VOLUME 4
Appendix A (continued)

Appendix A (continued)

Responses to Comments and Scoping Summary Report

APPENDIX A: RESPONSES TO COMMENTS AND SCOPING SUMMARY REPORT

Appendix A of the EIS for the proposed Keystone XL Project is included within Volumes 3 and 4 of the EIS and consists of the following:

- Part 1 – Consolidated Responses (Volume 3): Consolidated responses to substantive comments on the draft EIS and the supplemental draft EIS;
- Part 2 – Supplemental Draft EIS Comment Response Matrix (Volume 3): Responses to individual substantive comments on the supplemental draft EIS;
- Part 3 – Draft EIS Comment Response Matrix (Volume 4): Responses to individual substantive comments on the draft EIS; and
- Part 4 – Scoping Summary Report (Volume 4): A summary of scoping process and a listing of the scoping comments.

Part 1 – Consolidated Responses

The U.S. Department of State (DOS) prepared “consolidated responses” as a part of its responses to substantive comments on the draft EIS and the supplemental draft EIS. The consolidated responses address topics that were commented on by multiple reviewers and address the majority of the issues of concern submitted by commenters. Many of the responses to individual comments of substance (see below) refer the commenter to specific consolidated responses for a detailed response.

Part 2 – Supplemental Draft EIS Comment Response Matrix

DOS received comments on the supplemental draft EIS as individual or “unique” comment submissions and as “form letter” submissions. The comments were submitted in letters, faxes, postcards, emails, submittals to the DOS website, and CDs.

Individual (Unique) Comment Submissions

The first portion of the Supplemental Draft EIS Comment Response Matrix (Volume 3) presents the name of the commenter in alphabetical order by last name, the substantive comments submitted, and the DOS responses to those substantive comments. Where appropriate, responses in the matrix refer to a consolidated response or in some cases to multiple consolidated responses.

Form Letter Comment Submissions

The second portion of the Supplemental Draft EIS Comment Response Matrix (Volume 3) presents the 31 different form letters received by DOS. Each form letter is presented in its entirety and the rows in the matrix shaded in gray indicate the “base” form letter.

Many individuals personalized the form letters by adding comments to the base form letter. The subsequent rows (non-shaded rows) after the base form comments, list the names of the commenter who added to the form letter, the added substantive comments, and the DOS responses to those comments.

Part 3 – Draft EIS Comment Response Matrix

DOS received verbal comments on the draft EIS at public comment meetings and written comments that were submitted in letters, postcards, and electronic media. The verbal comments were transcribed and DOS selected substantive comments from the transcripts for responses.

The Draft EIS Comment Response Matrix (Volume 4) presents the name of the commenter in alphabetical order by last name, the substantive comments submitted, and the DOS responses to those substantive comments. Where appropriate, responses in the matrix refer to a consolidated response or in some cases to multiple consolidated responses.

Part 4 – Scoping Summary Report

The Scoping Summary Report (Volume 4) presents a summary report that describes the scoping process that DOS conducted and the results of that process.

Draft EIS Comment Response Matrix

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
1528	2	Abbot	Curtis	E2 Environmental Entrepreneurs	Permitting the Keystone XL pipeline is a long-term investment in tar sands oil, one of the most carbon and water intensive fuels available.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project. Consolidated Response GHG-1 addresses GHG life-cycle analyses.
1528	5	Abbot	Curtis	E2 Environmental Entrepreneurs	Financial analysts consider tar sands oil too expensive to compete economically. Last year Goldman Sachs said that tar sands projects require long-term oil prices greater than \$80 per barrel just to break even. At that price point Deutsch Bank forecasts a permanent shift in consumer demand toward more energy efficient products, concluding that “the value of high [capital expenditure] intensity, long lead time, currently undeveloped oil, such as Canadian heavy oil sands... could be far lower than the market currently expects.”	Consolidated Response P&N-1 addresses the need for the proposed Project, including information on crude oil supply and demand from a recent analysis specific to the proposed Project. Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information on current and future production.
1528	6	Abbot	Curtis	E2 Environmental Entrepreneurs	Despite the high-costs, energy companies are considering investments of hundreds of billions of dollars in tar sands development over the next 15 years - capital that could be deployed for clean, low-carbon energy projects.	Consolidated Response ALT-2 addresses the use of alternative technologies, alternative energy sources, and conservation of energy. Consolidated Response P&N-5 addresses issues related to investments in other technologies.
1528	7	Abbot	Curtis	E2 Environmental Entrepreneurs	Given the costs and liabilities of tar sands oil, we question whether it is in the national economic interest to diverge off the path toward clean energy by committing massive resources to a project that will prolong America's oil dependence and greatly increase our carbon emissions.	Consolidated Response P&N-1 addresses the need for the proposed Project. P&N-9 addresses the National Interest Determination process.
1528	9	Abbot	Curtis	E2 Environmental Entrepreneurs	Due to requested safety waivers, building the Keystone XL pipeline could expose a vast area of the American heartland, including an important water source on which eight states depend, to the risk of oil leaks and spills.	Keystone has withdrawn its application for a Special Permit as described in Consolidated Response REG-1. As described in Consolidated Response SAF-1, the Pipeline and Hazardous Materials Safety Administration (PHMSA) has regulatory requirements that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project. In addition, PHMSA developed 57 Project-specific Special Conditions (see Appendix U of the EIS) that Keystone has agreed to implement. Incorporation of those conditions would result in a Project that would have a degree of safety over any other typically constructed domestic oil pipeline system under current code and a degree of safety along the entire length of the pipeline system similar to that which is required in high consequence areas (HCAs) as defined in 49 CFR 195.450.
1528	10	Abbot	Curtis	E2 Environmental Entrepreneurs	It will continue our dependence on yet another hard to access and risky fossil fuel with high social and economic costs associated with its extraction.	The commenter's opinion is noted
1528	11	Abbot	Curtis	E2 Environmental Entrepreneurs	Before moving forward we urge you to take a closer look at the liabilities associated with this project than has currently been done in the draft environmental impact statement. The State Department has committed great time and resources toward establishing America's leadership on global challenges including clean, low carbon energy. We urge you to take more time to lead a thorough and high-level inter-agency process to more fully assess the Keystone XL proposal before making its final determination.	The EIS has been prepared to comply with NEPA and presents an assessment of the purpose of and need for the Project, an assessment of the potential impacts of implementation of the Project, as assessment of alternatives to the Project, cumulative impacts, and the reliability and safety of the Project, including an assessment of the potential impacts due to an accidental release from the Project. The EIS was prepared with the assistance of 11 cooperating agencies and many other assisting agencies as described in Section 1.5 of the EIS.
1544	1	Abramson	Stuart	Health Professionals	I'm very concerned about the health effects on vulnerable populations related to proposed tar sands oil refinery activity	Consolidated Response P&N-3 addresses issues related to emissions from refineries. Consolidated Response JUS-1

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
				for Clean Air	that's proposed in the east Houston area. In the EIS, there are five refineries noted on Table 3.4, Section 3.14, that would have direct access to the pipeline.	addresses issues related to the potential for disproportionate impacts to minority and low-income populations.
1544	2	Abramson	Stuart	Health Professionals for Clean Air	Reviewing the EIS, I did not note any particular mention of vulnerable populations.	Consolidated Response JUS-1 and Section 3.10.1.2 of the EIS describe the counties in the project area with higher populations of minority and low-income groups that may be impacted by the project. This analysis is in accordance with Council on Environmental Quality guidance for analysis of potential environmental justice effects. As noted in Section 3.10 of the EIS, implementation of the proposed Project is not expected to result in adverse impacts that would fall disproportionately on minority or low-income populations located along the pipeline route. Moreover, project-related spending and tax revenues would result in substantial socioeconomic benefits in the region of influence, which may positively affect low-income and minority populations and Native American tribes through increased employment opportunities, income benefits, and improved public service levels.
1544	4	Abramson	Stuart	Health Professionals for Clean Air	Tar sands oil is a heavier, dirtier oil with dirty by-products of refining that are extruded into our environment.	Consolidated Response OIL-4 addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils. As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries.
1544	5	Abramson	Stuart	Health Professionals for Clean Air	There is more particulate matter (and this spans the range from PM2.5 which is monitored, to ultrafine particles which are not yet available to be monitored), VOCs (which includes polyaromatic hydrocarbons), sulfur and nitrogen oxides, all of these are emitted in the production of tar sands oil. These chemicals re not only well-known respiratory irritants, but they can cause serious worsening of asthma and other lung and heart conditions, some with long-term consequences, such as stroke and heart attacks. In addition, known carcinogenic heavy metals such as lead, mercury and arsenic are also by-products.	As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries. Consolidated Response OIL-4 also addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils.
1544	6	Abramson	Stuart	Health Professionals for Clean Air	Unless substantial additional measures are instituted to control this pollution, the proximity to it and the undue burden to those in this area will cause damage in health affects.	As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries. Consolidated Response OIL-4 also addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils.
1544	7	Abramson	Stuart	Health Professionals for Clean Air	Water contamination is an issue to take into consideration.	Consolidated Response WAT-1 addresses concerns regarding potential water quality impacts.
1544	8	Abramson	Stuart	Health Professionals	There is a significant increase in greenhouse gas emission of CO2 as a by-product of this tar sands oil production, which	Consolidated Response GHG-1 addresses the greenhouse gas life-cycle analyses presented in the revised EIS.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
				for Clean Air	has a larger potential impact on global warming and health.	
742	1	Absher	Kimberly		There has been a lot of backlash from a variety of sources over the extension of the Keystone pipeline, and I am writing to add my voice to the dissent. The Keystone XL Pipeline project is destructive environmentally and culturally.	Section 3 of the EIS addresses the impacts of construction and operation of the proposed Project. Section 3.13 of the EIS addresses the risk and environmental impacts of a crude oil spill from the proposed Project.
742	2	Absher	Kimberly		This project will be contributing to further damage already fractured relationships with tribal communities...	Consolidated Response CUL-1 and Section 3.11.4.3 of the EIS address the consultation process between DOS and Indian tribes. As noted in Consolidated Response CUL-1, a Programmatic Agreement (PA) has been developed for the Project under Section 106 of the National Historic Preservation Act. The PA includes mitigation measures for known adverse effects and provides a process for ongoing surveys to be conducted in areas where access was not granted during the EIS process. The Traditional Cultural Property (TCP) reports (noted in Section 3.11.4-3 of the EIS) may not be disclosed due to concerns regarding confidentiality. Potential impacts to cultural resources are addressed in Section 3.11.3.1 of the EIS. DOS considers this assessment to be in compliance with NEPA environmental review requirements.
742	3	Absher	Kimberly		This proposed Project and its location over the Sand Hills will be horribly destructive to the incredibly amazing Sand Hill cranes.	Sensitive environments crossed by the proposed Project are discussed in Consolidated Responses ENV-1 and ENV-3. Issues related to the Sand Hills area are addressed in Consolidated Response ERO-1. Potential impacts of the proposed Project to sandhill cranes are discussed in Section 3.6. Most riverine roosting habitat within the migration corridor would be crossed using the horizontal directional drilling (HDD) method and would not result in alteration of these habitats.
742	4	Absher	Kimberly		Also horribly problematic is the extension will be directly over the Ogallala Aquifer. With the global water crisis becoming much more apparent, we cannot afford to ruin additional sources of water.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
742	6	Absher	Kimberly		...Our dependence on fossil fuels is the chief cause of damage to our environment, which means increased problems for us and the further destruction of the invaluable species that make the midwest in particular a plethora of beauty...What is important in this life? Is it really pumping more oil, thus continuing a never-ending pipeline of damage that murders species ...	Section 3 of the EIS addresses the impacts of construction and operation of the proposed Project. Section 3.13 of the EIS addresses the risk and environmental impacts of a crude oil spill from the proposed Project.
742	8	Absher	Kimberly		[Fossil fuel use has been the usual means of energy consumption for a long time and we are experiencing the repercussions of that now, with...] the disproportionate burden on already oppressed members of our community, such as the tribal peoples. ...What is important in this life? Is it really pumping more oil, thus continuing a never-ending pipeline of damage that ... oppresses those who the land belongs to? ...	As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries. Also see Consolidated Response JUS-1 which addresses potential impacts to minority and low-income populations.
742	9	Absher	Kimberly		...What is important in this life? ...Or is it working together to find ways to be sustainable, hearing feedback from the PEOPLE...	Consolidated Response CMT-2 addresses issues related to comment meetings on the draft EIS and requests for additional public involvement.
127	1	Acevedo	H.M.&Miguel		I have no idea how this 36" pipeline will impact the environment, but I can tell you that it IS devastating to us. We have 663 acres total, but Keystone is stealing some of it away	The impacts associated with implementation of the proposed Project are addressed in Section 3.0 of the EIS. As noted in Consolidated Response EAS-2, state laws dictate under what

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					from us. Keystone Pipeline is paying us what THEY want to pay us, not what we want.	circumstances eminent domain may be used and define the eminent domain process within the state. DOS has no legal authority in the easement negotiations or in eminent domain proceedings.
127	2	Acevedo	H.M.&Miguel		We strongly feel that we will never be able to sell our property for what we paid because of this pipeline crossing our property (almost in the center) and it will be 50' wide!!! This is outrageous that they can do this to us. We were planning on this property being "retirement." Now what will we do? Depend on our government to assist us in our old age? Our government assists too many people as it is. We wanted to take care of ourselves!	Consolidated Response VAL-1 addresses concerns regarding property values. Although there would be restrictions regarding buildings and trees within the 50-foot-wide permanent right-of-way, other land uses would be permitted within that area.
127	5	Acevedo	H.M.&Miguel		We are losing our trees on 110 feet of our property. 50 feet that they will have (but WE have to pay taxes on this property) and the other 60 feet they will use as temporary. They are removing our pine trees. Pine trees that help the environment with pollution. What does the pipeline help with?	Keystone would compensate landowners for the loss of trees; and will leave all cut timber with the landowner, if he or she desires, for the landowner's use or disposition. Trees would be allowed to naturally revegetate within the 110-foot-wide right-of-way, except within 10 to 15 feet of the pipeline. The construction right-of-way at timber shelterbelts in agricultural areas would be reduced to the minimum necessary to construct the pipeline. Mitigation measures designed to minimize impact on forested lands are described in Keystone's Construction Mitigation and Reclamation (CMR) Plan which is appendix B of the EIS; also included is a section on landowner complaint resolution procedures. The purpose of and need for the pipeline are described in Sections 1.2 and 1.4 of the EIS and additional discussions are presented in Consolidated Response P&N-1.
175	1	Adams	Fern		I spent half my working career with the U.S Geological Survey. That is when I became aware of the vast important resource Nebraska has--the Ogallala Aquifer. I find it very upsetting to see how our State is allowing the Keystone pipeline to pass through and endanger this aquifer. The gulf oil situation should be enough to wake up those representing us. I fear this pipeline could be a target for terrorists and a severe leak could destroy the pure water we enjoy--and destroy Nebraska's ability to function as an agricultural state. I doubt the gates could adequately serve as protection. Please stop this pipeline and process the oil near Canada.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. AQF-5, As described in Consolidated Response GLF-1, the risks associated with the proposed Project are substantially different from those associated with the BP Deepwater Horizon Project.
384	1	Adams	Kerry	3M Company	As a member of the Canadian Standards and NACE committees for corrosion protection of pipelines; I feel that TCPL is a premier pipeline operator. 3M has taken steps to building a new coating facility in Angleton, TX to manufacture the coating to be used to protect the Keystone XL pipeline from corrosion.	Comment acknowledged.
384	3	Adams	Kerry	3M Company	I am in favor of this project to proceed; as a resident of East Texas community.	Comment acknowledged.
807	1	Adams	Fern		The Keystone XL Pipeline should not go through the Ogallala Aquifer. I am appalled to learn that another Keystone pipeline started flowing across the eastern edge of this aquifer today! The claims of safety have not proved true time and time again--why should we believe it true this time?	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
807	2	Adams	Fern		With the chance of terrorist attacks in a sandhills area where the population is so small and the aquifer so at risk, how can	Consolidated Response TER-1 addresses potential terrorism associated with the proposed Project. The proposed Project

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					anyone make such claims? How many gallons per minute of spillage would occur? Whoever in Nebraska approved this?	has not been approved but is in the review stage. Issues related to the High Plains Aquifer System are addressed in Consolidated Response AQF-1 through AQF-4. Consolidated Response AQF-3 provides information on hypothetical spills from the Project over two areas of the Northern High Plains Aquifer System. Section 3.13 of the EIS addresses spill volumes and the potential impacts of spills.
807	3	Adams	Fern		Why has the average Nebraskan had no knowledge of this (until recently), which I hear has been planned for years?	Consolidated Response CMT-3 addresses the level of information provided to the public regarding the proposed Project and the scoping meeting locations and schedules.
807	4	Adams	Fern		Why not process this sludge in or near Canada?	Consolidated Response P&N-8 addresses issues related to shipping Canadian crude oil to refineries that are closer to the source of oil.
878	1	Adams	Patrick		Please don't allow this pipeline to cross the Nebraska Sandhills.	Identification of sensitive environments crossed by the proposed Project is discussed in Consolidated Response ENV-1 and ENV-3. Issues related to the Sand Hills area are addressed in Consolidated Response ERO-1. Consolidated Response ALT-1 addresses potential alternative routes, including routes that would avoid much of the Northern High Plains Aquifer system and the Sand Hills area.
878	2	Adams	Patrick		The underlying aquifer is a unique, precious commodity that could easily be permanently damaged by an accident or leak.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
925	1	Adams	Fern		Yesterday I thought I had submitted my Keystone XL pipeline concerns to you when I accidentally noticed a small red message saying it had not been submitted because of a technicality--I had failed to type the two words(in the box)that were difficult to read.This has troubled me. How many letters of concern do you think you may have missed because the sender failed to do this? I see those difficult-to-read words are different today.	The commenter is referring to a software filtering approach (CAPCHA technology) that is a commonly used method to block input from automatically generated from computer programs. DOS apologizes for the inconvenience to the commenter. Although some others may have experience difficulty with this filtering method, DOS received over 1,700 comment letters on the draft EIS (see Section 1.7 of the EIS),
1087	1	Adams	Fern		I have been told this pipeline is a "done deal" and trenches are already being dug. Is this true? How did something like this get planned without GREAT AWARENESS of the Nebraskans who care about their state? Who in Nebraska signed off on it?	The commenter is referring to the previously approved and currently in operation Keystone Oil Pipeline, not the proposed Keystone XL Project.
1087	2	Adams	Fern		The aquifer is not only of prime importance to our state but to our whole nation and our world who relies on our crops to feed them. Let's take no chances!	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
807	3	Adams	Fern		Why has the average Nebraskan had no knowledge of this (until recently), which I hear has been planned for years?	Consolidated Response INT-1 addresses concerns related to the Notice of Intent (NOI) to prepare an EIS for the proposed Project. Consolidated Response CMT-3 addresses the level of information provided to the public regarding the proposed Project and the scoping meeting locations and schedules.
314	1	Agnew	Patricia		I am extremely concerned about a proposed tar sands pipeline across eastern Montana. Every effort must be made to ensure it is of consistent, highest quality and vigilantly monitored so as not to impact Montana agriculture or in any way contaminate the land and affect livelihoods. This is not a "throwaway" area, nor are the families that have lived and worked here for over a century.	As described in Consolidated Response SAF-1, the Pipeline and Hazardous Materials Safety Administration (PHMSA) has regulatory requirements that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project in a manner that protects the health and safety of the public and the environment. In additions to its regulations in 49 CFR Parts 194 and 195, PHMSA developed 57 Project-specific Special Conditions that Keystone has agreed to implement and to incorporate into its manual for operations, maintenance, and emergencies that is required by

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
						49 CFR 195.402. PHMSA has the legal authority to inspect and enforce any items contained in a pipeline operator's operations, maintenance, and emergencies manual, and would therefore have the legal authority to inspect and enforce the regulations and the Special Conditions if the proposed Project is approved. Incorporation of those conditions would result in a Project that would have a degree of safety over any other typically constructed domestic oil pipeline system under current code and a degree of safety along the entire length of the pipeline system similar to that which is required in HCAs as defined in 49 CFR 195.450.
1418	1	Aguilar	Patty		I'd like to say that this is a small community and we could use the jobs. There are a lot of good people here looking for jobs so they can support their families. I hope you will consider sending the jobs here to Stroud, OK. None of the stimulus money has come our way. Thank you!!	Comment acknowledged.
948	1	Aichinger	Scott		Please deny permission to Keystone XL for their proposed new pipeline plotted to run through the sensitive Sandhills of NE, above the precious Ogallala Aquifer. They have the money to route the pipeline where there is less of a certainty that the environment will be impacted.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. Consolidated Response ALT-1 addresses potential alternative routes, including routes that would avoid much of the Northern High Plains Aquifer system.
948	2	Aichinger	Scott		The Sandhills are too fragile an ecosystem to take the stress of any leaks that will happen here.	Issues related to the Sand Hills area are addressed in Consolidated Response ERO-1. Issues related to the Northern High Plains Aquifer System are addressed in Consolidated Responses AQF-1 through AQF-4.
948	3	Aichinger	Scott		The Ogallala's water is too precious a resource, in this day's dwindling water supplies, to expose to any leaks that will happen here.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
948	4	Aichinger	Scott		Agriculture already pulls more water out of the Ogallala aquifer than is recharged by rainfall and runoff.	Operation of the proposed Project will not extract or use any water from the aquifer.
948	5	Aichinger	Scott		The Ogallala is already being toxified by Uranium tailings from Cameco's Crow Butte operations, it should not be allowed that oil from yet another carbon-polluting player seep into it as well.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
948	6	Aichinger	Scott		Their plan indicates that the pipeline will be buried, thus almost guaranteeing that any leaks will remain so for too long, thereby contaminating the Ogallala aquifer before a fix happens.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
948	7	Aichinger	Scott		A study released yesterday by Plains Justice indicates they've used defective steel in their current pipeline. This plus the smaller diameter pipe (would have higher internal pressure) forecasts failures of such a structure.	Consolidated Response PIP-1 addresses the issue of purchasing pipe for the proposed Project, including inspection of the pipe. Keystone has withdrawn its application for a Special Permit as described in Consolidated Response REG-1. Consolidated Response SAF-1 describes the regulatory requirements that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed proposed Project in a manner that protects the health and safety of the public and the environment. The maximum operating pressure of the pipeline would be in compliance with the regulations and Special Conditions of the Pipeline and Hazardous Materials Safety Administration regulations.
948	9	Aichinger	Scott		The presumed need for this extra oil is false. Much greater emphasis on end-use efficiency measures offsets such need, as well as offsets the ongoing carbon-loading into the	Consolidated Response P&N-1 addresses the need that the Project has been proposed to meet. Consolidated Response ALT-2 addresses the use of alternative technologies and

