Resource Council (www.northernplains.org) "Lessons and Recommendations to Improve Safety" directed to landowners and county officials regarding the Keystone XL project. The waiver refers to using the thinner pipe "in areas not designated as High Consequence" which is defined as having a population of 50,000 or more people or a density of 1,000 people per square mile. This does not allow consideration for environmental impact on soil or UNDERGROUND WATER needs in rural areas.	Keystone has withdrawn its application for a Special Permit as described in Consolidated Response REG-1. As described in Consolidated Response SAF-1, the Pipeline and Hazardous Materials Safety Administration (PHMSA) has regulatory requirements that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project in a manner that protects the health and safety of the public and the environment. In addition, PHMSA developed 57 Project-specific Special Conditions that Keystone has agreed to implement. Incorporation of those conditions would result in a Project that would have a degree of safety over any other typically constructed domestic oil pipeline system under current code and a degree of safety along the entire length of the pipeline system similar to that which is required in HCAs as defined in 49 CFR 195.450.
1277	3	White	Jerry		Additional requirements for long term safety should include double walled piping (a transporting steel pipe within a second plastic pipe. Again from the Northern Plains Resource Council recommendation "studies of major Canadian pipeline ruptures have found that during the first 10 years of operation stress cracking was the most common cause 2 of pipeline ruptures. The double wall would allow for containment as well as providing observation of leaking areas. During the second 10 years of operation external corrosion was the most common cause of pipeline rupture, thus the outer plastic piping would protect the outer wall of the steel transporting pipe.	Keystone would be required to comply with the regulatory requirements of the Pipeline and Hazardous Materials Safety Administration (PHMSA) as described in Consolidated Response SAF-1 and Section 3.13.1.1 of the EIS. Those regulations do not require double-walled pipe. The PHMSA regulatory requirements in 49 CFR 195 and in the Project-specific Special Conditions developed by Keystone address corrosion prevention, monitoring, and pipeline repair if corrosion is detected.
1277	4	White	Jerry		TransCanada proposes the use of cathodic protection to reduce (not eliminate) external corrosion rate by requiring a DC voltage be applied to the pipeline. Protection is lost if voltage fails (as observed by the Nebraska State Fire Marshal when testing existing cathodic systems). Additionally this will cause buried metal pipes and water well casings on property adjacent to the pipeline to corrode rapidly depending on the distance from the pipeline. "A buried water pipe that is within 100 feet of the pipeline will be destroyed in less than a year" Using the outer plastic piping would eliminate any current or future risk by others.	Keystone would be required to comply with the regulatory requirements of the Pipeline and Hazardous Materials Safety Administration as described in Consolidated Response SAF-1 and Section 3.13.1.1 of the EIS. Those regulations include consideration of the effects of the cathodic protection (CP) system on metal structures in the vicinity of the pipeline as well the potential effects of metal structures in the vicinity of the CP system on the CP system.
1277	5	White	Jerry		Nebraska already allows the use of double walled piping &/or storage of oil and other hazardous liquids and it would seem that such a requirement on highly pressurized piping systems would be a minimum requirement for long term protection.	Keystone would be required to comply with the regulatory requirements of the Pipeline and Hazardous Materials Safety Administration (PHMSA) as described in Consolidated Response SAF-1 and Section 3.13.1.1 of the EIS. Those regulations do not require double-walled pipe.
1277	6	White	Jerry		Because this proposed project will cross into the United States from Canada, a Presidential Permit issued by the U.S. Department of State is required for the project to proceed, I ask you to Please, PLEASE consider helping delay this project and implement additional safety requirements for pipeline construction as it is obvious we can no longer trust private industry to expend resources for the purpose of ensuring public safety and environmental protection!	Construction and operation of the Project would not "trust private industry" but would require compliance with federal regulations. As described in Consolidated Response SAF-1, the Pipeline and Hazardous Materials Safety Administration (PHMSA) has regulatory requirements that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project in a manner that protects the health and safety of the public and the environment. In addition, PHMSA developed 57 Project-specific Special Conditions that Keystone has agreed to implement.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
						Incorporation of those conditions would result in a Project that would have a degree of safety over any other typically constructed domestic oil pipeline system under current code and a degree of safety along the entire length of the pipeline system similar to that which is required in HCAs as defined in 49 CFR 195.450. It also describes the inspections and reviews of the proposed Project that the Pipeline and Hazardous Materials Safety Administration would conduct to ensure compliance with those regulatory requirements.
950	1	White,Jr	Loren		The Department of State should not give permits for pipelines importing the world's dirtiest fuel while the rest of the country fights to prevent catastrophic climate change. Tar sands will increase our transportation emissions, counteract existing efforts to fight global warming, and undermine U.S. energy independence by continuing our dependence on foreign oil.	Consolidated Response OIL-4 addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils. Consolidated Response GHG-2 addresses the potential causal connection of implementation of the proposed Project and expanded oil sands production in Canada and increases in refining. Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project. Consolidated Response P&N-1 addresses the need that the Project has been proposed to meet.
950	2	White,Jr	Loren		By expanding the U.S. market for tar sands oil, this pipeline will increase air pollution at American refineries and spur further expansion of the tar sands industry in Canada, an industry that has caused severe water and air contamination and destroyed hundreds of square miles of wetlands and forest. The very process requires massive deforestation, tremendous amounts of fresh water, and leaves behind toxic and cancer-causing chemicals, including benzene, cyanide, arsenic, and mercury in its midst.	Consolidated Response OIL-4 also addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils being processed in Gulf Coast refineries. As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries. Consolidated Response GHG-2 addresses the potential causal connection of implementation of the proposed Project and expanded oil sands production in Canada and increases in refining. Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project.
950	3	White,Jr	Loren		As a result Canada's tar sands is also having a devastating impact on the area's indigenous First Nations people. A recent study confirms that there are elevated levels of rare and other cancers among indigenous residents who live directly downstream from the tar sands activity, and that the contamination of the waters, snow, vegetation, wildlife and fish has grown exponentially in the past years.	Consolidated Response CAN-1 and Section 3.14.4 of the EIS address issues related to development of oil sands projects in Canada.
950	4	White,Jr	Loren		Also by allowing this the Canadian federal government will continue to fail to recognize Aboriginal Treaty 8 and 6 obligations of the concerns of the First Nations pertaining to the treaty and human rights abuses, the human and ecological health crisis, the climate change impacts, the damages to water and air quality and the recognition of First Nations sovereign rights to implement their own environmental and	Consolidated Response CAN-1 and Section 3.14.4 of the EIS address issues related to development of oil sands projects in Canada.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					health infrastructure to regulate and enforce their own laws within their lands and territories.	
950	5	White,Jr	Loren		Tying our future to toxic tar sands will never be in our national interest. Please consider the true impact of this pipeline by including the devastating effects of mining, refining, and burning this fuel when you make your decision. I am asking you to fulfill your role as protector of our country and say no to tar sands. At a time like this, the country needs investment in clean, renewable energy sources. We cannot afford to increase our emissions any further or invest in anything that will keep us hooked on dangerous fossil fuels for years to come.	Consolidated Response P&N-1 addresses the need that the Project has been proposed to meet. Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1. Consolidated Response P&N-3 addresses issues related to emissions from refineries. Consolidated Response P&N-9 addresses issues related to the National Interest Determination.
321	1	Whiting	Carolee		The pipeline will cross multiple scenic Nebraska rivers that provide habitat and wetlands for both local and migrating wildlife. The Platte River habitat provides the world with one of the most spectacular and populous migration stops for the Sandhill crane and is frequented by the endangered whooping crane.	Most large rivers would be crossed THE horizontal directional drilling method. River banks and channels are protected from disturbance using this method. The proposed Project does not cross rivers within any reaches that have been designated as federal Wild and Scenic Rivers nor does it cross any national parks or forests. Sandhill cranes are listed in Table 3.6.1-1 and whooping cranes are discussed in Section 3.8.1.2. Additional discussion of the identification of sensitive resources for the environmental review are provided in Consolidated Response ENV-1.
321	2	Whiting	Carolee		As the pipeline crosses a large portion of the porous Nebraska Sand Hills it also crosses one of the nation's largest clean water aquifers, the Ogallala Aquifer that is shared with many states. It does not make sense to jeopardize one of our countries most precious resources, fresh water. The potential to pollute this priceless fresh water resource with a tar sand oil spill are not worth the risk. Any risk.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. Consolidated Response OIL-1 addresses the likelihood of spills from the Project.
1271	2	Whitley	Douglas	Illinois Chamber of Commerce	You should know that other pipeline projects that connect the growing sources of crude oil from Canada to the United States have gone through similar review and been approved.	Comment acknowledged.
1271	4	Whitley	Douglas	Illinois Chamber of Commerce	The regulatory process for the KXL pipeline project is being conducted in accordance with the National Environmental Policy Act, which was determined to be of national interest as required under Executive Order 13337.	Comment acknowledged.
1271	6	Whitley	Douglas	Illinois Chamber of Commerce	The Department of State is the lead agency for this project and 11 additional cooperating and 10 assisting agencies, counties and resource districts have been involved in this process. The current process provides a myriad of opportunities for interested parties to comment on the draft Environmental Impact Statement.	Comment acknowledged.
1271	12	Whitley	Douglas	Illinois Chamber of Commerce	In the final paragraph of the letter to Secretary Clinton, it states that "As members of congress, we are bound to protect the national interest of this country and its citizens." I believe this pipeline is in the nation's interest because it secures energy from a friendly, North American country that is interested in being part of the overall solution when it comes to our environment. Therefore, I would ask that you help protect our national interest by retracting your signature from the letter.	Comment acknowledged.
1405	1	Whitley	Colin	Kansas Power	I am Colin Whitley, CEO and General Manager of the Kansas	Consolidated Response ECO-1 addresses potential

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
				Pool	Power Pool, a municipal energy agency in the State of Kansas, with offices located in Wichita. The U.S. Department of State has the opportunity to approve an energy infrastructure project that not only will strengthen long-term energy security, but it also will provide a powerful, private sector economic stimulus to the states and localities along the pipeline route during its construction at a time when the economy continues to struggle. As I understand it, Keystone XL will create more than 13,000 high-wage construction and manufacturing jobs during the project's 2011-2012 construction schedule. It also has come to my attention that the Canadian Energy Research Institute has found that the economic impact of oil sands development is expected to lead to the creation of more than 342,000 new U.S. jobs between 2011 and 2015. CERI's research found that, as oil sands production rises, demand for U.S. goods and services increases significantly, adding an estimated \$34 billion to U.S. gross domestic product in 2015 and \$42.2 billion in 2025. The Kansas Power Pool represents over 40 communities in Kansas. The opportunity provided by Keystone XL's route through Kansas will provide significant economic benefits to my State and particularly the communities that we represent. In particular, the City of Clay Center, Kansas will have the opportunity to increase employment in their region and to improve the cost and reliability of the energy services that currently exist. Other Kansas Power Pool communities such as Winfield, Kansas will experience similar benefits as a result of the infrastructure project. Keystone XL will generate substantial economic benefits for the United States and in states and communities along the proposed route. These are areas where economic performance has stagnated or is shrinking. I recently reviewed a study TransCanada commissioned to measure the project's economic stimulus to the U.S. and the states along the route. The study found that Keystone XL would generate \$20.9 billion in total expenditures, \$9.6 billion in output (gross product), personal income of \$6.5 billion and 118,935 person years of employment (jobs). In addition, the report concluded that during construction, Keystone XL would generate \$486.36 million tax revenue for state governments along the route and \$99.1 million for local taxing entities where the pipeline is located... As the CEO of the Kansas Power Pool, I encourage the Department of State to ... issue a Final Environmental Impact Statement that enables the communities and states along the pipeline route to collect the substantial economic benefits Keystone XL would create.	socioeconomic impacts, and Consolidated Response TAX-1 addresses concerns regarding taxes.
1405	2	Whitley	Colin	Kansas Power Pool	As the CEO of the Kansas Power Pool, I encourage the Department of State to confirm the findings of the Draft Environmental Impact Statement, which found that the proposed Keystone XL Pipeline would have "limited adverse environmental impact during construction and operation," and issue a Final Environmental Impact Statement that enables the communities and states along the pipeline route to collect the substantial economic benefits Keystone XL would create.	Comment acknowledged.
1343	1	Whitman	Thelma		Dear Ms. Orlando: As a resident of St. Marie in Valley County,	Comment acknowledged.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					Montana, I support the Keystone XL Pipeline project, which also incorporates the transmission line to be built by Big Flat Electric Cooperative to serve this load.	
370	3	Whitsitt	Bill	Devon Energy	Construction of additional pipeline facilities such as the KXL Project is critical for the transportation of oil sands production to the vitally important Gulf Coast refineries. These refineries are designed to process heavy crude but have recently experienced a reduction in supplies from their traditional sources, including Mexico, where heavy oil production is in steep decline, and Venezuela, which is targeting markets outside of the United States. These refineries are also strategic to meeting the refined product needs of the Midwest, Southeast and Northeast, United States. Turning to Canada for a secure oil supply is a logical step. In addition, this pipeline system could provide "on-ramp" opportunities for domestic production along its path, thereby eliminating regional infrastructure constraints while providing economical transportation to key markets.	Comment acknowledged.
370	4	Whitsitt	Bill	Devon Energy	The KXL Project will also provide a significant private sector economic stimulus to the states and localities along the pipeline route during its construction. It is estimated KXL will create over 13,000 high-wage construction and manufacturing jobs during the project's 2011 2012 construction schedule. In addition, the Canadian Energy Research Institute (CERI) has found that the economic impact of oil sands development is expected to lead to the creation of more than 342,000 new U.S. jobs between 2011 and 2015. CERI's research revealed that, as oil sands production rises, demand for U.S. goods and services increases significantly, adding an estimated \$34 billion to U.S. gross domestic product in 2015 and \$42.2 billion in 2025.	Consolidated Response ECO-1 addresses potential socioeconomic impacts, and Consolidated Response TAX-1 addresses concerns regarding taxes.
370	5	Whitsitt	Bill	Devon Energy	Completion of the previously permitted Keystone Pipeline does have the potential to create at least a temporary bottleneck for crude oil in Cushing. However, to minimize such a situation, the State Department and other agencies should do everything possible to expedite the permitting and construction of the southern leg of KXL from Cushing, OK, to the Gulf Coast.	Comment acknowledged.
370	6	Whitsitt	Bill	Devon Energy	Devon is a significant producer of oil and natural gas in both the United States and Canada. As such, we understand the importance of the KXL Project to the energy security of the United States. Please accept this letter as support for the Keystone XL Pipeline Project.	Comment acknowledged.
838	1	Wickizer	Eric		We need to use these resources to develop clean energy and jobs in Nebraska not outsource jobs for another pipeline. This is the 21st century, it's about time our energy production caught up with the rest of the developed world.	Consolidated Response P&N-1 addresses the need that the Project has been proposed to meet. Consolidated Response P&N-5 addresses issues related to investments in other technologies. Consolidated Response ECO-1 addresses potential socioeconomic impacts, and Consolidated Response TAX-1 addresses concerns regarding taxes.
968	1	Wiesman	David		Please do not allow the Keystone XL pipeline to be placed near any of the Nebraska aquifers. As a necessary part of Nebraska's (and the United States') clean water sources, this area should not be placed under any type of risk of being	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. Consolidated Response AQF-3 provides information on hypothetical spills from the Project over two areas of the

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					contaminated, as it would be virtually impossible to clean if a leak happened.	Northern High Plains Aquifer System and also addresses response actions. Consolidated Response ALT-1 addresses potential alternative routes, including routes that would avoid much of the Northern High Plains Aquifer system.
968	2	Wiesman	David		Water is and will be more important in the future than this fossil fuel source that could be collected and refined in Canada--in some type of partnership with the U.S.-- and then distributed by methods other than another pipeline.	Consolidated Response P&N-8 addresses issues related to shipping Canadian crude oil to refineries that are closer to the source of oil.
680	1	Wightman	Kathy		I think running the pipeline through the Sandhills anywhere near the aquifer would be one of the worst places possible. The oil company's profits are so obscene, make them reroute the pipeline to protect our natural resources.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. Consolidated Response ALT-1 addresses potential alternative routes, including routes that would avoid much of the Northern High Plains Aquifer system.
686	1	Wilderman	Heather		Office of Environmental Policy Department of State 2201 C Street NW Washington, DC 20520 I am writing regarding the Keystone XL Oil Pipeline that is being evaluated to go through the state of Nebraska. The Department of State will soon rule on this new pipeline and I wanted to express concerns about this going through Nebraska and the U.S. Nebraska's sustainability relies on the underground High Plains/Ogallala water aquifer. Nebraska is an important producer of beef, pork, corn and soybeans, which all rely on water from this aquifer to supply crops and animals with water. A large percentage of the population of the state relies on this aquifer for drinking water, as well as 82 percent of the population within the aquifer region. This High Plains Aquifer, one of the world's largest, stretches through 8 states, North Dakota, South Dakota, Nebraska, Wyoming, Colorado, Oklahoma, New Mexico and Texas, with water depth the deepest in Nebraska. The U.S. Geological Survey conducted a study on the High Plains Regional ground water which stated, "...92 percent of water used in the High Plains is supplied by ground water." The study also stated, "High Plains ground water is used primarily to grow crops for the Nation." The study also showed almost 2 million individuals rely on the aquifer for drinking water. Compromising this aquifer by allowing an oil pipeline to go through it, above it and/or under it could be devastating to the population of Nebraska as well as many other states. Hundreds of thousands, if not millions, of people could instantly lose drinking water. The economic livelihood of a large percentage of people would also be compromised as well as potential food supply for millions. I realize the United States, and people of the United States, rely heavily on oil due to our large oil consumption but I question to what extent we are continually willing to sacrifice land, water, people, food, livestock and other resources of the United States for oil. We are once again possibly witnessing one of the largest man-made environmental disasters from the Gulf oil spill – don't bring more potential devastation directly onto the land of the United States. Our most precious natural resource is not gold, silver or oil – it is water.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. Consolidated Response ALT-1 addresses potential alternative routes, including routes that would avoid much of the Northern High Plains Aquifer system.
694	1	Wilderman	James		I am writing regarding the Keystone XL Oil Pipeline that is being evaluated to go through the state of Nebraska. The Department of State will soon rule on this new pipeline and I	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. 694	2	Wilderman	James		The economic livelihood of a large percentage of people would also be compromised as well as potential food supply for millions. I realize the United States, and people of the United States, rely heavily on oil due to our large oil consumption but I question to what extent we are continually willing to sacrifice land, water, people, food, livestock and other resources of the United States for oil.	The impacts associated with implementation of the proposed Project are addressed in Section 3.0 of the EIS. As noted in that section, construction and normal operation the proposed Project would not result in significant environmental impacts. Section 3.13 of the EIS addresses reliability and safety issues, including calculations of the probability of a spill from the proposed Project and the potential environmental impacts associated with spills. Issues related to the High Plains Aquifer System are addressed in Consolidated Response AQF-1 through AQF-4. Consolidated Response AQF-3 provides information on hypothetical spills from the Project over two areas of the Northern High Plains Aquifer System. As noted in those responses, a spill over the Northern High Plains Aquifer system would not compromise the food supply for millions of people.
694	3	Wilderman	James		We are once again possibly witnessing one of the largest man-made environmental disasters from the Gulf oil spill – don't bring more potential devastation directly onto the land of the United States. Our most precious natural resource is not gold, silver, diamonds or oil – it is water. Do not allow this pipeline to come to Nebraska or the United States.	As described in Consolidated Response GLF-1, the risks associated with the proposed Project are substantially different from those associated with the BP Deepwater Horizon Project. Section 3.13 of the EIS addresses reliability and safety issues, including calculations of the probability of a spill from the proposed Project and the potential environmental impacts associated with spills. Issues related to the Northern High Plains Aquifer System are addressed in Consolidated Responses AQF-1 through AQF-4.
803	1	Wilkin	Garrett		I emphatically urge The Department of State to reject the Keystone XL Pipeline Project. The top reason to reject such a proposal is that our country should not be investing in or promoting further dirty technologies, such as energy production based on oil sands. This method of energy production destroys the land from which the oil is extracted and pollutes the air when it is burned. It also puts our lands at	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project. As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					risk due to the occurrence of future leaks and spills along the pipeline. We need to focus on sustainable industries for energy production.	not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries. Consolidated Response P&N-5 addresses issues related to investments in other technologies.
803	2	Wilkin	Garrett		As this report cites, the pipeline will run through the states which have the highest capacity for energy from wind. This should be the focus of our energy production, and not a side interest as part of a pipeline to pass the dirtiest fuel through more than a 1,000 miles of our country. Please do not dedicate the time and effort of our country to such a backward looking and non-sustainable technology. To be a leader in the world we must look forward into other energy solutions with far less environmental impact.	Consolidated Response ALT-2 addresses the use of alternative technologies and alternative energy sources. Consolidated Responses ENR-1 and P&N-9 provide information on the DOS environmental review process, the National Interest Determination process, and the need to complete those reviews before approving or denying the Presidential permit for the proposed Project.
1430	1	Willett	Tom	Laborers Local 340	Dear Mr. Goldwyn: The Iowa Building Trades Council urges the State Department to proceed without delay to provide the necessary approvals for the Keystone XL pipeline project. This project is necessary for two primary reasons. First, in these difficult economic times, Keystone XL promises to create more than 13,000 high wage construction jobs. These jobs will likely be drawn from, a broad pool of skilled craft workers located throughout the Midwest. It is important for Iowa's union workers.	Consolidated Response ECO-1 and Section 3.10.2.2 of the EIS address the potential socioeconomic impacts of the proposed Project.
1430	2	Willett	Tom	Laborers Local 340	Second, this project is critical to delivering North American crude from Alberta's Oil Sands. It is an energy security issue. Eleven governmental agencies and the State Department have reviewed this project	Comment acknowledged.
780	1	Willgues	Tara		As an American deeply concerned about our country's dependence on oil, I oppose the construction of this pipeline.	Comment acknowledged.
464	1	Williams	Martha		We would hope that you do not allow this pipeline to go through the Sandhills and over the aquifer. The land cannot repair itself and the aquifer is priceless.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. Issues related to the Sand Hills area are addressed in Consolidated Response ERO-1.
635	1	Williams	John&Kathleen		We live on the edge of the Nebraska Sandhills and are vitally aware of how easily an oil leak would pollute the Ogallala Aquifer. We feel that if the pipeline has to cross this area, extreme measures should be taken to assure that a leak could never occur. We would hope officials would see how devastating a leak would be, and find some other route for the pipeline. Someday, the water in the aquifer may be worth more than oil!	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. Consolidated Response ALT-1 addresses potential alternative routes, including routes that would avoid much of the Northern High Plains Aquifer system.
635	2	Williams	John&Kathleen		The Sandhills are a very rare ecosystem.	Identification of sensitive environments crossed by the proposed Project is discussed in Consolidated Response ENV-1 and ENV-3. Issues related to the Sand Hills area are addressed in Consolidated Response ERO-1.
740	1	Williams	Eric		Please do NOT allow the permit for the pipeline...	Comment acknowledged.
740	3	Williams	Eric		I have lived my whole life in Nebraska, and do not want to risk the safety of my ground water, for big oil profits.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
740	4	Williams	Eric		...By allowing this type of investment, Nebraskans will pay a terrible environmental and economic price for many decades to come...I have lived my whole life in Nebraska, and do not want to risk the ... agricultural economy of my state for big oil profits.	The impacts associated with implementation of the proposed Project are addressed in Section 3.0 of the EIS. As noted in that section, construction and normal operation the proposed Project would not result in significant environmental impacts. Section 3.13 of the EIS addresses reliability and safety issues,

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
						including calculations of the probability of a spill from the proposed Project and the potential environmental impacts associated with spills. Issues related to the High Plains Aquifer System are addressed in Consolidated Response AQF-1 through AQF-4. Consolidated Response AQF-3 provides information on hypothetical spills from the Project over two areas of the Northern High Plains Aquifer System. As noted in those responses, a spill over the Northern High Plains Aquifer system would not put the entire agricultural economy of Nebraska at risk.
1544	58	Williams	Jim		I don't think a drop of this toxic material should get into the United States.	Consolidated Response OIL-4 addresses the composition of the Canadian crude oil that would be transported by the proposed Project, including concerns relative to the corrosivity and erosivity of the crude oil. As noted in that Consolidated Response, that crude oil is similar in composition and properties to other heavy crude oils that are currently transported within the U.S. pipeline system and similar in composition and properties to other heavy crude oils that are currently refined in PADD III.
1544	59	Williams	Jim		We're destroying a boreal forest in Canada.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project. Consolidated Response GHG-4 addresses concerns regarding the loss of boreal forest and peat bogs.
1544	60	Williams	Jim		We're destroying jobs for the native Canadians.	Consolidated Response CAN-1 and Section 3.14.4 of the EIS address issues related to development of oil sands projects in Canada.
1544	61	Williams	Jim		We're putting far more CO2 into the atmosphere.	Consolidated Response GHG-1 addresses the greenhouse gas life-cycle analyses presented in the revised EIS.
1544	62	Williams	Jim		The amount of oil coming down is not enough to offset any kind of oil security here in the United States.	Consolidated Response P&N-1 addresses the need that the Project has been proposed to meet, including information on crude oil supply and demand from an analysis specific to the proposed Project.
1544	63	Williams	Jim		I can rant and rave about how bad this project is, how dirty it is.	Consolidated Response OIL-4 addresses the composition of the Canadian crude oil that would be transported by the proposed Project, including concerns relative to the corrosivity and erosivity of the crude oil. As noted in that Consolidated Response, that crude oil is similar in composition and properties to other heavy crude oils that are currently transported within the U.S. pipeline system and similar in composition and properties to other heavy crude oils that are currently refined in PADD III.
1544	65	Williams	Jim		The lowered engineering standard for this pipeline is subtracting from the safety of the project.	Keystone has withdrawn its application for a Special Permit as described in Consolidated Response REG-1. As described in Consolidated Response SAF-1, the Pipeline and Hazardous Materials Safety Administration (PHMSA) has regulatory requirements that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project in a manner that protects the health and safety of the public and the environment. In addition, PHMSA developed 57 Project-specific Special Conditions that Keystone has agreed to implement. Incorporation of those conditions would result in