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					atmosphere propagated by such pipeline plans. Our National Security would be better served by pushing for end-use, radical efficiency measures and sustainably produced, renewable energy sources, than continuing the inane, "Drill, Baby, Drill!" mentality which has led us to our current Gulf oilwell blowout.	alternative energy sources.
425	1	Ainsley	Amy	Mamas United For Freedom	I am opposed to the keystone pipeline in Nebraska.	Comment acknowledged.
425	2	Ainsley	Amy	Mamas United For Freedom	Burying this pipeline in the Nebraska Sandhills is positively crazy. This land lies directly over the Ogallala Aquifer, the largest source of underground freshwater in the United States. The aquifer is a national treasure and should not be threatened by oil contamination. TransCanada should not be allowed to do this. They want the pipe walls to be thinner than usual, and use higher pressure than usual to move these tar sands, which are notoriously difficult to cleanup. If the pipeline must be built, it should be above ground where a spill is more likely to be contained without poisoning the aquifer.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. Keystone has withdrawn its application for a Special Permit as described in Consolidated Response REG-1. Issues related to an aboveground pipeline are addressed in Consolidated Response CST-1.
425	5	Ainsley	Amy	Mamas United For Freedom	Do we want to contaminate one of the world's largest supplies of groundwater, and the primary source of groundwater for agriculture and domestic use in Nebraska. It also feeds our streams, rivers, and lakes, where countless wildlife, countless amounts of the food we grow to feed our country and humans would be affected.	Issues related to the Northern High Plains Aquifer System are addressed in Consolidated Responses AQF-1 through AQF-4. Consolidated Response AQF-3 provides information on hypothetical spills from the Project over two areas of the Northern High Plains Aquifer System.
425	6	Ainsley	Amy	Mamas United For Freedom	Building the pipeline would provide oil companies more incentives for further development of the tar sands in Canada, an expensive and extremely environmentally damaging process that generates greenhouse gases, pollutes watersheds and destroys woodlands and other wildlife habitat. Please please please, do not allow TransCanada to do this. Do not trust them to keep our best interest at heart. They will not. Please do not build this pipeline.	Consolidated Response GHG-2 addresses the potential causal connection of implementation of the proposed Project and expanded oil sands production in Canada and increases in refining. Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project.
425	7	Ainsley	Amy	Mamas United For Freedom	Building the pipeline would provide oil companies more incentives for further development of the tar sands in Canada, an expensive and extremely environmentally damaging process that generates greenhouse gases, pollutes watersheds and destroys woodlands and other wildlife habitat.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project. Consolidated Response GHG-1 addresses GHG life-cycle analyses.
425	8	Ainsley	Amy	Mamas United For Freedom	The sandhill crane migration (millions upon millions of sandhill cranes migrate right over this spot on the map) would be decimated if the Platte River became contaminated.	The horizontal directional drilling method would be used for the pipeline crossing of the Platte River. Section 3.13 of the EIS addresses reliability and safety issues, including calculations of the probability of a spill from the proposed Project and the potential environmental impacts associated with spills.
425	9	Ainsley	Amy	Mamas United For Freedom	Burying this pipeline in the Nebraska Sandhills is positively crazy.	Identification of sensitive environments crossed by the proposed Project is discussed in Consolidated Response ENV-1 and ENV-3. Issues related to the Sand Hills area are addressed in Consolidated Response ERO-1.
433	1	Akers,Sr.	Lee		The utilization of North American oil is of prime importance if we are to regain our independence from despotic foreign governments which have held America hostage for many years. Any disruption of the soil will be merely temporary, and within only a few years, unless one knows there is a pipeline,	Comment acknowledged.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					he will never know it is there.	
433	2	Akers, Sr.	Lee		I support the Keystone Pipeline, and urge it's early completion and utilization.	Comment acknowledged.
846	1	Alberts	Linda	Ainsworth Community School	I am against the oil pipeline crossing the Nebraska Sand Hills. Any accidental spill would contaminate our groundwater and be impossible to clean up.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
75	2	Allen	Frances		Our country should not develop other potential disastrous ones like Keystone XL's dirty tar sands oil pipeline.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information on current and future production. As noted in that Consolidated Response, without the proposed Project, oil sands development would continue at or above the current level until at least 2020, with or without the proposed Project. Consolidated Response SAF-1 describes the regulatory requirements and Project-specific Special Conditions that Keystone would comply with to construct, operate, maintain, inspect, and monitor the proposed Project. It also describes the monitoring, inspections, and reviews of the proposed Project that the Pipeline and Hazardous Materials Safety Administration would conduct to ensure compliance with those regulatory requirements.
114	1	Allen	Lily		Keystone land right-of-way personnel have been and are very courteous, helpful and desire to be very sensitive to the feelings and attitudes of the land owners concerning the planned construction of the pipeline. Our experience with these folks is very positive. I really feel they do have the desire to do the right thing for all concerned. Keystone personnel have never mislead us or misrepresented the truth in our working together with them over the past year!	Comment acknowledged.
349	1	Allen	Don	Western Environmental Trade Association	On behalf of the members of the Western Environmental Trade Association, I write in support of TransCanada's Keystone XL crude oil pipeline project and urge the department to grant a permit for the pipeline.	Comment acknowledged.
349	3	Allen	Don	Western Environmental Trade Association	This project is a vital link to secure energy supplies for the United States. According to the U.S. Energy Information Administration, oil and natural gas will continue to supply over 50 percent of U.S. energy needs in 2030. Canada is a valued trading partner and our most reliable supplier of foreign-based crude oil. The Keystone project will have the added benefit of potential links to growing domestic supplies of crude oil in Montana and North Dakota.	Comment acknowledged.
349	4	Allen	Don	Western Environmental Trade Association	Securing stable and affordable energy from our North American allies through projects such as the Keystone pipeline is in the national interest. Considering the economic and energy security benefits of these vital resources, we should continue to expand America's access to safe, affordable energy to help ensure improved domestic and global energy security and stable prices for consumers. This project will result in a significant economic boost for the State of Montana and the counties where the pipeline: will be constructed. About 800 construction jobs in Montana, along with about a dozen permanent jobs and the millions in property taxes generated will be a huge private investment. Rejection of the permit or suspension of the review would	Consolidated Response ECO-1 addresses potential socioeconomic impacts, and Consolidated Response TAX-1 addresses concerns regarding taxes.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					sacrifice the significant economic benefits this project stands to deliver and force U.S. consumers to rely on other sources of crude oil not economically and politically allied with U.S. interest. This would be a mistake. WETA urges the granting of the permit.	
349	5	Allen	Don	Western Environmental Trade Association	The environmental benefits of Keystone XL are very important. Pipelines are the safest, most reliable economical and environmentally favorable way to transport oil and petroleum products, as well as other energy liquids, throughout the U.S.	Comment acknowledged.
1452	1	Allen	Bob	Harris Cnty Public Health & Environmental Services	The DEIS indicates that the Houston Lateral pipeline construction operation will result in impacts to "the air primarily involving" fugitive dust emissions, construction equipment diesel emissions and open burning emissions. There are also potential impacts to water quality sources from leaks and runoff from construction sites. Harris County is currently designated as severe non-attainment for the 8-hour National Ambient Air Quality Standard (NAAQS) for ozone. Additionally, although Harris County is currently in compliance with NAAQS for PM 2.5, it is anticipated that the standard will be lowered in the near future potentially resulting in a non-attainment designation. Many of its water bodies including some water bodies that are proposed for pipeline crossing (e.g. San Jacinto), are impaired from pollutants such as PCBs and Dioxins. Another important drinking water source proposed to be in the pipeline crossing is the Trinity River.	<p>Section 3.13 of the EIS addresses reliability and safety issues, including calculations of the probability of a spill from the proposed Project and the potential environmental impacts associated with spills that reach surface water or groundwater. Section 3.3 of the EIS addresses potential water quality impacts to streams and rivers due to construction of the proposed Project.</p> <p>Based on the nonattainment status of Texas counties in which the pipeline will pass, a General Conformity analysis was prepared (see Section 3.12.1.3). It was determined that construction emissions for the Project would be accounted for in the SIP emissions budget and the proposed activity within the Houston-Galveston-Brazoria nonattainment area was presumed to conform to the SIP.</p> <p>As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries. Consolidated Response OIL-4 also addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils.</p>
1452	3	Allen	Bob	Harris Cnty Public Health & Environmental Services	The DEIS also contemplates notification procedures to follow federal and state regulatory requirements. It is requested that in the event of spills and air releases HCPHES, the local regulatory agency, be provided the same level of notification. In addition to our specific comments and concerns related to the construction and operation of the proposed pipeline, HCPHES has an overarching concern regarding the cumulative air quality impacts of processing additional volumes of heavy crude at the five refineries located in Harris County. As a county that will be heavily impacted by this proposed pipeline project, it is imperative that we understand the extent of additional pollutants that may be emitted into an already compromised air shed as a result of the heavy crude processing which produces higher levels of sulfur dioxide, nitrogen oxides, particulates and heavy metals. The DEIS is lacking in this area. HCPHES is requesting that the final EIS make a better effort to identify proposed air emissions by expanding the cumulative impacts analysis to include worst case emission estimates for the five Harris County refining	<p>If a spill were to occur in Harris County, Keystone or the incident command center for the spill would contact the appropriate responders and state and local health service agencies in accordance with the requirements of its emergency response plan. DOS anticipates that HCPHES would be included in the list of agencies to be contacted if a spill were to occur in Harris County. Consolidated Response RES-1 addresses issues related to preparation and review of the emergency response plan for the proposed Project.</p> <p>As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries. Consolidated Response OIL-4 also addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils.</p>

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					operations.	
500	2	Almarode	Lindsey		This pipeline goes over Sand Hills, home to many migrating cranes.	Issues related to the Sand Hills area are addressed in Consolidated Responses ERO-1 and ENV-1.
500	3	Almarode	Lindsey		It also goes over the Ogallala Aquifer. This pipeline would endanger the environment and perpetuate a system based on dirty energy.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
500	4	Almarode	Lindsey		In addition, it goes over Native American tribal lands. We've already exploited them enough! Please halt the expansion of this pipeline. Thank you.	Consolidated Response CUL-1 and Section 3.11 of the EIS address protection of historic properties and the consultations conducted in compliance with Section 106 of the National Historic Preservation Act, including consultation with Indian tribes.
862	1	Alston	Anne		I am writing as a citizen of Nebraska, who believes that the Ogallala Aquifer may well be the state's greatest and least appreciated natural resource. The proposed pipeline is a grave threat to it. It needs further study, further public scrutiny and if implemented at all, should be moved elsewhere.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. and ALT-1.
1394	1	Alworth	C.W.	City Council	I strongly encourage the U.S. Department of State to approve an energy infrastructure project that [not only will strengthen long-term energy security in the United States, but also will provide a powerful private sector economic stimulus to the communities along the pipeline route during its construction at a time when our economy continues to struggle.]... I enthusiastically support the Keystone XL Pipeline Project and encourage the Department of State to confirm the findings of the Draft Environmental Impact Statement, which found that the proposed Keystone XL Pipeline would have "limited adverse environmental impact during construction and operation." I look forward to the issuance of a Final Environmental Impact Statement followed by a Presidential Permit	Comment acknowledged.
1394	2	Alworth	C.W.	City Council	As a city official in the State of Texas, I strongly encourage the U.S. Department of State to approve an energy infrastructure project that not only will strengthen long-term energy security in the United States, but also will provide a powerful private sector economic stimulus to the communities along the pipeline route during its construction at a time when our economy continues to struggle... As I understand, Keystone XL will directly create more than 13,000 high-wage construction and manufacturing jobs during the project's 2011-2012 construction schedule. Many of those jobs will be created in Texas, in our counties, and in our cities, where too many of our residents continue to find it difficult to find good jobs. In addition to the jobs that Keystone XL will create, the project will generate substantial economic benefits for the United States and in states and communities along the proposed route. It is my understanding that TransCanada commissioned a study to measure the project's economic stimulus to the U.S. and the states along the route. The study found that in the U.S., Keystone XL would generate \$20.9 billion in total expenditures, \$9.6 billion in output (gross product), personal income of \$6.5 billion and 118,935 person years of employment (jobs). In addition, the report concluded that during construction, Keystone XL would generate \$486.36	Consolidated Response ECO-1 addresses potential socioeconomic impacts, and Consolidated Response TAX-1 addresses concerns regarding taxes.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					million in tax revenue for state governments along the route and \$99.1 million for local taxing entities where the pipeline is located. In Texas, the study found KeystoneXL expenditures during construction would total \$5.4 billion and generate an economic gross product of nearly \$2.86 billion, Keystone XL construction also would generate more than \$64.5 million in tax revenue for local government and \$152 million for state government. Furthermore, the delivery of secure and affordable supplies of Canadian energy to American consumers would have minimal impacts on the environment. This is a vital project that will strengthen U.S. energy security and reduce our dependence on unstable foreign sources of oil. The Perryman study concluded that the long-term increase in stable oil supplies will add at least 250,000 pennant jobs to the U.S. economy, and add \$29 billion to the nation's gross annual product, conservatively estimated... I look forward to the issuance of a Final Environmental Impact Statement followed by a Presidential Permit that allows the construction of Keystone XL and enables our counties, the State of Texas, and the United States to collect the substantial economic benefits Keystone XL would create.	
1394	5	Alworth	C.W.	City Council	Oil sands account for more than 97 percent of that vast reserve: 170 billion barrels of oil with the potential for more than 100 years of production.	Comment acknowledged.
946	1	Amundson	Nicolette		I am against the proposed Keystone Pipeline Expansion Project.	Comment acknowledged.
946	3	Amundson	Nicolette		The pipeline will run through the Ogallala Aquifer in Nebraska. The aquifer is one of the world's largest aquifers and a major fresh water resource for eight states.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
946	4	Amundson	Nicolette		The Sandhills and the Platte River are important to the migratory Whooping Crane and Sandhill Cranes that use the area as a nesting site. It has been identified that the pipeline will adversely affect at least five endangered species.	Neither sandhill cranes nor whooping cranes nest along the Platte River in Nebraska; both of these birds use the Platte River for migration stop-over. The assessment presented in Section 3.8 and in the Biological Assessment presented in Appendix T of the EIS conclude that the proposed Project would likely adversely affect only the American burying beetle.
946	5	Amundson	Nicolette		The pipeline will disturb prairie and farmland that are significant resources.	Consolidated Response FRM-1 addresses potential ranch of farmland impacts. Consolidated Response ENV-3 addresses concerns regarding potential impacts to native grasslands and prairies.
946	6	Amundson	Nicolette		The pipeline will deliver the tar sands to the Gulf Coast for refining. It is suspected by many that the product once refined will be shipped outside of the United States. We will be allowing this pipeline to jeopardize our environment with no guarantee of benefit.	Consolidated Response P&N-2 provides information on the export of refined product from Gulf Coast refineries as well as exporting WCSB crude oil from the Gulf Coast. As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries. Consolidated Response OIL-4 also addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils.
946	7	Amundson	Nicolette		There is no definite knowledge of the environmental impact of this pipeline. Studies must be done - including reviewing	Impacts associated with construction and normal operation of the proposed Project are presented in the resources sections

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					alternative installation and routes.	of Section 3.0 of the EIS. As described in those sections, construction and normal operation of the proposed Project would not result in significant impacts.
946	8	Amundson	Nicolette		No plan is currently in place in Nebraska to regulate this type of installation. I am concerned that the more remote locations could experience a leak that remains undetected for months.	As described in Consolidated Response SAF-1, the Pipeline and Hazardous Materials Safety Administration (PHMSA) has regulatory requirements that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project. In addition, PHMSA developed 57 Project-specific Special Conditions that Keystone has agreed to implement. Incorporation of those conditions would result in a Project that would have a degree of safety over any other typically constructed domestic oil pipeline system under current code and a degree of safety along the entire length of the pipeline system similar to that which is required in HCAs as defined in 49 CFR 195.450. It also describes the inspections and reviews of the proposed Project that PHMSA would conduct to ensure compliance with those regulatory requirements. Consolidated Response OIL-3 and Section 2.4.2.1 of the EIS address leak detection.
946	9	Amundson	Nicolette		Once the oil contaminates the land it will be impossible to reclaim its pristine quality. Such a catastrophe would decimate our economy.	Issues related to the High Plains Aquifer System are addressed in Consolidated Response AQF-1 through AQF-4. Consolidated Response AQF-3 provides information on hypothetical spills from the Project over two areas of the Northern High Plains Aquifer System. As noted in those responses, a spill over the Northern High Plains Aquifer system would not devastate the economy of Nebraska or the U.S.
946	10	Amundson	Nicolette		The pipeline expansion is not needed at this time. The existing pipeline can satisfy the current and projected need. It makes sense to at least delay the project until further studies made and protection statutes in place to protect the environment and the community.	Consolidated Response P&N-1 addresses the need that the Project has been proposed to meet. As noted in that response, the Project has been proposed to meet the heavy crude oil needs of refineries in the Gulf Coast area, not for the U.S. in general. In addition, the Alberta Clipper and existing Keystone pipeline projects serve other markets and do not meet the demands of the Gulf Coast refineries. Consolidated Responses ENR-1 and P&N-9 provide information on the DOS environmental review process, the National Interest Determination process, and the need to complete those reviews before approving or denying the Presidential permit for the proposed Project.
261	5	Anderson	David		The company says they will fix or reimburse any damages but it this true? If I lose one year of production I could lose the family farm that's in the 3 generation.	Consolidated Response LIA-1 addresses Keystone's liability if there is a spill of hazardous materials or fuel during construction or a spill of crude oil from the proposed Project. Easement agreements typically addresses other damages to property, and as noted in Consolidated Response EAS-2, state laws dictate under what circumstances eminent domain may be used and define the eminent domain process within the state. DOS has no legal authority or ability to intervene in the easement negotiations or in eminent domain proceedings.
261	6	Anderson	David		Sure county tax payers are all for it but what about the people that the pipeline actually crosses? It sure isn't going to make the value of the land go up. Why can't we get something from it besides the shaft?	Consolidated Response VAL-1 addresses concerns regarding property values.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
261	8	Anderson	David		Who's going to be liable? Again, they say they will but is this true?	Consolidated Response LIA-1 addresses Keystone's liability if there is a spill of hazardous materials or fuel during construction or a spill of crude oil from the proposed Project.
261	9	Anderson	David		As we understand it, Keystone XL will create more than 13,000 high-wage construction and manufacturing jobs during the project's 2011~2012 construction schedule. Many of those jobs will be created in rural and in my districts, where too many of our residents continue to find it difficult to find good jobs. With Keystone XL, they will have an opportunity to work on the project or for businesses that provide supplies, goods and services for its construction and operation.	Consolidated Response ECO-1 addresses potential socioeconomic impacts, and Consolidated Response TAX-1 addresses concerns regarding taxes.
261	10	Anderson	David		In addition to the jobs Keystone XL will create, the project will generate substantial economic benefits for the United States and in states and communities along the proposed route. Like our counties, in many cases these are areas where economic performance has stagnated or is shrinking. It is my understanding that TransCanada commissioned a study to measure the projects economic stimulus to the U.S. and the states along the route. The study found that in the U.S. Keystone XL would generate \$20.9 billion in total expenditures, \$9.6 billion in output (gross product), personal income of \$6.5 billion and 118,935 person years of employment (jobs).	Consolidated Response ECO-1 addresses potential socioeconomic impacts, and Consolidated Response TAX-1 addresses concerns regarding taxes.
261	11	Anderson	David		In addition, the report concluded that during construction, Keystone XL would generate \$486.36 million in tax revenue for state governments along the route and \$99.1 million for local taxing entities where the pipeline is located. In Oklahoma, the study found Keystone XL expenditures during construction would total \$1.2 billion and generate an economic gross product of nearly \$1.1 billion. Keystone 'XL construction also would generate more than \$7.7 million in tax revenue for local government and \$31.4 million for state government.	Consolidated Responses TAX-1 and ECO-1 address the estimated increases in the tax base and the jobs generated by the proposed Project. Also see the revisions to Sections 3.10.2.3 and 3.10.2.4 of the EIS.
261	15	Anderson	David		We enthusiastically support the Keystone XL Pipeline Project and encourage the Department of State to confirm the findings of the Draft Environmental Impact Statement, which found that the proposed Keystone XL Pipeline would have "limited adverse environmental impact during construction and operation."	Comment acknowledged.
722	1	Anderson	Richard		The Keystone XL Pipeline must not be allowed to cross the Ogallala Aquifer in Nebraska. To put this vital resource in jeopardy is an unwarranted proposal not only for current Nebraska residents and succeeding generations. It is also gambling recklessly with the future of the millions of others in the Midwest who rely on the aquifer as a vital source of water for their daily lives. It is simply irresponsible and immoral to allow the construction and operation of the Keystone Pipeline XL to endanger the delicate ecosystem of the Ogallala Aquifer.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
722	2	Anderson	Richard		Given the current and past irresponsibility of actions of the oil industry in detection, containment, and cleanup of oil spills...	Consolidated Response OIL-3 addresses the leak detection capabilities of the proposed Project, including the SCADA system, supplementary leak detection methods, physical leak detection methods, and concerns related to smaller leaks from the pipeline that may be under the SCADA detection