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
						a Project that would have a degree of safety over any other typically constructed domestic oil pipeline system under current code and a degree of safety along the entire length of the pipeline system similar to that which is required in HCAs as defined in 49 CFR 195.450.
1544	66	Williams	Jim		The safety factor is there because of the bumps the pipeline goes through, the dings it gets as it's backed in by a backhoe. It's quality control. We need that safety buffer because of corrosion from hydrogen sulfide, nitrogen compounds, nitric acids, or nitrous acids. This is a very corrosive mixture coming down the pipe.	Consolidated Response OIL-4 addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils. Sections 2.3 and 3.13 of the EIS describe the design features, safety precautions, construction procedures, monitoring procedures, maintenance practices, and other required actions that Keystone will implement to avoid or minimize corrosion and other damage to the pipeline.
1544	67	Williams	Jim		We have examples of pipelines that have failed because of corrosion, the BP pipeline in Prudhoe, Alaska they failed to maintain properly. A quarter inch hole squirted 5 to 6000 barrels of oil on the environment. This pipeline is even thinner and consequently, it looks like we're setting ourselves up for the next great national environmental disaster.	Keystone has withdrawn its application for a Special Permit as described in Consolidated Response REG-1. Consolidated Response SAF-1 describes the regulatory requirements that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project. It also describes the inspections and reviews of the proposed Project that the Pipeline and Hazardous Materials Safety Administration would conduct to ensure compliance with those regulatory requirements.
880	1	Willoz	John		Under no circumstances should this pipeline be allowed to cross the Ogallala Aquifer. After the past experiences with oil pipeline leaks in sensitive areas you would think the human race would have learned not to do that. The risk to millions of people's water supply is not worth taking at any cost. Do not allow this pipeline to go through and risk another leak or worse, any Deep Ocean sized oil spill. And don't believe it can't happen. That is what BP said about the DeppOcons site. Do not allow it!	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. As described in Consolidated Response GLF-1, the risks associated with the proposed Project are substantially different from those associated with the BP Deepwater Horizon Project.
578	1	Wilson	Jane		I am writing to let you know I oppose the granting of a permit to allow the Keystone XL pipeline to go through our beautiful Nebraska Sandhills. A fragile ecosystem relied upon by a myriad of wild creatures, farmers and ranchers alike, this area is critical to our state	Identification of sensitive environments crossed by the proposed Project is discussed in Consolidated Response ENV-1 and ENV-3. Issues related to the Sand Hills area are addressed in Consolidated Response ERO-1.
578	2	Wilson	Jane		The groundwater that supports it is the most vital resource of all. Any threat to that resource must be denied.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
578	4	Wilson	Jane		As a member of the Nebraska Sierra Club and numerous other organizations, and as a citizen of the State of Nebraska, I implore you to deny this proposal.	Comment acknowledged.
719	1	Wilson	Jane		I have already posted a comment but after attending a well-attended meeting in Omaha last night on this subject, I had to write again. I am even more vehemently opposed to this pipeline running through my state and for MANY reasons...At the same time, we have to stop those activities that are irreparably harming our natural systems and this pipeline is one of them. I encourage you to copy and paste this link into your browser and read why I am SO opposed to this pipeline. Thank you. http://blogs.nwf.org/files/nwf_tarsands_final_pages.pdf	The commenter's opinion is noted.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
719	2	Wilson	Jane		Our Sandhills are a beautiful, vital ecosystem that ranchers graze their cattle on - indeed, it is one of the last few intact ecosystems in the country - but it's very fragile and I cannot understand how anyone could put this area at risk. And for what? To further our dependence on dirty fossil fuels? There are some places - like the Gulf and the Arctic Refuge - that are too valuable to be put at risk and should be taken off the table. Our Sandhills are one of these priceless places.	Identification of sensitive environments crossed by the proposed Project is discussed in Consolidated Response ENV-1 and ENV-3. Discussions of the purpose and need for the proposed Project are provided in Consolidated Response P&N-1.
719	3	Wilson	Jane		...I find no comfort that TransCanada says it will have sensors to detect spills - what if they don't work?...	As described in Section 3.13.5, there would be a backup communication system for the detection system. In addition, Keystone would be required to monitor the entire pipeline route at least 26 times per year, at intervals not to exceed 3 weeks (see Consolidated Response SAF-1). There would also be the ad hoc monitoring by non-pipeline personnel such as ranchers, farmers, local citizens, recreationists, and emergency service personnel.
719	4	Wilson	Jane		...What gives TransCanada the right to ... put our whole economy at risk?	Issues related to the High Plains Aquifer System are addressed in Consolidated Response AQF-1 through AQF-4. Consolidated Response AQF-3 provides information on hypothetical spills from the Project over two areas of the Northern High Plains Aquifer System. As noted in those responses, a spill over the Northern High Plains Aquifer system would not ruin the economy of Nebraska or the U.S.
719	7	Wilson	Jane		[Nebraska is a farming/ranching state and] those entities rely heavily on the Ogallala Aquifer, a priceless underground reservoir that will be put at great risk if this project goes through. Our aquifer is one of these priceless places...	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
719	8	Wilson	Jane		...Nebraska is a farming/ranching state and those entities rely heavily on the Ogallala Aquifer...	Issues related to the High Plains Aquifer System are addressed in Consolidated Response AQF-1 through AQF-4. Consolidated Response AQF-3 provides information on hypothetical spills from the Project over two areas of the Northern High Plains Aquifer System. Consolidated Response ALT-1 addresses potential alternative routes, including routes that would avoid much of the Northern High Plains Aquifer system.
719	9	Wilson	Jane		...Tar sands are the DIRTIEST form of oil and instead of fueling its production we should be doing everything in our power to stop desecrating our environment in the pursuit of this deadly resource, one that is forever altering our climate and life as we know it...	Consolidated Response OIL-4 addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils. Consolidated Response GHG-2 addresses the potential causal connection of implementation of the proposed Project and expanded oil sands production in Alberta and increases in refining.
1020	1	Wilson	Tom&Blake		Dear Ms. Orlando: Recently a number of advocacy groups sent a letter seeking suspension of the permitting of the Keystone XL pipeline. I encourage you to reject the request and to continue to review the proposed project. The project has the potential to deliver significant energy security benefits to the United States, increasing access to significant land-based sources of oil from a trading partner with whom we are closely allied. At the same time, construction of this project stands to bring significant economic benefits to the areas where it will be built. In Harding County the pipeline will significantly lower taxes for land owners, as a livestock producer this will be a	Comment acknowledged.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					great help. It will have little to no adverse effects to the cattle men in this area; it will only be a benefit. In a time of bad economic times the short term effect of jobs with the pipeline will be a tremendous boost to the area. Provided it has limited impact on the environment, this project could be an important part of the solution to our energy supplies. The permitting processes in place are appropriate and should proceed so that a final determination can be made about the impacts of the project and whether it is in the national interest. Please reject the request to suspend the process and continue with the review.	
1187	2	Wilson	Bob		No system is totally perfect. Any leak or break will cause harm to the Ogalla Aquifer.	Section 3.13 of the EIS addresses reliability and safety issues, including calculations of the probability of a spill from the Project and the potential environmental impacts associated with spills. As noted in that section, the likelihood of a spill from the Project is low, but it is not zero. Issues related to the Northern High Plains Aquifer System are addressed in Consolidated Responses AQF-1 through AQF-4. Consolidated Response AQF-3 provides information on hypothetical spills from the Project over two areas of the Northern High Plains Aquifer System.
1187	3	Wilson	Bob		Anyone who has lived and worked in the Sandhills will tell you how fragile the topsoil cover in that region is. Leave it alone and it will produce grasses to feed livestock and other animals. Break the cover and the resulting scar will be evident for generations.	Identification of sensitive environments crossed by the proposed Project is discussed in Consolidated Response ENV-1 and ENV-3. Issues related to the Sand Hills area are addressed in Consolidated Response ERO-1.
1216	1	Wilson	J.		I do not have a problem with the construction of the Keystone pipeline. It will have the appropriate sensors and detection devices that will make it fail safe. This pipeline is minor, compared to the many miles of already existing pipeline structures carrying oil and natural gas that network across this country. We appear to focus way too much on non-event problems.	Comment acknowledged.
1391	2	Wilson	Gilbert	Board of County Commissioners, Atoka County	As county officials from the State of Oklahoma, we strongly encourage the U.S. Department of State to approve an energy infrastructure project that not only will strengthen long-term energy security in the United States, but also will provide a powerful private sector economic stimulus to the communities along the pipeline route during its construction at a time when our economy continues to struggle. As we understand it, Keystone XL will directly create more than 13,000 high-wage construction and manufacturing jobs during the project's 2011-2012 construction schedule. Many of those jobs will be created in Oklahoma and in our counties, where too many of our residents continue to find it difficult to find good jobs. With Keystone XL, they will have an opportunity to work on the project or for businesses that provide supplies, goods and services for its construction and operation. In addition to the jobs Keystone XL will create, the project will generate substantial economic benefits for the United States and in states and communities along the proposed route. Like our counties, in many cases these are areas where economic performance has stagnated or is shrinking. It is our understanding that TransCanada commissioned a study to	Consolidated Response ECO-1 addresses potential socioeconomic impacts, and Consolidated Response TAX-1 addresses concerns regarding taxes.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					measure the project's economic stimulus to the U.S. and the states along the route. The study found that in the U.S., Keystone XL would generate \$20.9 billion in total expenditures, \$9.6 billion in output (gross product), personal income of \$6.5 billion and 118,935 person years of employment (jobs). In addition, the report concluded that during construction, Keystone XL would generate \$486.36 million in tax revenue for state governments along the route and \$99.1 million for local taxing entities where the pipeline is located. Moreover, in addition to the construction and manufacturing jobs Keystone XL will create during construction, the economic stimulus provided by the pipeline's construction and development will lead to the creation of more than 100,000 additional jobs in the economy. In Oklahoma, the study found Keystone XL expenditures during construction would total \$1.2 billion and generate an economic gross product of nearly \$1.1 billion. Keystone XL construction also would generate more than \$7.7 million in tax revenue for local government and \$31.4 million for state government. Furthermore, the delivery of [secure and] affordable supplies of Canadian energy to American consumers would have minimal impacts on the environment...The Perryman study concluded that the long-term increase in stable oil supplies will add at least 250,000 permanent jobs to the U.S. economy, and add \$29 billion to the nation's gross annual product, conservatively estimated... We look forward to the issuance of a Final Environmental impact Statement followed by a Presidential Permit that allows the construction of Keystone XL and enables our counties, the State of Oklahoma, and the United States to collect the substantial economic benefits Keystone XL would create.	
1391	4	Wilson	Gilbert	Board of County Commissioners, Atoka County	Oil sands account for more than 97 percent of that vast reserve: 170 billion barrels of oil with the potential for more than 100 years of production.	Comment acknowledged.
1391	5	Wilson	Gilbert	Board of County Commissioners, Atoka County	We enthusiastically support the Keystone XL Pipeline Project and encourage the Department of State to confirm the findings of the Draft Environmental Impact Statement, which found that the proposed Keystone XL Pipeline would have "limited adverse environmental impact during construction and operation."	Comment acknowledged.
1543	36	Wilson	Tom		We have got to keep control of these spills.	Consolidated Response SAF-1 describes the regulatory requirements and Project-specific Special Conditions that Keystone would comply with to construct, operate, maintain, inspect, and monitor the proposed Project. It also describes the monitoring, inspections, and reviews of the proposed Project that the Pipeline and Hazardous Materials Safety Administration would conduct to ensure compliance with those regulatory requirements.
1543	37	Wilson	Tom		I have a copy of testimony by Michael Keenan that was presented to the PUC. The money that goes into those tax bases, what it will really do for Harding County, it will drop our taxes and it will help support the school system.	Consolidated Response ECO-1 addresses potential socioeconomic impacts, and Consolidated Response TAX-1 addresses concerns regarding taxes.
1543	38	Wilson	Tom		It is very important that there is a possibility of bringing in some jobs.	Consolidated Response ECO-1 and Section 3.10.2.2 of the EIS address potential socioeconomic impacts.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
1543	39	Wilson	Tom		TransCanada said there could be six permanent jobs. While in Rapid City, six permanent jobs is not much, but in Harding County, six permanent jobs is six families. That's kids for the school. That's help to keep local businesses open.	Consolidated Response ECO-1 and Section 3.10.2.2 of the EIS address potential socioeconomic impacts.
1546	180	Winfield	Christine		U.S. needs to move away from dependency on oil.	Consolidated Response ALT-2 addresses the use of alternative technologies, alternative energy sources, and conservation of energy. Consolidated Response P&N-5 addresses issues related to investments in other technologies.
1546	182	Winfield	Christine		U.S. history has proven that indigenous people do not benefit from large projects such as this pipeline.	The commenter's opinion is noted.
1546	185	Winfield	Christine		Tar sands oil is devastating to the environment, kills thousands of animals, and costs more than conventional oil.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information on current and future production. As noted in that Consolidated Response, without the proposed Project, oil sands development would continue at or above the current level until at least 2020, with or without the proposed Project.
1124	1	Winnik	Kelly&Kevin		To whom it may concern, We are writing to express our opposition to a Presidential permit being granted for the Keystone XL pipeline... Please do not grant a Presidential permit for this project.	Comment acknowledged.
1124	2	Winnik	Kelly&Kevin		A spill could contaminate the Ogallala High Plains Aquifer, one of Nebraska's most precious natural resources. The aquifer is 10 million years old; it is the largest aquifer in the United States and one of the largest in the world, encompassing an area of 174,050 square miles, with about the same amount of water as Lake Erie. This is pure, potable water..Those making comparisons between the Gulf oil spill and tar sands oil imply that pipelines overland are safe -- and that leaks are easily remedied. What these comparisons do not take into account is that the aquifer would quickly absorb any leaks like a sponge, contaminating the drinking water and agricultural irrigation waters in America's heartland from South Dakota to Texas.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
1124	3	Winnik	Kelly&Kevin		A spill could contaminate the Ogallala High Plains Aquifer, ...the aquifer would quickly absorb any leaks like a sponge, contaminating the drinking water and agricultural irrigation waters in America's heartland from South Dakota to Texas.	Issues related to the Northern High Plains Aquifer System are addressed in Consolidated Responses AQF-1 through AQF-4. Consolidated Response AQF-3 provides information on hypothetical spills from the Project over two areas of the Northern High Plains Aquifer System.
1124	5	Winnik	Kelly&Kevin		In Nebraska, the route runs directly through the grass-stabilized dunes of the Nebraska Sandhills that sit atop the Ogallala Aquifer. This is good cattle country but has topsoil so shallow that most of the area has never been plowed. In the spring, the meadows between the hills are dotted with shallow lakes formed by the groundwater that is never far from the surface.	Identification of sensitive environments crossed by the proposed Project is discussed in Consolidated Response ENV-1 and ENV-3. Issues related to the Sand Hills area are addressed in Consolidated Response ERO-1. Additional discussions of the High Plains Aquifer System and shallow groundwater connections are provided in Consolidated Response AQF-1 and AQF-2.
1124	6	Winnik	Kelly&Kevin		The newer tar sands pipelines are all high-pressure pipelines meant to transport corrosive and dirty bitumen. Yet the companies all have asked for waivers of safety standards that allow them to use less steel to save costs. To save their costs -- but increase the cost to this fragile and critically important environment.	Keystone has withdrawn its application for a Special Permit as described in Consolidated Response REG-1. As described in Consolidated Response SAF-1, the Pipeline and Hazardous Materials Safety Administration (PHMSA) has regulatory requirements that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project. In addition, PHMSA developed 57 Project-specific Special Conditions that Keystone has agreed to implement.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
						<p>Incorporation of those conditions would result in a Project that would have a degree of safety over any other typically constructed domestic oil pipeline system under current code and a degree of safety along the entire length of the pipeline system similar to that which is required in HCAs as defined in 49 CFR 195.450.</p> <p>The proposed Project would transport crude oil, not raw bitumen. As noted in Consolidated Response OIL-4, the crude oil that would be transported by the proposed proposed Project is similar to other heavy crude oils refined in the U.S. and transported by other pipeline systems.</p>
848	1	Winter	Tom	University of Nebraska-Lincoln	Make them go around the Ogallala Aquifer, or tell them to go away.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. Consolidated Response ALT-1 addresses potential alternative routes, including routes that would avoid much of the Northern High Plains Aquifer system.
1074	1	Witt	Tom		Please do everything in your power to keep the Keystone Pipeline from going through Nebraska, especially through the Sandhills and the Ogallala and High Plains Aquifers. I realize that going through Nebraska would be the cheapest and most cost effective way however the potential for having a leak into the aquifer/s would be a world catastrophe. The aquifers under Nebraska are more precious than all the oil in the world. Do not allow anyone to jeopardize our water resource. If there is anything that I can personally do to keep this from happening, please let me know.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
1074	2	Witt	Tom		Nebraska has such a huge impact on many because of the agriculture products produced for world wide consumption. I would think that everyone would want to protect the food resources that we in Nebraska produce.	Consolidated Response FRM-1 addresses potential ranch or farmland impacts, and Consolidated Response FRM-2 addresses potential impacts to irrigated cropland.
396	2	Wojtalewicz	Casey	Summer of Solutions	In addition, this pipeline will support tar sands-obtained oil, the dirtiest, most destructive means of getting oil that is also currently infringing on Native American lands and forests (aka carbon sinks). This is a lose-lose.	As noted in Consolidated Response OIL-4, the composition of crude oil that would be transported by the proposed Project would be essentially the same as that of other heavy crude oils refined in the U.S. Also see Consolidated Response CAN-1.
396	2	Wojtalewicz	Casey	Summer of Solutions	In addition, this pipeline will support tar sands-obtained oil, the dirtiest, most destructive means of getting oil that is also currently infringing on Native American lands and forests (aka carbon sinks). This is a lose-lose.	Consolidated Response OIL-4 addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils. Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project.
1520	1	Wolf	Clayton	Texas Parks and Wildlife	Dear Ms. Orlando: Texas Parks and Wildlife Department (TPWD) reviewed the DEIS for the TransCanada Keystone XL Pipeline. TransCanada Keystone LP has proposed to construct the Keystone XL Pipeline that will traverse more than 1,380 miles from Hardisty, Alberta Canada to the Texas Gulf Coast. The proposed pipeline will be anew buried 36-inch crude oil pipeline that will link the existing Texas Gulf Coast refineries with Canada's oilfields. The pipeline will be designed to initially transport approximately 700,000 barrels of crude oil	Concerns of the Texas Parks and Wildlife Department were considered and addressed in the EIS.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					<p>per day from Canada to markets in the U.S. and will compliment the Keystone Pipeline, which is currently underconstruction. The proposed pipeline will be constructed within a 110-footconstruction right-of-way (ROW) and will maintain a 50-foot permanent ROW. Under section 12.0011 of the Parks and Wildlife Code, TPWD is charged with providing recommendations that will protect fish and wildlife resources to local, state, and federal agencies that approve, permit, license, or construct developmental projects" and "providing information on fish and wildlife resources to any local, state, and federal agencies or private organizations that make decisions affecting those resources. "Comments provided by TPWD in previous letters are attached for your reference. The first, dated April 13, 2009 was addressed to you, and the second, dated September 25,2009 was addressed to Jerry Castillo at ABCOM. Both letters outline TPWD's concerns with the proposed project and its potential impacts on the state's fish and wildlife resources, and they provide guidelines for minimizing these impacts. SECTION 2.0 PROJECT DESCRIPTION The proposed project would consist of approximately 1,380 miles of new pipeline in the United States. Two of the three proposed pipeline segments will be traversing through Texas. The two segments are the Gulf Coast Segment (GCS) beginning in Cushing, Oklahoma to Nederland, Texas and the Houston Lateral (HL), which will begin at the Gulf Coast Segment in Liberty County, Texas to Moore Junction, Texas. The Texas portion of the GCS will be approximately 324.8 miles long and the HL will be approximately 48.6 miles long for a total length of 373.4 miles. A summary of the acreage for the pipeline and the ancillary facilities is found in the following table, excerpted from Table 2.1.4-1 in the DEIS Table 2.1.4-1 Summary of Lands Affected by the Proposed Action Land Affected During Construction (acres) Operation (acres)Texas GCS Pipeline ROW 4,180 1,965 Additional Temporary Workspace Areas 283 Pipe Storage Sites, Rail Sidings, and Contractor Yards 796 Pump Stations Delivery Facilities 48 Access Roads 329 55 GCS Subtotal 5,636 2,068 Houston Lateral ROW 652 294 Additional Temporary Workspace Areas 32 Pipe Storage Sites, Rail Sidings, and Contractor Yards 5 0 Access Roads 62 19 Lateral Subtotal 751 313 GCS and HL Total 6,387 2,381 The proposed pipeline will be constructed within a 110-foot construction ROW and would maintain a 50-foot permanent ROW. The ROW width within wetlands would be reduced to 85 feet. TPWD is concerned with the proposed construction and permanent ROW widths. Recent construction of Federal Energy Regulatory Commission (FERC) certified projects of similar large diameter pipelines, including42-inch diameter pipelines, have been safely and efficiently accomplished using a nominal ROW width of 100 feet, restricted to 75 feet in wetlands. The use of a narrower nominal ROW width would reduce impacts to fish and wildlife resources. A total of 30 new pump stations, each permanently situated on 5 to 10 acres, would be constructed. Ten of these pump stations would be constructed in the GCS. Additional temporary workspace</p>	

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					<p>areas would be needed for the areas requiring construction staging areas and special construction techniques, river, wetland, and railroad crossings; horizontal directional drill (HDD) entry and exit points; steep slopes; and rocky soils. According to the DEIS, these areas would be located at the prescribed setback distance from wetland and waterbody features as determined on a site-specific basis. SECTION 3.3 WATER RESOURCES According to the DEIS, 633 waterbody crossings would occur in Texas along the proposed GCS route, and 20 waterbody crossings along the proposed HL route. Details of these proposed crossings are shown in the following table, created from Section 3.3.1.2 Surface Water in the DEIS. Waterbodies Crossed in Texas Waterbody Crossings Texas GCS Perennial streams 199Intermittent Streams 198Ephemeral Streams 215Seasonal 5Artificial Path (any man-made or 2modified flow path) Canal Ditch. Houston Lateral Perennial streams 5Intermittent Streams 2Ephemeral Streams 8Artificial Path (any man-made or 2modified flow path)Canal Ditch 3Keystone proposes to cross 22 of these waterbodies with HDD. These waterbodies include: GCS• Red River in Fannin County, Texas• Bois d' Arc Creek in Fannin and Lamar counties• North Sulphur River in Lamar and Delta counties• South Sulphur River in Delta and Hopkins counties• White Oak Creek in Hopkins counties• Big Cypress Creek in Franklin County• Waterbody in Wood County• Big Sandy Creek in Upshur County • Sabine River in Upshur and Smith counties• East Fork Angelina River in Rusk County• Angelina River in Nacogdoches and Cherokee counties• Neches River in Angelina and Polk counties• Menard Creek in Liberty County• Neches Valley Canal Authority• Lower Neches Valley Canal Authority in Jefferson County• Willow Marsh Bayou in Jefferson County• Hillebrandt Bayou in Jefferson County• Port Arthur Canal and Entergy Corridor in Jefferson County HL Segment• Trinity Creek Marsh in Liberty County• Trinity River in Liberty County• Cedar Bayou in Harris County• San Jacinto River in Harris County The remaining 615 waterbodies on the GCS and 16 waterbodies on the HL would be crossed using either open-cut crossing method, dry flume method, or the dry dam and-pump method. Stream Crossings Within Texas, the proposed pipeline would cross streams, creeks and rivers. In association with those waterways, the proposed line would cross herbaceous, scrub/shrub, forested wetlands, bottomland forests, and riparian habitats. Wetlands, riparian areas, and bottomland forests generally provide habitat for local wildlife and protect waterways from sediment loads in runoff water. Riparian habitat is a priority habitat type targeted for conservation by TPWD across the state. Recommendation: In these areas, only vegetation impeding construction should be removed, equipment should not be driven over vegetation when it is extremely wet, and heavy machinery should not be stored on vegetative cover for long periods of time. Protective mats should be placed within streambeds during construction to reduce the amount of soil and root disturbance and aid in the recovery of plants. Recommendation: High quality wetland, riparian, and bottomland hardwood communities</p>	

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					<p>should be crossed using directional drilling techniques when avoidance is not feasible. Staging areas for the drilling equipment should be located in previously disturbed areas or areas of low value habitat. Recommendation: Vehicles not needed specifically at creek crossings should utilize nearby roadways and bridges when crossing wetlands and streams to avoid soil disturbances. Recommendation: The applicant should minimize disturbance to inert microhabitats, i.e., snags, brush piles, fallen logs, creek banks, and pools as these provide habitat for a variety of wildlife species and their food sources. No TPWD permit is required for boring underneath navigable streams (as defined in Texas state law). A permit under Parks and Wildlife Code Chapter 86 may be required for open-cutting navigable streams. Information regarding such permits can be found at http://www.tpwd.state.tx.us/faq/landwater/sand gravel. Recommendation: Disturbance to state-owned streambeds crossed by any pipeline may require a permit issued by TPWD. Regarding permits for streambed disturbances, please coordinate with Tom Heger, TPWD - Inland Fisheries at (512) 389-4583. Please keep the TPWD Wildlife Habitat Assessment Program up-to-date on the status of coordination with Inland Fisheries. Floodplains Five main line valves (MLVs) and two pump stations along the GCS route are within the 100-year floodplain. Pump Station 39 at MP 33.6 in Cherokee County is in the Angelina River floodplain. Pump Station 41 at MP 432.6 in Liberty County is within the Batiste Creek floodplain. Four MLVs are proposed in the 100-year floodplains for the HL segment. Floodplains and the riparian vegetation and wetlands they support act as natural buffers to floods and aid in water quality maintenance and groundwater recharge. These benefits can be lost through the clearing of vegetation, filling, and excavation activities associated with development. In addition to providing valuable foraging and nesting habitat to fish and wildlife, floodplains represent an important cultural resource to the public. Recommendation: TPWD cannot support placement of above-ground pipeline infrastructure and associated appurtenances within the floodplains and requests that TransCanada relocate infrastructure to upland areas to minimize impacts. It is also preferred by TPWD that the project infrastructure be placed in areas previously cleared or disturbed to avoid unnecessary removal of valuable forested communities. Additional concerns of placing the pump stations and MLVs within floodplains and within close proximity to major surface waters involves potential surface water contamination that may result from petroleum related spills or leaks. Although containment areas must be incorporated into the pump station and MLV design, overtopping of floodplain waters into the containment areas or excess storm water runoff from the facilities could cause contaminants to leave the project area. Pump stations and ML Vs should be placed outside of floodplains and at a significant distance from major surface waters to minimize potential contamination concerns. SECTION 3.4 WETLANDS Impacts to wetlands in Texas are summarized in the following</p>	