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
						threshold. Required emergency response plans for the proposed Project are discussed in Consolidated Response RES-1. As discussed in Section 3.13 of the EIS, federal, state, and local agencies would participate in response activities and soil, surface water, and groundwater cleanup consistent with their authorities and duties under applicable regulations and consistent with the requirements of the Emergency Response Plan and the Pipeline Spill Response Plan. A list of applicable regulations relative to remediation of crude oil spill contamination at the federal and state level is provided in Table 3.13.5-10. Required mitigation for crude oil or oil products spill impacts would be determined by these agencies.
722	3	Anderson	Richard		It is simply irresponsible and immoral to allow the construction and operation of the Keystone Pipeline XL to endanger the unique nature of the Nebraska Sandhills.	Identification of sensitive environments crossed by the proposed Project is discussed in Consolidated Response ENV-1 and ENV-3. Issues related to the Sand Hills area are addressed in Consolidated Response ERO-1.
722	4	Anderson	Richard		...Stop the construction of the Keystone Pipeline XL .	Consolidated Response ENR-1 provides information on the Department of State's environmental review process, the National Interest Determination process, and the need to complete those reviews before approving or denying the Presidential permit for the proposed Project.
905	1	Anderson	Ashley	Peaceful Uprising	This pipeline is a step backwards for our country. Please consider the long-term effects of more tar sands: bad jobs that will eventually run out, polluted communities, and most importantly, a precedent that the USA is not serious about leading the world in the creation of a sustainable existence. The road is open for us to move forward; lets not step back for a few easy bucks. Let's rally for a livable future.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information on current and future production. As noted in that Consolidated Response, without the proposed Project, oil sands development would continue at or above the current level until at least 2020, with or without the proposed Project. Consolidated Response P&N-5 addresses issues related to investments in other technologies.
1002	1	Anderson	Judy		Please note the problems that the Gulf oil spill have created for that area. Can we draw some experience from that situation and apply it to the pipeline being constructed that will cross Nebraska.	As described in Consolidated Response GLF-1, the risks associated with the proposed Project are substantially different from those associated with the BP Deepwater Horizon Project. Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
1122	1	Anderson	Bryce		The Keystone pipeline project should not be run through the Nebraska Sand Hills.	Identification of sensitive environments crossed by the proposed Project is discussed in Consolidated Response ENV-1 and ENV-3. Issues related to the Sand Hills area are addressed in Consolidated Response ERO-1.
1122	2	Anderson	Bryce		There is too much risk of contaminating the Ogallala Aquifer.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
583	1	Andreason	David		Utah, one of the most beautiful and unique places in the US, is set to be under attack once again. From oil exploration, mining, and the storage of everyone else's nuclear waste (we don't even have nuclear power in Utah), Utah is continuously the go-to state for environmental bullies. However, there are many here who are not willing to stand aside and let this continue any longer. The newest round of pollution is set to be the production of petro from oil sands and oil shale deposits in our state. This process is so filthy and destructive to the environment, not to mention that it creates 3X more GHGs that regular petro produation, that we must do all that we can to shut this ridiculous idea down. I have seen what this has	The proposed Project does not extend through Utah.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					done to the beautiful forests in Canada and I think it is disgraceful. Utah is a desert zone that is both fragile and dependent on wise water management—we not only do not want to use valuable water for this practice, we do not want our landscape to become host to a black, oily dead zone where almost nothing can grow or live. A pipeline for this project is currently being considered by the State Dept and I plead with you to deny this project and assign the money to clean energy projects instead. I thank you for your close consideration on this matter.	
130	1	Andrews	Wyn		I am strongly against the Keystone XL Pipeline project.	Comment acknowledged.
130	2	Andrews	Wyn		The comment period has been too short and the public has been inadequately noticed regarding the project planning meetings.	Consolidated Response CMT-1 addresses issues related to the length of the comment period for the draft EIS and supplemental draft EIS.
130	4	Andrews	Wyn		The proposal by Keystone to not inform landowners of spills under 5 barrels is environmentally dangerous and reflects disrespect for landowners in this project.	Keystone would report spills from the Project as required in 49 CFR Part 195.50. That regulation requires reporting of releases of 5 gallons or more, not 5 barrels, except as noted in that regulation for releases during maintenance that meet certain criteria. It would only be for maintenance releases that meet the criteria that Keystone would have to report spills of 5 barrels or more.
1372	1	Anoatubby	Bill	Governor, The Chickasaw Nation	If ... any culturally significant material or remains are unearthed, please immediately notify the Chickasaw Nation.	As noted in Consolidated Response CUL-1, a Programmatic Agreement (PA) has been developed for the Project under Section 106 of the National Historic Preservation Act. The PA includes a process for notifying consulting parties of unanticipated discoveries of significant cultural resources or human remains during Project construction.
652	1	Antrim	Melitta		Please do all possible to stop Keystone from burying pipelines in the Ogallala Aquifer. Like BP Keystone says it can handle leakage and we see how BP is handling it.	Consolidated Response ENR-1 provides information on the Department of State's environmental review process, the National Interest Determination process, and the need to complete those reviews before approving or denying the Presidential permit for the proposed Project.
652	2	Antrim	Melitta		The pure water of the aquifer is irreplaceable. Do all possible to stop any possible contamination and the driving of pipelines through it.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
1544	245	Apurim	Iman	Green Party	Pipeline could carry liquid hydrogen and not require transformers, etc.	Consolidated Response P&N-1 addresses the need that the Project has been proposed to meet. Consolidated Response ALT-2 addresses the use of alternative technologies, alternative energy sources, and conservation of energy.
1544	246	Apurim	Iman	Green Party	Advocates putting turbines in the gulf stream because ocean currents can generate power constantly.	Consolidated Response ALT-2 addresses the use of alternative technologies, alternative energy sources, and conservation of energy.
778	1	Arens	Kathy		I am writing to voice my opposition to the proposed Keystone Pipeline through the Sandhill region of Nebraska. The Sandhills are a fragile ecosystem to begin with.	Identification of sensitive environments crossed by the proposed Project is discussed in Consolidated Response ENV-1 and ENV-3. Issues related to the Sand Hills area are addressed in Consolidated Response ERO-1.
778	2	Arens	Kathy		[I am writing to voice my opposition to the proposed Keystone Pipeline through the Sandhills region. The Sandhills are a fragile ecosystem to begin with] and the entire region it encompasses is reliant upon the Ogallala Aquifer the pipeline	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					will traverse. The Aquifer is essential to wildlife, ranching and farming operations, as well as the individuals, towns and communities dependent upon it for water. From the single homeowner to large agribusiness our livelihoods and futures are linked to preserving the quality of the Aquifer.	
778	3	Arens	Kathy		...The Aquifer is essential to wildlife, ranching and farming operations...From the single homeowner to large agribusiness our livelihoods and futures are linked to preserving the quality of the Aquifer...	Issues related to the High Plains Aquifer System are addressed in Consolidated Response AQF-1 through AQF-4. Consolidated Response AQF-3 provides information on hypothetical spills from the Project over two areas of the Northern High Plains Aquifer System. Consolidated Response ALT-1 addresses potential alternative routes, including routes that would avoid much of the Northern High Plains Aquifer system.
778	4	Arens	Kathy		...From the single homeowner to large agribusiness our livelihoods and futures are linked to preserving the quality of the Aquifer...	Issues related to the High Plains Aquifer System are addressed in Consolidated Response AQF-1 through AQF-4. Consolidated Response AQF-3 provides information on hypothetical spills from the Project over two areas of the Northern High Plains Aquifer System.
778	5	Arens	Kathy		The aquifer is essential to communities dependent upon it for water.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
778	6	Arens	Kathy		...The damage caused by a spill might be something from which this region could never recover. And that is too great a risk to take...	Issues related to the Northern High Plains Aquifer System are addressed in Consolidated Responses AQF-1 through AQF-4. Consolidated Response AQF-3 provides information on hypothetical spills from the Project over two areas of the Northern High Plains Aquifer System. Section 3.13 of the EIS addresses reliability and safety issues, including calculations of the probability of a spill from the Project. The impacts are summarized in Sections 3.13.5 and 3.13.6, and as noted in those sections, even the largest spill is not expected to cause extensive and/or irreversible regional impacts to the natural resources or regional human uses.
778	7	Arens	Kathy		I am writing to voice my opposition to the proposed Keystone Pipeline through the Sandhill region of Nebraska...Please cancel this project.	Consolidated Response ENR-1 provides information on the Department of State's environmental review process, the National Interest Determination process, and the need to complete those reviews before approving or denying the Presidential permit for the proposed Project.
508	1	Armstrong	Ben		Please do not build this pipeline through the Ogallala Aquifer!	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
1548	26	Artz	Jason		Concern that pipeline officials are not being responsive to contacts by landowners about their concerns.	Consolidated Response EAS-2 addresses issues related to easement negotiations and eminent domain. DOS has no legal authority in the easement negotiations or in eminent domain proceedings.
1548	27	Artz	Jason		Concern about the way regulatory agencies are treating people around where the pipeline would go in.	Consolidated Response EAS-2 addresses issues related to easement negotiations and eminent domain. DOS has no legal authority in the easement negotiations or in eminent domain proceedings.
1548	30	Artz	Jason		Is there truly a demand for this oil to be pumped from Canada, considering the demand and supply fundamentals we have today? ...are the demand and supply fundamentals changing, not only on the demand side but what about the supply?	Consolidated Response P&N-1 addresses the need that the Project has been proposed to meet.
1548	31	Artz	Jason		So I guess the question that I have is, the lines that are currently being evaluated on whether or not they should be	Consolidated Response P&N-1 addresses the need that the Project has been proposed to meet.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					approved, for the federal government, are they looking not only at the demand and supply fundamentals when the initial application was put forward; or are they looking at those today and those in the near term, five to ten years?	
1548	32	Artz	Jason		has there been an impact study done on the effects of a pipeline explosion or rupture? What does that do to the community and the people that live there....(explosion lines, setback lines, proximity to schools, employment centers, residential houses.)	As noted in Consolidated Response OIL-5, crude oil pipelines do not explode and it is highly unlikely that there would be an explosion in a pump station. Section 3.13 of the EIS addresses reliability and safety issues, including calculations of the probability of a spill from the Project and the potential environmental impacts associated with spills.
1548	33	Artz	Jason		Effects of an explosion would be larger than the 50-500 ft ROW.	As noted in Consolidated Response OIL-5, crude oil pipelines do not explode and it is highly unlikely that there would be an explosion in a pump station.
1548	34	Artz	Jason		Will the construction jobs be able to be filled by local people?	Consolidated Response ECO-1 and Section 3.10.2.2 of the EIS address potential socioeconomic impacts.
1548	35	Artz	Jason		Questions about the property tax distributions given by state in the EIS - is there not a 10 year tax abatement? Why does the EIS say KS will get the smallest amount of the property tax compared to other states?	Consolidated Response TAX-1 and Section 3.10.2.4 of the EIS address tax-related issues.
1548	36	Artz	Jason		you have to consider that there may be leaks and explosions.	As noted in Consolidated Response OIL-5, crude oil pipelines do not explode and it is highly unlikely that there would be an explosion in a pump station. Section 3.13 of the EIS addresses reliability and safety issues, including calculations of the probability of a spill from the Project and the potential environmental impacts associated with spills.
1548	26	Artz	Jason		Concern that pipeline officials are not being responsive to contacts by landowners about their concerns.	Consolidated Response EAS-2 addresses issues related to easement negotiations. As noted in that Consolidated Response, DOS has no legal authority in the easement negotiation process.
46	1	Ascot	Karin		Please do not go forward with the tar sands pipeline project. The oil is too dirty and polluting, and the process wastes too much water, a far more precious resource. We need to focus instead on QUICKLY creating good public transit (light rail!) and other projects like retrofitting buildings for energy-efficiency, rather than trying to import oil obtained in such a polluting and filthy manner.	Consolidated Response OIL-4 addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils. Consolidated Response P&N-1 addresses the need that the Project has been proposed to meet. Consolidated Response ALT-2 addresses the use of alternative technologies, alternative energy sources, and conservation of energy. Consolidated Response P&N-5 addresses issues related to investments in other technologies. Consolidated Response GHG-2 addresses the potential causal connection of implementation of the proposed Project and expanded oil sands production in Canada and increases in refining. Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project.
252	2	Askins	Jari	Lieutenant Governor Oklahoma	As we understand it, Keystone XL will create more than 13,000 high-wage construction and manufacturing jobs during the project's 2011~2012 construction schedule. Many of those jobs will be created in rural and in my districts, where too many of our residents continue to find it difficult to find good	Consolidated Response ECO-1 addresses potential socioeconomic impacts, and Consolidated Response TAX-1 addresses concerns regarding taxes.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					jobs. With Keystone XL, they will have an opportunity to work on the project or for businesses that provide supplies, goods and services for its construction and operation.	
252	3	Askins	Jari	Lieutenant Governor Oklahoma	In addition to the jobs Keystone XL will create, the project will generate substantial economic benefits for the United States and in states and communities along the proposed route. Like our counties, in many cases these are areas where economic performance has stagnated or is shrinking. It is my understanding that TransCanada commissioned a study to measure the projects economic stimulus to the U.S. and the states along the route. The study found that in the U.S. Keystone XL would generate \$20.9 billion in total expenditures, \$9.6 billion in output (gross product), personal income of \$6.5 billion and 118,935 person years of employment (jobs).	Consolidated Response ECO-1 addresses potential socioeconomic impacts, and Consolidated Response TAX-1 addresses concerns regarding taxes.
252	4	Askins	Jari	Lieutenant Governor Oklahoma	In addition, the report concluded that during construction, Keystone XL would generate \$486.36 million in tax revenue for state governments along the route and \$99.1 million for local taxing entities where the pipeline is located. In Oklahoma, the study found Keystone XL expenditures during construction would total \$1.2 billion and generate an economic gross product of nearly \$1.1 billion. Keystone 'XL construction also would generate more than \$7.7 million in tax revenue for local government and \$31.4 million for state government.	Consolidated Responses TAX-1 and ECO-1 address the estimated increases in the tax base and the jobs generated by the proposed Project. Also see the revisions to Sections 3.10.2.3 and 3.10.2.4 of the EIS.
252	8	Askins	Jari	Lieutenant Governor Oklahoma	We enthusiastically support the Keystone XL Pipeline Project and encourage the Department of State to confirm the findings of the Draft Environmental Impact Statement, which found that the proposed Keystone XL Pipeline would have "limited adverse environmental impact during construction and operation."	Comment acknowledged.
1042	1	Astradick@aol.com			I strongly object that the State Department has the power to regulate this.	Consolidated Response REG-2 addresses issues related to concerns about the Department of State being the lead federal agency for the NEPA environmental review and the permits and regulatory approvals that Keystone would have to obtain to construct, operate, maintain, monitor, and inspect the Project.
1350	1	Atchison	Jim	SouthEastern Montana Development Corporation	As an economic development professional and Executive Director of Southeastern Montana Development (SEMDC), I would like to express my strong support for the TransCanada Keystone XL Pipeline Permitthat is before you.	Comment acknowledged.
1350	3	Atchison	Jim	SouthEastern Montana Development Corporation	Frankly speaking, the NEPA and MEPA permitting process are more than adequate to review and address the safety and environmental impacts that may be of issue.	Comment acknowledged.
1350	4	Atchison	Jim	SouthEastern Montana Development Corporation	This proposed pipeline would be a major benefit by creating additional tax base for the counties and cities.	Comment acknowledged.
1350	5	Atchison	Jim	SouthEastern Montana Development Corporation	It would also bring numerous jobs and economic benefits to a much needed rural and economically challenged part of Montana. Our politicians all speak about creating those "good and high paying jobs." These are those "good and high paying	Comment acknowledged.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					jobs." That is why SEMDC is strongly supporting this Keystone XL Pipeline Permit Application from TransCanada.	
562	1	Atkinson	James		Good Morning---I am 80 years old and grew up on the eastern edge of the Nebraska sand-hills. First came the homesteaders and plowed the fragil sandy soil,and the winds blew out the fields to it became imposible to feasible farm the soil.--Next came the wells and pivots and no-till farming.--Fertilizer and chemicals were applied leaching into the sandy soil---then came the hog confinements with gigantic manure pits atop the sandy soil---now comes the 36 inch pipeline--which is supposed to be 100 per cent leak-proof--but is this forever?---It looks as if there is a case of Russian Rolet here.--This may be the live one if and when the leak happens.---And if there is a leak and not found until to late.--and is leaked into the sandy soil,B-P's blowout would only be a minor situation to what can happen here.--other words if this pipe-line has to be built,common sense would say---BUILD IT AROUND OUR NEBRASKA SAND_HILLS---enough is enough.---Thank -You- --Jim Atkinson 1030 S. 2'nd St. Albion Ne-68620-1666	Section 3.13 of the EIS addresses reliability and safety issues, including calculations of the probability of an accidental release from the Project. That section does not make that statement that the Project would be "100 percent leak-proof." That section also addresses the potential environmental impacts of an accidental release from the Project. Issues related to the Sand Hills area are addressed in Consolidated Response ERO-1, and alternative routes are addressed in Section 4.3.
1333	1	Austin	Brian		I AM IN SUPPORT OF THE KEYSTONE XL PIPELINE PLEASE REJECT THE REQUEST TO SUSPEND THE PROCESS AND CONTINUE WITH THE REVIEW,	Comment acknowledged.
1333	2	Austin	Brian		We must procure the sovereign ability to deliver all the oil energy available to our nation. We must break the need for foreign supplied energy so that we can be independent from the world's influence. Energy security will only serve to keep the US Independents from outside influences,	Comment acknowledged.
1333	3	Austin	Brian		The jobs both in building phase and long term maintenance will serve to provide jobs for Americans economic recovery and long term jobs should rule over a very controllable and minute environmental impact. We need to curtail our penchant for letting the "green" clubs dictate over the majority of those of us who realize controlled environmental impact is acceptable. America can properly regulate environmental impacts as opposed to just saying "no".	Comment acknowledged.
1559	25	Avalos	Mona		Wants an elaboration on Keystone's solutions to possible impacts of oil spills on ground water. Especially if the cleanup after a spill does not return groundwater to drinking water quality.	Section 3.13 of the EIS addresses reliability and safety issues, including calculations of the probability of a spill from the proposed Project and the potential environmental impacts associated with spills. The assessment addresses impacts to groundwater. Issues related to the Northern High Plains Aquifer System are addressed in Consolidated Responses AQF-1 through AQF-4. DOS has also provided additional information on contaminant migration in aquifers and response procedures that would be used. Consolidated Response AQF-3 provides information on hypothetical spills from the proposed Project over two areas of the Northern High Plains Aquifer System. Consolidated Response LIA-1 addresses Keystone's liability if there is a spill of hazardous materials or fuel during construction and from a spill of crude oil from the proposed Project. As noted in that response, Keystone would be liable for all costs associated with cleanup and restoration as well as other compensations. If groundwater used for drinking water is affected by a spill, Keystone would be responsible for providing water until the affected source is

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
						considered acceptable for use.
1559	26	Avalos	Mona		Wants a site-specific map of the pipeline route near the Big Thicket.	Photoalignment sheets of the entire route are available on the Department of State web site for the Project at http://www.keystonepipeline-xl.state.gov/clientsite/keystonexl.nsf?Open . Click on "Project Documents" and the maps are accessible under "Supplemental Filing."
1559	27	Avalos	Mona		Horrible impact of this project on Canada's boreal forest is irreversible. "If accept this project, we are condoning the rape of an ecological diverse environment."	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project. Consolidated Response GHG-2 addresses the potential causal connection of implementation of the proposed Project and expanded oil sands production in Alberta and increases in refining.
1559	28	Avalos	Mona		The tar sand oil is not worth the environmental and public health trade-off.	The commenter's opinion is noted.
1559	29	Avalos	Mona		Tar sand oil has dangerously high greenhouse gas emissions. Alternative energies are available.	Consolidated Response P&N-1 addresses the need that the Project has been proposed to meet. Consolidated Response ALT-2 addresses the use of alternative technologies, alternative energy sources, and conservation of energy. Consolidated Response GHG-1 addresses the greenhouse gas life-cycle analyses presented in the revised EIS.
1559	30	Avalos	Mona		Pipelines are not safe, or there would not be over 400 pages for its DEIS. It is not a question of if, but when, an oil leak will occur.	Consolidated Response SAF-1 describes the regulatory requirements and Project-specific Special Conditions that Keystone would comply with to construct, operate, maintain, inspect, and monitor the proposed Project. It also describes the monitoring, inspections, and reviews of the proposed Project that the Pipeline and Hazardous Materials Safety Administration would conduct to ensure compliance with those regulatory requirements. Consolidated Response OIL-1 provides a summary of the range of spill frequency estimates addressed in the EIS. Consolidated Response OIL-2 addresses maximum-sized releases from the Project and addresses concerns about corrosion rate comparisons between the Alberta transmission pipeline system and the U.S. transmission pipeline system. Consolidated Response OIL-3 and Section 3.13.5 of the EIS describe the leak detection system for the proposed Project.
903	1	Ayers	Glen	EcoTerra Soil Consultants	Please put me on record as being strongly opposed to the Keystone XL Pipeline Project based on comprehensive and cumulative environmental impacts.	Comment acknowledged.
903	2	Ayers	Glen	EcoTerra Soil Consultants	This project has been poorly conceived, poorly studied, and will result in significant impacts to the human environment. The "No Action" alternative should be selected, based on the obvious impacts, but the environmental analysis process was flawed by arriving at a preconceived conclusion and then using the NEPA process to justify the project. This is a violation of the CEQ regulations and is clearly against the spirit and intent of the Law.	DOS does not agree with the commenter's claim that there would be significant impacts to the human environment. The environmental review of the proposed Project was conducted in accordance with NEPA regulations issued by CEQ and determined that implementation of the proposed Project would not result in significant environmental impacts (see Section 3.0 of the EIS). Consolidated Responses ENR-1 and REG-2 describe the review process that DOS is conducting. DOS did not initiate the review process with a "preconceived conclusion."
196	1	Bachman	Julie	JB Ranch	I am requesting (3) complete copies, CD-ROM copies, of the	Consolidated Response REQ-2 provides information for

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
				Kansas, LLC	TransCanada Keystone Pipeline Final Environmental Impact Statement (EIS)	request of locations of paper copies of the EIS and that copies of the draft EIS, other specific information, or references be sent directly to the commenter.
1450	1	Baden	Anne		What happens to Nebraska if the Keystone Pipeline springs a leak in Nebraska? Is it easier to clean up an underground oil spill in the Ogallala Aquifer than along the Gulf coast? Is it too late to rethink the route of this pipeline?	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. Consolidated Response ALT-1 addresses potential alternative routes, including routes that would avoid much of the Northern High Plains Aquifer system. As described in Consolidated Response GLF-1, the risks associated with the proposed Project are substantially different from those associated with the BP Deepwater Horizon Project.
951	2	Bahensky	Marion		Miles of undiscovered potential oil leaks into our precious, irreplaceable drinking water?? .	Sections 2.4.2.1 and 3.13.5 and Consolidated Response OIL-3 describe the leak detection system that would be used by Keystone. Section 3.13 of the EIS addresses reliability and safety issues, including calculations of the probability of a spill from the proposed Project and the potential environmental impacts associated with spills, including impacts to surface water and groundwater. Issues related to the Northern High Plains Aquifer System are addressed in Consolidated Responses AQF-1 through AQF-4. Consolidated Response AQF-3 provides information on hypothetical spills from the proposed Project over two areas of the Northern High Plains Aquifer System.
951	3	Bahensky	Marion		PLEASE do not allow this to happen	Comment acknowledged.
140	2	Bailey	Britton		The pipeline will cross multiple scenic Nebraska rivers that provide habitat and wetlands for both local and migrating wildlife.	Most large rivers will be crossed using horizontal directional drilling. River banks and channels are protected from disturbance using this method. The proposed Project does not cross rivers within any reaches that have been designated as federal Wild and Scenic Rivers nor does it cross any national parks or forests. Additional discussion of the identification of sensitive resources for the environmental review are provided in Consolidated Response ENV-1. Additional discussion of horizontal directional drilling is provided in Section 2.3.3.5 of the EIS.
140	3	Bailey	Britton		The Platte River habitat provides the world with one of the most spectacular and populous migration stops for the sandhill crane and is frequented by the endangered whooping crane.	Potential Project-related impacts and mitigation measures for the sandhill crane are discussed in Section 3.6 and for the whooping crane are discussed in Section 3.8.1.2 and in the Biological Assessment presented in Appendix T of the EIS.
140	4	Bailey	Britton		As the pipeline crosses a large portion of the porous Nebraska Sand Hills it also crosses one of the nation's largest clean water aquifers, the Ogallala Aquifer, that is shared with many states. It does not make sense to jeopardize one of our country's most precious resources, fresh water. The potential to pollute this priceless fresh water resource with a tar sand oil spill are not worth the risk. Any risk.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
140	7	Bailey	Britton		Please prevent the Keystone XL Oil Pipeline from crossing our nation in order to prevent more environmental catastrophes.	Consolidated Response ENR-1 provides information on the Department of State's environmental review process, the National Interest Determination process, and the need to complete those reviews before approving or denying the Presidential permit for the proposed Project.
420	2	Bamberger	Robin		No more oil production of any kind for this country. Without going into whole hearted detail, I will not vote for one elected	The commenter's opinion is noted.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					official that has anything to do with oil production. I am sick of the politics and money and I want MY country The "United" States Of America back.	
832	1	Bard	Michael		The Tar Sands project in Canada is endangering a large section of the Boreal forest habitat and is poisoning residents down stream.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project. Consolidated Response GHG-4 addresses concerns regarding the loss of boreal forest and peat bogs.
1314	2	Barnard	Jeanne	Big Flat Electric Co-operative	The benefits that this pipeline and the transmission line will bring to our communities are many. Let me list just a few: 1. Large Industrial load to Big Flat Electric: For many years Big Flat Electric served the Zortman/Landusky Gold Mine. This load helped Big Flat Electric in its overall operation and maintenance of our cooperative just by the sheer volume of kilowatts used by the mine. In 1997 this load abruptly went away when the mine declared bankruptcy. Big Flat Electric lost 60% of its load and 50% of its revenue overnight. Kilowatt hrs plunged and rates went up. Big Flat Electric is excited about the prospect of serving TransCanada pumping station #9 which is the first pumping station to welcome the pipeline to the United States. In an area where we are losing membership to attrition of older members selling to large out of state buyers and larger adjoining operations, this load brings relief to the remaining farms and ranchers of the area.	Comment acknowledged.
1314	3	Barnard	Jeanne	Big Flat Electric Co-operative	2. Taxes paid: Currently, The Northern Border Pipeline, a subsidiary of TransCanada is the largest paying taxpayer in our County. The wealth in taxes from the pipeline will help Phillips County support essential services. Phillips County as well as many of Communities along the Hi-Line are seeing the same attrition and decrease in numbers that Big Flat Electric is. The taxes paid by the pipeline will insure continued stabilization of the tax base. It is currently estimated that the taxes paid to Phillips County will be in the vicinity of \$5,000,000. In addition, there will be taxes from the transmission line which is solely in Phillips County.	Consolidated Response TAX-1 and revisions to Section 3.10.2.4 of the EIS address concerns regarding taxes associated with implementation of the proposed Project.
1314	4	Barnard	Jeanne	Big Flat Electric Co-operative	Economic Development: Construction of the pipeline and the transmission line that will serve the pipeline will be both a benefit to the Community as well as the potential jobs and services that will be utilized. The project has already resulted in benefits to the community. This is only the tip of the iceberg as the project proceeds. With the above comments, and as a matter of public record and with respect, Big Flat Electric expresses its strong support for the Pipeline. And on behalf of the membership I am here to present the positive attributes this project will bring to our area. Attached to this testimony is economic data from Fort Belknap. Rate stabilization as a result of this load from TransCanada will be a significant benefit to all. In addition and on behalf of area business's and schools, I have previously submitted 101 letters of support of the Keystone XL pipeline project and the transmission line to be built by Big Flat Electric Co-op., Inc.	Comment acknowledged.
1546	55	Barnard	Jeanne	Big Flat Electric Cooperative	I am the general manager of Big Flat Electrical cooperative...[which] will own, operate and maintain the	Comment acknowledged.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					transmission line that will serve Pump Station Number 9. Big Flat Electric wants to take this opportunity to express our support for the TransCanada Pipeline.	
1546	56	Barnard	Jeanne	Big Flat Electric Cooperative	Main benefit to area will be rate relief due to the economy of scale of serving a large load.	Comment acknowledged.
1551	8	Barnard	Jeanne	Big Flat Electric	I speak in favor of this project.	Comment acknowledged.
1551	10	Barnard	Jeanne	Big Flat Electric	Our members are farmers and ranchers, the people that take care of this land here, the original conservationists. They are the ones who direct how we do this. We believe this is a good project and it will keep this country running in a good way.	Comment acknowledged.
1555	1	Barnard	Jeanne	Big Flat Electric	As General Manager of Big Flat Electric, we propose to serve Pump Station No. 9, so we are part of this project. We promise to be environmentally sensitive to the land.	Comment acknowledged.
1555	2	Barnard	Jeanne	Big Flat Electric	As a former elected county official, past president of the Malta Area Chamber of Commerce and past elected school board member, I can attest to the benefits that the TransCanada pipeline will bring to our communities.	Comment acknowledged.
1555	3	Barnard	Jeanne	Big Flat Electric	Big Flat Electric supports the TransCanada pipeline.	Comment acknowledged.
1555	6	Barnard	Jeanne	Big Flat Electric	The economy of Big Flat Electric is approximately 80 percent dependent on agriculture. Large cattle ranching type operations support approximately 40 percent, with dry land wheat farming and some irrigated hay land, the other 40 percent. Economy of scale is low due to extreme drought and low pricing of products. Big Flat Electric is well experienced in serving large industrial loads. Large loads that run seven days a week, 24 hours a day can help stabilize the operation and maintenance of small co-ops such as Big Flat Electric.	Comment acknowledged.
1555	7	Barnard	Jeanne	Big Flat Electric	Big Flat Electric is excited about the prospect of serving TransCanada Pump Station No. 9, which is the first pumping station to welcome the pipeline to the United States. In an area where we are losing membership to attrition of older members selling to large, out of state buyers and larger adjoining operations, this load brings relief to the remaining farms and ranches of the area.	See Consolidated Response ELE-1.
1555	8	Barnard	Jeanne	Big Flat Electric	Currently the Northern Border Pipeline, a subsidiary of TransCanada, is the largest paying taxpayer in our county. The wealth in taxes from the pipeline will help Phillips County support essential services.	Comment acknowledged.
1555	10	Barnard	Jeanne	Big Flat Electric	The taxes paid by the pipeline will ensure continued stabilization of the tax base. It is currently estimated that the taxes paid to Phillips County will be in the vicinity of \$5 million. There will also be taxes from the transmission line, which is solely in Phillips County.	Consolidated Response TAX-1 and revisions to Section 3.10.2.4 of the EIS address concerns regarding taxes associated with implementation of the proposed Project.
1555	11	Barnard	Jeanne	Big Flat Electric	Construction of the pipeline and the transmission line that will serve the pipeline, will be both a benefit to the community as well as the potential jobs and services that will be utilized.	Comment acknowledged.
1555	12	Barnard	Jeanne	Big Flat Electric	The project has already resulted in benefits to the community. This is only the tip of the iceberg as the project proceeds.	Comment acknowledged.
1555	13	Barnard	Jeanne	Big Flat Electric	Big Flat Electric expresses its strong support for the pipeline. In addition, and on behalf of area businesses and schools, I have 101 letters of support to submit with our testimony of the	Comment acknowledged.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					Keystone XL pipeline project.	
491	1	Barnes	Marilyn		I am horrified that the United States government would consider allowing any oil company, especially a foreign company, to run an oil pipe line across land over the Ogallala Aquifer. This body of water is our country's most precious water reserve, the source for cattle, corn, wheat, sunflowers, and some of the country's unique ecosystems. Re-route this pipeline so that it does not risk our water, food, and ethanol supply on which much of the Great Plains depends. The present plan is an unnecessary arrangement to save a little money. We can live without oil -- there are other fuels and technologies. We cannot live without water.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. Consolidated Response ALT-1 addresses potential alternative routes, including routes that would avoid much of the Northern High Plains Aquifer system.
1199	1	Barnes	Marilyn		The proposed routing of the TransCanada oil pipeline over one of the nation's most precious water resources is dangerous and of little potential benefit to American citizens. The Ogallala Aquifer is one of the world's great water resources. [The Ogallala Aquifer...] is millions of years old and replenished by ground water. TransCanada does not need to route this pipeline over our priceless aquifer.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. Consolidated Response ALT-1 addresses potential alternative routes, including routes that would avoid much of the Northern High Plains Aquifer system.
1199	2	Barnes	Marilyn		[The Ogallala Aquifer is one of the world's great water resources.] It supplies water for agricultural products in eight states, notably cattle, corn, and wheat. ... If the Ogallala were contaminated, cleanup would be much worse than the present tragedy in the Gulf of Mexico. It would negatively affect the nation's bread basket.	Issues related to the High Plains Aquifer System are addressed in Consolidated Response AQF-1 through AQF-4. Consolidated Response AQF-3 provides information on hypothetical spills from the Project over two areas of the Northern High Plains Aquifer System and also addresses response actions.
1199	3	Barnes	Marilyn		Every welded seam in the pipe is a potential leak.	Consolidated Response SAF-1 describes the regulatory requirements and Project-specific Special Conditions that Keystone would comply with to construct, operate, maintain, inspect, and monitor the proposed Project. It also describes the monitoring, inspections, and reviews of the proposed Project that the Pipeline and Hazardous Materials Safety Administration would conduct to ensure compliance with those regulatory requirements.
1199	5	Barnes	Marilyn		This pipeline will transport oil much of which does not meet American emissions standards. If so this oil will be sold to other countries. Why should the U.S. allow our precious landscape and water to be bargained away to enrich a foreign company, even if it is our close ally and companion Canada? Many things are worth more than money -- or crude oil. Water is among them.	Consolidated Response OIL-4 addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils. Consolidated Response P&N-1 addresses the need that the Project has been proposed to meet. As noted in that response, the Project has been proposed to meet the heavy crude oil needs of refineries in the Gulf Coast area.
1199	6	Barnes	Marilyn		Please do not permit TransCanada to ruin our Great Plains with this badly planned pipeline proposal.	Consolidated Response SAF-1 describes the regulatory requirements and Project-specific Special Conditions that Keystone would comply with to construct, operate, maintain, inspect, and monitor the proposed Project. It also describes the monitoring, inspections, and reviews of the proposed Project that the Pipeline and Hazardous Materials Safety Administration would conduct to ensure compliance with those regulatory requirements.
1335	4	Barnes	Marilyn		Many things are worth more than money. Water is among them. Please do not permit TransCanada to ruin our Great Plains with the present pipeline proposal.	Comment acknowledged.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
1557	11	Barnett	David		Pipeline will promote our energy security. It will create many jobs. Canada supplies more oil to the U.S. than any other country. We all drive and need oil.	Comment acknowledged.
200	1	Barnhardt	Jacqueline		I have serious concerns about the rational of laying the Keystone oil pipeline over the top of our nation's biggest source of fresh underground water supply. ...In the event of an oil leak into the aquifer, how can that contamination be cleaned up? The risk to our water quality on our health, our agriculture economy, our wildlife, and all of the industry cannot be waged.	Issues related to the Northern High Plains Aquifer System are addressed in Consolidated Responses AQF-1 through AQF-4. Consolidated Response AQF-3 provides information on hypothetical spills from the Project over two areas of the Northern High Plains Aquifer System. Consolidated Response RES-1 addresses issues related to preparation and review of the Emergency Response Plan (ERP) for the proposed Project. Spill Prevention, Control, and Countermeasure plans are addressed in Sections 2.3 and 3.13.5 of the EIS and in the Construction, Mitigation, and Reclamation Plan presented in Appendix B of the EIS.
1531	1	Barnhart	Bill		In regard to the TransCanada Keystone XL Pipeline project, we support the project.	Comment acknowledged.
1531	2	Barnhart	Bill		We feel that it would provide an economic boost to areas of Eastern Montana by providing some jobs as well as much needed tax revenue. The economic boost would aid schools, fire departments, and county governments, as well as agencies.	Comment acknowledged.
1531	4	Barnhart	Bill		In addition, the new pipeline will benefit the cooperatives in the areas that it crosses. This will especially be beneficial to Big Flat Electric Cooperative consumers. The closing of the Zortman-Landusky mine created increased rates to the other consumers of the Cooperative due to the lost revenue provided by the mine for its electric usage. The addition of a new industrial load would help to share the burden of costs.	Comment acknowledged.
1531	5	Barnhart	Bill		In all, we feel that the pipeline would be beneficial for Montana.	Comment acknowledged.
550	1	Barnick	Sandra		Need · The DEIS assumes there is a need for the Keystone XL pipeline but without doing a thorough, independent, and detailed analysis of the need for the pipeline. It glosses over the need and fails to analyze reasonable alternatives.	Consolidated Response P&N-1 addresses the need for the Proposed Project and provides an explanation of the thorough and independent analysis of need that was conducted for the EIS.
550	2	Barnick	Sandra		If TransCanada is given a permit for this pipeline, the company will have the power to condemn landowners to build it. The company shouldn't get this power of eminent domain. By allowing the force of eminent domain, you are essentially telling all of the U.S agricultural producers that the lands to produce the nations food is less valuable and less important than a large oil company turning a profit with the production of a dirty fuel.	As noted in Consolidated Response EAS-2, state laws dictate under what circumstances eminent domain may be used and define the eminent domain process within the state. DOS has no legal authority in the easement negotiations or in eminent domain proceedings. After completion of construction, reclamation, and restoration, farming would be able to continue along the pipeline right-of-way. As noted in Consolidated Response OIL-4, the crude oil that would be transported by the proposed Project is similar to other heavy crude oils refined in the U.S. and transported by other pipeline systems.
550	3	Barnick	Sandra		The recently completed Alberta Clipper and Keystone I pipelines offer more than enough capacity for the most optimistic projections of tar sands production for many years, if not indefinitely. The DEIS ignores this existing overcapacity. The scoping summary report clearly outlines the questions to	Consolidated Response P&N-1 describes the need that the Project has been proposed to meet and provides an explanation of the thorough and independent analysis of need that was conducted for the EIS. As noted in that response, the Project has been proposed to meet the heavy crude oil needs

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					be answered, and the DEIS fails to do so. 2. The DEIS glosses over the need for the pipeline and fails to analyze reasonable alternatives. The recently completed Alberta Clipper and Keystone I pipelines offer more than enough capacity for the most optimistic projections of tar sands production for many years, if not indefinitely. The DEIS ignores this existing overcapacity and assumes the need for the pipeline as projected by TransCanada. "If my land is to be condemned, it sure as better be for something America needs."	of refineries in the Gulf Coast area, not for the U.S. in general. In addition, the Alberta Clipper and existing Keystone pipeline projects serve other markets and do not meet the demands of the Gulf Coast refineries. Section 4.0 addresses a wide variety of alternatives to the proposed Project and meets the requirements of NEPA.
551	1	Barnick	Sandy		AGRICULTURAL CONCERNS UNDER-ESTIMATED 1. The EIS severely underestimates the impact that construction or any potential leaks would have on agricultural land, saying that ag land will recover in 1 year (EIS reference: 3.13-50, 3.14-26). Farmers know that it takes many seasons (years) to recover from soil damage, weed introduction, settling, and everything else that will be associated with a massive construction project with a large number of heavy machinery. Also, the idea that our crops will grow back after nature fixes the problem of any spills within one year is absolutely inaccurate and verging on offensive.	Response FRM-1 describes potential impacts to farmland and ranches and Keystone's responsibilities to compensate for damage to these crops. The EIS was revised to reflect that the potential impacts to agricultural land from construction and from an oil spill and subsequent response actions may last for one to a few years, depending upon the amount of oil, area impacted, and the type of cleanup actions taken by Keystone. In general, oil on and/or in the soils is weathered through biodegradation by micro-organisms, photodegradation by sunlight, and physical-chemical degradation. These basic processes generally reduce or eliminate the lighter fractions of oil that may be harmful to plants and/or animals and do so in a few months to a year or two. The heavier fractions of the oil (commonly called tar or asphalt) may persist for longer periods of time but are not toxic to organisms. The response actions may disturb the soils and provide habitat for weeds, reduce or remove the native or agricultural vegetation, and otherwise have impacts that may persist for a year or more.
551	2	Barnick	Sandy		The EIS affords government land some protections but leaves agricultural reclamation up to landowner easements (EIS reference 3.2-12). Private landowners should be afforded the same protections as the government.	Keystone would be required to restore all land, both public and private, to approximately previous conditions in accordance with the requirements of easement agreements and the requirements of the Keystone Construction, Mitigation, and Reclamation (CMR) Plan (presented in Appendix B of the EIS). The easement agreements and CMR Plan include requirements for restoration that meet the needs of the landowner, or if those requirements cannot be met, require that Keystone compensate the landowner for losses incurred. Keystone would be required to accomplish the restoration, not the landowner. The page referred to by the commenter confirms this: "If negative impacts to agricultural productivity did occur, these impacts would be addressed by Keystone's easement agreements. Keystone would be required to restore the productivity of the ROW and/or compensate landowners for demonstrated losses associated with decreased productivity resulting from pipeline operation."
551	3	Barnick	Sandy		The seriousness of noxious weeds to farmers and ranchers is clearly not understood because this EIS allows TransCanada a major loophole stating in 3.5-27 that it is ok if "benefits" outweigh the harm. "How are "benefits" defined and who decides?"	The language cited by the Commentor concerning "benefits" refers to language within Executive Order 13112 which directs federal agencies to prevent the introduction of invasive species. . . In this case "benefits" would refer to the benefits to the United States provided by the proposed Project as described in Section 1.2. This Executive Order also specifies that feasible and prudent measures to minimize risk have been taken. The proposed mitigation measure for preventing the spread of noxious weeds are described in the