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					<p>table, excerpted from Table 3.4.3-1 in the DEIS: This bank was approved as a wetland mitigation banking site due to its intact bottomland forest and vast size of the tract. Additional information regarding the mitigation site can be found at http://www.pineywoodsbank.com. Recommendation: TPWD strongly recommends that the pipeline be rerouted to avoid impacting the Pineywoods Mitigation Bank. There is a cleared ROW east of US Highway 59 that the project proponent should investigate as a potential alternate route. This recommendation was provided in a letter dated September 25, 2009 to AECOM, attached, and this recommendation was not incorporated in the DEIS. TPWD requests that the recommended change in the pipeline route be reflected in the FEIS. Additionally, TPWD requests that the FEIS assess why the route will or will not be routed to bypass the mitigation bank.</p> <p>SECTION 3.5 TERRESTRIAL VEGETATION Impacts to vegetation in Texas are summarized in the following table, excerpted from Table 3.5.5-1 in the DEIS: Table 3.5.5-1 Summary of Estimated Impacts on Vegetation Communities by State for the Project Length of Community Area Community Affected during Affected during Crossed (miles) In the letter dated April 13, 2009, TPWD outlined recommendations for Revegetation and Exotic and Invasive Species Control. Recommendations: TPWD recommends that TransCanada review these recommendations and incorporate them into their proposed Construction, Revegetation, and Mitigation plan.</p> <p>SECTION 3.8 THREATENED AND ENDANGERED SPECIES AND SPECIES OF CONSERVATION CONCERN In the letter dated April 13, 2009, attached, TPWD presented information regarding the Texas Natural Diversity Database (TXNDD). Determining the actual presence of a species in a given area depends on many variables including daily and seasonal activity cycles, environmental activity cues, preferred habitat, transiency and population density (both wildlife and human). The absence of a species can be demonstrated only with great difficulty and then only with repeated negative observations, taking into account all the variable factors contributing to the lack of detectable presence. Impacts to vegetation communities of conservation concern in Texas are summarized in the following table, excerpted from Table 3.5.5-3 in the DEIS: Table 3.5.5-3 Estimated Impacts on Vegetation Communities of Conservation Concern Occurring along the Project Route Length Number of Milepost (miles) Communities Crossed. The project would cross numerous locations of the WO-WO vegetative community associated with bottomland ecosystems that contains valuable resources biologically and ecologically rich in animal and plant species. Placement adjacent to an exist in utility corridor should have less impact on the resource than creating a new corridor through the resource at a different location and would minimize fragmentation to the WO-WO community at this location. Please note that the mapped boundary of the WO-WO community in the vicinity of the project may not be precise due to more recent land use changes that may have occurred since the community was</p>	

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					<p>first delineated. Recommendation: To avoid impacts to the WO-WO community, all efforts should be made to re-route around the resource or bore underneath the resource, where feasible. Recommendation: Where unavoidable, TPWD recommends mitigation for permanent impacts to the WO- WO communities that do not fall under the jurisdiction of the U.S. Army Corps of Engineers (USACE). Habitat restoration would be most beneficial within the same system impacts occur. If nearby restoration is not feasible, purchase of credit at a mitigation bank would suffice. Recommendation: The proposed construction and permanent ROW should be surveyed to determine the extent and quality of the WO- WO community present in the project area and the anticipated impacts to the community should be quantified. The tree species, range of tree heights, diameters-at breast-height (dbh), and percent canopy cover should be determined.</p> <p>Comment: Other areas along the pipeline ROW may occur that are similar in species composition to the mapped WO- WO community; thus the applicant should avoid and minimize impact to other WO-WO communities encountered along the proposed ROW. All efforts should be made to avoid or minimize impact to the WO-WO community, wetlands, bottomland hardwoods, riparian habitat, and other sensitive communities or special habitat features during project planning, construction, and maintenance activities. Mussels - On November 5, 2009, the Texas Parks and Wildlife Commission acted to place 15 native freshwater mussel species on the state-threatened species list. The following state-listed threatened freshwater mussel species may occur within the project area where suitable habitat exists: Louisiana pigtoe (<i>Pleurobema ridellii</i>), Sandbank pocketbook (<i>Lampsilis satura</i>), Southern hickorynut (<i>Obovaria jacksoniana</i>), Texasheel splitter (<i>Potamilus amphichaenus</i>), Texas pigtoe (<i>Fusconaia askewi</i>), and Triangle pigtoe (<i>Fusconaia lananensis</i>). The DEIS Section 3.8.3 State-Protected Animals and Plants did not address the potential impacts to state-listed mussels. Recommendation: Potentially impacted waterways within the range of state listed mussels should be assessed for rare mussel habitat. Where suitable habitat is present, mussel surveys should be conducted prior to construction. Direct disturbance of habitat and degradation of water quality should be avoided where threatened mussels or their habitat are found. Recommendation: TPWD recommends use of best management practices(BMP) for riparian areas to minimize impacts on mussel and fish species, the mussel larval host. BMPs would include measures such as avoiding construction during fish and mussel spawning periods, directional drilling below the streambed, completing construction through the streambed during periods of drought when the stream is dry, and use of double silt fences and doubling soil stabilization measures along the banks to avoid increasing the turbidity of the creek. If mussel populations are present within the limits of the proposed project area, those populations should be protected from disturbance to the greatest extent possible. If disturbance of mussel beds cannot be avoided then the</p>	

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					<p>TPWD Wildlife Habitat Assessment Program(512-389-4571) should be contacted for guidance on mitigation. Plants - Section 3.8.1.7 Federally-Protected and Candidate Plants, of the DEIS, indicates that no impact will occur to the federal- and state-listed endangered Texas Trailing Phlox(<i>Phlox nivalis</i> ssp <i>texensis</i>) because the project would avoid the known locations of this species. Although known locations of this species are recorded, other populations may exist indifferent locations where suitable habitat occurs. Recommendation: Surveys to assess habitat suitability and occurrence should be conducted before a determination of no effect is made. TPWD County Lists Section 3.8.4 Animals and Plants of Conservation Concern, of the DEIS, identifies animals and plants of conservation concern, though a number of species provided in the TPWD Annotated County Lists of Rare Species were not included in the document. These lists are available at http://gis.tpwd.state.tx.us/TPwEndangeredSpecies/DesktopDefault.aspx and provide information regarding rare species that have potential to occur within each county. Rare species could potentially be impacted if suitable habitat is present at or near the project site. Section 3.8.5 References of the DEIS, does not include an entry for the TPWD county lists; therefore it appears that the county lists were not utilized in the DEIS. Recommendation: The TPWD Annotated County Lists of Rare Species should be reviewed and cross referenced with the species assessed in the DEIS. The species not included in the DEIS should be included in the FEIS.APPENDIX B.</p> <p>CONSTRUCTION, MITIGATION, AND RECLAMATION PLAN</p> <p>The DEIS provides a Construction, Mitigation, and Reclamation Plan created in November 2008, that describes the proposed plan to minimize impact and mitigate for impact of the proposed project. The plan does not include a summary of proposed mitigation for impacts to habitat. Recommendation: TPWD recommends TransCanada Keystone Pipeline, LP prepare a mitigation plan to provide compensatory mitigation for those habitats listed above where impacts from the pipeline cannot be avoided or minimized. This would include impacts to species and habitats covered under federal law (wetlands and associated habitats, threatened or endangered species) and state resource habitat types not covered by state or federal law (riparian areas, native prairies, certain types of bottomland hardwoods). At a minimum, TPWD recommends a replacement ratio of 1:1 for state resource habitat types. TPWD advises review and implementation of the comments and recommendations.</p>	
1520	2	Wolf	Clayton	Texas Parks and Wildlife	<p>Recommendation: Because the proposed pipeline diameter is less than that used for the recently constructed FERC-regulated natural gas pipelines in Texas, TPWD recommends that the project ROW be limited in wetlands to no more than 75 feet in width, including any use of existing permanent easements or recently cleared temporary easements that would be overlapped by the project. Additionally, the project ROW in uplands should be limited to no more than 100 feet in width.</p>	<p>For safety reasons, previously cleared areas over existing pipelines cannot be used during the installation of new pipelines adjacent to existing pipelines. Temporary easements for the proposed Project would be reduced to the maximum area practicable to provide for a safe work surface for pipeline construction while minimizing impacts. the width of a construction ROW and additional workspaces are not determined exclusively by pipeline diameter. The maximum extent within wetlands would typically be 85 feet in wetlands</p>

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
						and 110 feet in uplands; but a narrower widths would be used to the extent practicable in sensitive habitats.
1520	3	Wolf	Clayton	Texas Parks and Wildlife	Recommendation: The FEIS should address wetland, riparian, and bottomland hardwood impacts at the proposed river and stream crossings to determine that the location chosen is most suitable and provides the least amount of unavoidable impacts compared to other possible crossing locations nearby. Mitigation for impacts to all wetlands, bottomland forests, and riparian areas should be provided.	The alternatives analysis was initially conducted as a screening process that first identified potential alternatives to the proposed Project then screened out alternatives that were not judged to be reasonable. As noted in Section 4.0, all major alternatives identified were screened out as not being reasonable and were not further evaluated. Therefore, DOS has not addressed specific wetlands along the alternative routes identified in the assessment. All wetlands will receive construction mitigations as described in Keystone's Construction, Mitigation, and Reclamation Plan (Appendix B of the DEIS). Keystone has committed to follow the same construction, mitigation, and reclamation plan for all wetland crossings regardless of whether the wetland qualifies as jurisdictional under the U.S. Army Corps of Engineer Section 404 permits. The only difference would be the requirement for compensatory mitigation for permanent wetland losses which will be negotiated with the USACE during the permitting process. Most wetlands would be restored after pipeline construction. See additional discussion of this issue in Consolidated Response WAT-2.
1520	4	Wolf	Clayton	Texas Parks and Wildlife	Recommendation: In these areas, only vegetation impeding construction should be removed, equipment should not be driven over vegetation when it is extremely wet, and heavy machinery should not be stored on vegetative cover for long periods of time. Protective mats should be placed within streambeds during construction to reduce the amount of soil and root disturbance and aid in the recovery of plants.	Keystone's Construction, Mitigation, and Reclamation plan provides for implementation of these recommended mitigations. In addition for the Gulf Coast Segment, contractors would be directed to use mats regardless of wetland moisture content.
1520	5	Wolf	Clayton	Texas Parks and Wildlife	Recommendation: High quality wetland, riparian, and bottomland hardwood communities should be crossed using directional drilling techniques when avoidance is not feasible. Staging areas for the drilling equipment should be located in previously disturbed areas or areas of low value habitat.	Using Horizontal Directional Drilling (HDD) to cross all wetlands and waters would not be practical as described in general Consolidated Response ENV-5. There is currently one wetland area that has been identified through for crossing using HDD on the Houston Lateral at about MP 17.7 Turkey Creek Marsh. Most HDD crossings of rivers and streams are designed to cross under and avoid riparian forests and riverine wetlands.
1520	6	Wolf	Clayton	Texas Parks and Wildlife	Recommendation: Vehicles not needed specifically at creek crossings should utilize nearby roadways and bridges when crossing wetlands and streams to avoid soil disturbances.	Keystone's Construction, Mitigation, and Reclamation plan provides for implementation of this recommended mitigation.
1520	7	Wolf	Clayton	Texas Parks and Wildlife	Recommendation: The applicant should minimize disturbance to inert microhabitats, i.e., snags, brush piles, fallen logs, creek banks, and pools, as these provide habitat for a variety of wildlife species and their food sources.	Section 3.6.3 of the EIS was revised to add the mitigation measure recommended by the commenter.
1520	8	Wolf	Clayton	Texas Parks and Wildlife	Recommendation: Disturbance to state-owned streambeds crossed by any pipeline may require a permit issued by TPWD. Regarding permits for streambed disturbances, please coordinate with Tom Heger, TPWD – Inland Fisheries at (512) 389-4583. Please keep the TPWD Wildlife Habitat Assessment Program up-to-date on the status of coordination with Inland Fisheries.	All applicable permits for construction would be obtained by Keystone.
1520	9	Wolf	Clayton	Texas Parks and Wildlife	Recommendation: TPWD cannot support placement of above-ground pipeline infrastructure and associated appurtenances	The placement of aboveground infrastructure is addressed in Section 2 of the EIS. Potential impacts of the proposed

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					within the floodplains and requests that TransCanada relocate infrastructure to upland areas to minimize impacts. It is also preferred by TPWD that the project infrastructure be placed in areas previously cleared or disturbed to avoid unnecessary removal of valuable forested communities.	Project are addressed in Section 3 of the EIS. Consolidated Response WAT-3 addresses concerns regarding potential impacts to wetlands and waterbodies due to construction of ancillary facilities.
1520	10	Wolf	Clayton	Texas Parks and Wildlife	Additional concerns of placing the pump stations and MLVs within floodplains and within close proximity to major surface waters involves potential surface water contamination that may result from petroleum related spills or leaks. Although containment areas must be incorporated into the pump station and MLV design, overtopping of floodplain waters into the containment areas or excess storm water runoff from the facilities could cause contaminants to leave the project area. Pump stations and ML Vs should be placed outside of floodplains and at a significant distance from major surface waters to minimize potential contamination concerns.	Consolidated Response SAF-1 describes the regulatory requirements that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project. Those regulations include requirements for the placement of valves. In addition, as noted in Section 3.13.1, Keystone has agreed to incorporate 57 Project-specific Special Conditions (see Appendix U of the EIS) into the proposed Project as requested by PHMSA, including special requirements for valve placement. Based on currently proposed locations for mainline valves, there would be 10 valves located in floodplains in Texas (see Section 3.3.1.3 of the EIS). However, final locations would be determined during final design of the Project. The locations of pump stations are based on the hydraulics of the pipeline system, with a relatively small length of optional locations for each station along the pipeline. Wherever possible, Keystone has avoided environmentally sensitive areas and areas of concern such as floodplains. As noted in Section 3.3.1.3 of the EIS, there are two pump stations proposed to be located in floodplains in Texas. Keystone would comply with the county requirements regarding construction in floodplains.
1520	11	Wolf	Clayton	Texas Parks and Wildlife	Recommendation: TPWD strongly recommends that the pipeline be rerouted to avoid impacting the Pineywoods Mitigation Bank. There is a cleared ROW east of US Highway 59 that the project proponent should investigate as a potential alternate route. This recommendation was provided in a letter dated September 25, 2009 to AECOM, attached, and this recommendation was not incorporated in the DEIS. TPWD requests that the recommended change in the pipeline route be reflected in the FEIS. Additionally, TPWD requests that the FEIS assess why the route will or will not be routed to bypass the mitigation bank.	The pipeline route has been changed to avoid crossing the Pineywoods Mitigation Bank. The EIS has been revised accordingly.
1520	12	Wolf	Clayton	Texas Parks and Wildlife	In the letter dated April 13, 2009, TPWD outlined recommendations for Revegetation and Exotic and Invasive Species Control. Recommendations: TPWD recommends that TransCanada review these recommendations and incorporate them into their proposed Construction, Revegetation, and Mitigation plan.	The information provided by TPWD was transmitted to Keystone.
1520	13	Wolf	Clayton	Texas Parks and Wildlife	Recommendation: To avoid impacts to the WO-WO community, all efforts should be made to re-route around the resource or bore underneath there source, where feasible.	Section 3.5.5.2 of the EIS was revised to the following language, as recommended by the commenter: "In Texas, avoid impacts to water oak-willow oak forest communities; survey route to determine extent and quality of water oak-willow oak community (tree species, tree heights, tree diameter at breast height, and percent canopy); avoid by re-route or by boring underneath; where unavoidable provide mitigation for permanent impacts the do not fall under the jurisdiction of the Corp through habitat restoration, purchase of

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
						mitigation bank credits (TPWD)."
1520	14	Wolf	Clayton	Texas Parks and Wildlife	Recommendation: Where unavoidable, TPWD recommends mitigation for permanent impacts to the WO- WO communities that do not fall under the jurisdiction of the U.S. Army Corps of Engineers (USACE). Habitat restoration would be most beneficial within the same system impacts occur. If nearby restoration is not feasible, purchase of credit at a mitigation bank would suffice.	Section 3.5.5.2 of the EIS was revised to the following language, as recommended by the commenter: "In Texas, avoid impacts to water oak-willow oak forest communities; survey route to determine extent and quality of water oak-willow oak community (tree species, tree heights, tree diameter at breast height, and percent canopy); avoid by re-route or by boring underneath; where unavoidable provide mitigation for permanent impacts the do not fall under the jurisdiction of the Corp through habitat restoration, purchase of mitigation bank credits (TPWD)."
1520	15	Wolf	Clayton	Texas Parks and Wildlife	Recommendation: The proposed construction and permanent right-of-way should be surveyed to determine the extent and quality of the WO- WO community present in the project area and the anticipated impacts to the community should be quantified. The tree species, range of tree heights, diameters-at breast-height (dbh), and percent canopy cover should be determined.	Section 3.5.5.2 of the EIS was revised to the following language, as recommended by the commenter: "In Texas, avoid impacts to water oak-willow oak forest communities; survey route to determine extent and quality of water oak-willow oak community (tree species, tree heights, tree diameter at breast height, and percent canopy); avoid by re-route or by boring underneath; where unavoidable provide mitigation for permanent impacts the do not fall under the jurisdiction of the Corp through habitat restoration, purchase of mitigation bank credits (TPWD)."
1520	16	Wolf	Clayton	Texas Parks and Wildlife	Comment: Other areas along the pipeline ROW may occur that are similar in species composition to the mapped WO- WO community; thus the applicant should avoid and minimize impact to other WO-WO communities encountered along the proposed ROW. All efforts should be made to avoid or minimize impact to the WO-WO community, wetlands, bottomland hardwoods, riparian habitat, and other sensitive communities or special habitat features during project planning, construction, and maintenance activities.	The text of Section 3.5.5.2 of the EIS was revised in response to this comment.
1520	17	Wolf	Clayton	Texas Parks and Wildlife	Recommendation: Potentially impacted waterways within the range of state listed mussels should be assessed for rare mussel habitat. Where suitable habitat is present, mussel surveys should be conducted prior to construction. Direct disturbance of habitat and degradation of water quality should be avoided where threatened mussels or their habitat are found.	An assessment for state listed mussels has been added to Section 3.8.3.5 and includes Keystone's proposed mitigation to cross all waterbodies identified as potentially containing state threatened mussel species using the horizontal directional drilling method to avoid direct disturbance and degradation of mussel habitats.
1520	18	Wolf	Clayton	Texas Parks and Wildlife	Recommendation: TPWD recommends use of best management practices(BMP) for riparian areas to minimize impacts on mussel and fish species, the mussel larval host. BMPs would include measures such as avoiding construction during fish and mussel spawning periods, directional drilling below the streambed, completing construction through the streambed during periods of drought when the stream is dry, and use of double silt fences and doubling soil stabilization measures along the banks to avoid increasing the turbidity of the creek. If mussel populations are present within the limits of the proposed project area, those populations should be protected from disturbance to the greatest extent possible. If disturbance of mussel beds cannot be avoided then the TPWD Wildlife Habitat Assessment Program(512-389-4571) should be contacted for guidance on mitigation.	An assessment for state listed mussels has been added to Section 3.8.3.5 and includes Keystone's proposed mitigation to cross all waterbodies identified as potentially containing state threatened mussel species using the horizontal directional drilling method to avoid direct disturbance and degradation of mussel habitats.
1520	19	Wolf	Clayton	Texas Parks	Section 3.8.1.7 Federally-Protected and Candidate Plants, of	An assessment for occurrence of potentially suitable soils and

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
				and Wildlife	the DEIS, indicates that no impact will occur to the federal- and state-listed endangered Texas Trailing Phlox (<i>Phlox nivalis</i> ssp <i>texensis</i>) because the project would avoid the known locations of this species. Although known locations of this species are recorded, other populations may exist in different locations where suitable habitat occurs. Recommendation: Surveys to assess habitat suitability and occurrence should be conducted before a determination of no effect is made.	vegetation cover was completed for the Texas trailing phlox and has been added to Section 3.8.1.7.
1520	20	Wolf	Clayton	Texas Parks and Wildlife	Section 3.8.5 References, of the DEIS, does not include an entry for the TPWD county lists; therefore it appears that the county lists were not utilized in the DEIS. Recommendation: The TPWD Annotated County Lists of Rare Species should be reviewed and cross referenced with the species assessed in the DEIS. The species not included in the DEIS should be included in the FEIS.	The EIS was revised in response to this comment.
1520	22	Wolf	Clayton	Texas Parks and Wildlife	The use of wetland and waterbody construction and mitigation procedures. Crossing wetlands using boring techniques, and 6. Reducing maintenance of the permanent ROW in wetlands to a 10-foot (ft) wide area centered over the pipeline. Pipeline projects usually do not result in a net loss of wetlands, though there are reductions in overall functional value when forested wetlands are permanently and temporarily converted to emergent or scrub-shrub. Typically, an area 10-ft wide centered over the pipeline is permanently maintained in an herbaceous state. Often times, trees beyond the 10-ft. wide area are selectively removed or prevented trimmed; therefore, forested wetlands beyond the 10-ft. wide area would not be given the chance to become a mature forested wetland. Recommendation: The permanent impacts to forested wetlands should be calculated to include the total width of area where trees would be removed during long-term maintenance including any removal areas beyond the 10-ft. wide area. All forested wetland clearing is considered a permanent impact that would require compensatory mitigation. Recommendation: The wetland mitigation plan should take into consideration the temporary and permanent impacts associated with conversion from forested to herbaceous or scrub/shrub wetlands. Recommendation: The wetland mitigation plan should be developed in consultation with TPWD. TPWD requests that TransCanada address impacts to all wetland types in the wetland mitigation plan and mitigate for these impacts. VEGETATION Within Texas, the proposed project crosses the Blackland Prairie, Pineywoods, Oak Woods and Prairies, and the Gulf Coast Prairies and Marshes Ecoregions and potentially crosses different vegetation types based on the TPWD Vegetation Types of Texas - 1984 map and companion book, which can be accessed at http://www.tpwd.state.tx.us/landwater/land/maps/gis/data/downloads/ and http://www.tpwd.state.tx.us/publications/pwdpubs/pwd_bn_w7000_0120/download_book! . Because this data is at a broad scale, the project would likely cross additional vegetation types and habitats such as those associated with streams and wetland areas. Native Prairie Based upon the project	The placement of aboveground infrastructure is addressed in Section 2 of the EIS. Potential impacts of the proposed Project are addressed in Section 3 of the EIS. Consolidated Response WAT-3 addresses concerns regarding potential impacts to wetlands and waterbodies due to construction of ancillary facilities.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					<p>information provided, it is unclear if the proposed pipeline route would impact remnants of native prairie located in Lamar County. Native prairies are important for supporting the declining populations of most grassland bird species. America's prairies are also diminishing due to habitat fragmentation and loss as a result of development, conversion to non-native pastures, and woody encroachment. TPWD recommends that the stand of native prairie found within the project area be avoided. Revegetation Plan For revegetation, TPWD recommends selection of species that are suited to the site conditions, ecoregion, and intended uses and to consider native species that have multiple values and provide species diversity. Comment: TPWD prefers that disturbed areas be restored to preconstruction contours and planted with a mixture of native herbaceous species, especially when the adjacent property on one or both sides of the pipeline ROW contains native species of vegetation. Introduction of non-native species into native landscapes should be prevented. Native perennial grass species preferred by TPWD for permanent cover include Switchgrass (<i>Panicum virgatum</i>), Eastern Gamagrass (<i>Tripsacum dactyloides</i>), Virginia Wildrye (<i>Elymus virginicus</i>), Canada Wildrye (<i>E. canadensis</i>), Yellow Indiangrass (<i>Sorghastrum nutans</i>), and Little Bluestem (<i>Schizachyrium scoparium</i>). Other species appropriate for the area can be found by accessing the TPWD Texas Plant Information Database at http://tpid.tpwd.state.tx.us/overview.asp or by accessing the TPWD Wildscapes website at http://www.tpwd.state.tx.us/huntwild/wild/wildscapes/. Recommendation: During the easement acquisition process, each landowner should be offered a native seed mix. Comment: To verify successful revegetation and to determine the need for additional restoration, the applicant should conduct at least 2 years of post-construction monitoring. Recommendation: In wetlands, vegetation should be allowed to reestablish naturally, though a three-year monitoring plan to determine success should be conducted. Unsuccessful revegetation would require active planting with native wetland herbaceous and woody plant species in consultation with a professional wetland ecologist. Through experience, pipeline projects typically propose seed mixes that contain primarily Bermuda grass (<i>Cynodon dactylon</i>) and/or Bahia grass (<i>Panicum notatum</i>). Both of these grasses are non-native species that typically create a monoculture on the landscape and limit biodiversity. Bahia grass is considered undesirable from a wildlife perspective due to its invasive nature and lack of providing habitat for most wildlife. Once established, Bahia grass can thrive with little water and fertilizer and produces an abundance of seed. In habitat restoration, herbicide treatment may remove Bahia grass for one season, though eradication of Bahia grass is very difficult because of the seed that remains in the soil and its aggressive rhizome system. Whereas, without applications of fertilizer and lime, Bermuda grass tends to diminish and other herbaceous species are able to compete, thus biodiversity increases. Additionally,</p>	

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					<p>eradication of Bermuda grass with herbicide is more feasible than eradication of Bahia grass. Comment: When the use of native seed mixes is not feasible, TPWD prefers the use of Bermuda grass rather than Bahia grass for reasons mentioned above. Exotic and Invasive Species Control The Chinese Tallow tree (<i>Triadica sebifera</i>) is an invasive species that is known to invade stream banks, riverbanks, and wet areas as well as upland sites. Disturbed areas are especially susceptible to infestation of tallow trees. Other exotic species with potential to invade portions of the project ROW include cogon grass (<i>Imperata cylindrica</i>), Chinese privet (<i>Ligustrum sinense</i>), Japanese honeysuckle (<i>Lonicera japonica</i>), deep-rooted sedge (<i>Cyperus enterianus</i>), and purple loosestrife (<i>Lythrum salicaria</i>). Recommendation: A revegetation and maintenance plan should be prepared to monitor and control invasive species within the construction and operation ROWs. Occurrences of the exotic species listed above should be treated and controlled. RARE, THREATENED AND ENDANGERED RESOURCES Texan Natural Diversity Database (TXNDD) Determining the actual presence of a species in a given area depends on many variables including daily and seasonal activity cycles, environmental activity cues, preferred habitat, transiency and population density (both wildlife and human). The absence of a species can be demonstrated only with great difficulty and then only with repeated negative observations, taking into account all the variable factors contributing to the lack of detectable presence. The TXNDD is intended to assist users in avoiding harm to rare species or significant ecological features. Given the small proportion of public versus private land in Texas, the TXNDD does not include a representative inventory of rare resources in the state. Absence of information in the database does not imply that a species is absent from that area. Although it is based on the best data available to TPWD regarding rare species, the data from the TXNDD do not provide a definitive statement as to the presences, absence, or condition of special species, natural communities, or other significant features within your project area. These data are not inclusive and cannot be used as presence/absence data. They represent species that could potentially be in your project area. This information cannot be substituted for on-the-ground surveys. TPWD has conducted a review of the TXNDD based upon the pipeline route map dated 04/23/2008. Recommendation: TPWD requests that TransCanada provide a GIS shapefile of the preliminary pipeline alignment to further assist in the search of the TXNDD for known rare resource occurrences and management areas in the vicinity of the project. Review of the TXNDD revealed the following occurrences of rare and protected species within 5 miles of the proposed project route. Blackland Prairie Ecoregion Special Features and Natural Communities Arkansas meadow-rue (<i>Thalictrum arkansanum</i>) (EO ID 6618 and 553) Silveanus Dropseed Series (<i>Sporobolus silveanus</i>) Series Community (EO ID 1651) Please refer to the attached map (Figure 2) and Element Occurrence Record printouts for</p>	

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					<p>more information regarding the occurrences in the Blackland Prairie Ecoregion. TXNDD records in such a large area are difficult to display graphically and are best viewed in a Geographic Information System. Pineywoods Ecoregion Federal and State Listed Threatened Black Bear (<i>Ursus americanus</i>) (EO ID 1354) State Listed Threatened Bald Eagle (<i>Haliaeetus leucocephalus</i>) (EO IDs 5988, 6039, 6944, and 6438) Candidate for Federal Listing Neches River rose-mallow (<i>Hibiscus dasycalyx</i>) (EO ID 5503) Candidate for Federal Listing and State Listed Threatened Louisiana Pine Snake (<i>Pituophis ruthveni</i>) (EO ID 308) Species of Concern Southern Myotis Bat (<i>Myotis austroriparius</i>) (EO ID 8676 and 6672) Texas screw stem (<i>Bartonia texana</i>) (EO ID 1030) Special Features and Natural Communities Colonial Waterbird Rookeries (EO IDs 1325, 3191, 6522, 7811, and 717) Silveanus Dropseed Series (<i>Sporobolus silveanus</i>) Series Community (EO ID 368) Water Oak- Willow Oak Series (<i>Quercus nigra</i>- <i>Quercus phellos</i>) Series (EO IDs 7838, 6060, 4415, 3073, 5092, and 3756) Please refer to the attached map (Figure 3) and Element Occurrence Record printouts for more information regarding the occurrences in the Pineywoods Ecoregion. As stated above, TXNDD records in such a large area are difficult to display graphically and are best viewed in a Geographic Information System. Gulf Coast Prairies and Marshes Ecoregion Federal and State Listed Endangered Houston Toad (<i>Bufo houstonensis</i>) (EO ID 3224) Species of Concern Threeflower broomweed (<i>Thurovia triflora</i>) Special Features and Natural Communities Colonial Waterbird Rookeries (EO IDs 5599, 4869, 5879, and 1170) Water Oak- Willow Oak Series (<i>Quercus nigra</i>- <i>Quercus phellos</i>) Series (EO IDs, 1095 and 1092) Please refer to the attached map (Figure 3) and Element Occurrence Record printouts for more information regarding the occurrences in the Gulf Coast Prairies and Marshes Ecoregion. As stated above, TXNDD records in such a large area are difficult to display graphically and are best viewed in a Geographic Information System. Bald Eagle. The Bald Eagle is known to nest and winter in the ecoregions along the pipeline route. Please note that, although the Bald Eagle is no longer federally listed threatened, this species remains state listed threatened and receives protection under the U.S. Bald and Golden Eagle Protection Act. Under this act eagles are protected from disturbance which is defined as: "To agitate or bother a bald or golden eagle to a degree that causes, or is likely to cause, based on the best scientific information available, 1) injury to an eagle, 2) a decrease in its productivity, by substantially interfering with normal breeding, feeding, or sheltering behavior, or 3) nest abandonment, by substantially interfering with normal breeding, feeding, or sheltering behavior. "In addition to immediate impacts, this definition also covers impacts that result from human-caused alterations initiated around a previously used nest site during a time when eagles are not present, if upon the eagles return, such alterations agitate or bother and eagle to a degree that injures an eagle or substantially interferes with normal breeding, feeding, or</p>	

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					<p>sheltering habits and causes, or is likely to cause, a loss of productivity or nest abandonment. Guidelines for minimizing disturbance to both nesting and wintering Bald Eagles can be found at http://www.tpwd.state.tx.us/publications/pwdpubs/media/pwd_bk_w7000_0013_bald_eagle_mgmt.pdf. Water Oak - Willow Oak (WO-WO) Series Community The project would crosses numerous locations of the WO-WO vegetative community associated with bottomland ecosystems that contains valuable resources biologically and ecologically rich in animal and plant species. Placement adjacent to an existing utility corridor should have less impact on the resource than creating a new corridor through the resource at a different location and would minimize fragmentation to the WO-WO community at this location. Please note that the mapped boundary of the WO-WO community in the vicinity of the project may not be precise due to more recent land use changes that may have occurred since the community was first delineated. Recommendation: To avoid impacts to the WO-WO community all efforts should be made to re-route around the resource or bore underneath the resource, where feasible. Recommendation: Where unavoidable, mitigation should be provided for permanent impacts to the WO-WO communities that do not fall under the jurisdiction of the U.S. Army Corps of Engineers (USACE). Habitat restoration would be most beneficial within the same system impacts occur. If nearby restoration is not feasible, purchase of credit at a mitigation bank would suffice. Recommendation: The proposed construction and permanent ROW should be surveyed to determine the extent and quality of the WO-WO community present in the project area and the anticipated impacts to the community should be quantified. The tree species, range of tree heights, diameters-at-breast-height, and percent canopy cover should be determined. Comment: Other areas along the pipeline ROW may occur that are similar in species composition to the mapped WO-WO community, thus the applicant should avoid and minimize impact to other WO-WO communities encountered along the proposed ROW. All efforts should be made to avoid or minimize impact to the WO-WO community, wetlands, bottomland hardwoods, riparian habitat, and other sensitive communities or special habitat features during project planning, construction, and maintenance activities. TPWD County Lists The TPWD county lists for rare species may be obtained from the following link: http://gis.tpwd.state.tx.us/Tpw_Endangered_Species/DesktopDefault.aspx. These lists provide information regarding rare species that have potential to occur within each county. Rare species could potentially be impacted if suitable habitat is present at or near the project site. Recommendation: Using the county lists of rare species, the portions of the proposed ROW with potential to support rare species should be field surveyed to determine the extent and quality of the suspect habitat and potential impacts. Recommendation: If rare species or their habitat would be impacted by the proposed project, the applicant</p>	

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					<p>should coordinate with TPWD and the U.S. Fish and Wildlife Service, as appropriate, to determine avoidance, minimization, and mitigation strategies. Recommendation: Construction crews should be informed of the rare species that have potential to occur in the project county and should avoid disturbance to sensitive species if encountered during construction. Only personnel with a TPWD scientific collection permit are allowed to handle and move state listed species. Further consultation with TPWD would be warranted upon detection of a Texas listed rare, threatened, or endangered species within or near the ROW at any time prior to or during avoided or minimized. This would include impacts to species and habitats covered under federal law (wetlands and associated habitats, threatened or endangered species) and state resource habitat types not covered by state or federal law (riparian areas, native prairies, various areas of bottomland hardwoods). At a minimum, TPWD recommends a replacement ratio of 1:1 for state resource habitat types. TPWD advises review and implementation of the comments and recommendations. The permittee will use aerial photography with GIS analysis to monitor the entire pipeline construction corridor and an additional 200 meter buffer zone (100 meters paralleling each side of the construction corridor). The purpose of the GIS analysis is to quantify habitat conversion, particularly emergent marsh to open water. The resource agencies recommend the following GIS/ Remote Sensing method and standard be used in order to produce accurate and consistent results. The pipeline corridor will be monitored by providing pre- and post- construction aerial photography, (taken 24 months after construction completion to allow for vegetative re-grow) at a scale of 1: 4800 or 1 inch to 400 feet. The applicant will then be required to utilize GIS and Remote Sensing techniques to conduct an analysis of change to determine the amount of vegetated marsh impacted by pipeline construction activities. Monitoring reports should be submitted by the applicant that includes at a minimum:1) a pre-project GIS analysis assessing the existing emergent marsh to open water ratio, in acres, within the permitted corridor (which includes the construction corridor and the 200 meter buffer zone).2) a post -project GIS analysis assessing the emergent marsh to open water ratio, in acres, within the entire permitted corridor (which includes the construction corridor and the 200 buffer zone).3) Ortho corrected imagery covering the construction corridor and buffer zone, maximum of 6 inch pixel size and CIR imagery, +/- 2 meters spatial accuracy, 4) Allvector deliverable to be in Arcview Shape file format with FGDC compliant metadata and all raster imagery in GEOTiff format with FGDC compliant metadata. A binary classification system should be used consisting of open water and vegetated areas. The classified data should meet or exceed 90 % attribute accuracy as determined by industry standard and be verified by statistically valid ground truth sampling techniques, this can include GPS based ground surveys.</p>	
1520	24	Wolf	Clayton	Texas Parks	Recommendation: To minimize habitat fragmentation, the	The Keystone XL pipeline runs parallel to existing utility

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
				and Wildlife	pipeline should be routed to run alongside existing utility corridors except where this would cause greater impact to wetland and riparian habitats or rare resources. The EIS should indicate the locations where the proposed pipeline would and would not run parallel to existing utility corridors.	corridors to the maximum extent practicable. Appendix N of the EIS identifies areas where the proposed Project runs next to and existing utility corridor or within a greenfield location (away from existing utility corridors).
1520	25	Wolf	Clayton	Texas Parks and Wildlife	Recommendation: The pipeline alignment should be routed to avoid or minimize disturbance to wetland, bottomland forest and riparian areas, especially large contiguous tracts of quality habitats. When it is not feasible to avoid such habitats, the footprint of disturbance should be reduced as much as possible and crossings should be conducted perpendicular to linear stream and riparian habitats to reduce the amount of disturbance.	Using Horizontal Directional Drilling (HDD) to cross all wetlands and waters would not be practicable as described in general Consolidated Response ENV-5. There is currently one wetland area that has been identified through for crossing using HDD on the Houston Lateral at about MP 17.7 Turkey Creek Marsh. Most HDD crossings of rivers and streams are designed to cross under and avoid riparian forests and riverine wetlands.
1520	26	Wolf	Clayton	Texas Parks and Wildlife	Recommendation: In these areas, only vegetation impeding construction should be removed, equipment should not be driven over vegetation when it is extremely wet, and heavy machinery should not be stored on vegetative cover for long periods of time. Protective mats should be placed within streambeds during construction to reduce the amount of soil and root disturbance and aid in the recovery of plants.	The EIS has been revised in response to this comment. However, DOS anticipates that requirements for any such mitigation measures for stream crossings in Texas would be included in the Section 404 permitting process conducted by the U.S. Army Corps of Engineers and the Texas Commission on Environmental Quality.
1520	27	Wolf	Clayton	Texas Parks and Wildlife	Recommendation: High quality wetland, riparian, and bottomland hardwood communities should be crossed using directional drilling techniques when avoidance is not feasible. Staging areas for the drilling equipment should be located in previously disturbed areas or areas of low value habitat.	Using Horizontal Directional Drilling (HDD) to cross all wetlands and waters would not be practicable as described in general Consolidated Response ENV-5. There is currently one wetland area that has been identified through for crossing using HDD on the Houston Lateral at about MP 17.7 Turkey Creek Marsh. Most HDD crossings of rivers and streams are designed to cross under and avoid riparian forests and riverine wetlands.
1520	28	Wolf	Clayton	Texas Parks and Wildlife	Recommendation: Vehicles not needed specifically at creek crossings should utilize nearby roadways and bridges when crossing wetlands and streams to avoid soil disturbances.	Keystone's Construction, Mitigation, and Reclamation plan provides for implementation of this recommended mitigation.
1520	29	Wolf	Clayton	Texas Parks and Wildlife	Recommendation: The applicant should minimize disturbance to inert microhabitats, i.e., snags, brush piles, fallen logs, creek banks, and pools, as these provide habitat for a variety wildlife species and their food sources.	Section 3.6.3 of the EIS was revised to add the mitigation measure recommended by the commenter.
1520	30	Wolf	Clayton	Texas Parks and Wildlife	Recommendation: Disturbance to state-owned streambeds crossed by any pipeline may require a permit issued by TPWD. Regarding permits for streambed disturbances, please coordinate with Rollin MacRae, TPWD - Inland Fisheries at (512) 389-4639. Please keep the TPWD Habitat Assessment Program up-to-date on the status of coordination with Inland Fisheries.	Comment acknowledged.
1520	31	Wolf	Clayton	Texas Parks and Wildlife	Recommendation: The pipeline crossing of the rivers and streams should be located to avoid or minimize loss to wetland, riparian, and bottomland hardwood habitat. Placing the proposed pipeline alongside existing corridors is preferred, except when doing so would have a greater impact on natural resources. The Environmental Assessment or EIS should address wetland, riparian, and bottomland hardwood impacts at the proposed river and stream crossings to determine that the location chosen is most suitable and provides the least amount of unavoidable impacts compared to other possible crossing locations nearby. Mitigation for impacts to all	The Keystone XL pipeline was co-located with existing utility corridors to the maximum extent practicable. Appendix N of the EIS identifies areas where the proposed Project runs next to and existing utility corridor or within a greenfield location (away from existing utility corridors). The alternatives analysis was initially conducted as a screening process that first identified potential alternatives to the proposed Project then screened out alternatives that were not judged to be reasonable. As noted in Section 4.0, all major alternatives identified were screened out as not being reasonable and were not further evaluated. Therefore, DOS has not addressed

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					wetlands, bottomland forests, and riparian areas should be provided.	specific wetlands along the alternative routes identified in the assessment. All wetlands will receive construction mitigations as described in Keystone's Construction, Mitigation, and Reclamation Plan (Appendix B of the DEIS). Keystone has committed to follow the same construction, mitigation, and reclamation plan for all wetland crossings regardless of whether the wetland qualifies as jurisdictional under the U.S. Army Corps of Engineer Section 404 permits. The only difference would be the requirement for compensatory mitigation for permanent wetland losses which will be negotiated with the USACE during the permitting process. See Section 3.4 of the EIS for further information on wetland impacts and mitigation.
1520	32	Wolf	Clayton	Texas Parks and Wildlife	Recommendation: Boring underneath the rivers and streams and the associated bottomland hardwood habitat should be conducted to minimize impacts.	Consolidated Response ENV-5 addresses requests for the use of the horizontal direction drilling method for all wetlands and waterbodies. Consolidated Response WAT-1 addresses stream crossing methods and the associated potential water quality impacts.
1520	33	Wolf	Clayton	Texas Parks and Wildlife	Recommendation: Wetland impacts should be monitored using the attached U.S. Army Corps of Engineers-Galveston District Interagency Guidelines. Avoidance and minimization of impacts to wetlands should be proposed through:1. reductions in the nominal construction ROW width in wetlands,2. placement of the pipeline parallel to existing utility ROW,3. selective routing,4. the use of wetland and waterbody construction and mitigation procedures,5. crossing wetlands using boring techniques, and6. reducing maintenance of the permanent ROW in wetlands to a 10-foot (ft) wide area centered over the pipeline.	Keystone will follow the Construction, Mitigation, and Reclamation Plan (Appendix B of the EIS) for construction through wetlands under a U.S. Army Corps of Engineers (USACE) Section 404 Nationwide Permit. Keystone has used the cited guidelines to avoid and minimize Proposed Project impacts to wetlands. Keystone will follow any conditions issued with the Nationwide Permits issued by each USACE District Office. The monitoring protocol identified in this comment is the USACE-Galveston District's Monitoring Protocols for Pipelines Impacting Emergent Marsh. As such, these monitoring protocols may be included as a permit conditions by the USACE-Galveston District for the portions of the Keystone XL Nationwide permits issued by the Galveston District Office for the Gulf Coast Segment and Houston Lateral.
1520	34	Wolf	Clayton	Texas Parks and Wildlife	Pipeline projects usually do not result in a net loss of wetlands, though there are reductions in overall functional value when forested wetlands are permanently and temporarily converted to emergent or scrub-shrub. Typically, an area 10-ft wide centered over the pipeline is permanently maintained in an herbaceous state. Often times, trees beyond the 10-ft. wide area are selectively removed or prevented trimmed; therefore, forested wetlands beyond the 10-ft. wide area would not be given the chance to become a mature forested wetland. Recommendation: The permanent impacts to forested wetlands should be calculated to include the total width of area where trees would be removed during long-term maintenance including any removal areas beyond the 10-ft. wide area. All forested wetland clearing is considered a permanent impact that would require compensatory mitigation.	Keystone has committed to follow the same construction, mitigation, and reclamation plan for all wetland crossings. Permanent wetland impacts and requirements for compensatory mitigation will be determined during permitting under the U.S. Army Corps of Engineer Section 404 permits.
1520	35	Wolf	Clayton	Texas Parks and Wildlife	Recommendation: The wetland mitigation plan should take into consideration the temporary and permanent impacts associated with conversion from forested to herbaceous or scrub/shrub wetlands.	Keystone has committed to follow the same construction, mitigation, and reclamation plan for all wetland crossings. Permanent wetland impacts and requirements for compensatory mitigation will be determined during permitting under the U.S. Army Corps of Engineer Section 404 permits. See Section 3.4 of the EIS for further information on wetland

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
						impacts and mitigation.
1520	36	Wolf	Clayton	Texas Parks and Wildlife	Recommendation: The wetland mitigation plan should be developed in consultation with TPWD. TPWD requests that TransCanada address impacts to all wetland types in the wetland mitigation plan and mitigate for these impacts.	Keystone has committed to follow the same construction, mitigation, and reclamation plan for all wetland crossings. Permanent wetland impacts and requirements for compensatory mitigation will be determined during permitting under the U.S. Army Corps of Engineer Section 404 permits. See Section 3.4 of the EIS for further information on wetland impacts and mitigation.
1520	37	Wolf	Clayton	Texas Parks and Wildlife	Based upon the project information provided, it is unclear if the proposed pipeline route would impact remnants of native prairie located in Lamar County. Native prairies are important for supporting the declining populations of most grassland bird species. America's prairies are also diminishing due to habitat fragmentation and loss as a result of development, conversion to non-native pastures, and woody encroachment. TPWD recommends that the stand of native prairie found within the project area be avoided.	Texas Parks and Wildlife Department was contacted to confirm that the native prairie remnant was avoided by the proposed route. The current alignment was compared to the Texas Natural Diversity Database to ensure that the current alignment through Lamar County would not cross any listed features -- none are crossed. TPWD responded that it had not consulted with Keystone on this matter; however, the landowner of the native prairie remnant had indicated that the pipeline route would not cross this property.
1520	38	Wolf	Clayton	Texas Parks and Wildlife	Comment: TPWD prefers that disturbed areas be restored to preconstruction contours and planted with a mixture of native herbaceous species, especially when the adjacent property on one or both sides of the pipeline right-of-way contains native species of vegetation. Introduction of non-native species into native landscapes should be prevented. Native perennial grass species preferred by TPWD for permanent cover include Switchgrass (<i>Panicum virgatum</i>), Eastern Gamagrass (<i>Tripsacum dactyloides</i>), Virginia Wildrye (<i>Elymus virginicus</i>), Canada Wildrye (<i>E. canadensis</i>), Yellow Indiangrass (<i>Sorghastrum nutans</i>) and Little Bluestem (<i>Schizachyrium scoparium</i>). Other species appropriate for the area can be found by accessing the TPWD Texas Plant Information Database at http://tpid.tpwd.state.tx.us/overview.asp or by accessing the TPWD Wildscapes website at http://www.tpwd.state.tx.us/huntwild/wild/wildscapes/ .	As required by the Keystone the Construction, Mitigation, and Reclamation Plan in Appendix B of the EIS, the final seed mixes for restoration will be developed by Keystone in consultation with the local Natural Resource Conservation Service and based on the availability of seed at the time of reclamation. The landowner or the land management agency may request specific seeding requirements during easement negotiation. The recommendation for native perennial grass species was relayed to Keystone by Department of State through transmittal of the comment letter.
1520	39	Wolf	Clayton	Texas Parks and Wildlife	Recommendation: During the easement acquisition process, each landowner should be offered a native seed mix.	Final seed mixes for restoration would be developed by Keystone in consultation with the local Natural Resource Conservation Service and based on the availability of seed at the time of reclamation. The landowner or the land management agency may request specific seeding requirements during easement negotiation. The recommendation for native perennial grass species was relayed to Keystone by the Department of State through transmittal of the comment letter.
1520	40	Wolf	Clayton	Texas Parks and Wildlife	Comment: To verify successful revegetation and to determine the need for additional restoration, the applicant should conduct at least 2 years of post-construction monitoring.	Revegetation monitoring and repair would be conducted for several years after construction of the proposed Project, as described in the Construction Mitigation and Reclamation Plan, which is incorporated as Appendix B of the EIS. Section 3.5.5.1 of the EIS was revised to add the following statement: "Monitor the right-of-way for several years and repair erosion and reseed poorly revegetated areas as necessary; inform landowners of efforts and intentions."
1520	41	Wolf	Clayton	Texas Parks and Wildlife	Recommendation: In wetlands, vegetation should be allowed to reestablish naturally, though a three-year monitoring plan to	Keystone will follow the Construction, Mitigation, and Reclamation Plan (Appendix B of the EIS) for construction

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					determine success should be conducted. Unsuccessful revegetation would require active planting with native wetland herbaceous and woody plant species in consultation with a professional wetland ecologist. Through experience, pipeline projects typically propose seed mixes that	through wetlands under a U.S. Army Corps of Engineers (USACE) Section 404 Nationwide Permit. Keystone has used the cited guidelines to avoid and minimize Proposed Project impacts to wetlands. Keystone will follow any conditions issued with the Nationwide Permits issued by each USACE District Office. Native seed mixes for reclamation have been developed in consultation with local U.S. Department of Agriculture, Natural Resources Conservation Services offices. The monitoring protocol identified in this comment is the USACE-Galveston District's Monitoring Protocols for Pipelines Impacting Emergent Marsh. As such, these monitoring protocols may be included as a permit conditions by the USACE-Galveston District for the portions of the Keystone XL Nationwide permits issued by the Galveston District Office for the Gulf Coast Segment and Houston Lateral. See Section 3.4 of the EIS for further information on wetland impacts and mitigation.
1520	42	Wolf	Clayton	Texas Parks and Wildlife	Through experience, pipeline projects typically propose seed mixes that contain primarily Bermuda grass (<i>Cynodon dactylon</i>) and/or Bahia grass (<i>Panicum notatum</i>). Both of these grasses are non-native species that typically create a monoculture on the landscape and limit biodiversity. Bahia grass is considered undesirable from a wildlife perspective due to its invasive nature and lack of providing habitat for most wildlife. Once established, Bahia grass can thrive with little water and fertilizer and produces an abundance of seed. In habitat restoration, herbicide treatment may remove Bahia grass for one season, though eradication of Bahia grass is very difficult because of the seed that remains in the soil and its aggressive rhizome system. Whereas, without applications of fertilizer and lime, Bermuda grass tends to diminish and other herbaceous species are able to compete, thus biodiversity increases. Additionally, eradication of Bermuda grass with herbicide is more feasible than eradication of Bahia grass. Comment: When the use of native seed mixes is not feasible, TPWD prefers the use of Bermuda grass rather than Bahia grass for reasons mentioned above.	Final seed mixes for restoration will be developed by Keystone in consultation with the local Natural Resource Conservation Service and based on the availability of seed at the time of reclamation. The landowner or the land management agency may request specific seeding requirements during easement negotiation. The recommendation for native perennial grass species was relayed to Keystone by the Department of State through transmittal of the comment letter.
1520	43	Wolf	Clayton	Texas Parks and Wildlife	The Chinese Tallow tree (<i>Triadica sebifera</i>) is an invasive species that is known to invade stream banks, riverbanks, and wet areas as well as upland sites. Disturbed areas are especially susceptible to infestation of tallow trees. Other exotic species with potential to invade portions of the project ROW include cogon grass (<i>Imperata cylindrica</i>), Chinese privet (<i>Ligustrum sinense</i>), Japanese honeysuckle (<i>Lonicera japonica</i>), deep-rooted sedge (<i>Cyperus setigerianus</i>), and purple loosestrife (<i>Lythrum salicaria</i>). Recommendation: A revegetation and maintenance plan should be prepared to monitor and control invasive species within the construction and operation ROWs. Occurrences of the exotic species listed above should be treated and controlled.	Keystone would implement measures to prevent the spread of noxious weeds and invasive aquatic animals as described in Sections 3.5.5.4 and 3.7.3.1 of the EIS. Section 3.7.3.1 of the EIS was revised to include additional measures Keystone would implement to prevent the spread of aquatic invasive species. The measures described were recommended by federal and state management agencies. Keystone will develop and implement weed control plans which includes identification of weed sources identified along the ROW that includes additional specific descriptions of methods for containment and control as part of its Construction, Mitigation, and Reclamation Plan, which is in Appendix B of the EIS.
1520	44	Wolf	Clayton	Texas Parks and Wildlife	Determining the actual presence of a species in a given area depends on many variables including daily and seasonal activity cycles, environmental activity cues, preferred habitat, transiency and population density (both wildlife and human).	Data from the Texas Natural Diversity Database for the area within 5 miles of the proposed route were requested and reviewed during development of the draft EIS. The county lists were obtained and a table listing these species was