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
						Construction, Mitigation, and Reclamation (CMR) Plan (Appendix B of the EIS). Mitigation to prevent the spread of noxious weeds are described in Section 3.5.5.4 of the EIS.
551	4	Barnick	Sandy		The EIS states that an oil spill would be no problem to mammals (EIS reference: 3.13-45)	The complete text of the paragraph in the draft EIS associated with mammals is as follows: "Most oil spills, even large to very large ones, would result in a limited impact on most of the terrestrial mammals found in the proposed pipeline area. The extent of impacts would depend on the type and amount of oil spilled; the location and terrain of the spill; the type of habitat affected; the mammals' distribution, abundance, and behavior at the time of the spill; and the effectiveness of the spill cleanup response. The proportion of habitat affected would be very small relative to the size of the habitat utilized by most of the mammals."
551	5	Barnick	Sandy		5. This pipeline will have devastating and permanent effects on Irrigated land, which this EIS glossed over. DOS officials clearly need to interview more irrigators to understand the situation that they (the government) is about to permit. "This is a matter of our livelihoods!"	Consolidated Response FRM-2 addresses potential impacts to irrigated cropland.
551	6	Barnick	Sandy		6. The EIS states that cover depth can be 18" in rocky areas (EIS reference: 2.3.2.3). Where is the line for "rocky?" 18" is not nearly deep enough to avoid damage from agricultural equipment and other concerns.	As stated in Section 2.3.2.3 of the EIS, the Pipeline and Hazardous Materials Safety Administration requires a burial depth of 18 inches in rocky areas; however, Keystone would bury the pipe to a depth of 36 inches in consolidated rock which would avoid damage from agricultural equipment if such equipment is used in rocky areas.
551	7	Barnick	Sandy		7. According to Appendix B of the EIS, Keystone commits to monitoring, repair and reclamation for several years. What defines "several" and shouldn't Keystone be required to monitor, repair and reclaim for as long as there is a problem?	As noted in Section 4.16 of the Keystone Construction, Mitigation, and Reclamation (CMR) Plan in Appendix B of the EIS, Keystone would monitor reclaimed areas until the revegetation effort is considered successful as defined in the CMR Plan or by relevant permit requirements.
551	8	Barnick	Sandy		Topsoil considerations are inadequate. The EIS says that 12" will be separated, but in actuality top soil and the layers below need to be treated specifically to the situation of the land, and that may or may not be 12" of top soil. (EIS reference: page 3.9-20) There is no study or data to back up claims that disturbing the subsoil will have an impact on the soil, such as moisture retention, and disturbing layers of the nutrients and soil types. How do they (TransCanada) propose to replace the soil so that it retains the natural stability?	See Consolidated Response SOI-2 and Section 3.2.2.1 of the EIS for a discussion of topsoil handling and restoration concerns.
551	10	Barnick	Sandy		There is no data included in the DEIS regarding the temperature of the tar sands in the pipeline. No studies or data on the temperature effects on the root systems of the native grasses, grains or alfalfa. The warm temperatures will potentially impair the natural growth and water absorption of the naive plants. With the pipeline being so large, it will impair the root systems, therefore causing uneven growth in a field. This issue has not been addressed in the DEIS. The impact of disturbing the natural layers of the subsoil has not been addressed either.	Heat dissipation and potential impacts on native vegetation and crops are discussed in Section 3.5.5 of the EIS. The EIS was revised to add discussions of temperature effects on native prairie grasses and crops in Section 3.5.5, and additional discussions of this issue are included in Consolidated Response ENV-2. Appendix L of the EIS illustrates modeled temperature effects of the pipeline from Montana to Texas and reviews effects of increased soil temperature on native prairie grasses and crops.
551	11	Barnick	Sandy		The potential of permanent loss of production of the US food supply is at risk. Why is the ability to produce the nations food supply of less importance than the profits of a foreign dirty tar sands product? Please protect the US producers, and not	Implementation of the proposed Project would not result in the potential for a permanent loss of production of the U.S. food supply. The impacts associated with implementation of the proposed Project are addressed in Section 3.0 of the EIS. As

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					grant the application for condemnation.	noted in that section, construction and normal operation the proposed Project would not result in significant environmental impacts. Section 3.13 of the EIS has been revised and addresses reliability and safety issues, including calculations of the probability of a spill from the proposed Project and the potential environmental impacts associated with spills.
551	12	Barnick	Sandy		As a US citizen and agricultural producer, please allow the landowners the option of saying "No" to having our land devalued and taken with an unfair minimal fee that TransCanada has offered at this point.	As noted in Consolidated Response EAS-2, state laws dictate under what circumstances eminent domain may be used and define the eminent domain process within the state. DOS has no legal authority in the easement negotiations or in eminent domain proceedings.
552	3	Barnick	Sandy		The DEIS doesn't analyze the environmental effects of tar sands oil, which some say is the dirtiest form of energy available.	Consolidated Response OIL-4 addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils. Section 3.13 of the EIS addresses the impacts of a release of crude oil from the proposed Project. As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries.
552	4	Barnick	Sandy		Emergency Response Plan · The DEIS does not contain or evaluate a complete emergency response plan. This poses an unacceptable risk to Montana. The largely volunteer emergency personnel and potentially affected property owners and others who live near the pipeline deserve an opportunity to comment on TransCanada's emergency response plan prior to issuance of permits and approval of the plan.	Consolidated Response RES-1 addresses issues related to preparation and review of emergency response plans for the proposed Project
1552	59	Barnick	Sandy		In reference to the 50 foot permanent easement; is this width necessary for one 36-inch pipe?	The width of the permanent right-of-way is typical of a large-diameter oil pipeline and provides protection from encroachment that could damage the pipe.
1552	60	Barnick	Sandy		Keystone's plan to include "post blasting testing for surface water and water wells within 150 feet of centerline" to ensure water quality is not degraded, is too close to be blasting near a water well. Water is critical in this country for both livestock and human uses.	As described in Section 2.3.3 of the EIS, blasting is no longer planned as part of installation activities for the proposed Project. In areas of shallow bedrock and cemented, dense soil, ripping will be employed. It is not likely that wells used for domestic purposes, irrigation, and livestock would be affected during construction and normal operation of the proposed Project. However, if there is damage, Compensation to landowners is addressed in Consolidated Response FRM-1 and in Section 2.5 of the Keystone Construction, Mitigation, and Reclamation Plan in Appendix B of the EIS. If there is a spill from the proposed Project, Keystone or the incident response team would inform all landowners in the vicinity of the spill that the release had occurred and advise the landowners of the appropriate precautions. Keystone would be liable for all costs associated with cleanup and restoration as well as other compensations, as noted in Consolidated Response LIA-1. If a stock pond or a well used as a source of domestic or irrigation water is affected, Keystone would provide water until the affected water is proven to be acceptable for use.
1552	61	Barnick	Sandy		The DEIS states "Grassland impacts due to pipeline	The Executive Summary of the EIS has been revised. A

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					construction are expected to be minimal, and affected vegetative communities are generally expected to reestablish within two years." I feel this timeline is too short, and directly contradicted in the DEIS Terrestrial Vegetation chapter 3.5.5.1: "Although native grassland would be restored, construction effects on previously untilled native prairies could be long term, as destruction of the prairie sod during trenching may require more than 100 years for recovery." How can it be said that grassland impacts will be minimal and 'expected to reestablish within 2 years, if within the Draft EIS it clearly states it could require more than 100 years?	timeframe of 1 to 5 years is appropriate for re-establishment of most native grasses with the expectation that in northern arid regions perennial herbaceous cover may require as long as 5 to 8 years, especially when drought conditions or livestock grazing interfere with reestablishment.
1552	62	Barnick	Sandy		The increase in soil temperatures caused by the pipeline will affect the reestablishment of climax vegetation in prairie sods and will affect the growing of crops on farmland.	Section 3.5.5.1 of the EIS addresses potential impacts to vegetation due to increased temperature in the soil in the vicinity of the proposed pipeline.
1558	24	Barnick	Sandy		We do not feel that the construction on our affected farmland and rangeland has been adequately addressed in the EIS.	Keystone would reclaim all lands affected by construction to pre-construction to the extent practicable and described in Sections 2.3.2.8 and 2.3.2.9 of the EIS and in the Keystone Construction, Mitigation, and Reclamation Plan (presented in Appendix B of the EIS) unless the landowner and Keystone agree to an alternate restoration. Consolidated Response FRM-1 addresses potential ranch of farmland impacts, including compensation for lost crops. As noted in the EIS, after construction is complete, farming and grazing can continue over the pipeline.
1558	25	Barnick	Sandy		We farm and ranch. In most places our property has a layer of gravel that can range from 3 to 6 feet below the surface. The topsoil varies greatly. In the Draft EIS it states the topsoil is 12 inches deep. There are areas where we might have 4 inches of topsoil. We don't want that 4 inches mixed with that extra 8 inches of subsoil. Our topsoil will never regain its productivity if that does happen.	The draft EIS did not state that topsoil is 12 inches deep. As stated in Section 2.3.2.3 of the EIS, "In areas where topsoil segregation would be required, the actual depth of topsoil would be removed up to a maximum depth of 12 inches and segregated." See Consolidated Response SOI-2 and Section 3.2.2.1 of the EIS for a discussion of topsoil and restoration concerns.
1558	26	Barnick	Sandy		When they remove the topsoil and dig, those levels of gravel, dirt and more gravel, then they just mix it all up, and the integrity of that land will forever be altered and the production will never be the same. It will never come back to 100 percent, very likely not even 50 percent. It will impact the way in which the water is absorbed into and retained in the ground.	See Consolidated Response SOI-2 and Section 3.2.2.1 of the EIS for a discussion of topsoil and restoration concerns. Topsoil would not be mixed with subsoils.
1558	27	Barnick	Sandy		There are no proven studies on the effect of the heat from the pipe on land production. We've been told that within one foot of the pipe it is 85 degrees. We don't know how the heat will conduct through different types of soils, clay, gumbo, sand, gravel. We have no guarantee, no studies to tell us how this will impact crops that we produce.	Consolidated Response ENV-2 addresses concerns related to pipeline temperature effects.
1558	28	Barnick	Sandy		For those of us that grow winter wheat, there's great concern that the ground will never be able to produce winter wheat at an appropriate level as it is now.	Keystone would reclaim all lands affected by construction to pre-construction to the extent practicable and described in Sections 2.3.2.8 and 2.3.2.9 of the EIS and in the Keystone Construction, Mitigation, and Reclamation Plan (presented in Appendix B of the EIS) unless the landowner and Keystone agree to an alternate restoration. Consolidated Response FRM-1 addresses potential ranch of farmland impacts, including compensation for lost crops. As noted in the EIS, after construction is complete, farming can continue over the pipeline.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
1558	30	Barnick	Sandy		The DEIS has an inadequate assessment of potential spills and what the spills will be. They are not disclosing what they consider a high consequence area where they are not applying this pressure waiver application such as water areas, rivers, etc.	<p>Keystone has withdrawn its application for a Special Permit as described in Consolidated Response REG-1. As described in Consolidated Response SAF-1, the Pipeline and Hazardous Materials Safety Administration (PHMSA) has regulatory requirements that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project. In addition, PHMSA developed 57 Project-specific Special Conditions (see Appendix U of the EIS) that Keystone has agreed to implement. Incorporation of those conditions would result in a proposed Project that would have a degree of safety over any other typically constructed domestic oil pipeline system under current code and a degree of safety along the entire length of the pipeline system similar to that which is required in high consequence areas (HCAs) as defined in 49 CFR 195.450.</p> <p>Section 3.13 of the EIS was revised to update spill incident statistics and projections, provide additional information on composition of the crude oil that would be transported by the proposed Project, additional information on potential impacts to the Northern High Plains Aquifer system, and other key information. This section addresses reliability and safety issues, including calculations of the probability of a spill from the proposed Project and the potential environmental impacts associated with spills. .</p>
1558	31	Barnick	Sandy		We, out in the far reaches of the prairie, feel that we are considered low consequence, and therefore, our property, our lives, our livelihood, our source of income don't matter to the Draft EIS.	The Pipeline and Hazardous Materials Safety Administration (PHMSA) regulations define high consequence area (HCAs) based on population levles and environmentally sensitive areas. Keystone is required to identify what areas along the proposed route are HCAs. By complying with PHMSA regulations and incorporating PHMSA's 57 Project-specific Special Conditions (see Sections 2.3 and 3.13.1.1, the proposed Project would have a degree of safety over any other typically constructed domestic oil pipeline system under current code and a degree of safety along the entire length of the pipeline system similar to that which is required in HCAs as defined in 49 CFR 195.450.
1558	33	Barnick	Sandy		There are at this point no known pipelines operating such as this. We don't like the possibility that we are considered the guinea pigs on this pressure waiver.	Issuance of a Special Permit would not be an experiment. Several pipelines have been granted the Special Permit and are in operation, including the Keystone Oil Pipeline System. However, Keystone has withdrawn its application for a Special Permit as described in Consolidated Response REG-1. As described in Consolidated Response SAF-1, the Pipeline and Hazardous Materials Safety Administration (PHMSA) has regulatory requirements that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project in a manner that protects the health and safety of the public and the environment. In addition, PHMSA developed 57 Project-specific Special Conditions that Keystone has agreed to implement. Incorporation of those conditions would result in a Project that would have a degree of safety over any other typically constructed domestic oil pipeline system under current code and a degree of safety along the entire length of the pipeline system similar to that which is required in HCAs as defined in 49 CFR 195.450.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
1558	34	Barnick	Sandy		A spill could impact our entire livelihood.	Section 3.13 of the EIS addresses reliability and safety issues, including calculations of the probability of a spill from the proposed Project and the potential environmental impacts associated with spills.
1558	35	Barnick	Sandy		A spill is not something that can be addressed in a one year recoup or clean-up of the property.	Consolidated Response RES-1 addresses issues related to preparation and review of the emergency response plan for the proposed Project. Response actions for small spills that do not extend over large areas may be cleaned up quickly and the land reclaimed and productive in a relatively short period of time. Reclamation after the cleanup of large spills covering more extensive areas would require a longer period of time. The EIS has been revised to address this comment.
1558	36	Barnick	Sandy		We feel like there hasn't been a thorough and independent study on whether this pipeline is needed.	Consolidated Response P&N-1 addresses the need for the Proposed Project.
1558	37	Barnick	Sandy		We feel like there hasn't been a thorough and independent study on whether it positively impacts the State of Montana or even the United States.	Consolidated Response P&N-1 addresses the need that the Project has been proposed to meet. Consolidated Response ECO-1 and Section 3.10.2.2 of the EIS address potential socioeconomic impacts.
1558	38	Barnick	Sandy		Without something that says this is going to benefit my home land, I don't feel that a permit for eminent domain should be granted to take my property for something that does not benefit us.	As noted in Consolidated Response EAS-2, state laws dictate under what circumstances eminent domain may be used and define the eminent domain process within the state. DOS has no legal authority in the easement negotiations or in eminent domain proceedings. Consolidated Response P&N-1 and Section 1.4 of the EIS address the need that the Project has been proposed to meet.
1558	39	Barnick	Sandy		My ranch has been in my husband's family for 100 years. I'm concerned about the value of the farmland after it is forever altered by the pipeline.	Consolidated Response VAL-1 addresses concerns regarding property values. Consolidated Response EAS-2 addresses issues related to easement negotiations. As noted in that response, DOS has no legal authority in the easement negotiation process.
1558	40	Barnick	Sandy		How the pipeline will affect farmland production is an unknown factor.	Keystone would reclaim all lands affected by construction to pre-construction to the extent practicable and described in Sections 2.3.2.8 and 2.3.2.9 of the EIS and in the Keystone Construction, Mitigation, and Reclamation Plan (presented in Appendix B of the EIS) unless the landowner and Keystone agree to an alternate restoration. Consolidated Response FRM-1 addresses potential ranch of farmland impacts, including compensation for lost crops. As noted in the EIS, after construction is complete, farming can continue over the pipeline.
1558	41	Barnick	Sandy		The wells that we have on our property, with the droughts over the years, are tenuous. We're concerned with the heavy weight of this machinery, that we'll have cave-ins in the well. There are no guarantees that we will be provided a new well, that a new well will be drilled, or that they will be able to find water to provide to us.	It is not likely that wells used for domestic purposes, irrigation, and livestock would be affected during construction and normal operation of the proposed Project. However, if there is damage, Compensation to landowners is addressed in Consolidated Response FRM-1 and in Section 2.5 of the Keystone Construction, Mitigation, and Reclamation Plan in Appendix B of the EIS. If there is a spill from the proposed Project, Keystone or the incident response team would inform all landowners in the vicinity of the spill that the release had occurred and advise the landowners of the appropriate