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					The absence of a species can be demonstrated only with great difficulty and then only with repeated negative observations, taking into account all the variable factors contributing to the lack of detectable presence. The TXNDD is intended to assist users in avoiding harm to rare species or significant ecological features. Given the small proportion of public versus private land in Texas, the TXNDD does not include a representative inventory of rare resources in the state. Absence of information in the database does not imply that a species is absent from that area. Although it is based on the best data available to TPWD regarding rare species, the data from the TXNDD do not provide a definitive statement as to the presences, absence or condition of special species, natural communities, or other significant features within your project area. These data are not inclusive and cannot be used as presence/absence data. They represent species that could potentially be in your project area. This information cannot be substituted for on-the-ground surveys. The TXNDD is updated continuously based on new, updated and undigitized records; TPWD has conducted a review of the TXNDD based upon the pipeline route map dated 04/23/2008. Recommendation: TPWD requests that TransCanada provide a GIS shapefile of the preliminary pipeline alignment to further assist in the search of the TXNDD for known rare resource occurrences and management areas in the vicinity of the project.	incorporated into the Biological Assessment presented in Appendix T of the EIS.
1520	45	Wolf	Clayton	Texas Parks and Wildlife	Recommendation: To avoid impacts to the WO-WO community all efforts should be made to re-route around the resource or bore underneath the resource, where feasible.	Section 3.5.5.2 of the EIS was revised to the following language, as recommended by the commenter: "In Texas, avoid impacts to water oak-willow oak forest communities; survey route to determine extent and quality of water oak-willow oak community (tree species, tree heights, tree diameter at breast height, and percent canopy); avoid by re-route or by boring underneath; where unavoidable provide mitigation for permanent impacts the do not fall under the jurisdiction of the Corp through habitat restoration, purchase of mitigation bank credits (TPWD)."
1520	47	Wolf	Clayton	Texas Parks and Wildlife	Recommendation: The proposed construction and permanent right-of-way should be surveyed to determine the extent and quality of the WO-WO community present in the project area and the anticipated impacts to the community should be quantified. The tree species, range of tree heights, diameters-at-breast-height, and percent canopy cover should be determined.	Section 3.5.5.2 of the EIS was revised to the following language, as recommended by the commenter: "In Texas, avoid impacts to water oak-willow oak forest communities; survey route to determine extent and quality of water oak-willow oak community (tree species, tree heights, tree diameter at breast height, and percent canopy); avoid by re-route or by boring underneath; where unavoidable provide mitigation for permanent impacts the do not fall under the jurisdiction of the Corp through habitat restoration, purchase of mitigation bank credits (TPWD)."
1520	48	Wolf	Clayton	Texas Parks and Wildlife	Comment: Other areas along the pipeline right-of-way may occur that are similar in species composition to the mapped WO-WO community, thus the applicant should avoid and minimize impact to other WO-WO communities encountered along the proposed right-of-way. All efforts should be made to avoid or minimize impact to the WO-WO community, wetlands, bottomland hardwoods, riparian habitat, and other sensitive communities or special habitat features during project planning, construction, and maintenance activities.	Section 3.5.5.2 of the EIS was revised to the following language, as recommended by the commenter: "In Texas, avoid impacts to water oak-willow oak forest communities; survey route to determine extent and quality of water oak-willow oak community (tree species, tree heights, tree diameter at breast height, and percent canopy); avoid by re-route or by boring underneath; where unavoidable provide mitigation for permanent impacts the do not fall under the jurisdiction of the Corp through habitat restoration, purchase of

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
						mitigation bank credits (TPWD)."
1520	49	Wolf	Clayton	Texas Parks and Wildlife	Recommendation: Using the county lists of rare species, the portions of the proposed ROW with potential to support rare species should be field surveyed to determine the extent and quality of the suspect habitat and potential impacts.	Keystone initiated consultation with federal and state agencies regarding the presence of sensitive species within the proposed Project area in 2008. Using available desktop resources, including natural heritage database search results, Keystone met with federal and state agencies to determine which sensitive species would occur within the proposed Project area and that would require additional survey or habitat information. Section 3.8 identifies potential Project-related impacts to animals and plants specifically identified during these consultations.
1520	51	Wolf	Clayton	Texas Parks and Wildlife	Recommendation: Construction crews should be informed of the rare species that have potential to occur in the proposed Project county and should avoid disturbance to sensitive species if encountered during construction. Only personnel with a TPWD scientific collection permit are allowed to handle and move state listed species. For further information on the required permit please contact Chris Maldonado, TPWD Wildlife Permits Specialist, at (512) 389-4647. Comment: Further consultation with TPWD would be warranted upon detection of a Texas listed rare, threatened, or endangered species within or near the ROW at any time prior to or during construction and operation of the pipeline.	Construction personnel would attend environmental training sessions and would be informed of the potential presence of sensitive species within or in close proximity to the construction right-of-way. Keystone would train and use environmental inspectors to ensure adherence to relevant environmental regulatory requirements.
1520	53	Wolf	Clayton	Texas Parks and Wildlife	The resource agencies recommend the following GIS/ Remote Sensing method and standard be used in order to produce accurate and consistent results. The pipeline corridor will be monitored by providing pre- and post- construction aerial photography, (taken 24 months after construction completion to allow for vegetative regrow) at a scale of 1: 4800 or 1 inch to 400 feet. The applicant will then be required to utilize GIS and Remote Sensing techniques to conduct an analysis of change to determine the amount of vegetated marsh impacted by pipeline construction activities. Monitoring reports should be submitted by the applicant that includes at a minimum:1) a pre-project GIS analysis assessing the existing emergent marsh to open water ratio, in acres, within the permitted corridor (which includes the construction corridor and the 200 meter buffer zone).2) a post -project GIS analysis assessing the emergent marsh to open water ratio, in acres, within the entire permitted corridor (which includes the construction corridor and the 200 buffer zone),3) Ortho corrected imagery covering the construction corridor and buffer zone, maximum of 6 inch pixel size and CIR imagery, +/- 2 meters spatial accuracy, 4) All vector deliverable to be in Arc view Shape file format with FGDC compliant metadata and all raster imagery in GGeoTiff format with FGDC compliant metadata. A binary classification system should be used consisting of open water and vegetated areas. The classified data should meet or exceed 90 % attribute accuracy as determined by industry standard and be verified by statistically valid ground truth sampling techniques, this can include GPS based ground surveys.	Keystone would follow the Construction, Mitigation, and Reclamation Plan (Appendix B of the EIS) for construction through wetlands and the permit requirements of a U.S. Army Corps of Engineers (USACE) Section 404 Nationwide Permit. Keystone will follow any conditions issued with the Nationwide Permits issued by each USACE District Office. The monitoring protocol identified in this comment is the USACE-Galveston District's Monitoring Protocols for Pipelines Impacting Emergent Marsh. As such, these monitoring protocols may be included as a permit conditions by the USACE-Galveston District for the portions of the Keystone XL Nationwide permits issued by the Galveston District Office for the Gulf Coast Segment and Houston Lateral.
1520	54	Wolf	Clayton	Texas Parks and Wildlife	Therefore, TPWD cannot support placement of pipeline infrastructure within the floodplains and requests that	The placement of aboveground infrastructure is addressed in Section 2 of the EIS. Potential impacts of the proposed

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					TransCanada relocate infrastructure to upland areas to minimize impacts. It is also preferred by TPWD that the project infrastructure be placed in areas previously cleared or disturbed to avoid unnecessary removal of valuable forested communities,	Project are addressed in Section 3 of the EIS. Consolidated Response WAT-3 addresses concerns regarding potential impacts to wetlands and waterbodies due to construction of ancillary facilities.
1520	55	Wolf	Clayton	Texas Parks and Wildlife	An additional concern of placing the pump station within the floodplain and within close proximity to the Angelina River involves potential surface water contamination that may result from petroleum related spills or leaks at the pump station, Although containment areas must be incorporated into the pump station design, overtopping of floodplain waters into the containment areas or excess storm water runoff from the pump station facility could cause contaminants to leave the station, The pump station should be placed outside of the floodplain and at a significant distance from a major surface water to minimize potential contamination concerns,	The placement of aboveground infrastructure is addressed in Section 2 of the EIS. Potential impacts of the proposed Project are addressed in Section 3 of the EIS. Consolidated Response WAT-3 addresses concerns regarding potential impacts to wetlands and waterbodies due to construction of ancillary facilities.
1520	56	Wolf	Clayton	Texas Parks and Wildlife	The proposed route will cross through the Pineywoods Wetland Mitigation Bank. This bank was approved as a wetland mitigation banking site due to its intact bottomland forest and vast size of the tract. Therefore, TPWD recommends that the pipeline be rerouted to avoid impacting the bank site. There is a cleared right-of-way east of US Highway 59 that the project proponent should investigate as potential alternate route.	The pipeline route was realigned to avoid crossing the Pineywoods Mitigation Bank and the EIS was revised accordingly.
1520	57	Wolf	Clayton	Texas Parks and Wildlife	Your June 30, 2009 letter indicated that a rookery was found within the proposed Project's workspace. To avoid impacts to the rookery, a route adjustment should be made to avoid removal of trees that contain active or inactive nests. The new route should not come within 500 ft of the rookery. Permanent pump stations should be placed at a greater distance from a rookery so that noise levels do not disturb birds or prevent the rookery from being utilized.	This comment was from a letter dated September 25, 2009 from Texas Parks and Wildlife to Mr. Jerry Castillo of AECOM Environmental. The combined survey data indicate that 8 great blue heron rookeries or nests were identified along the proposed Project right-of-way in Texas. Two of these would be within 500 feet of the proposed route alignment, and one may be within a work area. The requested mitigation was added to Table 3.8.4-1 of the EIS as follows: "adjust route to avoid removal of trees with active or inactive nests, avoid rookeries by 500 feet, avoid placing pump stations close to rookeries in Texas (TPWD)".
1520	58	Wolf	Clayton	Texas Parks and Wildlife	Recommendation. TPWD prefers that both the WO-WO community and the Angelina River at this location involve HDD or a reroute of the pipeline around the resources, if feasible. Extra workspaces and staging areas should be placed in previously cleared areas to avoid further loss of habitat. Non-regulatory mitigation should be provided for unavoidable impacts.	The Angelina River crossing at MP 334.2 would be crossed using HDD, which would include the area of native forest on either side of the river. Further information about HDD is included in Section 2.3.3.5 of the EIS. Extra workspaces are proposed within planted pine plantations. Permanent wetland impacts and requirements for compensatory mitigation will be determined during permitting under the U.S. Army Corps of Engineer Section 404 permits. See Section 3.4 of the EIS for further information on wetland impacts and mitigation.
1520	61	Wolf	Clayton	Texas Parks and Wildlife	MP 333-337. The project includes a HDD of the river at this location, though the project would cross riparian habitat and a WO-WO community associated with the Angelina River and involves placement of a pump station south of the river within the floodplain as previously mentioned above. Recommendation: A route alternative that runs west of the Angelina River from approximately MP 308 to MP 338 should be considered. Such a route would eliminate the two crossings of the Angelina River and would avoid impacts associated with crossing the Angelina River floodplain and bottomland	The current alignment of the Keystone XL pipeline from MP 333 to MP 337 includes a revision to the HDD entry point. The revised HDD entry is located within a forest plantation and the pipeline would run beneath the native riparian forest. The HDD exit point is also located within a forest plantation on the south side of the Angelina River. The previous location for Pump Station 39 just south of the Angelina River was revised to near MP 338. The proposed Project alignment from MP 332.9 to MP 338.0 is adjacent to the existing pipeline right-of-way for 62 percent of this 5.2-mile-long area which would minimize the

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					habitats.	impacts to willow oak - water oak communities.
1520	62	Wolf	Clayton	Texas Parks and Wildlife	MP 347-348.5, MP 351-352.5, MP 359-360.5, and MP 366-370. WO-WO communities would be crossed by the project.	The alignment of the route was been revised after the September 25, 2009 comment was submitted. However, several instances of water oak-willow oak series communities as identified in the Texas Natural Diversity Database (TXNDD) still appear to be crossed by the current alignment. Table 3.5.5-3 of the EIS was revised with current values based on the TXNDD data. Recommended mitigation for these communities is addressed in Section 3.4.4 of the EIS.
1520	63	Wolf	Clayton	Texas Parks and Wildlife	MP 374. The project crosses Piney Creek, an ecologically significant stream segment. Request. To protect aquatic resources, TPWD requests that this stream be crossed using HDD. Staging areas for HDD should be placed in previously cleared areas to avoid disturbance to existing wooded corridor.	There are actually two proposed channel crossings of Piney Creek at MP 376.43 and MP 376.45. These crossings are not currently scheduled for HDD methodology. The request of TPWD has been forwarded to Keystone.
1520	64	Wolf	Clayton	Texas Parks and Wildlife	MP 386 - 389.5. The project runs parallel to and crosses four times Big Sandy Creek, an ecologically significant stream segment. Recommendation. To avoid removal of riparian habitat, the project should be routed to avoid running parallel to this stream.	There are actually five proposed crossings of Big Sandy Creek from MP 388.49 to MP 391.67. These crossings are not currently scheduled for HDD methodology. The request of TPWD has been forwarded to Keystone.
1520	66	Wolf	Clayton	Texas Parks and Wildlife	MP 394.5 - 395. The project workspace encroaches on the riparian habitat up to the streambank of Menard Creek, an ecologically significant stream segment. Recommendation: To avoid removal of riparian habitat, the project should be routed to avoid running parallel to this stream. If a reroute is not feasible, the workspace should be narrowed and non-regulatory mitigation should be provided for riparian impacts.	This segment of the proposed route from MP 394.5 to MP 395.0 in the draft EIS (currently MP 397.1 to MP 397.6) was realigned to cross under the existing pipeline corridor and back to avoid running parallel to Menard Creek and reduce impacts to riparian habitat to the extent practicable. The construction right-of-way was narrowed and extra workspaces were relocated to the extent practicable to reduce impacts to riparian habitats and forested wetlands.
1520	67	Wolf	Clayton	Texas Parks and Wildlife	MP 401.5. The project crosses Menard Creek, and extra workspaces are proposed on both sides of the creek within existing wooded riparian habitat. Recommendation: The workspaces should be moved farther from the creek and placed within existing cleared areas.	This segment of the proposed route near MP 401.5 (currently MP 404.2) has been realigned since this September 25, 2009 comment was submitted. The workspaces have been reduced to the extent practicable, although some forested wetlands near the stream bank would still be affected by the extra workspaces during construction.
1520	68	Wolf	Clayton	Texas Parks and Wildlife	MP 446-449.5. The project runs parallel to and twice crosses Pine Island Bayou, an ecologically significant stream segment. Additionally, from MP 452.5 - 455.5 the project crosses a Swamp Chestnut Oak - Willow Oak G3S3 Series Community. Request. TPWD requests that the project be routed to avoid these resources.	The proposed Project alignment at MP 449.0 to 451.7, which crosses Pine Island Bayou twice (original MP 446.4 to 449.5) is adjacent or parallel to an existing pipeline ROW along this entire route. The first crossing of Pine Island Bayou would be completed using the horizontal directional drilling (HDD) method from MP 448.6 to 449.2. The construction right-of-way would be reduced where Pine Island Bayou and forested wetlands are crossed the second time at MP 451.4 to 452.0. The section of the proposed Project from MP 455.3 to 457.7 that has been identified as a Swamp Chestnut Oak – Willow Oak Series Community (original MP 452.5 to 455.5) based on the Texas Natural Diversity Database is also adjacent or parallel to existing rights-of-way. As a result, impacts to these resources have been avoided or minimized.
1520	69	Wolf	Clayton	Texas Parks and Wildlife	MP 22-23 Houston Lateral. The project runs crosses the Trinity River, an ecologically significant stream segment. WO-WO communities would be crossed by the project. Request. To protect aquatic resources, TPWD requests that this stream be crossed using HDD, where feasible. Staging areas for HDD	The Trinity River at MP 22.8 is planned to be crossed using HDD methodology. Wherever possible, staging areas would be placed in previously cleared areas to avoid disturbance to the existing wooded corridor.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					should be placed in previously cleared areas to avoid disturbance to existing wooded corridor.	
1520	70	Wolf	Clayton	Texas Parks and Wildlife	MP 27-28 Houston Lateral. The project crosses Old River, an ecologically significant stream segment. Request. To protect aquatic resources, TPWD requests that this stream be crossed using HDD, where feasible. Staging areas for HDD should be placed in previously cleared areas to avoid disturbance to existing wooded corridor.	The Old River crossing at MP 27-28 is not currently scheduled for HDD methodology. The request of TPWD has been forwarded to Keystone.
440	2	Wolfe	Jane		Please find another route for the pipeline planned to go through Nebraska. The project threatens the Ogallala Aquifer, containing approximately 2/3 of the water volume of the High Plains system. The Aquifer is one of the greatest fresh water resources of the world and supports the sand dunes in the area. The entire system recharges lakes, streams, and wet meadows in the region.	Consolidated Response ALT-1 addresses potential alternative routes, including routes that would avoid much of the Northern High Plains Aquifer system.
1412	1	Wolff	E.James	Wolff Corporation	As a landowner having the pipeline cross my land on three separate sections, I write in support of TransCanada's Keystone XL crude oil pipeline project and urge the department to grant a permit for the pipeline... I urge the granting of the permit. Thank you for the opportunity to comment.	Comment acknowledged.
1412	4	Wolff	E.James	Wolff Corporation	Considering the economic [and energy security] benefits of these vital resources, we should continue to expand America's access to safe, affordable energy to help ensure [improved domestic and global energy security and] stable prices for consumers. This project also stands to provide a powerful private sector economic stimulus. During construction, Keystone XL will create more than 13,000 jobs funded with private investment. In addition, local governments will have a steady source of income from economic activity associated with construction and from property taxes the pipeline company will pay. Rejection or the permit or suspension of the review would sacrifice the significant economic benefits this project stands to deliver and force U.S. consumers to rely on other sources of crude oil not economically and politically allied with U.S. interests. This would be a mistake.	Consolidated Response ECO-1 addresses potential socioeconomic impacts, and Consolidated Response TAX-1 addresses concerns regarding taxes.
1412	5	Wolff	E.James	Wolff Corporation	Pipelines are the safest, most reliable, economical and environmentally favorable way to transport oil and petroleum products, as well as other energy liquids, throughout the U.S.	Comment acknowledged.
1545	16	Wolff	Jim	Landowner	I'm totally in favor of the pipeline; dealing with Keystone, we've dealt with them ever since the get-go here; they've been very up front, they've been very fair. I think, I have no problem with them. I think it's good for the county, it's good for the state.	Comment acknowledged.
1089	1	Wolken	D.L.		It is absolutely ridiculous and irresponsible to even consider the proposed route of the Keystone pipeline. The soil over which it passes is sand and sand is very porous allowing any potential hazards of leakage to penetrate directly into a pure fresh water aquifer. Adequate safeguards are not enough to protect this very valuable resource and the whole project will leave an un-erasable scar on the whole area and one that can never be removed and reclaimed in the future.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. As described in Consolidated Response GLF-1, the risks associated with the proposed Project are substantially different from those associated with the BP Deepwater Horizon Project.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
1089	3	Wolken	D.L.		No thank you. We have all seen irreversible damages caused by quest for wealth and oil. The environment and the people always loose in these situations. Please let common sense prevail and disallow the propose pipeline route.	The commenter's opinion is noted.
398	1	Wood	Janet		Tar sands are not the answer for clean energy, the destruction they have caused should not happen here in Utah on our beautiful lands.	The proposed Project does not extend through Utah.
826	1	Wood	Cindy		I am against this project. I just don't think it is worth the risk to our natural resources!	The commenter's opinion is noted.
1375	1	Woodard	W.Shayne		Recently a number of advocacy groups sent a letter seeking suspension of the permitting of the Keystone XL pipeline. I encourage you to reject the request and to continue to review the proposed project...The permitting processes in place are appropriate and should proceed so that a final determination can be made about the impacts of the project and whether it is in the national interest. Please reject the request to suspend the process and continue with the review.	Comment acknowledged.
1375	4	Woodard	W.Shayne		At the same time, construction of this project stands to bring significant economic benefits to the areas where it will be built.	Comment acknowledged.
1228	2	Woods	Dave	Energy Systems Company	For over a century pipelines have been providing the needs of Energy, water, liquids, gasses and other products above and below ground to the populations of the world. The United States and Canada possess the leading technological knowhow to construct safe pipelines. This Technology includes radiographic inspection (x-ray) which is extremely good. I would say 100% failsafe but I am a believer that nothing is 100%. Other Technology to give long longevity to the pipeline is "Cathodic Protection" (the use of coatings and anodes to minimize or eliminate corrosion). I know that these two methods will be used in the construction of this pipeline.	Consolidated Response SAF-1 describes the regulatory requirements and Project-specific Special Conditions that Keystone would comply with to construct, operate, maintain, inspect, and monitor the proposed Project. It also describes the monitoring, inspections, and reviews of the proposed Project that the Pipeline and Hazardous Materials Safety Administration would conduct to ensure compliance with those regulatory requirements.
1228	3	Woods	Dave	Energy Systems Company	Hundreds of thousands of miles of pipeline serve every community in the United States with every kind of product imaginable. Some products are much more hazardous than oil which, like it or not, is the lifeblood of American Industry. It provides Jobs, comfort, fuel for everything, including farms, buildings (my specialty, cars, trucks, Railroads and on and on	Comment acknowledged.
1228	4	Woods	Dave	Energy Systems Company	Yes there accidents; Some are severe and cause damage to the environment, death and destruction. It would be nice to eliminate all problems but it is not realistic. We need to do our best to take care of the Earth and the resources God has provided. We need to be ethical and not abuse the privileges given to us by God. We need to do what is best for mankind.	Consolidated Response OIL-1 provides a summary of the range of spill frequency estimates addressed in the EIS. Consolidated Response OIL-2 addresses maximum-sized releases from the Project and addresses concerns about corrosion rate comparisons between the Alberta transmission pipeline system and the U.S. transmission pipeline system. Required emergency response plans for the proposed Project are discussed in Consolidated Response RES-1. As discussed in Section 3.13 of the EIS, federal, state, and local agencies would participate in response activities and soil, surface water, and groundwater cleanup consistent with their authorities and duties under applicable regulations and consistent with the requirements of the Emergency Response Plan and the Pipeline Spill Response Plan. A list of applicable regulations relative to remediation of crude oil spill contamination at the federal and state level is provided in Table 3.13.5-10. Required mitigation for crude oil or oil

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
						products spill impacts would be determined by these agencies.
1228	5	Woods	Dave	Energy Systems Company	I believe that adequate safeguards are in place to regulate the Industry. If anything is missing it is to hold the executives personally liable for their conduct in running a company. If it is proven that they have violated proper ethical conduct they should be prosecuted and penalized.	Comment acknowledged.
1228	6	Woods	Dave	Energy Systems Company	The key to construction of a "SAFE" pipeline is to get personal assurances from the top five people from the companies that own the pipeline. They should take an oath that they will perform in the highest ethical standards and not cut corners when it comes to the CONSTRUCTION, OPERATION, MAINTENANCE AND SAFETY of the pipeline. This oath is binding, enforceable and carries penalties for breach.	The commenter's opinion is noted.
1559	80	Woods	Cody		Pipeliners that have tested pipeline for 15 years. He says 1440 pounds is operating pressure and they test at time and a half of operating pressure. Different pipes get tested differently depending on the wall thicknesses to make sure there are no leaks in the water.	Comment acknowledged.
1559	81	Woods	Cody		Pipeliners that work for Michael's Pipeline who works for Keystone. He does everything he can to put the land back the way they found it.	Comment acknowledged.
1559	82	Woods	Cody		He is for the pipeline because it brings a lot of good jobs, and the people that work are professionals.	Comment acknowledged.
617	1	Workman	Peggy		Do not put a pipeline in the Sandhills. I have visited the beautiful Sandhills area many times over the years. I can hardly believe it is my Nebraska it is so unique. It is a fragile ever changing topography. No pipeline.	Identification of sensitive environments crossed by the proposed Project is discussed in Consolidated Response ENV-1 and ENV-3. Issues related to the Sand Hills area are addressed in Consolidated Response ERO-1.
470	1	Wright	Wendy		I am writing to oppose pipelines from the Canadian Tar Sands across the country including over Nebraska's Ogallala Aquifer. Our precious resources will be compromised by this action.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
513	1	Wright	Christiana		I think this is a horrible idea, especially considering the recent Gulf of Mexico oil spill that continues to spill thousands upon thousands of barrels of oil per day. Not only will building this pipeline damage the environment, it will also harm the people living in those areas. Displacing indigenous tribes has been a reoccurring theme ever since our English/European ancestors sailed to this land we now call "The United States of America," and it needs to stop now. Repeating history is not something we should be doing, especially with all the negative consequences and realities that come with it. Our dependence on oil needs to end, and be cut down significantly, in order for us as human beings to realize that the Earth is our only home, and that by destroying the Earth we are simply destroying our future and the futures of generations to come.	As described in Consolidated Response GLF-1, the risks associated with the proposed Project are substantially different from those associated with the BP Deepwater Horizon Project. The proposed Project would not displace Indian tribes and does not cross Indian land (see Section 3.1.1 of the EIS).
1016	1	Wright	Marion		Please, please, please do not allow this pipeline to cross Nebraska in the Sandhills area over the Ogallala aquifer and threaten this very valuable natural resource.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
1559	69	Wright	MaryJane		Concerned about the cutting of large trees. What about the stumps? Will they clear those as well?	Stumps would be removed over the trench and in areas of the construction right-of-way where it is necessary to ensure safety and access for vehicles and equipment.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
1559	70	Wright	MaryJane		We don't get to use the land like we want but we still have to pay taxes on it. The pipeline should pay the taxes.	After construction an dreclamation of the pipeline is complete, most current land uses along the right-of-way can continue, particularly farming and grazing. Consolidated Response TAX-1 and revisions to Section 3.10.2.4 of the EIS address concerns regarding taxes associated with implementation of the proposed Project.
1559	71	Wright	MaryJane		Does not feel was paid enough to cross her land.	As noted in Consolidated Response EAS-2, state laws dictate under what circumstances eminent domain may be used and define the eminent domain process within the state. DOS has no legal authority in the easement negotiations or in eminent domain proceedings. As noted in that response, the Department of State does not have legal authority to intervene in those processes.
1559	72	Wright	MaryJane		Wants to know what is the liability if people get sick?	Consolidated Response LIA-1 addresses Keystone's liability if there is a spill of hazardous materials or fuel during construction or a spill of crude oil from the proposed Project. Crude oil pipeline spills do not pose a substantial risk to the general public. If people experience sickness that is directly attributable to the accidental release, Keystone would be liable for related medical costs.
1559	73	Wright	MaryJane		Who is liable for the damages if an oil spill occurs on your land?	Consolidated Response LIA-1 addresses Keystone's liability if there is a spill of hazardous materials or fuel during construction or a spill of crude oil from the proposed Project.
1559	74	Wright	MaryJane		Wants to be notified if there is any spill on her property no matter how small.	Required emergency response plans for the proposed Project are discussed in Consolidated Response RES-1. As discussed in Section 3.13 of the EIS, federal, state, and local agencies would participate in response activities and soil, surface water, and groundwater cleanup consistent with their authorities and duties under applicable regulations and consistent with the requirements of the Emergency Response Plan and the Pipeline Spill Response Plan. A list of applicable regulations relative to remediation of crude oil spill contamination at the federal and state level is provided in Table 3.13.5-10. Required mitigation for crude oil or oil products spill impacts would be determined by these agencies.
1559	76	Wright	MaryJane		Where is all this oil going? Will it be shipped to China? Agree that we need oil, but thinks there is a better way to do it.	Consolidated Response P&N-1 addresses the need for the proposed Project. As stated in that response, the crude oil would be transported to delivery points in Texas and refined in Gulf Coast refineries. Alternatives are addressed in Section 4.0 of the EIS.
1559	78	Wright	MaryJane		Pipeline goes near their well. How long would it take before we'd find out there is a hazard? How would we know?	<p>If oil from a spill from the proposed Project were to enter the well water, the user would likely know as soon as the water is used because of the smell and/or taste. If that situation occurs, the commenter should call the 800 number listed on the pipeline markers as well as the local health department.</p> <p>If there is a spill from the proposed Project, Keystone or the incident response team would inform all landowners in the vicinity of the spill that the release had occurred and advise the landowners of the appropriate precautions. Keystone would be liable for all costs associated with cleanup and restoration as well as other compensations, as noted in Consolidated Response LIA-1. If a well used as a source of</p>