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
						precautions. Keystone would be liable for all costs associated with cleanup and restoration as well as other compensations, as noted in Consolidated Response LIA-1. If a stock pond or a well used as a source of domestic or irrigation water is affected, Keystone would provide water until the affected water is proven to be acceptable for use.
1558	42	Barnick	Sandy		We have concerns about a leak or a spill, even diesel spills from the machinery used throughout the construction project.	Section 3.13 of the EIS addresses reliability and safety issues, including calculations of the probability of a spill from the proposed Project and the potential environmental impacts associated with spills. The assessment addresses releases during both construction and operation of the proposed Project.
1558	43	Barnick	Sandy		We have concerns about the Draft EIS's assessment of how long it will take to reclaim our property.	Consolidated Response FRM-1 addresses potential ranch of farmland impacts.
1558	44	Barnick	Sandy		We have concerns about the roads. We know that we will be faced with an increase in traffic on the roads, and those of us that do travel this road on a daily basis will be put into an unsafe situation on the gravel roads with blind hills, blind corners, with people that do not know the property and don't know how to drive these roads.	Consolidated Response RDS-1 addresses concerns about the condition of roadways and roadway structures associated with construction and operation of the proposed Project as well as traffic safety measures that would be incorporated into the Project.
1558	45	Barnick	Sandy		The upkeep of these roads is going to be monumental, I don't want any of this to fall on us as taxpayers. The farmers, the ranchers, the property owners, we pay property taxes that keep up our roads	Consolidated Response RDS-1 addresses concerns about the condition of roadways and roadway structures associated with construction and operation of the proposed Project as well as traffic safety measures that would be incorporated into the Project. As noted in that response, Keystone would restore the roads to their preconstruction condition or better and would pay for the restoration.
1558	46	Barnick	Sandy		We think that everything should be carefully and thoroughly inspected by an outside entity.	As noted in Consolidated Response SAF-1, Keystone must comply with the Pipeline and Hazardous Materials Safety Administration (PHMSA) regulatory requirements for design and construction, and PHMSA would conduct on-site inspections during construction. There would also be on-site Environmental Inspector during construction as described in Section 2.3.5.2 of the EIS.
1423	1	Barnitz	Frank	Missouri Senate	I write in support of Trans Canada's Keystone XL crude oil pipeline project and urge the department to grant a permit for the pipeline... I urge the granting of the permit. Thank you for the opportunity to comment.	Comment acknowledged.
1423	4	Barnitz	Frank	Missouri Senate	Considering the economic [and energy security benefits] of these vital resources, we should continue to expand America's access to safe, affordable energy to help ensure [improved domestic and global energy security and] stable prices for consumers... This project also stands to provide a powerful private sector economic stimulus. During construction, Keystone XL will create more than 13,000 jobs funded with private investment. In addition, local governments will have a steady source of income from economic activity associated with construction and from property taxes the pipeline company will pay... Rejection of the permit or suspension of the review would sacrifice the significant economic benefits this project stands to deliver and force U.S. consumers to rely on other sources of crude oil not economically and politically allied with U.S. interests. This would be a mistake.	Consolidated Response ECO-1 addresses potential socioeconomic impacts, and Consolidated Response TAX-1 addresses concerns regarding taxes.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
1423	5	Barnitz	Frank	Missouri Senate	Pipelines are the safest, most reliable, economical and environmentally favorable way to transport oil and petroleum products, as well as other energy liquids, throughout the U.S.	Comment acknowledged.
1190	1	Barron	John		Why is it necessary to spend so much money to carry the oil so far from it's source over vulnerable aquifers to a refinery site so far south. Would it not be more cost effective to construct the refineries and distribution centers closer to the source? This becomes even more reasonable with the renewed interest and activity in the Bakken region of the Dakotas and Montana. Has this even been considered?	Consolidated Response P&N-8 addresses issues related to shipping Canadian crude oil to refineries that are closer to the source of oil. Consolidated Response P&N-1 addresses the need that the Project has been proposed to meet; transporting Canadian crude oil in the Keystone XL Project to refineries outside of the Gulf Coast region would not meet the current and near-term crude oil needs of those refineries. Consolidated Response ALT-3 addresses the potential for a pipeline connection to the Keystone XL Project in Montana.
1190	2	Barron	John		With the recent disaster we are confronting in the gulf I am of the opinion any industrial "mishap" over our aquifer would definitely bring an end to sustainable life in Nebraska.	As described in Consolidated Response GLF-1, the risks associated with the proposed Project are substantially different from those associated with the BP Deepwater Horizon Project. Issues related to the Northern High Plains Aquifer System are addressed in Consolidated Responses AQF-1 through AQF-4. Consolidated Response AQF-3 provides information on hypothetical spills from the Project over two areas of the Northern High Plains Aquifer System. As noted in those responses, a spill from the proposed Project over the NHPAQ system would not end sustainable life in Nebraska.
1231	1	Bartels	Scott		How is the pipeline owner prepared in dealing with a break in the pipeline and/or a massive separation causing an oil leak. How will they stop the flow?	Leak detection is discussed in Sections 3.13.5 and 3.13.6 of the EIS and in Consolidated Response OIL-3. As described in Section 2.4.2 and Sections 3.13.5 and 3.13.6 of the EIS, the pipeline would be shut down automatically and remotely when a leak is detected. Response times and methods would vary according to environmental factors, logistics, and other operational variables. As noted in Consolidated Response RES-1, the procedures used will be addressed in detail in the Emergency Response Plan. Spill Prevention, Control, and Countermeasure plans are addressed in Sections 2.3 and 3.13.5 of the EIS and in the Construction, Mitigation, and Reclamation Plan presented in Appendix B of the EIS.
1231	2	Bartels	Scott		How will they remove the spilled crude?	The methods used and the response times would vary according to environmental factors, logistics, and other operational variables. As noted in Consolidated Response RES-1, the procedures used will be addressed in detail in the Emergency Response Plan. Spill Prevention, Control, and Countermeasure plans are addressed in Sections 2.3 and 3.13.5 of the EIS and in the Construction, Mitigation, and Reclamation Plan presented in Appendix B of the EIS.
1231	3	Bartels	Scott		How will they ensure the Ogallala Aquifer will not become contaminated as the pipeline is already underground to start with?	As described in Consolidated Response GLF-1, the risks associated with the proposed Project are substantially different from those associated with the BP Deepwater Horizon Project. Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
441	1	Batcher	Gwen		How can you possibly think it is a good idea to cross the country's largest aquifer with an oil pipeline? It would only be a small detour to avoid this possible disaster.	Consolidated Response ALT-1 addresses potential alternative routes, including routes that would avoid much of the Northern High Plains Aquifer system.
871	1	Bates	Arthur		Please do not allow the proposed Keystone XL pipeline to pass through the Nebraska Sandhills and through the Ogallala	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					Aquifer. It presents a significant and unnecessary risk to the water supply in the aquifer.	
872	1	Bates	Frances		Please do not allow the proposed Keystone XL pipeline to pass through the Nebraska Sandhills and through the Ogallala Aquifer. It presents a significant and unnecessary risk to the water supply in the aquifer.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
1116	1	Bates	Arthur&Frances		Please do not allow the proposed Keystone XL oil pipeline to pass through the Nebraska Sandhills.	Identification of sensitive environments crossed by the proposed Project is discussed in Consolidated Response ENV-1 and ENV-3. Issues related to the Sand Hills area are addressed in Consolidated Response ERO-1. Consolidated Response ALT-1 addresses potential alternative routes, including routes that would avoid much of the Northern High Plains Aquifer system and the Sand Hills area.
1116	2	Bates	Arthur&Frances		Please do not allow the proposed Keystone XL oil pipeline to pass through the Ogallala Aquifer. It presents a significant and unnecessary risk to the water supply in the aquifer.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
1471	1	Batey	LouAnn		I am a member of the Sierra Club. The club's reason for existence is protection of the environment. The Keystone Pipeline is disastrous for the environment. Tar Sands oil is so nasty that it takes large amounts of water to produce, comparable to the amount of water used in the production of animals for food.	Consolidated Response OIL-4 addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils. Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project.
1471	2	Batey	LouAnn		If anyone thinks we need oil wait & see what it's like to scramble for water It's coming!	Comment acknowledged.
1471	3	Batey	LouAnn		We don't need a pipeline explosion in Oklahoma if they plan to use thin pipe, then speed the oil through it at high pressures, all involved are just asking for trouble.	Keystone has withdrawn its application for a Special Permit as described in Consolidated Response REG-1. As described in Consolidated Response SAF-1, the Pipeline and Hazardous Materials Safety Administration (PHMSA) has regulatory requirements that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project. In addition, PHMSA developed 57 Project-specific Special Conditions that Keystone has agreed to implement. Incorporation of those conditions would result in a Project that would have a degree of safety over any other typically constructed domestic oil pipeline system under current code and a degree of safety along the entire length of the pipeline system similar to that which is required in HCAs as defined in 49 CFR 195.450. Reliability and safety, including the risk of release from the proposed proposed Project, are addressed in Section 3.13. As noted in that section and in Consolidated Response OIL-5, crude oil pipelines do not explode and it is highly unlikely that there would be an explosion in a pump station.
1471	4	Batey	LouAnn		We can't trust these companies. Consider what is going on in the Gulf right now. The Keystone Pipeline isn't going to help any the states it goes through. It puts the lives & health of the people at risk in order to line the pockets of Trans Canada.	As described in Consolidated Response GLF-1, the risks associated with the proposed Project are substantially different from those associated with the BP Deepwater Horizon Project.
1471	5	Batey	LouAnn		Please, Secretary Clinton, don't permit the pipeline to cross the 'border into this country, Pipelines are dangerous things.	The incident referred to by the commenter occurred on a natural gas pipeline, not a crude oil pipeline. As noted in

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					One exploded near Darrouzett, TX, yesterday (June 8), killing one Oklahoman & I don't know how many others.	Consolidated Response OIL-5, crude oil pipelines do not explode and it is highly unlikely that there would be an explosion in a pump station.
1097	1	Bathen	Ed		Pipelines are a wonderful land based transport mode for all types of necessary products... As long as oversight and due diligence is exercised in the construction and maintenance of the line.	Consolidated Response SAF-1 describes the regulatory requirements of the Pipeline and Hazardous Materials Safety Administration (PHMSA) that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project. It also describes the inspections and reviews of the proposed Project that PHMSA would conduct to ensure compliance with those regulatory requirements. .
160	1	Batten	Barbara		I would like to add my name to that of my many fellow citizens who request that the Dept. of State refuse permission to build an oil pipeline from Canada to Texas.	Consolidated Response ENR-1 provides information on the Department of State's environmental review process, the National Interest Determination process, and the need to complete those reviews before approving or denying the Presidential permit for the proposed Project.
160	2	Batten	Barbara		The pipeline application calls for use of a thinner pipe than standard and a higher pressure than standard. It is inevitable that there will be a leak at some point, even with standard equipment, which could endanger our water supplies, both above and below ground (e.g. the Ogallala Aquifer in the central U.S.).	Keystone has withdrawn its application for a Special Permit as described in Consolidated Response REG-1. Issues related to the Northern High Plains Aquifer System are addressed in Consolidated Responses AQF-1 through AQF-4.
160	3	Batten	Barbara		The tar sand crude will be headed for Houston where there are facilities for handling this type of crude and its residue. We are already struggling with air pollution here and this will add a new problem.	As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries. Consolidated Response OIL-4 also addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils.
1544	91	Batten	George		I appreciate that the State Department decided to hold a meeting here in Houston, although I still harbor a little bit of anger that it wasn't on the first list.	Consolidated Response CMT-2 addresses issues related to comment meetings on the draft EIS and requests for additional public involvement.
1544	92	Batten	George		For the sake of myself and my family, I raise my voice in protest against the proposed Keystone XL pipeline.	Comment acknowledged.
1544	93	Batten	George		The negative long term effects of this pipeline will be felt for several generations.	Section 3 of the EIS addresses the impacts of construction and operation of the proposed Project. Section 3.13 of the EIS addresses the risk and environmental impacts of a crude oil spill from the proposed Project.
1544	94	Batten	George		Concern about the use of high sulfur content Canadian oil sands being bound to create and aggravate acid rain issues in the US.	Consolidated Response OIL-4 addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils. As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries.
1544	95	Batten	George		Concern about Houston's risk of contamination from the pipeline and possible spills.	The pipeline does not extend to Houston.
1544	96	Batten	George		Concern about the possibility of the destruction of water	The impacts associated with implementation of the proposed

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					supplies.	Project are addressed in Section 3.0 of the EIS. As noted in that section, construction and normal operation the proposed Project would not result in significant environmental impacts. Section 3.13 of the EIS addresses reliability and safety issues, including calculations of the probability of a spill from the proposed Project and the potential environmental impacts associated with spills.
1544	97	Batten	George		Concern about damage to fisheries.	Section 3.7.3 of the EIS discusses potential impacts to fisheries as well as proposed avoidance and mitigation measures to minimize potential Project-related impacts to fisheries resources.
1544	98	Batten	George		Concern about damage to wilderness habitats.	The proposed Project does not cross any designated "Wilderness Areas" and would not affect these areas.
1544	99	Batten	George		Concern about damage to wetlands and other sensitive entities.	Identification of sensitive environments crossed by the proposed Project is discussed in Consolidated Responses ENV-1 and ENV-3. The potential impacts to wetlands crossed by the proposed Project are addressed in Section 3.4. All wetlands would receive construction mitigations as described in Keystone's Construction, Mitigation, and Reclamation Plan (Appendix B of the EIS) and any other applicable guidance from the U.S. Army Corps of Engineers in the permitting process conducted in accordance with Section 404 of the Clean Water Act. Keystone has committed to follow the same construction, mitigation, and reclamation plan for all wetland crossings regardless of whether the wetland qualifies as jurisdictional under the U.S. Army Corps of Engineer Section 404 permits.
1544	102	Batten	George		Concern about the threat of green house gases and climate change.	Consolidated Response GHG-1 addresses the greenhouse gas life-cycle analyses presented in the revised EIS. Climate change is addressed in Section 3.14.3.14. As noted in that Section, implementation of the proposed Project is unlikely to result in a measureable climate change.
1544	103	Batten	George		If the State Department approves this project, it will be an enabler for the release of vast quantities of carbon into our atmosphere. Huge amounts of carbon will be released from the large boreal forests destroyed in the process of tar sands extraction.	Consolidated Response GHG-1 addresses the greenhouse gas life-cycle analyses presented in the revised EIS. Consolidated Response GHG-4 addresses concerns regarding the loss of boreal forest and peat bogs.
1544	104	Batten	George		Extraction of oil from the tar sands will use much more energy and the release of more carbon than that of most other petroleum sources.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project. Consolidated Response GHG-1 addresses GHG life-cycle analyses.
1544	105	Batten	George		This project and the acceptance of oil sands crude flies in the face of President Obama's aim to reduce carbon emissions.	Consolidated Response GHG-1 addresses the greenhouse gas life-cycle analyses presented in the revised EIS. Climate change is addressed in Section 3.14.3.14. As noted in that Section, implementation of the proposed Project is unlikely to result in a measureable climate change.
1544	106	Batten	George		Virtually every project producing profit and needing governmental approval has claimed how many jobs will be created, or lost if the project is not approved. I believe that knowledgeable people with good information can establish that in the long run this project will result in a net loss of jobs.	Consolidated Response ECO-1 and Section 3.10.2.2 of the EIS address potential socioeconomic impacts.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
1544	107	Batten	George		Concern that the jobs created by the pipeline would not replace the amount of jobs lost in the management of oil tankers, particularly in Houston.	Consolidated Response ECO-1 and Section 3.10.2.2 of the EIS address potential socioeconomic impacts.
1264	1	Batten,Jr.	George	Advanced Image Measurement Systems	At the June 18, 2010 public meeting relating to the Keystone XL Pipeline Draft Environmental Impact Statement, I commented that I thought the net number of jobs added by the pipeline project might be negative. This is a written expansion on that comment. According to information I obtained from the U. S. Coast Guard, there are roughly 20 oil tankers (ships) arriving at Houston every day. Many, perhaps most, of these have capacities around 70,000 DWT (dead weight tonnes), corresponding to about 500,000 barrels of crude oil. That is about the amount of so-called synthetic crude oil (SCO) that would be delivered to Houston-area (including Beaumont-Port Arthur) refineries each day by the proposed pipeline. Thus, if the pipeline is built and delivers SCO at the proposed rate, at least one tanker per day will not be needed by Houston-area chemical plants. The effect is that jobs associated with one such tanker will be lost.	Consolidated Response ECO-1 addresses potential socioeconomic impacts, and Consolidated Response TAX-1 addresses concerns regarding taxes.
1264	2	Batten,Jr.	George	Advanced Image Measurement Systems	I have not been able to get accurate estimates of the number of jobs directly associated with a tanker, but I believe that it must be in the hundreds. Each tanker has a relatively small crew, but there are many port-based jobs: pilots, boat crews transporting pilots, tugboat crews, loading and unloading personnel, maintenance crews, provisioning crews, etc. The result of the loss of one arriving tanker per day will be the direct loss of those hundreds of jobs, and there is a multiplication factor for the net effect on jobs in the area.	Consolidated Response ECO-1 addresses potential socioeconomic impacts, and Consolidated Response TAX-1 addresses concerns regarding taxes.
1264	3	Batten,Jr.	George	Advanced Image Measurement Systems	I believe that, for the 20-year lifetime of the proposed pipeline, there will be a loss of many thousands of job-years. While the construction of the pipeline will produce a lot of temporary job-years, the Houston-area will not gain many of those, and the net for the area will be a substantial loss. Therefore, I request that the Environmental Impact Study for this pipeline project include an accurate analysis of tanker-related job-years gained and/or lost over the lifetime of this project, and specifically the effect on jobs in the Houston area.	Consolidated Response ECO-1 addresses potential socioeconomic impacts, and Consolidated Response TAX-1 addresses concerns regarding taxes.
38	1	Bauer	Kim		The State Department would be making an enormous mistake to allow this pipeline to move forward. The global warming pollution from this project is staggering. Building this one pipeline would be the equivalent of putting 6 million new cars on the road. Any analysis of environmental impacts must take the pipeline's global warming impact into account. We've urged the State Department to reject permit applications for the project, based on concerns about water contamination, toxic waste, deforestation, and global warming pollution from tar sands operations.	Consolidated Response GHG-1 addresses the greenhouse gas life-cycle analyses presented in the revised EIS. Consolidated Response GHG-3 addresses the decreased rate of GHG gas emissions from oil sands production in Canada. Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project.
38	2	Bauer	Kim		The tar sands oil this pipeline would carry into the U.S. is the dirtiest form of oil in the world. It requires clear-cutting ancient forests, sucking up water supplies and leaving behind toxic lakes so big they can be seen from space.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project.
868	1	Baum	Brent		Hello, I see no reason AT ALL for a country who, for the last several decades, has been claiming to want to ween itself	Consolidated Response P&N-1 addresses the need that the Project has been proposed to meet. Consolidated Response

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					from oil dependency to build a pipeline across many states. Aside from this continuing the dependency on oil for energy, which these states could provide in the form of solar and/or wind,	ALT-2 addresses the use of alternative technologies and alternative energy sources. Issues related to the High Plains Aquifer System are addressed in Consolidated Response AQF-1.
458	1	Bauman	Sarah		I am concerned that Keystone XL oil pipeline project may cross over Nebraska and the invaluable Ogallala Aquifer. There is always the possibility of leaks and breaks, and the smallest amount can go through the porous soil rapidly, polluting this pristine, invaluable water resource forever. Recent disasters on the Gulf and in Salt Lake City should be enough to awaken officials to be more prudent with possibilities of disaster. Why not keep it all close to the source in Canada, processing it there? Please protect the Ogallala Aquifer.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. As described in Consolidated Response GLF-1, the risks associated with the proposed Project are substantially different from those associated with the BP Deepwater Horizon Project. Consolidated Response P&N-8 addresses issues related to shipping Canadian crude oil to refineries that are closer to the source of oil.
1139	1	Baumann	Tom		I know access to oil is vital to our economy, but preserving the country's food production is even more critical, and the Ogallala Aquifer is a most critical resource absolutely necessary to U.S. food production.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
1139	2	Baumann	Tom		I know access to oil is vital to our economy, but preserving the Country's food production is even more critical, and the Ogallala Aquifer is a most critical resource absolutely necessary to US food production.	Issues related to the High Plains Aquifer System are addressed in Consolidated Response AQF-1 through AQF-4. Consolidated Response AQF-3 provides information on hypothetical spills from the Project over two areas of the Northern High Plains Aquifer System.
1139	3	Baumann	Tom		Routing the oil pipeline to avoid contaminating the Aquifer makes far more sense then believing that an oil pipeline can be made safe from the kind of breakdown that will permanently poison the well. To build an oil pipeline across the Ogallala Aquifer is like telling someone that using a condom will prevent HIV. Everyone knows it may reduce the risk, but what happens if the 99% won't happen becomes the 1 % did happen?	Consolidated Response ALT-1 addresses potential alternative routes, including routes that would avoid much of the High Plains Aquifer System. Issues related to the High Plains Aquifer System are addressed in Consolidated Responses AQF-1 through AQF-4. Section 3.13 of the EIS addresses reliability and safety issues, including calculations of the probability of a spill from the proposed Project and the potential environmental impacts associated with spills.
1139	4	Baumann	Tom		The well head accident in the Gulf should more than adequately demonstrate the potential catastrophic loss if the unforeseen happens with the pipeline and the US loses one of its most valuable and irreplaceable resources.	As described in Consolidated Response GLF-1, the risks associated with the proposed Project are substantially different from those associated with the BP Deepwater Horizon proposed Project. Section 3.13 of the EIS presents the probability of a spill from the proposed Project, cleanup procedures that would be conducted, and the impacts of such a release. Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
1139	5	Baumann	Tom		If the unforeseen happens with the pipeline and the US loses one of its most valuable and irreplaceable resources. ...Water is more vital to life in America than oil. Water affects life, while oil affects a way of life.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
1131	1	Bausch	Janet		I am writing to express my displeasure with putting an oil pipeline through our state which also goes through the Ogallala Aquifer.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
1131	2	Bausch	Janet		I don't care if crude oil is not poisonous, any leak would contaminate our water which should be protected at all costs.	Consolidated Response SAF-1 describes the regulatory requirements that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project in a manner that protects the health and safety of the public and the environment. The proposed Project would be in

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
						compliance with those regulations. Section 3.13 of the EIS addresses reliability and safety issues, including calculations of the probability of a spill from the proposed Project and the potential environmental impacts associated with spills including impacts to surface water and groundwater.
1131	4	Bausch	Janet		I am writing to express my displeasure with putting an oil pipeline through our state which also goes through the Ogallala aquifer. I don't care if crude oil is not poisonous, any leak would contaminate our water which should be protected at all costs. So put the pipeline somewhere there is no aquifer. And not to mention this in the many paged report is suspicious. I have so little trust in our government anymore especially when it comes to protecting the best interests of our state.	Issues related to the High Plains Aquifer System are addressed in Consolidated Response AQF-1 through AQF-4. Consolidated Response AQF-3 provides information on hypothetical spills from the Project over two areas of the Northern High Plains Aquifer System. Consolidated Response ALT-1 addresses potential alternative routes, including routes that would avoid much of the Northern High Plains Aquifer system.
1149	1	Baxter	Lodelia		I also am against putting the pipe line below ground. I believe it would be more insightful to have it above ground were a leak can be spotted and stopped sooner and be cleaned up . If it leaks below ground it cannot be retrieved and would pollute the whole aquifer. Our ground water is to precious not only to the state of Nebraska but to the nation as a whole. A concerned Nebraskan. Lodelia Baxter	Issues related to an aboveground pipeline are addressed in Consolidated Response CST-1. Issues related to the Northern High Plains Aquifer System are addressed in Consolidated Responses AQF-1 through AQF-4. Issues related to the Sand Hills area are addressed in Consolidated Response ERO-1.
860	1	Beale	Mike	Environment Canada	A number of statements made at the Public Comment Meeting in Washington on June 29 provide a misleading impression of the environmental impacts of production from Canada oil sands. I would like in particular to set the record straight on a few key points. Reference was made to leakage from oil sands tailings ponds. The Province of Alberta regulates effluent and emissions from the oil sands. With respect to effluent, Alberta has a zero discharge standard, including from tailings ponds. To this end they regularly monitor seepage from the tailings ponds and require re-capture of any seepage. The Government of Alberta shares this information with Environment Canada. That being said, determining whether or not oil sands tailings ponds are leaching into the groundwater or seeping into surface water is a key preoccupation yet is complicated given that there is natural bitumen leaching in the region. Environment Canada has no scientific evidence that leakage from tailings ponds is occurring. Environment Canada is monitoring the issue, and has undertaken a number of studies on the potential seepage from the oil sands development into the Athabasca River and into groundwater. This work has recently been intensified, and significant investments are being made in areas such as chemical "fingerprinting" and groundwater monitoring. Processing bitumen might result in the production of unique chemical compounds that are not naturally found in aquatic systems. If such a compound is found, it could be used as a unique "fingerprint" of industrial activity enabling the tracking and potential quantification of the fate of mining residues in the river basin. For example, a new science program that includes state-of-the-art analysis of chemical "fingerprinting" will allow us to identify if chemicals produced in the oil sands operations are seeping into the surrounding environment. This equipment and research support will allow scientists to identify unique	Comment acknowledged.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					chemical compounds produced during oil sands processing that can be used as “fingerprints” in the ecosystem. In addition, groundwater sampling is being expanded almost four-fold to 100 sites primarily along the Athabasca River in the vicinity of the oil sands tailings facilities. Samples will mainly be collected from groundwater beneath streams but will also include existing land-based monitoring wells. The Government of Canada will enforce the relevant legislation and regulations in the event leakage from tailings ponds is determined and violations are detected. Reference was also made to impacts on migratory birds. Environment Canada administers and enforces the Migratory Birds Convention Act and its associated Migratory Birds Regulations, which could impact on tailings ponds. The Department works to ensure that any existing, new or expanded facility does not have adverse impacts on populations of migratory birds. Where there are violations, we prosecute; for example, one company was recently found guilty of charges related to the deaths of migratory birds. Environment Canada shares the goal that oil sands are developed in a way that protects the environment. I trust you will find these clarifications useful.	
1019	1	beb521@windstream.net			I wish to express opposition to the route over the Nebraska Sandhills (Ogallala Aquifer). All the reasons should be obvious; even if the line were double lined within a concrete ditch, I would be opposed to such an easy target for terrorism or natural disaster. Please reconsider this unwise proposal.	Consolidated Response TER-1 addresses potential terrorism associated with the proposed Project. Consolidated Response ALT-1 addresses potential alternative routes, including routes that would avoid much of the Northern High Plains Aquifer system and the Sand Hills area. Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. Issues related to the Sand Hills area are addressed in Consolidated Response ERO-1.
1019	2	beb521@windstream.net			I would be opposed to such an easy target for terrorism or natural or natural disaster.	Consolidated Response GEO-3 addresses potential geologic hazards. Consolidated Response TER-1 addresses the potential for terrorism.
603	1	Becher	Candace		Keystone wants to run its pipeline over our fragile sand hills because it is “cheaper than going around” it. Isn't it glaringly obvious that desire for profit comes before concern for the environment? Keep this pipeline away from our Nebraska Sand Hills!	Consolidated Response ALT-1 addresses potential alternative routes, including routes that would avoid much of the Northern High Plains Aquifer system and the Sand Hills area. See Consolidated Response ERO-1.
603	2	Becher	Candace		No spill is “little”!! One day, water will be much more precious than oil.	Consolidated Response OIL-1 provides a summary of the range of spill frequency estimates addressed in the EIS. Consolidated Response SAF-1 describes the regulatory requirements and Project-specific Special Conditions that Keystone would comply with to construct, operate, maintain, inspect, and monitor the proposed Project. It also describes the monitoring, inspections, and reviews of the proposed Project that the Pipeline and Hazardous Materials Safety Administration would conduct to ensure compliance with those regulatory requirements.
605	1	Becher	Blake		As a young Nebraskan, I want to be assured that my lovely state and its’ biggest asset, the Ogallala Aquifer are undisturbed for many decades. The Keystone group cannot provide this assurance. Please tell them no!	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
1119	1	Behm	Marlene		Here in Nebraska and all of the states in the heartland of the	Issues related to the Northern High Plains Aquifer system are