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
						water is affected, Keystone would provide water until the well water is proven to be acceptable for use.
1559	79	Wright	MaryJane		Doesn't like that pipeline can go within 25 feet of your house.	Consolidated Response SAF-1 describes the regulatory requirements that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project. It also describes the inspections and reviews of the proposed Project that the Pipeline and Hazardous Materials Safety Administration would conduct to ensure compliance with those regulatory requirements. The regulations and Special Conditions that Keystone would follow do not require that the pipeline be more than 25 feet from a home. The commenter can work with Keystone to address potential minor realignments that can be made during final design, assuming the realignment are consistent with the requirements of environmental permits. In addition, for residences within 25 feet of a residence, Keystone would follow the special construction procedures presented in Section 4.14 of its Construction, Mitigation, and Reclamation Plan in Appendix I.
1559	74	Wright	MaryJane		Wants to be notified if there is any spill on her property no matter how small.	Consolidated Response OIL-3 and Section 3.13.5 of the EIS describe the leak detection system for the proposed Project. Required emergency response plans for the proposed Project are discussed in Consolidated Response RES-1. As discussed in Section 3.13 of the EIS, federal, state, and local agencies would participate in response activities and soil, surface water, and groundwater cleanup consistent with their authorities and duties under applicable regulations and consistent with the requirements of the Emergency Response Plan and the Pipeline Spill Response Plan. A list of applicable regulations relative to remediation of crude oil spill contamination at the federal and state level is provided in Table 3.13.5-10. Required mitigation for crude oil or oil products spill impacts would be determined by these agencies.
446	1	Yardley	Julie		PLEASE, PLEASE, PLEASE DO NOT ALLOW THIS TO GO THROUGH!!!!!!!!!!!!!!!!!!!! I think we humans have done enough harm to the world already!!!!!!!!!!!!	Consolidated Response ENR-1 provides information on the Department of State's environmental review process, the National Interest Determination process, and the need to complete those reviews before approving or denying the Presidential permit for the proposed Project.
446	2	Yardley	Julie		ANY Leakage by this pipeline would have disastrous consequences for millions of Americans and if the water is contaminated enough, there could be dire consequences for food production, that helps to feed the entire world.	Issues related to the Northern High Plains Aquifer System are addressed in Consolidated Responses AQF-1 through AQF-4. Consolidated Response AQF-3 provides information on hypothetical spills from the Project over two areas of the Northern High Plains Aquifer System.
446	3	Yardley	Julie		Please do not run this pipeline underground in the Oglala Aquifer area.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. Consolidated Response ALT-1 addresses potential alternative routes, including routes that would avoid much of the Northern High Plains Aquifer system.
1496	1	Yeoman	Joe		I am for this project. I prefer buying oil from Canada with a land pipe line it is an easier clean up than in water.	Comment acknowledged.
1496	2	Yeoman	Joe		Rules are already in place for safety this will create American	Comment acknowledged.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					jobs. This will keep tax dollars at home all these environmental road blocks are making us a 3rd world country.	
1017	1	Yost	Todd		It is very frustrating to me that we are willing to do whatever with regard to our current energy policy. Wind generation is in the same category, current legislation does not care about the environmental issues of the current residents of the state only the governmental push to save the planet. I appreciate your concerns and support you help to try to protect the citizens of this state. Common sense is backdoor to the current renewable energy push. If the current path continues we are going to pay and the impact on the next generation will be devastating! As a resident of Nebraska, a lifelong resident of the Midwest, I'm strongly opposed to putting a pipeline through the heart of a primary water source. I would ask that this project be stopped. When the water is no longer usable our very existence will be threatened. I feel there should be more focus on cutting demand than on grabbing at supply straws. We can survive with less oil. Our lives will change but we can survive. Please, please, please do not allow this pipeline to cross Nebraska in the Sandhills area over the Ogallala aquifer and threaten this very valuable natural resource. Let Canada take care of it in their own country. With what has been going on in the Gulf of Mexico, it amazes me anyone would consider the threat this would cause with the current plan. Please cancel it! been out there with NO prior accidents. Now that Obama and the Socialists want to kill off the United States by economical means, all of a sudden we have an "accident"? Why aren't there any news reports stating the actual cause of the explosion? You know that if it were a real accident there would have been some answers by now...	Keystone submitted an application for a Presidential permit, and as described in Section 1.0 of the EIS, DOS is required to review the proposed Project. Consolidated Response ENR-1 provides information on the DOS environmental review process, the National Interest Determination process, and the need to complete those reviews before approving or denying the Presidential permit for the proposed Project. Consolidated Response P&N-1 addresses the need that the Project has been proposed to meet. Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. Issues related to the Sand Hills area are addressed in Consolidated Response ERO-1.
1051	1	Yost	Charles		I urge all pertinent government agencies to be very careful before approving the proposed transcanada pipeline through	Consolidated Response ENR-1 provides information on the Department of State's environmental review process, the National Interest Determination process, and the need to complete those reviews before approving or denying the Presidential permit for the proposed Project.
676	1	Youmans	Susan	Environmental Partnerships	I am extremely concerned about the economic impact any leakage would have on U.S. agriculture from the regions that depend on this aquifer. Corn and soy are critical exports as well as critical for feeding U.S. livestock and for their role in U.S. food supply. Run it on top of the ground, route it around the Ogallala Aquifer and wait to authorize it so the most basic lessons from BP disaster can be built into the structure and the monitoring.	See Consolidated Response ALT-1 addresses potential alternative routes, including routes that would avoid much of the Northern High Plains Aquifer system. Issues related to an aboveground pipeline are addressed in Consolidated Response CST-1. As described in Consolidated Response GLF-1, the risks associated with the proposed Project are substantially different from those associated with the BP Deepwater Horizon Project.
1037	1	Young	Charlotte		Thank you for a chance to voice my opinion on this. I am concerned about the fact that there is such an open area with no one around to watch if there would be a leak or problem, and then if it could be stopped fast enough to save our amazing underground water supply. I read something once about an airplane checking things out, but that doesn't give me alot of confidence still. I don't know what the answer is BUT I KNOW this needs to be brought to us with MORE answers and protection!!	Consolidated Response OIL-1 and Section 3.13.4 address the likelihood of spills from the Project, and Consolidated Response OIL-3 and Section 3.13.5 of the EIS address detection of small releases from the Project. Large spills would be detected immediately and the pipeline shut down to stop the leak as discussed in Section 3.13.5. As noted in Consolidated Response SAF-1, Keystone would be required to monitor the entire pipeline route 26 times per year, at intervals not to exceed 3 weeks. That monitoring plus the remote detection systems described in Consolidated Response OIL-3 and Section 3.13.5 of the EIS would assist in

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
						identifying leaks in a timely fashion.
1553	19	Zbranek	Zeb		while it would be nice to build and put in more pipes to help union workers, even looking at the map, there seems to be another pipeline running parallel with this one, at least from the Canadian border down to, it looks like the Cushing area. And my question there is why can't you use that pipe?	As noted in Consolidated Response P&N-1, the Project has been proposed to meet the heavy crude oil needs of refineries in the Gulf Coast area, not for the U.S. in general. There is not sufficient pipeline capacity to that location. The Alberta Clipper and existing Keystone pipeline projects serve other markets and do not meet the demands of the Gulf Coast refineries.
1553	20	Zbranek	Zeb		Are there alternative routes that if you are going to put this thing through, that you can do without having to put in a pipe, where you run the risk of hurting the environment.	The No Action and System Alternatives are the only possible alternatives that would not require installation of a pipeline to transport the oil. As noted in the EIS, construction and normal operation of the proposed Project would not result in significant environmental impacts.
1553	21	Zbranek	Zeb		My concern about putting in this type of crude or the way it's going to be processed and transported down and refined down here, makes me concerned about the emissions. And if we're going to have a situation where our emissions are going to be affected negatively, then I would certainly not support this project.	As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries. Consolidated Response OIL-4 also addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils.
1553	22	Zbranek	Zeb		But why not put the refinery there in Canada?	Consolidated Response P&N-8 addresses issues related to shipping Canadian crude oil to refineries that are closer to the source of oil.
1553	23	Zbranek	Zeb		if there is places in the United States that are not part of the non-attainment area that have refinery capacity, those probably should be looked at as well. [for the refinery location]	Keystone has proposed the Project to meet a need for heavy crude oil in the Gulf Coast of the U.S. as described in Consolidated Response P&N-1 and in Section 1.4.2 of the EIS. Consolidated Response P&N-3 addresses issues related to emissions from refineries. Consolidated Response P&N-8 addresses issues related to shipping Canadian crude oil to refineries that are closer to the source of oil.
1553	24	Zbranek	Zeb		on behalf of myself individually and my family, we would certainly be opposed to this project.	Comment acknowledged.
970	1	Zdan	Sandra		I'm against a pipe carrying hundreds of thousands of barrels of dirty tar sand oil through Nebraska, with questionable safety construction, right over our wonderful underground clean water reserve, the Ogallala Aquifer.	Consolidated Response OIL-4 addresses the composition of the Canadian crude oil that would be transported by the proposed Project, including concerns relative to the corrosivity and erosivity of the crude oil. As noted in that Consolidated Response, that crude oil is similar in composition and properties to other heavy crude oils that are currently transported within the U.S. pipeline system and similar in composition and properties to other heavy crude oils that are currently refined in PADD III. Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. Consolidated Response SAF-1 describes the regulatory requirements and Project-specific Special Conditions that Keystone would comply with to construct, operate, maintain, inspect, and monitor the proposed Project. It also describes the monitoring, inspections, and reviews of the proposed Project that the Pipeline and Hazardous Materials Safety Administration would conduct to ensure compliance with those regulatory requirements.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
741	1	Zieg	Patricia		I implore you to deny permits to place the Keystone XL pipeline in the Sandhills...Do not let the Sandhills become the next Gulf of Mexico eco disaster. We know clearly and definitively that there are no guarantees and this is not a project to gamble on.	Issues related to the Sand Hills area are addressed in Consolidated Response ERO-1.
741	2	Zieg	Patricia		The Sandhills protect the largest supply of clean water in the world and are a fragile part of the ecosystem...	Identification of sensitive environments crossed by the proposed Project is discussed in Consolidated Responses ENV-1 and ENV-3. Issues related to the Sand Hills area are addressed in Consolidated Response ERO-1. Issues related to the Northern High Plains Aquifer system are addressed in Responses AQF-1 through AQF-4.
1138	1	Ziegler	Dick&Ruth		NOT ACROSS THE SAND HILLS !!!!! ESPECIALLY AFTER THE BP DISASTER - NOW IN ITS 72ND DAY !!!!!	As described in Consolidated Response GLF-1, the risks associated with the proposed Project are substantially different from those associated with the BP Deepwater Horizon proposed Project. Consolidated Response ALT-1 addresses potential alternative routes, including routes that would avoid much of the Northern High Plains Aquifer system and the Sand Hills area. Section 3.13 of the EIS addresses reliability and safety issues, including calculations of the probability of a spill from the proposed Project and the potential environmental impacts associated with spills. Issues related to the Sand Hills area are addressed in Consolidated Response ERO-1.
1383	1	Zimdars	Rocky	RZ Realty	I write in support of TransCanada's Keystone XL crude oil pipeline project and urge the department to grant a permit for the pipeline... I urge the granting of the permit. Thank you for the opportunity to comment.	Comment acknowledged.
1383	4	Zimdars	Rocky	RZ Realty	Considering the economic [and energy security] benefits of these vital resources, we should continue to expand America's access to safe, affordable energy to help ensure [improved domestic and global energy security and] stable prices for consumers... This project also stands to provide a powerful private sector economic stimulus. During construction, Keystone XL will create more than 13,000 jobs funded with private investment. In addition, local governments will have a steady source of income from economic activity associated with construction and from property taxes the pipeline company will pay. Rejection of the permit or suspension of the review would sacrifice the significant economic benefits this project stands to deliver and force U.S. consumers to rely on other sources of crude oil not economically and politically allied with U.S. interests. This would be a mistake.	Consolidated Response ECO-1 addresses potential socioeconomic impacts, and Consolidated Response TAX-1 addresses concerns regarding taxes.
1383	5	Zimdars	Rocky	RZ Realty	Pipelines are the safest, most reliable, economical and environmentally favorable way to transport oil and petroleum products, as well as other energy liquids, throughout the U.S. America depends on the more than 168,000 miles of liquid pipelines to move energy and raw materials our country relies on.	Comment acknowledged.
1384	1	Zimdars	Rocky	Northern Heights Housing Authority of Glasgow	The above Glasgow Area Chamber of Commerce business is in support of the Keystone XL Pipeline project which also incorporates the transmission line to be built by Big Flat Electric Cooperative to serve this load.	Comment acknowledged.
537	1	Zimmer	Emily		Please do not allow the Keystone pipeline to cross through the	Issues related to the Northern High Plains Aquifer system are

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					Sandhills of Nebraska. The Ogallala Aquifer is, arguably, the most important resource of the state of Nebraska. The additional costs to move the pipeline further east will not compare to the damages caused by a breach into the aquifer.	addressed in Consolidated Responses AQF-1 through AQF-4. Consolidated Response ALT-1 addresses potential alternative routes, including routes that would avoid much of the Northern High Plains Aquifer system.
845	1	Zimmer	Stephen	Creighton University	This pipeline is a disaster waiting to happen. We have seen time and again what happens with dirty energy. The Gulf disaster is only the latest crisis. Do NOT build a pipeline across the breadbasket of the United States and the world. It would be disastrous. It is not a question of if a disaster would happen, but rather when. We need clean energy now more than ever! Do not continue with the status quo and build this pipeline. Rather, let's forge a new path and take this opportunity to begin the transition to a clean energy economy. Nebraska can certainly help in this transition. Let's see more wind turbines built to harness the plethora of wind Nebraska has, not see another dirty oil pipeline built and another oil disaster.	Consolidated Response P&N-1 addresses the need for the proposed Project, including information on crude oil supply and demand from a recent analysis specific to the proposed Project. Consolidated Response P&N-5 addresses issues related to investments in other technologies, and Consolidated Response ALT-2 addresses alternative energy policies and technologies.
1054	1	Zimmerman	Linda		I've always marveled at the incredible resource the Ogallala Aquifer provides. Please continue to keep its safety as apriority.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
1309	1	Zook	Randy	Arkansas Chamber of Commerce	I write to urge the Department to consider promptly a permit for TransCanada's Keystone XL (KXL) crude oil pipeline project as soon as possible.	Comment acknowledged.
1309	2	Zook	Randy	Arkansas Chamber of Commerce	This project serves as a vital step in Arkansas' road to economic recovery, as hundreds of Arkansans depend on major projects like KXL to keep their factories running. The prompt approval of this project will put people to work immediately making pipe and other materials for the project, jobs that Arkansas desperately needs.	Comment acknowledged.
1309	3	Zook	Randy	Arkansas Chamber of Commerce	These jobs will not only fuel the economy of the State; they will also help fund State and local government by providing taxes and consumer spending from manufacturing, construction and operation of the pipeline and related projects. Further delay in the permit process could jeopardize the expected economic benefits.	Comment acknowledged.
1309	4	Zook	Randy	Arkansas Chamber of Commerce	The KXL project also has benefits for the entire country. During construction, the project will create more than 13,000 private sector jobs, generate some \$60 million in direct payrolls and millions more in indirect jobs.	Consolidated Response ECO-1 and Section 3.10.2.2 of the EIS address the potential socioeconomic impacts of the proposed Project.
1309	6	Zook	Randy	Arkansas Chamber of Commerce	We can help the econorriy and our security by building for a future of increased long-term energysecurity at stable prices for Americans. Arkansans stand ready and willing to do their part. Weneed immediate action, as high unemployment serves as a continuing reminder of the costsattendant to delay in projects such as KXL. I therefore urge you to consider the permit applicationfor the KXL project as quickly as possible so that hard-working Arkansans can get back to workfor themselves and for America. Thank you for your consideration of these comments.	Comment acknowledged.
565	1	(no last name provided)	Alec		I don't need or want an oil leak in my lifetime. I'm 15.	Consolidated Response OIL-1 provides a summary of the range of spill frequency estimates addressed in the EIS.
581	1	(no last name)	Julie		Please do not allow this pipeline to cross our aquifer.	Issues related to the Northern High Plains Aquifer system are

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
		provided)				addressed in Consolidated Responses AQF-1 through AQF-4.
581	2	(no last name provided)	Julie		That water will be worth more than oil in only a couple decades, and if you'all do not realize this you have no business working for the government or an oil company. It is yet another stupid and greedy project by our venal and negligent oil industry. While I do not like the oil companies and our national dependence on oil, I blame our government for failing to oversee this industry and for outright corruption where regulations of oil companies are concerned.	Consolidated Response SAF-1 describes the regulatory requirements and Project-specific Special Conditions that Keystone would comply with to construct, operate, maintain, inspect, and monitor the proposed Project. It also describes the monitoring, inspections, and reviews of the proposed Project that the Pipeline and Hazardous Materials Safety Administration would conduct to ensure compliance with those regulatory requirements.
597	1	(no last name provided)	Deborah		Keep this pipeline away from the Nebraska Sand Hills.	Identification of sensitive environments crossed by the proposed Project is discussed in Consolidated Response ENV-1 and ENV-3. Issues related to the Sand Hills area are addressed in Consolidated Response ERO-1.
643	1	(no last name provided)	Danielle		what kinds of studies have been done to show the effects of communities exposed to the chemicals in the tar sand oil?	Communities would not be exposed to crude oil transported by the proposed project during normal operation. Section 3.13 of the EIS addresses reliability and safety issues, including calculations of the probability of a spill from the proposed Project and the potential environmental impacts associated with spills. As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries.
643	2	(no last name provided)	Danielle		(what kinds of studies have been done to show the effects) of the wildlife?	Sections 3.6 and 3.8 of the EIS present assessments of the effects of construction and normaloperation of the proposed Project on wildlife and wildlife habitats based on reviews and conclusions from previous studies. Section 3.13 of the EIS addresses reliability and safety issues, including calculations of the probability of a spill from the proposed Project and the potential environmental impacts associated with spills.
643	3	(no last name provided)	Danielle		How effective are the pipes in this project, at keeping contaminants out of groundwater supplies? This is a very scary idea, and the fact that it's almost a reality is fantastic. I love this country, but I'm ashamed of the people in it, who would rather make a dollar, than take advantage of the bounty this land has to offer.	Consolidated Response SAF-1 describes the regulatory requirements that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project. It also describes the inspections and reviews of the proposed Project that the Pipeline and Hazardous Materials Safety Administration would conduct to ensure compliance with those regulatory requirements. As noted in Consolidated Responses AQF-1 through AQF-4, there is limited potential for a substantial impact due to an oil plume in the sediments or impacts to the groundwater.
670	1	(no last name provided)	Else		Climate scientists have made it quite clear that if we do not rapidly move off fossil fuels such that our economy is virtually decarbonized in 40 years we run unimaginable risks that include threatening global food and water security, the devastation of major cities and coastlines around the world (including Miami, New York, New Orleans, and Boston), and mass migrations of people that will most likely lead to conflict (as it has in the case of Darfur). The tar sands project is accelerating us into the climate catastrophe because extracting oil from the tar sands produces 2 to 3 times more carbon dioxide pollution than conventional oil and part of the process involves clear cutting of sections of the boreal forest.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project. Consolidated Response GHG-1 addresses GHG life-cycle analyses. Consolidated Response GHG-2 addresses the potential causal connection of implementation of the proposed Project and expanded oil sands production in Alberta and increases in refining.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					In this context, supporting the Tar Sands project by building a pipeline from the Canadian Tar Sands through the United States would be terribly destructive.	
727	2	(no last name provided)	Holly		Please take some time to think about this again.	Consolidated Response ENR-1 provides information on the Department of State's environmental review process, the National Interest Determination process, and the need to complete those reviews before approving or denying the Presidential permit for the proposed Project.
727	3	(no last name provided)	Holly		Why would you want to tap into a resource that is so close to one of the largest drinking water supplies? I am aware that the Ogallala Aquifer, the largest source of drinking water for the central United States, lies directly under the area where you plan to put the pipeline..	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
876	1	(no last name provided)	Navneet		Great Project. We need all the tax money and Job Creation this Project will bring to the United States. It will also reduce our dependence on farther sources of crude.	Consolidated Response ECO-1 addresses potential socioeconomic impacts associated with construction and normal operation of the proposed Project. Consolidated Response TAX-1 addresses concerns regarding taxes associated with implementation of the proposed Project.
943	1	(no last name provided)	April		I do not agree with the pipeline going thru Nebraska and Ogallala Aquifer. Ridiculous. Please do not carry thru with it	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
296	1	(no name provided)			I am opposed to allowing any penetration of the Ogallala aquifer. This natural underground water containment system has provided water for this region forever. It has come under stress in the last hundred years from the volume of water being drawn off, but the quality has remained high. It is a trusted water source for an entire region.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
296	2	(no name provided)			I do not believe any corporation, foreign or national, will accurately access the potential forces that could act upon the proposed pipeline. I do not believe the design will err on the side of caution. I believe cost cutting measures will be employed at every decision point to favor "stockholders" bottom line. I do not believe the entity proposing this will put the interests of nature balance and the people who benefit in the areas they propose passing through above their interests.	As described in Consolidated Response SAF-1, the Pipeline and Hazardous Materials Safety Administration (PHMSA) has regulatory requirements that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project in a manner that protects the health and safety of the public and the environment. In addition, PHMSA developed 57 Project-specific Special Conditions that Keystone has agreed to implement. Incorporation of those conditions would result in a Project that would have a degree of safety over any other typically constructed domestic oil pipeline system under current code and a degree of safety along the entire length of the pipeline system similar to that which is required in HCAs as defined in 49 CFR 195.450.
296	3	(no name provided)			I want the raw material to be processed where it lays. Build the refining plants there. Once processed, pass the final product through established systems already in use.	Consolidated Response P&N-8 addresses issues related to shipping Canadian crude oil to refineries that are closer to the source of oil.
1296	1	(no name provided)		Indigenous Environmental Network	In the comments below, we describe our concerns as to several aspects of the construction and operation of this pipeline, including: the potential impacts on Native American culture, potential threats to the Ogala Aquifer, and pipeline safety and structural integrity.	Consolidated Response CUL-1 and Section 3.11.4.3 of the EIS address the consultation process between DOS and Indian tribes. Consolidated Response SAF-1 addresses the design and safety of the proposed Project, and Consolidated Responses AQF-1 through AQF-4 address issues associated with the Northern High Plains Aquifer system.
1296	2	(no name provided)		Indigenous Environmental Network	We recommend that the Department of State does not issue a permit on this Project, since its significant deficiencies render it squarely outside of the "national interest." These comments incorporate, by reference, the entirety of the comments	Consolidated Response ENR-1 provides information on the Department of State's environmental review process, the National Interest Determination process, and the need to complete those reviews before approving or denying the

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					supplied by a consortium of non-profit organizations including Plains Justice, Sierra Club, and NRDC.	Presidential permit for the proposed Project.
1296	3	(no name provided)		Indigenous Environmental Network	NEPA requires that the DEIS must "present the environmental impacts of the proposal and the alternatives in a comparative form, thus sharply defining the issues and providing a clear basis for choice among options by the decision maker and the public." 40 C.F.R. § 1502.14. In this case, such a clear basis entails a presentation of all impacts of the Keystone XL Pipeline Project, including impacts associated with mineral extraction, mineral refining, and end use combustion. 40 C.F.R. §§ 1502.14 and 1502.16.	Mineral extraction, mineral refining, and end-use combustion are not a part of the proposed Project and have not been included in the EIS.
1296	4	(no name provided)		Indigenous Environmental Network	In order to adequately evaluate the environmental impacts of the project and its alternatives, the DEIS must assess the direct, indirect, and cumulative impacts that the proposed project and each alternative would have. For the reasons stated below, the DEIS for the Keystone XL Pipeline Project is unsound because DOS failed to adequately assess all of the direct, indirect and cumulative impacts of the project.	Alternatives are addressed in Section 4.0 of the EIS. Cumulative impacts are addressed in Section 3.14 of the EIS. The assessments in Section 3.14 were conducted following CEQ guidance on cumulative impact analyses. As noted in Consolidated Response ENR-1, the environmental review, including preparation of this EIS, has been conducted consistent with the DOS regulations pertaining to NEPA (22 CFR Part 161) as well as the Council on Environmental Quality (CEQ) regulations for implementing NEPA (40 CFR Part 1500). As a result, DOS considers the EIS to be consistent with the requirements of a NEPA environmental review.
1296	5	(no name provided)		Indigenous Environmental Network	We request that the State Department determine that the Project will cause significant unpreventable environmental harm and is not in the national interest, and thereby deny the application for a Presidential Permit.	The impacts associated with implementation of the proposed Project are addressed in Section 3.0 of the EIS. As noted in that response, the proposed Project would not result in significant environmental impacts. Consolidated Responses ENR-1 and P&N-9 provide information on the DOS environmental review process, the National Interest Determination process, and the need to complete those reviews before approving or denying the Presidential permit for the proposed Project.
1296	6	(no name provided)		Indigenous Environmental Network	The DEIS indicates that the Project may cause negative impacts to significant cultural and historic resources on public lands, including historic Native American sites. While the DEIS recommends that the Project avoid such sites during construction and operation, actual strategies for avoidance are not mentioned as to each site, on a site-by-site basis. Therefore, the public is unable to evaluate and comment upon these potential impacts and their associated avoidance strategies.	A Programmatic Agreement (PA) has been developed for the Project under Section 106 of the National Historic Preservation Act. The PA includes mitigation measures for known adverse effects and provides a process for ongoing surveys to be conducted in areas where access was not granted during the EIS process.
1296	7	(no name provided)		Indigenous Environmental Network	It is especially incumbent upon DOS to identify those Native American sites where negative environmental impacts are purported to be unavoidable, so that the public can adequately evaluate the degree to which the Project serves the national interest despite its harm to parties' cultural patrimony.	Potential impacts of the proposed Project on cultural resources are discussed in Section 3.11.1 and Section 3.11.3.1 of the EIS. As noted in Consolidated Response CUL-1, a Programmatic Agreement (PA) has been developed for the Project under Section 106 of the National Historic Preservation Act. The PA includes mitigation measures for known adverse effects and provides a process for ongoing surveys to be conducted in areas where access was not granted during the EIS process.
1296	8	(no name provided)		Indigenous Environmental Network	The DEIS fails to mention the Project's potential impact on traditional Native American hunting and subsistence areas, including the creation of new access to such areas, and the	Consolidated Response CUL-1 and Section 3.11.1.2 of the EIS address properties of religious and cultural significance to Indian tribes, including Traditional Cultural Properties. Section

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					creation of multiple rights-of-way to such areas.	3.11.4.3 of the EIS addresses the consultation process between DOS and Indian tribes. The consultation process included the development of Traditional Cultural Property studies that discuss traditional activities and land use by Indian tribes who have traditionally used lands within the Project area.
1296	9	(no name provided)		Indigenous Environmental Network	Tribe members throughout every state implicated by the Project still conduct traditional hunting, fishing, cultivation and harvesting activities on public and tribal lands. The Project may significantly interfere with these activities, through pipeline construction, operation, and especially any potential spill incidents. Without a full and fair discussion of these concomitant environmental and cultural impacts, the DEIS is incomplete.	DOS has consulted with Indian tribes and the BIA in accordance with regulations. A Programmatic Agreement (PA) has been developed for the Project under Section 106 of the National Historic Preservation Act. The PA includes mitigation measures for known adverse effects and provides a process for ongoing surveys to be conducted in areas where access was not granted during the EIS process. Consolidated Response CUL-1 and Section 3.11.1.2 of the EIS address properties of Religious and Cultural Significance to Indian tribes, including Traditional Cultural Properties. The consultation process included the development of Traditional Cultural Property studies that discuss traditional activities and land use by Indian tribes who have traditionally used lands within the Project area.
1296	10	(no name provided)		Indigenous Environmental Network	The DEIS fails to evaluate the Project's impacts on tribal nations subject to extractive operations on traditional lands in Alberta, Canada. Canadian First Nations peoples already experience, and will continue to experience, catastrophic negative environmental impacts due to the expansion of tar sands extraction operations on their traditional lands - and such an expansion must be evaluated as a potential indirect result of the proposed Project, since the Project assumes the increased production of tar sands oil.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1.
1296	11	(no name provided)		Indigenous Environmental Network	The DEIS does not examine alternatives to the Project, including the no action alternative, that would allow for the preservation of traditional lands in Canada.	Consolidated Responses ALT-1 and ALT-2 discuss alternatives to the Project. Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1.
1296	12	(no name provided)		Indigenous Environmental Network	The DEIS fails to provide the public with adequate opportunity to comment on adverse impacts to tribal nations and their lands, because DOS' consultation with such tribes is incomplete as of the time of publication of the DEIS.	Consolidated Response CUL-1 and Section 3.11.4.3 of the EIS address the consultation process between DOS and Indian tribes.
1296	13	(no name provided)		Indigenous Environmental Network	Federal regulations require a process of formal consultation for any properties of "historic significance" to Native American nations and tribes, but many of these consultations are still "on-going" and incomplete. While these regulations require that federal agencies share consultation processes and results with the public, DOS has failed to provide the public with the information it needs to adequately comment. In order to rectify this error, DOS must undertake and complete the required process of consultation with affected Native American nations and tribes prior to publishing a final EIS, and share the results of these consultations with the public.	Consolidated Response CUL-1 and Section 3.11.4.3 of the EIS address the consultation process between DOS and Indian tribes. As noted in Consolidated Response CUL-1, a Programmatic Agreement (PA) has been developed for the Project under Section 106 of the National Historic Preservation Act. The PA includes mitigation measures for known adverse effects and provides a process for ongoing surveys to be conducted in areas where access was not granted during the EIS process.
1296	14	(no name provided)		Indigenous Environmental Network	Section 3.3.1.1 of the DEIS indicates that the proposed route for the project passes directly over a number of shallow aquifers in the eastern Dakotas and Nebraska, including the Ogallala Aquifer.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
1296	15	(no name provided)		Indigenous	The Ogallala Aquifer, a vast, shallow underground water table,	Issues related to aquifers along the proposed Project corridor

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
		provided)		Environmental Network	is one of the world's largest aquifers spanning portions of South Dakota, Nebraska, Wyoming, Colorado, Kansas, Oklahoma, New Mexico, and Texas.	are addressed in Consolidated Responses AQF-1 through AQF-4.
1296	16	(no name provided)		Indigenous Environmental Network	The Ogallala Aquifer provides drinking water to 82 percent of the people who live within the aquifer's boundary, including a significant number of indigenous peoples, many of whom are constituents of the Indigenous Environmental Network. This aquifer's saturated thickness ranges from 10 to 200 feet in the northern part of Nebraska to more than 600 feet in central Nebraska beneath the Sand Hills, an ecologically sensitive region.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
1296	17	(no name provided)		Indigenous Environmental Network	The Ogallala Aquifer, just like many of the shallow aquifers along the project's proposed route, lies close to the surface and receives replenishment from rainwater and nearby surface water sources. Therefore a spill or related incident from the pipeline may contaminate the Ogallala and other underlying aquifers – either directly through contamination to the water supply, or indirectly through soil contamination that eventually leaches into the aquifer. However, unlike surface waters, aquifers cannot be directly accessed for the purpose of clean-up and mitigation measures.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
1296	18	(no name provided)		Indigenous Environmental Network	The draft EIS does not adequately address the full range of consequences to potable water supply, agriculture, and ecological integrity that would result from oil contamination through a leak or spill from the pipeline,	Section 3.13 of the EIS addresses reliability and safety issues, including calculations of the probability of a spill from the Project and the potential environmental impacts associated with spills. That assessment addresses impacts to surface water and groundwater. DOS considers the assessment to be in compliance with NEPA environmental review requirements.
1296	19	(no name provided)		Indigenous Environmental Network	The DEIS does not properly evaluate the safety concerns associated with the Project, including pipe thickness, emergency response and pipeline end-of-life management, and standards for pipeline operation and maintenance.	All issues related to design specifics and operation of the proposed pipeline system are under the jurisdiction of the Pipeline and Hazardous Materials Safety Administration (PHMSA), as explained in Sections 2.3, 2.3.1, and 3.13.1 and in Consolidated Response SAF-1. That includes specific requirements for pipe thickness, pipe material, and operation and maintenance. Keystone would also comply with the 57 Project-specific Special Conditions which also address similar issues (see Appendix U). The EIS describes the basic elements of design, construction, and operation that need to be considered in assessments of the potential impacts of construction and normal operation. PHMSA is responsible for review of the safety of the Project, and the environmental review of the Project described in the EIS assumes that the Project would be in compliance with PHMSA's safety requirements. Consolidated Response RES-1 addresses issues related to preparation and review of the emergency response plan for the proposed Project. Responses related to the life of the Project and taking the Project out of service are presented in Consolidated Response DEC-1.
1296	20	(no name provided)		Indigenous Environmental Network	The catastrophic consequences of a pipeline rupture and spill cultural and biotic resources, including the well-being of indigenous communities, along the route should require the enforcement of the highest possible standards for the length of	Comment acknowledged.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					the Pipeline.	
1296	21	(no name provided)		Indigenous Environmental Network	At present, the DEIS anticipates adverse consequences to cultural resources, stating at 3.13.5.7 that “it is anticipated that cultural resources in the ROW would be adversely impacted by small spills or by subsequent small spill cleanup.” The DEIS fails to account for safety standards that would ensure avoidance and mitigation of these adverse impacts; as such, it is flawed.	Consolidated Response CUL-1 and Section 3.11.4.3 of the EIS address the consultation process between DOS and Indian tribes. As noted in Consolidated Response CUL-1, a Programmatic Agreement (PA) has been developed for the Project under Section 106 of the National Historic Preservation Act. The PA includes mitigation measures for known adverse effects and provides a process for ongoing surveys to be conducted in areas where access was not granted during the EIS process. The Traditional Cultural Property (TCP) reports (noted in Section 3.11.4-3 of the EIS) may not be disclosed due to concerns regarding confidentiality. Potential impacts to cultural resources are addressed in Section 3.11.3.1 of the EIS. DOS considers this assessment to be in compliance with NEPA environmental review requirements. Consolidated Response SAF-1 describes the regulatory requirements and Project-specific Special Conditions that Keystone would comply with to construct, operate, maintain, inspect, and monitor the proposed Project. It also describes the monitoring, inspections, and reviews of the proposed Project that the Pipeline and Hazardous Materials Safety Administration would conduct to ensure compliance with those regulatory requirements.
1296	24	(no name provided)		Indigenous Environmental Network	The DEIS fails to provide information about important aspects of the Project’s lifespan, including emergency response, abandonment, and inspections. The public cannot adequately provide comments on the Project, and the degree to which it is in the national interest, without a full overview of this information.	Issues related to the life of the Project and taking the Project out of service are addressed in Consolidated Response DEC-1. Consolidated Response RES-1 addresses issues related to preparation and review of emergency response plans for the proposed Project. Information on monitoring and inspection is presented in Sections 2.4 and 3.13.5.5 of the EIS. Consolidated Response P&N-9 addresses issues related to the National Interest Determination. Further, as noted in Consolidated Response ENR-1, the national interest determination process is separate from the NEPA environmental review process and many issues are not a part of the NEPA environmental review process and are not addressed in the EIS.
1296	28	(no name provided)		Indigenous Environmental Network	The DEIS also fails to provide or evaluate emergency response plans. To ensure safety of natural and cultural resources, the DEIS must analyze the adequacy of the applicant’s response plans for accidents, spills, and related emergencies.	Consolidated Response RES-1 addresses issues related to preparation and review of emergency response plans for the proposed Project.
1296	29	(no name provided)		Indigenous Environmental Network	The Project traverses remote, fragile regions, where detecting, preventing and responding to accidents may be impaired. Project proponents should indicate how they will prepare internally to respond to such incidents, and how they will work with local first responders to adequately prepare for such incidents, so that the public can evaluate and comment on the efficacy of these plans.	Consolidated Response RES-1 addresses issues related to preparation and review of emergency response plans for the proposed Project
1296	30	(no name provided)		Indigenous Environmental Network	The draft EIS fails to provide for a regular, frequent inspection schedule – instead accounting for “periodic” and “regular” inspections. Given the Project proponent’s request for a thickness waiver, without corresponding regulations governing the operation of a thinner pipe, it is incumbent upon Project proponents to account for frequent and rigorous inspections,	Keystone has withdrawn its application for a Special Permit as described in Consolidated Response REG-1. Consolidated Response SAF-1 describes the regulatory requirements that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					and to make the public aware of plans for such inspections. Otherwise, the public cannot sufficiently evaluate and comment upon the inspection schedule and the overall plan for pipeline safety.	It also describes the inspections and reviews of the proposed Project that the Pipeline and Hazardous Materials Safety Administration would conduct to ensure compliance with those regulatory requirements. Keystone would also have to conduct pipeline monitoring and inspections as required by existing regulations and the relevant PHMSA Special Conditions (see Appendix U). There is no public review associated with the inspection schedule or pipeline safety requirements.
1296	32	(no name provided)		Indigenous Environmental Network	The DEIS' analysis of national interest does not account for threats to national security and economic well-being from a continued dependence on fossil fuels.	The EIS does present an analysis of national interest. Consolidated Responses ENR-1 and P&N-9 provide information on the DOS environmental review process, the National Interest Determination process, and the need to complete those reviews before approving or denying the Presidential permit for the proposed Project. As noted in those responses, those are two separate processes and therefore some of the information considered in the determination of national interest is not included in the EIS.
1296	33	(no name provided)		Indigenous Environmental Network	The proposed Project will catalyze increased development of Canadian tar sands. Such an increase only aggravate the extant plethora of environmental and social problems in the region - including global warming pollution from tar sands oil production; destruction of the Canadian Boreal forest and local wetlands and water resources; and threats to First Nations peoples.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information on current and future production. As noted in that response, without the proposed Project, oil sands development would continue at or above the current level until at least 2020, with or without the proposed Project. Consolidated Response GHG-1 addresses the greenhouse gas life-cycle analyses presented in the EIS. In addition, Section 3.13.4 of the EIS has been revised to expand discussions of extraterritorial concerns.
1296	34	(no name provided)		Indigenous Environmental Network	First Nations such as the Mikisew Creek and Athabasca Chipewyan Nations, whose traditional territories include the tar sands oil development region, experience negative impacts from development on their environment, culture, and land uses - all of which are inextricably interrelated, where harm to environment is harm to culture. Such threats and destructive impacts may accumulate to the degree that the cultural integrity of these Nations is severely impaired, thereby threatening cultural diversity and world heritage, and perpetuating environmental injustice.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1.
1296	35	(no name provided)		Indigenous Environmental Network	Presidential Permit applications require parties to address whether granting such a permit for the proposed project "would be in the national interest." The Project proponent alleges that the project will serve the national interest, but we disagree. Instead, we believe that this proposed Project will prolong and increase domestic reliance on fossil fuel sources such as the Canadian tar sands that are environmentally and culturally destructive.	Consolidated Response ENR-1 provides information on the Department of State's environmental review process, the National Interest Determination process, and the need to complete those reviews before approving or denying the Presidential permit for the proposed Project.
1296	36	(no name provided)		Indigenous Environmental Network	We believe that the DEIS does not provide a full and fair discussion of significant environmental impacts of the Project.	The impacts associated with implementation of the proposed Project are addressed in Section 3.0 of the EIS. As noted in that section, construction and normal operation the proposed Project would not result in significant environmental impacts.
1296	37	(no name provided)		Indigenous Environmental	We believe, based on the inadequate demonstration of need for the pipeline and the significant impacts that the project is	Consolidated Response P&N-1 addresses the need that the Project has been proposed to meet. The impacts associated

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
				Network	likely to have on human health and the environment, that the Project is not in the national interest and that the No Action alternative should be selected. Alternatively, we request that DOS issue a subsequent DEIS that addresses these shortcomings and allows for further review and comment.	with implementation of the proposed Project are addressed in Section 3.0 of the EIS. As noted in that response, the proposed Project would not result in significant environmental impacts. As noted in Consolidated Responses ENR-1 and P&N-9, the decisions on the National Interest Determination and a Presidential permit will be made after the final EIS is issued. Consolidated Response P&N-6 addresses the need for a supplemental DEIS.
1186	1	2010vam@cablene.com	Velma		It sickens me to think there are not secure and sure safety measures in place before drilling for oil anywhere, especially in water or over important ground water areas.	The proposed Project would be an oil transportation system and does not include drilling for oil.
1186	2	2010vam@cablene.com	Velma		[It sickens me to think there are not secure and sure safety measures in place before drilling for oil anywhere,] especially in water or over important ground water areas.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
1186	3	2010vam@cablene.com	Velma		I believe piping over Aquifers is even more risky. There is no way to clean that up from a spill. Its insanity.	Section 3.13 of the EIS addresses reliability and safety issues, including calculations of the probability of a spill from the Project and the potential environmental impacts associated with spills, including discussions of surface water and groundwater. Consolidated Response AQF-3 provides information on hypothetical spills from the Project over two areas of the Northern High Plains Aquifer System and also addresses response actions. Consolidated Response RES-1 addresses issues related to preparation and review of the Emergency Response Plan (ERP) for the proposed Project. Spill Prevention, Control, and Countermeasure plans are addressed in Sections 2.3 and 3.13.5 of the EIS and in the Construction, Mitigation, and Reclamation Plan presented in Appendix B of the EIS.

Scoping Summary Report

**United States Department of State
Scoping Summary
for the
Keystone XL Project
Environmental Impact Statement**

May 2009

1.0 INTRODUCTION

TransCanada Keystone Pipeline, L.P. has applied to the United States Department of State (DOS) for a Presidential Permit at the border of the United States for the proposed construction, connection, operation, and maintenance, of facilities for the importation of crude oil from Canada. DOS determined that the issuance of the Presidential Permit would constitute a major federal action that may have a significant impact upon the environment within the context of the National Environmental Policy Act of 1969 (NEPA), and on January 28, 2009 issued a Notice of Intent (NOI) to prepare an environmental impact statement (EIS) to address reasonably foreseeable impacts from the proposed action and alternatives.

The NOI informed the public about the proposed action, announced plans for scoping meetings, invited public participation in the scoping process, and solicited public comments for consideration in establishing the scope and content of the EIS. The NOI was published in the Federal Register and distributed to:

- Landowners along the proposed route,
- Federal, state, and local agencies,
- Municipalities and counties,
- Native American Tribes,
- Elected officials,
- Non-governmental organizations,
- Media, and
- Interested individuals.

The scoping period was originally planned to extend from January 28 to March 16, 2009. However, an amended NOI published on March 23, 2009 extended the scoping period until April 15, 2009.

2.0 SCOPING MEETINGS

DOS held 20 separate scoping meetings in the vicinity of the proposed route to give the public the opportunity to provide comments regarding the scope of the EIS. The dates and locations of the meetings are listed below, along with the attendance at each meeting (in parentheses).

February 9 – Beaumont, TX (10)

February 10 – Liberty, TX (15)

February 11 – Livingston, TX (15)

February 12 – Tyler, TX (60)

February 17 – Durant, OK (34)

February 18 – Ponca City, OK (12)

February 19 – El Dorado, KS (10)
February 19 – Clay Center, KS (20)
February 23 – York, NE (62)
February 23 – Baker, MT (39)
February 24 – Atkinson, NE (65)
February 24 – Terry, MT (30)
February 25 – Murdo, SD (46)

February 25 – Circle, MT (100)
February 25 – Plentywood, MT (7)
February 25 Glendive, MT (45)
February 26 – Glasgow, MT (53)
February 26 – Malta, MT (32)
April 8 – Faith, SD (12)*
April 8 – Buffalo, SD (31)*

*Originally scheduled for February 26, 2009, but rescheduled due to hazardous weather conditions.
Amended NOI published on March 23, 2009.

3.0 SCOPING COMMENTS

3.1 Public, Agency, and Stakeholder Comments

The verbal comments recorded during the 20 meetings and comments from comment forms, letters, and emails received during the scoping period were received, entered into the administrative record, reviewed and assigned an issue code. In total, 122 people provided oral testimony at the meetings, incorporating over 340 individual scoping comments. In addition to the oral testimony, 194 letters, cards, emails, e-comments, or telephone conversation records (henceforth referred to as “letters”) incorporating 1350 individual comments were received from the public, agencies, and other interested groups and stakeholders. Additionally, over 13,000 NGO-sponsored duplicate form letters were received electronically. Issues addressed in comments from all of these sources are summarized in this document.

In addition, at scoping meetings held in Montana, the Montana Department of Environmental Quality accepted verbal comments on route maps for the state using their Geographic Information System (GIS) computer. These comments were recorded by tagging the digital data (shapefiles) to specific geographic locations on the maps. All verbal comments were transcribed and all comments, both written and verbal were recorded, categorized by the specific issue addressed in the comment, and entered into a spreadsheet for ease of review. The following sections summarize the comments by EIS section or issue. Comments have been summarized as appropriate, particularly for concerns that were raised by several commentors.

Purpose and Need

1. TransCanada must provide updated Canadian tar sands oil production forecasts together with a description of how such forecasts may be served by other pipelines that are either under construction or in more advanced stages of permitting. TransCanada should also explain how other planned pipelines will not meet the need for supply diversification.
2. The purpose and economics of this project needs to be fully explained so that we can easily understand why money and resources are being spent to transport and refine oil in the southern US when it could possibly be used to build an oil refinery in Canada.
3. Evaluate the project in the context of overall US oil production, transportation, storage, and refining. How does this pipeline relate to other needed oil and refined product infrastructure in the US?
4. What are the latest forecasts for crude oil demand in 1) the U.S. as a whole and 2) in the Midwest and Gulf Coast regions? What are the short and long-term (10 years) trends in U.S. crude oil demand?

5. How much Alberta oil sands crude can be exported considering Canadian domestic demand? Is the amount of crude available for export out of Alberta greater than the current export pipeline capacity out of Alberta?
6. Assuming that there is an increasing need for oil in the US from friendly sources, how much additional supply is needed? How much comes from which nations? How much comes from sources that are unstable? What is the DOS policy on where the U.S. should get its crude oil in the future?
7. TransCanada bases the need for this project on unsupported allegations of commercial commitments to the Project, but provides neither a quantification of such commitments nor a description of the commercial terms of such commitments. TransCanada must provide current commercial status of and commercial terms for commitments to the Project.
8. Would the Canadian crude coming into PADD III be competitive with other foreign and domestic sources coming into PADD III?
9. Indicate how long the oil supply for the pipeline is projected to last at the throughput volumes planned for the project.

Project Description

1. Construction should be timed in a manner to minimize damage to area soils, crops and/or rangelands.
2. Why does this pipeline need to have so wide of a permanent easement? The minimum easement possible should be investigated.
3. How long will the pipeline be in use and maintained? What is the life expectancy of the pipe?
4. Describe the methods that would be used to abandon and remove the pipeline.
5. Describe the methods that would be used to cross under or over other pipelines and other utility lines.
6. Indicate whether or not pipe to be used for the project would be purchased from U.S. firms.
7. Welders need to be certified and well trained.
8. It is important that the quality of pipe be addressed. It should have sufficient coating as to eliminate potential rusting. The ditch should be a minimum of 7-8' in depth.
9. What happens when the pipeline needs replacing or needs normal repairing?
10. Describe the regulatory restrictions regarding proximity to residences and other buildings, including historical buildings and sites.
11. Include a site specific analysis and discussion of alternative stream crossing techniques that could be used on individual streams. This analysis should be based on site specific inspections, hydrologic conditions at each stream crossing, and biological conditions near each crossing. We recommend use of directional drilling for the pipeline routing under all water crossings and their associated floodplains and wetlands to the maximum extent practicable to avoid and minimize aquatic impacts.

12. The irrigation ditches and the drain ditches should be considered the same as creek crossings and should be bored under if possible.
13. The EIS should indicate the locations where the proposed pipeline would and would not run parallel to existing utility corridors.
14. How will the pipeline be marked so that years later, when grass has regrown over the trench, people don't accidentally dig it up and disturb the pipe?
15. Indicate what will be done with trees that are removed from the right-of-way.
16. Indicate what the temperature of the oil will be in the pipeline.
17. Provide information on the burial depth of the pipeline along all portions of the alignment.
18. How would trenching and pipeline construction and operation alter the grade of fields, dikes, and the effectiveness of irrigation systems? What measures would be taken to prevent potential effects?
19. If the pipeline is shut down for a period of time with crude oil in the line, describe the procedures that would be implemented to return the line to service.
20. Describe what would happen to farm fences during construction.
21. Concern that the pipeline trench should not be open very long (2 weeks or less) across county roads so that farmers can carry on their farming operations.
22. Discuss the potential to change the product shipped through the pipeline at a later date.
23. How will electricity be supplied to the pump stations?
24. Describe what maintenance and inspection activities are required by regulations and what specific activities Keystone will conduct as a part of maintenance and inspection; including the schedule for those activities.
25. Describe how maintenance activities would continue should the pipeline be sold.
26. We also recommend that the EIS identify and discuss proposed environmental inspection and monitoring during pipeline construction to ensure that appropriate techniques to minimize environmental impacts are implemented.
27. Who will inspect the pipe to guarantee that it meets US DOT specifications?