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					USA we have some of the best, if not the best, water in the world in the Ogallala Aquifer under our land. In some places it's only a few feet underground. [To build a pipeline carrying oil across this area would be a disaster in the making.]	addressed in Consolidated Responses AQF-1 through AQF-4.
1119	2	Behm	Marlene		[PLEASE LISTEN!!! Here in Nebraska and all of the states in the heartland of the USA we have some of the best, if not the best, water in the world in the Ogallala Aquifer under our land. In some places it's only a few feet underground.] To build a pipeline carrying oil across this area would be a disaster in the making. I'm 78 years old, and won't live to see such a disaster happen, but my great-grandchildren will.	Issues related to the Northern High Plains Aquifer System are addressed in Consolidated Responses AQF-1 through AQF-4. Consolidated Response AQF-3 provides information on hypothetical spills from the Project over two areas of the Northern High Plains Aquifer System.
1119	3	Behm	Marlene		So as a voting citizen, I vote a resounding NO to the XL pipeline!	Comment acknowledged.
859	1	Behne	Tara	University of Nebraska Medical Center	We need to be investing in a positive future for Nebraska. This oil project is only a threat to the natural beauty that only our state can claim.	Consolidated Response P&N-1 addresses the need that the Project has been proposed to meet. Consolidated Response P&N-5 addresses issues related to investments in other technologies.
874	1	Behne	Joslyn		Do not pass the bill to approve the pipeline.	As noted in Section 1.0 of the EIS and Consolidated Response ENR-1, DOS is considering whether or not to issue a Presidential permit for the proposed Project and is assessing whether or not the proposed Project is in the national interest. There is no legislation involved in approving or denying the permit application.
1376	2	Beisner	Kent	The Kansas Chamber	The U.S. Department of State has the opportunity to approve an energy infrastructure project that ... will provide a powerful, private sector economic stimulus to the states and localities along the pipeline route during its construction at a time when the economy continues to struggle. We understand Keystone XL will create more than 13,000 high-wage construction and manufacturing jobs during the project's 2011-2012 construction schedule. We also understand the Canadian Energy Research Institute has found the economic impact of oil sands development is expected to lead to the creation of more than 342,000 new U.S. jobs between 2011 and 2015. CERI's research found as oil sands production rises, demand for U.S. goods and services increases significantly, adding an estimated \$34 billion to U.S. gross domestic product in 2015 and \$42.2 billion in 2025. Keystone XL will generate substantial economic benefits for the U.S. and in states and communities along the proposed route. These are areas where economic performance has stagnated or is shrinking. We recently reviewed a study TransCanada commissioned to measure the project's economic stimulus to the U.S. and the states along the route, which found that Keystone XL would generate \$20.9 billion in total expenditures, \$9.6 billion in output (gross product), personal income of \$6.5 billion and 118,935 person years of employment (jobs). In addition, the report concluded that during construction, Keystone XL would generate \$486.36 million tax revenue for state governments along the route and \$99.1 million for local taxing entities where the pipeline is located. The Kansas Chamber encourages the Department of State to confirm the findings of the Draft Environmental Impact Statement, which found that the proposed Keystone XL Pipeline would have "limited adverse	Consolidated Response ECO-1 addresses potential socioeconomic impacts, and Consolidated Response TAX-1 addresses concerns regarding taxes.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					environmental impact during construction and operation," and issue a Final Environmental Impact Statement that enables the communities and states along the pipeline route to collect the substantial economic benefits Keystone XL would create.	
1218	1	Bell	John		I am in total agreement that the oil pipeline should be routed in the safest route possible to ignore contamination to our Ogallala Aquifer. And if that means not running it through the Sandhills, that is what I want as a Nebraska citizen.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. Consolidated Response ALT-1 addresses potential alternative routes, including routes that would avoid much of the Northern High Plains Aquifer system.
478	1	Bellin	Ted		Allowing the Keystone XL pipeline to cross the Ogallala Aquifer is an extremely bad decision. The pipeline may deliver oil to the final destination without any problem for a period of time, and then a failure could take place resulting in oil leaking into the aquifer for some time before being discovered and possibly contaminating the water supply that thousands of people depend on for fresh water. Cities, towns, agriculture and wildlife will suffer all to enhance profit for a corporate entity only because it's cheaper to run a pipeline in a straight line. Have we not learned anything in the past 60+ days since the catastrophe in the Gulf?	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. Consolidated Response OIL-1 addresses the likelihood of spills from the Project.
1548	11	Bennett	Harry		I also request that some monitoring be done. In 1997 I had a Kansas biological survey did a survey of the fishery in my stream, and we found that we had 20 species of fish. I feel like it would be a good place right now to monitor these crossings, wherever this people is affecting a stream, that we find out what the fishery is like and then after and periodically thereafter that this be monitored, so we know that the species that we enjoy and need to have in our streams is maintained.	Environmental surveys were conducted where required by regulatory agencies; including surveys for protected species and delineations of waters of the United States. Keystone initiated agency consultation regarding sensitive environmental features and would obtain appropriate agency clearance and permitting prior to the commencement of construction. The perennial waterbodies that were identified as containing aquatic species of concern would be crossed using the horizontal directional drilling method and therefore may not require species-specific surveys. After agency consultation and a desktop review of aquatic species of concern, it was concluded that aquatic surveys would not be needed for those waterbodies that would be open-cut due to the lack of habitat support for these specific organisms.
1548	14	Bennett	Harry		Is this going to be done safely?...I don't want to be sitting downstream from a failure and have to leave my home of 30 years and have it degraded because I didn't ask the right questions and I didn't get the right answers.	As described in Consolidated Response SAF-1, the Pipeline and Hazardous Materials Safety Administration (PHMSA) has regulatory requirements that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project in a manner that protects the health and safety of the public and the environment. In addition, PHMSA developed 57 Project-specific Special Conditions that Keystone has agreed to implement. Incorporation of those conditions would result in a Project that would have a degree of safety over any other typically constructed domestic oil pipeline system under current code and a degree of safety along the entire length of the pipeline system similar to that which is required in HCAs as defined in 49 CFR 195.450.
1548	23	Bennett	Harry		How do you think the oil producer in this county feels, paying property taxes and they pay a barrel tax, a production tax; and now we've got a company coming in from Canada that's getting a skate on it for ten years. I mean, this is appalling to a local industry.	The applicant for the proposed Project is TransCanada-Keystone Pipeline LP (Keystone), a limited partnership organized under the laws of the state of Delaware. Consolidated Response TAX-1 addresses concerns regarding taxes associated with implementation of the proposed Project.
1548	13	Bennett	Harry		Frustrated because cannot get anyone to answer his	Section 3.3, 3.4 and Appendix B of the EIS address

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					questions about how construction will take place in the riparian zone on his property.	construction activities in riparian zones.
992	1	Benoit	Dutilleul		Tar sands are the dirtiest fuel we use, creating 3 times the greenhouse gases as conventional oil, contaminating entire rivers and watersheds from leaking toxic tailings lakes and devastating an area of Canada the size of Florida.	Consolidated Response GHG-1 addresses the greenhouse gas life-cycle analyses presented in the revised EIS. Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project.
992	2	Benoit	Dutilleul		Letting this project through would be criminal, not only for the people and ecosystems living close to extraction areas but also, in light of fossil fuels' relationship to climate change, to the whole of mankind and earthlings.	Consolidated Response GHG-1 addresses the greenhouse gas life-cycle analyses presented in the revised EIS. Consolidated Response GHG-2 addresses the potential causal connection of implementation of the proposed Project and expanded oil sands production in Canada and increases in refining. Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project. Climate change is addressed in Section 3.14.3.14. As noted in that Section, implementation of the proposed Project is unlikely to result in a measureable climate change.
709	1	Benson	Sandy		This pipeline is slated to cross some of the most fragile habitat in North America we should not so heavily tie our vision of energy "independence" to potential environmental disaster.	Identification of sensitive environments crossed by the proposed Project is discussed in Consolidated Response ENV-1 and ENV-3. Discussions of the purpose and need for the proposed Project are provided in Consolidated Response P&N-1.
1098	1	Beranek	Shirley		We citizens of Nebraska need to oppose this pipeline which will be through Nebraska and could very well threaten the Ogallala Aquifer. How can this even be considered when an accident of any kind could damage our precious water? I am urging this be defeated and that it be stopped.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
1544	88	Berlinghoff	John		There was a November 17th, 2006 permit issued by DOT to change the design percentage from 72 to 80 percent. This permit also had 51 other items that TransCanada had agreed to, including extra material testing, data testing, surveying testing, etc. I would like to know how we get assurances that these new standards will be met and what kind of progress reports are on it.	As described in Consolidated Response PVT-3, the commenter is referring to the existing Keystone Oil Pipeline System, not the proposed Keystone XL proposed Project. Consolidated Response SAF-1 addresses compliance issues for the proposed Project. The Pipeline and Hazardous Materials Administration is responsible for the monitoring of and reporting on compliance of oil pipeline projects with regulations.
1544	89	Berlinghoff	John		After the experience with the BP spill in the Gulf of Mexico, I feel hesitant about accepting the word of an energy company on what they're going to do in the future.	As described in Consolidated Response GLF-1, the risks associated with the proposed Project are substantially different from those associated with the BP Deepwater Horizon Project.
1544	90	Berlinghoff	John		I agree that we are heading down the wrong path in a very environmentally damaging way on this.	The commenter's opinion is noted.
237	1	Bernard	Michael	Mid-Continent Oil and Gas Association	The Mid-Continent Oil and Gas Association of Oklahoma wants to encourage the U.S. Department of State to approve an energy infrastructure project that not only will strengthen long-term energy security in the United States, but also will provide a powerful private sector economic stimulus to the mostly rural communities along the pipeline route during its construction. We have been told that Keystone XL will create more than 13,000 high-wage construction and manufacturing jobs during the project's 2011-2012 construction schedule. In	Consolidated Response ECO-1 and Section 3.10.2.2 of the EIS address the potential socioeconomic impacts of the proposed Project.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					addition to the jobs Keystone XL will create, the project will generate substantial economic benefits for the United States and in states and communities along the proposed route. [letter contains a detailed discussion of potential jobs and environmental benefits]	
448	1	Beyer	George		The Keystone pipeline can be safely constructed and operated. The safety record of crude oil and refined products pipelines in Nebraska, existing and those no longer active, should be made public and cited as evidence that such an operation can be safe and the environment properly protected. A pipeline laid in 1923 from Fort Laramie, Wyoming to Washington, Kansas conveyed crude oil until December of 1954, then was converted to natural gas. This crossed many miles of the Ogallala aquifer. It also skirted the north shore of Lake McGonaghy. Check the record for ANY environmental damage! NONE! Platte Pipeline, 1954 to the present. Crude oil from Wyoming to SE Nebraska, crossing into Kansas. Check the record! Look up Luddites on Google. Don't let that kind of attitude stifle all useful endeavor.	Comment acknowledged.
139	1	Bhat	Anand		I am strongly against such a dirty fuel being imported to the U.S. for refining. DO NOT BUILD THIS PROJECT	Consolidated Response OIL-4 addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils.
210	1	Bierle	James		Subject: Topographical and hydrological problems; moveable Pierra Shale is very close to surfaces. Surface water tables are 22'-26' deep (in bad river valley). Only a few plant species are present to help to retain topsoil. It is not unusual to wait 3-5 years for replanted grass to grow again (green needle and western wheat grass). It is absolutely imperative that no travel, construction, surveying, or any activity take place on our gumbo soil when it is wet or saturated with water.	Consolidated Response SOI-1 addresses issues related to construction during wet weather conditions.
210	2	Bierle	James		Another problem in our areas is that of "alkali seeps." These are surface veins of water saturated with salts from heavy soils. These veins "seep" over underlying layers of shale, surface as white areas, kills vegetation, and "eats" away man-made metals. I would suggest reclamation plans to be made very clear in any easement offered to landowners. Finally, that the reclamation plans be tailored to specific areas or individual landowners. This step of the project needs to be as long in time as nature needs to heal itself. Mud may have to be pumped into surface soil cracks to seal the ground; as was done when Oahe Dam was build.	Reclamation and restoration measures are summarized in Sections 2.3.2.8 and 2.3.2.9 of the EIS and are presented the Keystone Construction, Mitigation, and Reclamation Plan in Appendix B to the EIS. The plan states reclamation will be ". . . designed for current land uses on the property. Landowners can request modifications to these procedures if it does not result in increased environmental impact, is agreed upon with Keystone, and documented in the landowner agreement the change directed by the landowner". Consolidated Response EAS-2 addresses issues related to easement negotiations. As noted in that response, DOS has no legal authority in the easement negotiation process.
211	1	Bierle	James		This comment shall deal with county road maintenance and upkeep: Haakon Co, South Dakota. – the problem of very narrow roads (3 track), on coming local traffic, pilot vehicles for heavy equipment, road drainage problems, narrow approaches, abiding by S.D. load limits for highway use (and bridges). Along with the above; fences, and gates. Lastly, the matter of "quality material" rock, sand, gravel – for surface covering. This is already in short supply. I was told by an employee of Universal Field Services that "the counties are to have roads" upgraded for us before construction" – Do I as Haakon Co. taxpayer get the tax bill for this?	Consolidated Response RDS-1 addresses concerns about the condition of roadways and roadway structures associated with construction and operation of the proposed Project as well as traffic safety measures that would be incorporated into the Project. Keystone would be financially responsible for all road improvements associated with the proposed Project. Maintenance, repair, and replacement of fences and gates is addressed in Sections 2.3.2.1 and 2.3.2.8 of the EIS and in the Keystone Construction, Mitigation, and Reclamation Plan (presented in Appendix B of the EIS).

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
						The use of gravel for the proposed Project is addressed in Section 3.1.3.2 of the EIS. If roadways require upgrading, Keystone would be responsible for conducting the work at no cost to taxpayers.
1556	9	Bierle	Jim		there is a better place to put it and a better way to deliver the energy. There are wide open spaces out here, and in our country at Midland, and one of my neighbors is here, but within a period or a space of about 4 miles they severely disrupt five to seven families by going close to their headquarters building or close to their barns or things like that, and their existing water wells.	Section 4.0 of the EIS provides and assessment of alternatives to the proposed Project. As noted in Sections 3.1 through 3.12 of the EIS, implementation of the proposed Project would not result in any significant impacts.
245	2	Bingham	Brian	Senate OK District 12	As I understand it, Keystone XL will create more than 13,000 high-wage construction and manufacturing jobs during the project's 2011-2012 construction schedule. Many of those jobs will be created in rural and in our districts, where too many of our residents continue to find it difficult to find good jobs. With Keystone XL, they will have an opportunity to work on the project or for businesses that provide supplies, goods and services for its construction and operation.	Consolidated Response ECO-1 and Section 3.10.2.2 of the EIS address the potential socioeconomic impacts of the proposed Project.
245	3	Bingham	Brian	Senate OK District 12	In addition to the jobs Keystone XL will create, the project will generate substantial economic benefits for the United States and in states and communities along the proposed route. Like our counties, in many cases these are areas where economic performance has stagnated or is shrinking. It is our understanding that TransCanada commissioned a study to measure the project's economic stimulus to the U.S. and the states along the route. The study found that in the U.S., Keystone XL would generate \$20.9 billion in total expenditures, \$9.6 billion in output (gross product), personal income of \$6.5 billion and 118,935 person years of employment (jobs). In addition, the report concluded that during construction, Keystone XL would generate \$486.36 million in tax revenue for state governments along the route and \$99.1 million for local taxing entities where the pipeline is located. In Oklahoma, the study found Keystone XL expenditures during construction would total \$1.2 billion and generate an economic gross product of nearly \$1.1 billion. Keystone XL construction also would generate more than \$7.7 million in tax revenue for local government and \$31.4 million for state government.	Consolidated Response ECO-1 addresses potential socioeconomic impacts, and Consolidated Response TAX-1 addresses concerns regarding taxes.
245	4	Bingham	Brian	Senate OK District 12	The delivery of secure and affordable supplies of Canadian energy to American consumers would have minimal impacts on the environment.	Comment acknowledged.
245	7	Bingham	Brian	Senate OK District 12	Construction of additional pipeline facilities such as the Keystone XL Project, to transport oil sands production to the vitally important Gulf Coast area is critical. These refineries also have excess capacity as a result of reduced production from Mexico, where heavy oil production is in steep decline, and Venezuela, which is moving to other markets. Turning to Canada for a secure oil supply is a logical step.	Comment acknowledged.
245	8	Bingham	Brian	Senate OK District 12	I enthusiastically support the Keystone XL Pipeline Project and encourage the Department of State to confirm the findings	Comment acknowledged.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					of the Draft Environmental Impact Statement, which found that the proposed Keystone XL Pipeline would have limited adverse environmental impact during construction and operation.	
245	9	Bingham	Brian	Senate OK District 12	I look forward to the issuance of a Final Environmental Impact Statement followed by a Presidential Permit that allows the construction of Keystone XL and enables our districts, the State of Oklahoma, and the United States to collect the substantial economic benefits Keystone XL would create.	Comment acknowledged.
1401	4	Bingman	Brian	The Energy Council	Consequently, the Energy Council strongly supports North American energy infrastructure improvements.	Comment acknowledged.
1401	6	Bingman	Brian	The Energy Council	As Chairman of the Energy Council, I urge you to support, without delay, U.S. Canadian energy infrastructure projects, which offer beneficial energy supply security to U.S. citizens and our economy.	Comment acknowledged.
576	1	Binick	George		The Keystone XL Pipeline Project should be accepted. It is the best interest of the citizens of the United States that this pipeline be extended.	Comment acknowledged.
60	1	Bintliff	Hollis		It is utter stupidity to use tar sands oil in the first place since they produce three times more greenhouse gases during production than conventional gasoline. It requires clear cutting ancient forests and will also suck up water supplies and leave behind massive toxic lakes.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project. Consolidated Response GHG-1 addresses GHG life-cycle analyses.
1039	1	Birge	Bruce		As a retired petroleum geologist I do not see how the proposed pipeline would seriously impact the Ogalla Aquifer despite how scary the BP blowout is. Still, I think a thorough study should be done considering all conceivable scenarios such as long-term leakage versus a full scale rupture. A rupture would likely be well contained fairly quickly with limited product release, where a leak might continue for a long time and do much more damage in the long run. I'm a geologist, not an engineer, but I would think the pipeline design might include some type of trench liner or barrier to prevent any leakage from trickling down into the aquifer. Pipelines have (or should have) redundant safety systems including remote controlled shutoff valves, monitoring of pressure and flow characteristics, and frequent areal and surface reconnaissance.	Section 3.13 of the EIS addresses reliability and safety issues, including calculations of the probability of a spill from the Project and the potential environmental impacts associated with spills. Consolidated Response OIL-3 and sections 2.4.2.1 and 3.13.5 describe the systems that Keystone would have in place to detect leaks from the pipeline. Those systems and the design, construction, operation, inspection, and monitoring of the Project would be in compliance with the regulatory requirements of the Pipeline and Hazardous Materials Safety Administration and the 57 Project-specific Special Conditions (see Appendix U of the EIS) developed by the Pipeline and Hazardous Materials Safety Administration as described in Consolidated Response SAF-1. Neither the regulations nor the Special Conditions (see Appendix U of the EIS) require a trench liner or barrier in the trench. Consolidated Response OIL-2 addresses maximum-sized releases from the Project, and Consolidated Response OIL-3 addresses issues related to small leaks from the pipeline.
1039	2	Birge	Bruce		The main area of concern would be in taking special precautions where the pipeline crosses the Ogallala outcrop which covers the western two-thirds of our state. We may wish to add more stringent safety requirements in the design, construction, operation, and inspections of the pipeline in this area of the state. Since water is such a critical and widespread resource in Nebraska, we should not ignore the potential impact on other shallow aquifers and surface water resources on which we depend for domestic, agricultural, and industrial usage as well.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
1039	3	Birge	Bruce		I question the State Department's roll in the permitting of an	Consolidated Response REG-2 addresses issues related to