Soils & Geology

1. Methods to prevent erosion near the pipeline should be investigated and reported. Describe the methods to be used to stabilize stream banks and address the associated potential for erosion.
2. Substantial precipitation or snowmelt events may create erosion channels, and the NEPA analysis should develop mitigation and monitoring provisions to repair construction areas in a timely manner when erosion channels occur and to implement further sediment controls if necessary.
3. Address the potential for soils settling along the route after abandonment of the project based on the anticipated abandonment procedures that would be used.

4. The lower portion of the Niobrara River is underlain by Pierre shale. Clays in the shale, particularly those derived from volcanic ash, make it a very weak rock prone to fracturing and slumping.
5. Describe the methods to be used to separate topsoil from subsoil during excavation of the trench and the sequence of events to be followed during burial of the installed pipeline. Demonstrate how the identity of the topsoil will be preserved and how it will be returned to the correct place.
6. Address the issue of restoring the right-of-way land to its previous state. Define restoration in the context of this project.
7. Address the potential effects of the temperature of the pipeline on the surrounding soils, including effects on soil freezing and drying.
8. Does frost or moisture action bring rocks to the soil surface after the pipeline is constructed? If so, what can be done to mitigate this effect?
9. Consider the level of seismicity in the vicinity of the Brockton-Froid fault zone and potential effects on the integrity of the pipeline.
10. Assess erosional impacts of pipeline construction on the sand dunes of the Sand Hills region of South Dakota.

Groundwater

1. The EIS should generally identify the location of public water supply surface water intakes or ground water supply aquifers along potential pipeline corridors.
2. Evaluate the impacts of construction, normal operation, and spills or leaks on springs and on public and private wells used for drinking water. What underground sources of water would be at risk of the pipeline leaked? There is concern about possible damage to shallow wells near proposed pipeline route.
3. Describe what procedures would be put in place to provide drinking water if groundwater is polluted due to a spill, including long-term procedures in the event that cleanup after a spill does not return groundwater to drinking water quality.

Surface Water

1. Address the potential for erosion in creek beds during and after pipeline construction. Indicate what regulations would require stream bank stabilization during and immediately after construction, as well as what regulations would require that Keystone repair stream bank stabilization structures that become damaged.
2. Include a list of streams where pipeline construction would potentially introduce sediment or disturb the bed or banks of a stream.
3. Evaluate the effects of spills on surface impoundments and reservoirs used for domestic water, and also the effects of runoff during construction.
4. Is there adequate water available from the source streams to support diversion for hydrostatic testing without adversely affecting water rights or biological resources of the source streams? Water quality and availability needs to be taken into account when filing for a water right to perform hydrostatic testing.

5. The EIS should clearly describe water bodies and aquatic resources, including wetlands, and surface and ground water resources within the analysis area which may be impacted by project activities. The description of physical characteristics should include stream and surface water quality standards designations.

Wetlands and Vegetation

1. Wetlands that may be affected by proposed pipeline construction and operation should be identified and potential impacts on wetland functions assessed. We recommend that a draft Wetland Mitigation Plan be prepared and included in the DEIS to assure that adequate replacement of lost wetland functions and values occurs.
2. Any loss or impact to wetlands from pipeline construction should be fully mitigated by replacement or restoration of an equal or greater acreage in the immediate locale of the impact. Construction of a trench through wetlands creates opportunities for the trench to act as a drainage channel. Wetland drainage as a result of trenching should be avoided, but drainage impacts should be estimated and included in the acres of wetland impact.
3. Evaluate the impact on native prairie and other areas of native vegetation that the route might cross.
4. Discuss revegetation of the pastures and farm grounds. Reclamation standards should include revegetation of native shrubs and grasses. Include discussion of how the revegetated areas would be monitored to ensure that the vegetation becomes properly established.
5. Concerned with the tree shelter belts on our land.
6. It is unclear if the proposed pipeline route would impact remnants of native prairie located in Lamar County, Texas.
7. The threat of wildland fire, including the financial burden to landowners, should be assessed and analyzed in the EIS.
8. Evaluate the impacts of the project on wetlands and describe the mitigation procedures that would be implemented to offset impacts.
9. Evaluate the impacts of the project on woodland areas.
10. Identify any rare plant communities which may exist in the areas you cross and any rare plants and discuss any impacts to such.
11. The EIS should evaluate the potential for impacts to the riparian corridor, such as tree and shrub loss, as a result of pipeline construction at stream crossing.
12. How will the temperature of the pipeline impact vegetation and crops in the right-of-way?
13. Evaluate whether or not the burial depth of the pipeline is sufficient to avoid problems with the roots of crops such as alfalfa and corn.
14. There is concern regarding the spread of invasive weeds and non native species along the pipeline corridor. Discuss potential for invasive and noxious weeds infestations and potential for outbreaks in future years.
15. Discuss the impacts of trenching on regrowth, particularly during drought periods.

Fish, Wildlife and Threatened and Endangered Species

1. The Niobrara, the South Fork of the North Fork of the Elkhorn River, Cedar River, Loup River, and the West Fork of the Big Blue River, at the point of crossing, are ranked as highest-valued or high priority fishery resources.
2. What will be done to minimize effects on threatened and endangered species?
3. Depending upon the time of construction, the impact could be devastating to endangered or threatened species if spawns are prevented or interrupted.
4. Disruption of surface water flows due to fracture events could impede movements of fish or could significantly impact habitats of local flora and fauna, causing losses of threatened or endangered species, or promoting the introduction of exotic species.
5. Discuss how the pipeline construction and maintenance will alter and fragment existing habitat the pipeline passes through. Post-development surveys should also be addressed.
6. On-site or off-site mitigation may be necessary to compensate for unavoidable impacts to fisheries and wildlife habitat and recreational opportunities.
7. Conservation of large, intact tracts of sagebrush and riparian habitats are important to the biological needs of a diversity of native species including neo-tropical migrant birds, sage grouse, antelope, white-tailed deer and mule deer.
8. Impacts and mitigation to prairie dog colonies and populations should be addressed. We request an estimate of the number of prairie dog habitat acres that will be lost to the pipeline (we estimate 13 colonies).
9. Would the power lines leading to pump stations pose a risk of avian collision? If so, what can be done to reduce or eliminate the collision hazard? Are any of the lines located near water features that may attract waterfowl and other birds?
10. The EIS should also evaluate potential impacts to migratory birds, including the bald eagle.
11. Construction would pass through or near the Deep Fork Wildlife Management Area (DFWM) which has protected habitats for mammals and waterfowl including bald eagles and river otters.
12. Texas Parks and Wildlife Department requests that TransCanada provide a GIS shapefiles of the preliminary pipeline alignment to further assist in the search of the Texas Natural Diversity Database (TXNDD).
13. The right-of-ways should be visually inspected for leks and other critical or sensitive bird or wildlife habitats.

Land Use

1. Evaluate the impact of restrictions on land-use over and near the pipeline, such as restrictions on constructing new buildings or impeding other future property development.
2. The cost of reclaiming agricultural land should be analyzed.
3. What protections are in place for landowners' rights to graze their cattle, run equipment, and be free of invasive weeds?

4. Evaluate the impact of soil compaction on farmland due to the use of heavy construction equipment.
5. Evaluate the impacts of construction normal operation, and spills and leaks on agricultural uses, including impacts on surface and subsurface drainage, farm ponds, waterlines, and drainage ditches.
6. Address the potential for farmers to have difficult access to farmland during construction.
7. What compensation would Keystone provide for impacts to crop production along the construction right-of-way? Damages should be paid to the landowners that would lose the crops because they cannot water, spray for weeds, cultivate, harvest or care for their crops. The damages should be paid for the three crop years and for years after if the property isn't restored sufficiently.
8. How will cattle be protected during construction?
9. The EIS needs to identify how many residences would be located within 500 feet of each alternative.
10. Land ownership(s) that would be crossed by each alternative needs to be broken out for comparison purposes.

Recreation

1. Under current consideration is a state park located at the confluence of the Missouri and Milk Rivers. If this site is acquired, potential impacts to recreational users should be mitigated or avoided to minimize interruption of recreation.
2. Describe the construction and operation effects resulting from pipeline location through land being considered for a Montana State Park near the confluence of the Milk and Missouri rivers.
3. The proposed TransCanada Keystone XL pipeline route crosses the Lewis and Clark National Historic Trail (LCNHT) at two locations in Montana.
4. The proposed site is within two miles of the eastern-most terminus of the Niobrara National Scenic River (NNSR), but outside the designated boundary.
5. Spills of fuel or other hazardous materials could restrict boating, tubing, and other on-water activities due to health or other safety concerns.
6. Construction and long-term operation and maintenance activities, including noise, lights, and movement, could degrade recreation opportunities.
7. Assess the impacts to recreational use of the El Camino Real de los Tejas trail in Nacogdoches County, Texas, and other National Historic Trails.

Visual Resources

1. What would be the visual impacts of the above ground facilities?
2. For permanent facilities associated with pipeline operation, such as pump stations, will one of the 'Standard Environmental Colors' recognized by the BLM be selected and used on exterior surfaces? Will DOS require this mitigation?

3. Drilling mud seepage into the Niobrara could produce an unsightly plume visible through the western-most portion of the MNRR.
4. Fuel spills and/or their impacts (coatings on rocks, plants, etc.) might be visible both up and down river.
5. Assess potential visual impacts at crossings of any designated National Wild and Scenic Rivers.
6. Assess impacts on historic landscapes.

Cultural Resources

1. Address the impact of the project on archaeological sites, specifically in the Mission Concepcion and Presidio Delores archaeological zone.
2. Paleontological resources that lie within the proposed pipeline corridor should be protected. The proposed pipeline route would cross directly over three known T-Rex sites.
3. The ROW should be visually inspected for historic properties including: stone circles, Indian campsites, early settlements, artifacts dinosaur bones, and historic buildings and structures.
4. The route must avoid any significant cultural resources on public lands. The pipeline route should avoid hunting and subsistence areas. It should not create new access to these areas and it should not facilitate multiple rights-of-way.
5. The historic sites of the early Native American population must be preserved. Please also discuss concerns Native Americans have about treaty violations and any contested land ownership.
6. The proposed route crosses several National Historic Trails. A thorough analysis of satellite imagery, coupled with comprehensive surveys, should be conducted where the proposed pipeline crosses each trail to survey for cultural resources.
7. When adverse impacts to cultural resources cannot be avoided, they must be properly mitigated at the applicant's expense.
8. The proposed pipeline has the potential for major adverse impacts to the cultural resources associated with El Camino Real de los Tejas in Nacogdoches County, Texas.
9. The EIS should evaluate and disclose the potential environmental impacts on tribal trust resources as well as any health impacts to tribal communities.
10. Assess impacts on historic landscapes.

Socioeconomics

1. Address the issue of the potential decrease in property value and impacts on planned development.
2. Will our taxes and land value be increased or decreased by this pipeline?
3. Indicate what the project-related tax revenues would be to the municipalities and counties along the pipeline route associated with construction and during operation for the life of

- the project. A tax assessment should be conducted to determine how property taxes for landowners crossed by the pipeline will be affected.
4. Indicate whether or not the project-related tax revenues would offset costs to the principalities and counties along the route (such as the cost of road repairs due to damage caused by construction traffic).
 5. Introduction of WCSB or tar sands production can have impacts on production of oil and natural gas within the US, particularly in more isolated markets such as North Dakota and Montana.
 6. The number and types of jobs, the length of employment, and the likelihood of local employment should be assessed and detailed.
 7. With the large number of construction workers moving into an area there is bound to be and increase in drinking and drunk driving, drug use and crime.
 8. Indicate how local union hire will be supported. There are projects bringing in foreign labor (e.g., welders from Mexico) and this is undesirable for U.S. workers during the recession.
 9. Will electricity costs rise due to the need for additional power at the pump stations? How much power will it take to move the oil through this pipeline? Where will this power come from? Will there be new power plants built to provide the power? Will the pipeline pay the full costs of that new power, or will local residents rates go up to finance their construction?
 10. Land owners should be allowed to claim a portion of the proceeds from the crude oil piped over their property.
 11. What is the predicted effect of potential carbon taxes and potential U.S. carbon legislation on the Keystone pipeline?
 12. Would the oil products created at the end point be used in the USA or shipped to other countries?
 13. The EIS should identify the characteristics of the communities that are impacted, particularly the socio-economic characteristics (e.g., race, income). The EIS should pay close attention to communities that may be considered environmental justice (EJ) communities and should address the short-term and long-term impacts on these communities.
 14. Consider the impacts of building and operating this pipeline on the farmers, ranchers, and rural communities along the route.

Transportation and Traffic

1. Address the impacts associated with use of county and private roadways during construction, including how Keystone would restore or provide compensation for, or repair of the roadways.
2. Describe the impacts to transportation facilities, including increased traffic on roadways, construction material transportation, and construction crew transportation. Also explain what method(s) the pipeline would use for crossings of state and federal highways, county and local roads, and railroad crossings.

3. Are existing bridges and cattle guards adequate to handle projected loads from construction traffic?
4. Describe the methods that would be used to cross roadways and driveways, including the extent and duration of road closures associated with construction across roadways, and the impacts associated with each construction method.
5. Please disclose any areas that are greater than 5,000 acres without a road, that you will be crossing and adding roads to.

Air Quality, Noise and Vibration

1. Address the impacts of air emissions and air pollution abatement from pumping stations.
2. Address the air quality impacts of refining tar sands; greenhouse gas emissions due to the project and increased carbon emissions. We suggest that the EIS include a separate section on Climate Change impacts and cover the full slate of greenhouse gas emissions that are foreseeable from the extraction, refining, and end-use of the tar sands as fuel.
3. Address potential impacts of noise from pump stations to both human receptors and cattle.
4. Address the impacts due to construction noise.
5. Address potential for oil moving through the pipeline to cause vibration and generate magnetic fields that might then impact nearby houses and cattle.

Reliability and Safety and Emergency Response

1. Is there a copy of an Emergency or Disaster plan available? Is a plan being prepared, and if so will local counties receive a copy of this plan? What input has been, or will be, sought from local counties?
2. We recommend that the industry state-of-the-art pipeline leak monitoring and detection equipment, and pipeline operation and valving systems be included in pipeline alternatives.
3. Pressure should be monitored and a sufficient number of shut-off valves should be required in order to prevent explosions along the pipeline, attend to any leaks or spills and other safety concerns.
4. In the case of a pipeline failure, what is the spacing between the shut-off valves? Is the system set up to automatically “Shut-Down” when a leak has been discovered?
5. Once discovered, what would be a reasonable time expectation for the flow of oil to be stopped? How frequently do valves fail to close in an emergency situation?
6. Will leak detection software be able to detect small leaks as well as changes in pressure and flow? Describe how a release from the pipeline would be detected, especially when there is snow cover throughout the area of the release.
7. The EIS should analyze the costs and risks of thinner pipe as TransCanada has proposed; how much more oil will leak or spill from ruptures?
8. Adequately assess the corrosive nature of Canadian tars sands oil.

9. Does TransCanada have any experience with operating high pressure crude oil pipelines or own any?
10. How far out (from the easement area) will the pipe company go to clean up spill? Where will soil or water contaminated by oil leaks be treated or stored as waste?
11. Describe how spills that reach rivers will be contained or cleaned up, especially if there is ice on the water.
12. Indicate what entity would be responsible for cleanup after a spill.
13. Where will pipeline repair crews or clean-up crews be stationed? Will these crews be on-call? What provisions are or will be in place for travel to remote pipeline sites. What type of equipment is anticipated being needed to ensure responding to needs at these remote locations?
14. Is there any fire risk associated with leaks?
15. Could pipeline potentially become a terrorist target?
16. Is there any training being proposed for Local Responders and 911 Dispatch centers?
17. Describe all pipeline safety requirements that Keystone would be required to comply with and any additional safety features that would be included in the project.
18. In the case of third party damage to the pipeline, who is responsible for cleanup costs: the owner(s), operator(s), or the party causing the damage?
19. If the farmer crosses this line and it ruptures, who is responsible? Is the farmer liable for the spill/explosion since he broke the line, or is TransCanada liable for saying he could cross it?
20. As part of the application process, has the State developed adequate bonding requirements to cover pipeline contamination and clean-up?
21. The EIS needs to document how the proposed pipeline and associated facilities would conform to applicable state and local laws and regulations.
22. TransCanada's risk assessment document does not provide the Department or citizens of Montana with an adequate understanding of the risk of spills from this pipeline.
23. TransCanada has not disclosed maximum spill volumes.

Impacts from Oil Spills and Leaks

1. In the event the pipeline leaks or ruptures and spills, soil will be contaminated, drinking water and other groundwater or surface water may be threatened, and local governments may face expensive clean-ups.
2. What harmful chemicals can be leaked out during a spill, and what effect will these chemicals have on animals and humans?
3. An oil spill would have a devastating impact on a large number of game fish and other aquatic animals as well as the large number of water fowl who live year-round on or near Lake Eufaul.
4. If the pipeline cracks and starts to leak or explodes what are all potential threats to landowners, wildlife, water, vegetation, and surface resources?

5. Assess potential impacts of spills and leaks from the pipeline or during construction on water wells.
6. Who determines if the spill is cleaned up properly?
7. How well will the landowners and the landowners' neighbors be compensated for any damages?
8. Who will handle the cleanup or any oil fires that might be associated with a spill?
9. In the Hill Creek formation, which is a good portion of Harding County, there are massive channel sands and some of them are hundreds of feet thick. If you put a pipeline in there and it leaks into the ground, you can't contain that oil. It drains immediately into the sand.

Alternatives

1. The EIS should analyze alternative routes that avoid risks to homes, farming operations, and wells and springs used by rural residents, livestock, and wildlife.
2. Place the pipeline in existing right-of-ways to minimize disturbance and damage.
3. Describe how the preferred alternative was selected.
4. The proposed pipeline does not fully utilize state-owned lands in Montana for routing. One or more alternatives need to be developed that maximize the use of state-owned lands, while minimizing adverse environmental impacts and costs.
5. The EIS should analyze the impacts of the alternative route through North Dakota.
6. List other proposed new U.S. and Canadian pipelines. Would any of these meet the need that Keystone proposes to fill? For pipelines with additional capacity available, which markets do these pipelines serve?
7. Why can't the new Keystone XL follow the same route to Steele City, NE, already established by the Keystone project?
8. Other methods of transportation should be reviewed and examined. Other routes which might transport the crude oil using existing facilities which would not require the extensive construction of a new line should also be reviewed and examined.
9. Evaluate the alternative of expanding refining capacity in Canada, refining the oil from the source planned for shipment in the Keystone pipeline, and shipping petroleum products to the US instead of crude oil.
10. In addition to alternative routes, the EIS must fully evaluate the no-action alternative.
11. Evaluate the use of renewable energy sources to meet the market demands that the energy derived from the Keystone XL project would meet.
12. Consider alternative routes that are adjacent to or within existing interstate highway right-of-ways.

Cumulative Impacts

1. Concerns were expressed regarding building another pipeline through properties that may have up to four other pipelines already crossing the land.

2. The EIS should analyze all of the impacts of mining, making, refining and using tar sands oil.
3. Analyze the cumulative effects of the construction ROW, construction activities, and associated infrastructure.
4. All analyses of management actions and impacts of the pipeline project should consider cumulative impacts from activities outside the project area such as new roads, gas or oil wells, power lines, wind farms, coal mining, farming, new homes, airstrips, industry, etc.
5. Evaluate the existing storage and transportation capacity in Wood River and Patoka, IL and Cushing, OK and the impact of introducing additional volumes of crude oil.

3.2 Agency Comment Letters

The DOS has received 13 letters or emails from state and/or federal agencies. These letters are briefly summarized below; more detailed comments within the letters have been included in the summary presented above in Section 3.1.

- United States Department of the Interior, Bureau of Reclamation, Great Plains Region. March 3, 2009. It appears that the proposed pipeline may cross Reclamation's irrigation canals in Montana and Nebraska. If it does, construction activities will need to be coordinated with Reclamation and the local Irrigation Districts that operate and maintain the canals. If the proposed construction will alter, modify, or disturb in any manner any of Reclamation's facilities or cross its lands, a Special Use Permit containing provisions necessary to protect the interests of the United States may be granted.
- Montana Department of Natural Resources and Conservation. March 6, 2009. The proposed pipeline will cross two navigable rivers administered by the DNRC Eastern Land Office. Any crossing of grades/slopes greater than 10% on DNRC administered lands will require site specific erosion control methods. All disturbed areas on DNRC administered lands will be required to be reseeded to a native grass mixture recommended by the Eastern Land Office field staff. Any noxious weeds within the project area on DNRC administered lands should be controlled by TransCanada. Archeological, paleontological, and historical sites will be managed under the "Guidelines for Conducting Cultural/Paleontologic Resources Inventory Work on Montana State Lands." DNRC will review TransCanada easement applications, conduct site specific EAs, and subsequently recommend any further mitigation measures prior to issuing Land Use Licenses for the construction phase.
- South Dakota Department of Game, Fish and Parks. March 10, 2009. We have concerns with the pipeline crossing South Dakota Game, Fish and Parks lands (Game Production Areas) which are managed specifically for wildlife populations, associated habitats, and recreational purposes. Any level of disturbance or destruction could be detrimental to the management and vitality of these areas, including direct negative impacts to wildlife production. We request these impacts be taken under consideration when establishing the final path of the pipeline.
- Montana Fish, Wildlife and Parks. March 12, 2009. Montana Fish, Wildlife and Parks believes that the priorities for protecting fish, wildlife and recreational resources in Montana should be 1) avoidance (through appropriate field surveys and siting), 2) on-site mitigation (using best mitigation techniques and effective reclamation), and 3) off-site

mitigation (to compensate for irreparable harm to fish, wildlife, their habitat, and recreational resources).

- South Dakota Department of Environment and Natural Resources. March 12, 2009. The Draft EIS needs to evaluate the potential impacts of the project on groundwater quality and quantity, and on public and private drinking water sources near the proposed pipeline. Specifically, the evaluation needs to address this issue where the project crosses surficial aquifers such as the Hell Creek, Fox Hills, and Ogallala aquifers. Also the Draft EIS, as part of its evaluation of the potential impacts to existing land uses, needs to evaluate the potential impacts to South Dakota's existing crude oil and natural gas pipeline infrastructure.
- Nebraska Game and Parks Commission. March 13, 2009. In general, we have concerns for impacts to wetland and stream resources, as they provide valuable habitat to many fish and wildlife species. Because the proposed pipeline is a lengthy, linear project we acknowledge that it would be impossible to completely avoid impacting stream and wetland resources. However, we encourage that impacts to these resources be avoided and minimized to the extent possible and that mitigation be considered for unavoidable impacts, as necessary.
- Montana Department of Environmental Quality. March 16, 2009. The EIS must comply with the Montana Environmental Policy Act as well as National Environmental Policy Act, and must provide the information and analysis required for DEQ to make its findings under MFSA. Because of this, most of our comments reflect our needs in making those findings.
- Montana Department of Natural Resources and Conservation/NELO. March 17, 2009. TransCanada will need to secure a lease for Pump Station number 9. The DNRC will complete an EA Checklist that addresses site specific impacts for the lease.
- U.S. Army Corps of Engineers, Omaha District. March 20, 2009. If the proposed pipeline construction crosses the flood plains of small drainage ways and streams, flood related problems should not occur if the lines are buried far enough below the beds of drainage ways and streams to prevent exposure due to streambed erosion during periods of high flood flows. If the construction activities involve any work in waters of the United States, a Section 404 permit may be required.
- National Park Service, Environmental Quality Division. March 27, 2009. The proposed pipeline may cross through, or very near, two units of the National Park System including Niobrara National Scenic River in Nebraska and Big Thicket National Preserve in Texas. The installation of a pipeline directly adjacent to NPS lands or waters should be done in a manner that avoids or minimizes cross-boundary adverse impacts. The proposed route crosses several National Historic Trails. Be aware of these trails and their significance as well as any other NPS special status areas such as National Historic Sites, National Natural Landmarks, National Heritage Areas, etc., that may be located in or near the proposed pipeline route.
- Texas Parks & Wildlife Department, April 14, 2009. TPWD will participate in the DOS process for preparation of an EIS. Based on the information provided to date TPWD offers preliminary comments and recommendations concerning: habitats associated with water resources, stream crossings, significant stream segments (Red River Basin, Cypress Creek Basin, Neches River Basin, Trinity River Basin), wetlands, vegetation including native prairie, rare, threatened, and endangered resources, the Water Oak – Willow Oak series community, TPWD County Lists, and Mitigation Plans.

- U.S. Environmental Protection Agency, Region 8 Montana Office. April 15, 2009. Primary issues for the project involve: (1) potential impacts to rivers, streams, lakes, and wetlands, and surface and ground water quality, including aquatic habitat impacts, sedimentation of waters during pipeline crossings of rivers and streams, and water quality impacts due to possible pipeline spills, leaks, and/or other unintended product or chemical releases to the environment during construction or operations; (2) potential impacts to air quality; (3) potential fish and wildlife impacts, including impacts to threatened and endangered species and other special status species, and impacts to sensitive terrestrial and aquatic habitats, particularly wetland and riparian habitats; (4) minimization of disturbances to vegetation, effectiveness of revegetation, potential for spread of noxious weeds; (5) human health and socio-economic impacts, including communities, tribal, environmental justice; (6) greenhouse gas emissions and climate change; (7) cumulative impacts; and (8) other issues such as historic and cultural resources and pollution prevention.
- U.S. Fish and Wildlife Service, Realty Specialist, Lewistown, Montana. May 18, 2009. The routes are the same for the majority of the way through Phillips County. The pipeline route crosses a Waterfowl Management Rights (wetland) easement managed by the Bowdoin NWR. We are not sure whether or not the Pump Station Transmission Line impacts any FWS interest. **Alternative A1A:** From our understanding, the pipeline would cross over Medicine Lake NWR owned property (the canal). It appears the Pump Station Transmission Line closely follows the pipeline and would, therefore, cross FWS owned property. **Alternative A:** This Alternative varies slightly from the other two in Phillips and Valley Counties. However, we don't believe the pipeline crosses any FWS owned or partial interest (easement) lands outside the portion in Phillips County. We do not believe the Pump Station Transmission Lines for this Alternative impact FWS owned or partial interest lands. **Alternative B:** The pipeline does not cross any FWS owned or partial interest (easement) lands outside the portion in Phillips County. The Pump Station Transmission Line does cross a small portion of primary jurisdiction property on CMR.