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					interstate pipeline. This highly puzzling to me, and I think it is none of their business.	concerns about the Department of State being the lead federal agency for the NEPA environmental review and the permits and regulatory approvals that Keystone would have to obtain to construct, operate, maintain, monitor, and inspect the Project.
1039	4	Birge	Bruce		I do advocate that the State of Nebraska take a closer look at this project as well as existing pipelines already operating in this state. A pipeline rupture may not adversely affect the aquifer greatly, but still damage the environment and pose a safety risk. Keep in mind that the Alaskan pipeline was controversial when it was first constructed, and that it has operated for several decades without any major environmental impact as have the numerous other pipelines crisscrossing the United States.	Consolidated Response SAF-1 describes the regulatory requirements and Project-specific Special Conditions that Keystone would comply with to construct, operate, maintain, inspect, and monitor the proposed Project. It also describes the monitoring, inspections, and reviews of the proposed Project that the Pipeline and Hazardous Materials Safety Administration would conduct to ensure compliance with those regulatory requirements. Consolidated Response OIL-1 provides a summary of the range of spill frequency estimates addressed in the EIS.
1039	6	Birge	Bruce		Never-the-less, we need to ensure stringent caution be taken to make sure the design, construction, operation, and inspections of this pipeline, along with all existing pipelines in the state, will not drastically effect the Ogalla or any of the other aquifers or surface waters in the state nor create a possibility of a large above-ground disaster	Consolidated Response SAF-1 describes the regulatory requirements of the Pipeline and Hazardous Materials Safety Administration (PHMSA) that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project. It also describes the inspections and reviews of the proposed Project that PHMSA would conduct to ensure compliance with those regulatory requirements. Issues related to the High Plains Aquifer System are addressed in Consolidated Responses AQF-1 through AQF-4.
1348	1	Birge	Raechel		I live in Utah currently, but if this pipeline is allowed to go through, it won't matter where you live, the outcome will affect us all. According to www.transcanada.com/keystone the Keystone Pipeline is: "an innovative and cost-competitive solution to a growing North American demand for energy, the Keystone Pipeline System will link a reliable and stable source of Canadian crude oil with U.S. demand." Very few people seem to know or care how this growing demand for oil gets fed and I highly suggest that they look at this before proceeding with commitment to the Keystone Pipeline project. The oil that Canada plans on assisting the U.S. in acquiring is from the depths of areas of demolished boreal forest that these energy companies (Syncrude, Petro Canada, Synenco and Suncor) have ripped out with a seemingly complete sense of disregard for the native environment and the peoples' lives (namely the members of the Native Canadian Chipewyan Tribe) that relied on those lands to survive. I have spoken with several residents of Alberta, and Canada in general, on the oil sands projects. 90% of them have stated that they are disappointed in the way that it has been handled and are ashamed to admit that they have allowed these companies to come and cause such large scale devastation to a previously untouched area of the country; they are also ashamed that their country continues to allow greed to overcome its sense of preservation, conservation and environmental conscience, and I, as a U.S. citizen, am ashamed that my country would assist them in perpetuating the destruction of not only valuable natural resources, such as fresh water and timber, but also of its willingness to turn a	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project. Consolidated Response GHG-4 addresses concerns regarding the loss of boreal forest and peat bogs. Consolidated Response GHG-2 addresses the potential causal connection of implementation of the proposed Project and expanded oil sands production in Alberta and increases in refining. Consolidated Response OIL-4 addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					blind eye to what I, and many others, consider to be the dirtiest, most environmentally destructive, man made project our planet has ever seen.	
1348	3	Birge	Raechel		I want you to think past our countries pocketbooks and look at the quality that is desperately lacking in the lives of the U.S. Forcing taxpayers to spend money that they no longer have on a dirty-oil pipeline is not morally or ethically right. We should be spending it on public transit systems and local developments.	Keystone, a private company, is proposing the Project, and neither federal nor state government agencies would pay for the proposed Project. As noted in Consolidated Response ECO-1 and in Section 3.10 of the EIS, implementation of the proposed Project would result in positive economic benefits. Consolidated Response OIL-4 addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils.
1348	6	Birge	Raechel		It's bad enough that our government has allowed and encouraged the development of oil sands and oilshale projects in the Uinta Basin and the "Tar Sands Triangle". With all of this talk about being more environmentally aware and going "green", the leaders of this country have a poor way of showing that they are on board with it, especially if/when they allow a new projects like this one to go through.	Consolidated Response ENR-1 provides information on the Department of State's environmental review process, the National Interest Determination process, and the need to complete those reviews before approving or denying the Presidential permit for the proposed Project.
1348	7	Birge	Raechel		President Obama and his predecessors talk on about needing to find alternatives for our energy sources, and I agree that this is a true need, but the moment an opportunity like obtaining cheap oil through the Keystone Pipeline project arises, those thoughts fly out the window and they start giving talk about having "security in our energy supplies and being less reliant on foreign fuels" to brainwash our citizens into thinking that their futures depend on this dirty-fuel, simply because the corporate tycoons want to continue to build their excessively large bank accounts and continue the rampant addiction to oil.	Consolidated Response P&N-1 addresses the need that the Project has been proposed to meet. As noted in that response, the Project has been proposed to meet the heavy crude oil needs of refineries in the Gulf Coast area. Consolidated Response ALT-2 addresses the use of alternative technologies and alternative energy sources. Consolidated Response Oil-4 addresses the composition of the Canadian crude oils that would be transported by the proposed Project. As noted in that response, the Canadian crude oil that would be transported is similar in composition to other heavy crude oils.
1348	8	Birge	Raechel		In order to get a better sense of the massiveness of a mistake this project would bring to the U.S., I suggest you look back at its source and follow it through, keeping in mind the recent oil spill crisis in the Gulf of Mexico to further color the absolutely real probability of having that same devastation caused on our land from an unattended leak (of which they have many at the source processing location in Canada) or disruptive action.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1. As described in Consolidated Response GLF-1, the risks associated with the proposed Project are substantially different from those associated with the BP Deepwater Horizon Project. Section 3.13 of the EIS addresses reliability and safety issues, including calculations of the probability of a spill from the Project and the potential environmental impacts associated with spills.
1348	9	Birge	Raechel		By allowing reliance on unconventional fuels via the Keystone, and other pipelines that are under plans to bring "cheap" Athabasca and other oil sands crude into the U.S., we are speeding up our fall into an unstoppable snowball of economic disaster.	The commenter's opinion is noted.
1348	11	Birge	Raechel		Just by starting our own oil sands projects in the U.S. we are guaranteeing that we will pull oil from our lands and not need to be reliant on other countries, but we are also guaranteeing that a large portion of our Midwest will no longer have life-sustaining abilities once we do so. Gallons upon gallons of water are used to extract and refine the tar-like crude that resides in these oil sands deposits and with the a consistent drought already abundant in our area (the Utah,	The commenter's opinion is noted.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					Nevada, Colorado, Arizona, New Mexico area), we certainly can't afford to waste it on energy production.	
1348	12	Birge	Raechel		The tailings ponds that would hold what would then become toxic water supplies would begin to leak into the surrounding environment and mutate/kill the wildlife just as it does in Alberta now, and this doesn't begin to comment on the cancers that the Albertans are unwilling to concede are caused from exposure to such an environment. We have only to look into the east coast coal mines to find a smaller scale of what the oil sands will do to our country. Where coal is the king of the energy, the cancers and toxins kill and the people are told that if they don't put themselves in this environment that they will be unable to provide for their families, making them slaves to their demand for energy and money, but the corporations there don't care, just as they don't up in Canada and the governments willingly looks the other way as long as they are paid enough of the profits.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information on current and future production. As noted in that Consolidated Response, without the proposed Project, oil sands development would continue at or above the current level until at least 2020, with or without the proposed Project.
1348	13	Birge	Raechel		Figure 1: Athabasca Oil Sands Project (picture taken via helicopter) The Alberta oil sands currently cover a ground area larger in size than that of the state of Florida [www.energyinsights.net]. This area was once a lush forest surrounding the Athabasca River system. Figure 2: Athabasca River without Oil Sands Project (picture taken via helicopter). Due to the devastation of the Alberta oil sands project, a large portion of this once thriving ecosystem is no longer and oil refiners in the U.S. are proposing to change their refineries to support this monstrosity in expanding the grip that it is beginning to hold upon the oil industry.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information on current and future production. As noted in that Consolidated Response, without the proposed Project, oil sands development would continue at or above the current level until at least 2020, with or without the proposed Project.
1348	14	Birge	Raechel		Yes, that is Alberta and the U.S. is just arrogant enough to think that they will do a better job than what the Canadians have, but they can't promise their people that. The Midwest corridor plays host to hundreds of farming communities as well as national parks and fresh water tributaries, and it doesn't take very much of a leak from one of these pipelines to decimate a large portion of that environment. Once it gets in our river systems, just as it has in Alberta, we will sign a death warrant to the plants and animal life that need them to survive. The scientists don't want to say for certain that most all of the mutations, the wildlife with tumors and extra appendages or other deformities are connected to this crude that the Keystone Pipeline would bring into our country, but I know for certain that they are and it's about time that the government give this recognition, in both countries, and do the right thing by not allowing it to go further.	Consolidated Response OIL-4 addresses the composition of the Canadian crude oils that would be transported by the proposed Project. As noted in those responses, the Canadian crude oil that would be transported is similar in composition to other heavy crude oils. Sections 3.13.5.6 and 3.13.6 of the EIS address the potential impacts of spills from the proposed Project. As noted in those sections, although pipeline spills would have an adverse effect on the environment, the resources affected would be expected to recover over time.
1348	15	Birge	Raechel		Figure 3: Athabasca Oil Sands Project (picture taken via helicopter). Would you want this in your backyard? Each of the tailing ponds (as shown in Figure 3) are full of toxic waste that, once let into the environment, will destroy any hope of forestry rehabilitation, clean water supplies and healthy animal life. If it is not stopped, the U.S. will be assisting in destroying our planet even more, because about \$53-billion+ (USD) is being spent to expand refineries to handle Alberta bitumen. [The Globe and Mail]	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information on current and future production. As noted in that Consolidated Response, without the proposed Project, oil sands development would continue at or above the current level until at least 2020, with or without the proposed Project.
1348	16	Birge	Raechel		Yes, the oil that they are producing can be used as a	Consolidated Response P&N-1 addresses the need that the

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					supplement to the growing oil demand, however, we need to ask ourselves, "What cost are we willing to pay to continue satiating our ever-growing need for oil?" Once you ask this question, then you need to ask, what type of government would allow its people to come into contact with this type of "project"? I urge you not to allow this and to stop our country from continuing with any other pipeline projects that want to bring in crude from the Canadian oil sands. Yes, I know that it will create jobs, but so will laying the foundations for a sustainable transit system and making changes to how Americans are required to take responsibility for their gluttonous, oil-consuming nature. I love my country and the beauty that we have here, please don't mar it further by bringing in dirty fuels from other countries, the cost is not one that the people of the U.S. can afford.	Project has been proposed to meet. As noted in that response, the Project has been proposed to meet the heavy crude oil needs of refineries in the Gulf Coast area. This need is due to the declining supplies of heavy crude oil from Mexico and Venezuela. Consolidated Responses Oil-4 and P&N-3 address the composition of the Canadian crude oils that would be transported by the proposed Project. As noted in those responses, the Canadian crude oil that would be transported is similar in composition to other heavy crude oils.
554	1	Black	Shelly		Keep this pipeline away from the Nebraska Sandhills. We do not need another oil leak/spill ruining our environment!	Consolidated Response ALT-1 addresses potential alternative routes, including routes that would avoid much of the Northern High Plains Aquifer System and the Sand Hills area. Issues related to the Northern High Plains Aquifer System are addressed in Consolidated Responses AQF-1 through AQF-4. Consolidated Response AQF-3 provides information on hypothetical spills from the Project over two areas of the Northern High Plains Aquifer System. Issues related to the Sand Hills area are addressed in Consolidated Response ERO-1.
841	1	Black	William		This project is fraught with many environmental risks, not the least of which is potential contamination of the Ogallala Aquifer.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
963	1	Black	Lyndee		I strongly oppose the construction of the TransCanada Keystone XL pipeline. I believe the construction of this pipeline presents a significant risk to our natural resources of land and water.	The commenter's opinion is noted.
1470	1	Black	Guy	Bryan Cave LLP	I write in support of TransCanada's Keystone XL crude oil pipeline project and urge the department to grant a permit for the pipeline.	Comment acknowledged.
1470	2	Black	Guy	Bryan Cave LLP	This project is a vital link to secure energy supplies for the United States. According to the U.S. Energy Information Administration, oil and natural gas will continue to supply over 50 percent of US energy needs in 2030; Canada is a valued trading partner and our most reliable supplier of foreign-based crude oil. The Keystone project will have the added benefit of potential links to growing domestic supplies of crude oil in Montana and North and South Dakota.	Comment acknowledged.
1470	3	Black	Guy	Bryan Cave LLP	The environmental benefits of Keystone XL should not be overlooked. The current tragedy in the Gulf underscores the importance of a diverse portfolio of energy supplies. Within the spectrum of viable options, it is appropriate to seek a growing role for oil resources that are: • Land-based; • North American; and, • Transported by pipeline. This project meets each of these criteria.	Comment acknowledged.
1470	4	Black	Guy	Bryan Cave LLP	Securing stable and affordable energy from our North American allies through projects such as the Keystone pipeline is in the national interest. Considering the economic	Comment acknowledged.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					and energy security benefits of these vital resources, we should continue to expand America's access to safe, affordable energy to help ensure improved domesticated global energy security and stable prices for consumers.	
1470	5	Black	Guy	Bryan Cave LLP	Pipelines are the safest, most reliable, economical and environmentally favorable way to transport oil and petroleum products, as well as other energy liquids, throughout the U.S: America depends on the more than 168,000 miles of liquid pipelines to move energy and raw materials our country relies on. Additional pipeline capacity will help consumers and businesses throughout the United States.	Comment acknowledged.
1470	6	Black	Guy	Bryan Cave LLP	This project also stands to provide a powerful private sector economic stimulus. During construction, Keystone XL will create more than 13,000 jobs funded with private investment. In addition, local governments will have a steady source of income from economic activity associated with construction and from property taxes the pipeline company will pay.	Consolidated Response ECO-1 addresses potential socioeconomic impacts, and Consolidated Response TAX-1 addresses concerns regarding taxes.
1470	7	Black	Guy	Bryan Cave LLP	Rejection of the permit or suspension of the review would sacrifice the significant economic benefits this project stands to deliver and force U.S. consumers to rely on other sources of crude oil not economically and politically allied with U.S. interests. This would be a mistake. I urge the granting of the permit. Thank you for the opportunity to comment.	Comment acknowledged.
1127	2	Blackburn	Sharon		This Keystone pipeline should never be built in proximity to the Ogallala Aquifer. We have to say "no" when our precious resources are threatened.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
1127	3	Blackburn	Sharon		We are doing our best already to deplete it [the aquifer] by the overuse of irrigation and it does not need to face another danger. Water is now and will soon become more of a valuable resource as we continue our wasteful water policies. We need to begin protecting our natural resources.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
909	1	Blesi	Raphael		Please, stop the insanity; global warming, air pollution, oil leaks, obesity, etc. etc is all REAL. So, please support a green and renewable energy policy rather than dirty sand tar.	Consolidated Response ENR-1 provides information on the Department of State's environmental review process, the National Interest Determination process, and the need to complete those reviews before approving or denying the Presidential permit for the proposed Project. Consolidated Response ALT-2 addresses the use of alternative technologies, alternative energy sources, and conservation of energy.
705	1	Bless	Candy		Please do not let another pipeline cross Nebraska! We already have one and that is enough!	Consolidated Response ALT-1 addresses potential alternative routes and system alternatives, including rail and barge networks.
705	2	Bless	Candy		The XL extension is slated to cross the fragile sand hills and the Ogallala aquifer, which supplies water to most of the Midwest. [Contaminating this water supply when it leaks would be devastating to the area.]	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
705	3	Bless	Candy		...the Ogallala aquifer, which supplies water to most of the midwest. Contaminating this water supply when it leaks would be devastating to the area.	Issues related to the Northern High Plains Aquifer System are addressed in Consolidated Responses AQF-1 through AQF-4. Consolidated Response AQF-3 provides information on hypothetical spills from the Project over two areas of the Northern High Plains Aquifer System.
1038	1	Block	Bruce		The Ogallala Aquifer is the primary source of fresh water in	Issues related to the Northern High Plains Aquifer system are

					the Great Plains states for drinking water and crop irrigation. So far proponents of the pipeline have not addressed how they will protect this national resource and prevent a disaster such as the BP spill. We do not need an environmental disaster in Nebraska or any other Plains state.	addressed in Consolidated Responses AQF-1 through AQF-4. As described in Consolidated Response GLF-1, the risks associated with the proposed Project are substantially different from those associated with the BP Deepwater Horizon Project.
1038	3	Block	Bruce		Stop this insanity.	Consolidated Response ENR-1 provides information on the Department of State's environmental review process, the National Interest Determination process, and the need to complete those reviews before approving or denying the Presidential permit for the proposed Project.
292	1	Bloom	Erica		I strongly oppose the construction of the Keystone XL Pipeline Project and urge the Department of State to halt all development of this pipeline. I strongly oppose the Keystone XL Pipeline and further development that will enable the Alberta Tar Sands to operate. .	Consolidated Response ENR-1 provides information on the Department of State's environmental review process, the National Interest Determination process, and the need to complete those reviews before approving or denying the Presidential permit for the proposed Project.
292	3	Bloom	Erica		In Montana we have the opportunity to close the Tar Sands by prohibiting the trucks from coming from Missoula and building pipelines.	Comment acknowledged.
1328	1	Bloom	Bill		I am writing about Trans-Canada officials, land agents, contacting me as to the pipeline and surveying, etc, they wanted to do on my land. I was first contacted by a Jerry Mitchell, he came to my ranch, ask to cross my land, told me I would get paid when the pipeline went through, he said they would build me a big reservoir and do other dirt work for me for letting the pipeline through my land. I told them I don't know if you will ever be back. I took the time to show them to the river and across my land. Then he called again, was to meet at my home at 2:30 pm, with just two pickups and a few people. I got home at 2:00 pm, there were six pickups, full of people in my yard. I was upset, when I asked the agent if he had answers to my previous questions, he did not. Next, an agent whom said he was his boss is calling. I spend more time letting them in here, it was hunting season and they run everything out of here. I was made promises and allowed them access again, they were going to drill a hole but did not, and I never heard from them until the next year. This agent told me the first had been fired, he also told me he had been a lawyer, then when he was here again I asked him about having been a lawyer, he then told me he had never been a lawyer. The next summer, another agent calls, says they want to treat me right this time. Ends up offering me \$50,000 if I will let them through my land to drill a hole near the river. He came to my house, told me he had two checks for \$25,000 each in his pocket and would give them to me if I signed their contract for the pipeline to cross my land. I repeated, what I had told him over the phone, that I had not had time to study all the liability and other issues that would need to be in the contract. They also offered me more for crossing my land. For the 50,000 to drill the hole, I told them I wanted it in writing, I said they could access the site through my land or the railroad right of way. But I told them I thought it was illegal for them to access my property through the railroad right of way. He told me they would put it in writing, and for a week or so he would call and say they were working on it. Then one evening, when	<p>State or local trespass and access laws are applicable along the entire route and therefore along each landowner's property. Keystone seeks permission to use. DOS has no legal authority over negotiating temporary use agreements or easement agreements, no legal status to enforce the conditions of an easement agreement, and no legal authority over Keystone representatives who gain access to private property. The commentor has the option to take up the matter with Keystone or local law enforcement officials, or initiate legal consultation.</p> <p>Consolidated Response EAS-2 addresses issues related to easement negotiations. As noted in that response, DOS has no legal authority in the easement negotiation process.</p>

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					I come home, I saw a drilling rig set up next to my property line. So I called the agent if they were still going to come drill the hole. He told me they were still working on the paperwork, and assured me they still going to pay me, then after some conversation he realized I had seen the rig, and then lied some more changing what he had just said. I did not hear from the pipeline for some time again, then another agent calls, says the previous agent was fired, they want to go through here again and survey. I said I want to know why, after so many times, and I wanted everything in writing. He says ok, we are working on it. Next after a meeting in Terry, this agent introduces himself, tells me they have all the paperwork and will be calling soon. I haven't heard from them since that. Everytime except once, when I asked that they put it in writing, they promised they would, but never produced anything in writing and I would not hear from them for a long time. I have helped them out, let them cross my land, just to be lied to and manipulated.	
1111	2	Blosser	D'Arcy		It is unconscionable that the aquifer that covers a good part of the Great Plains and provides not only drinking water, but also a resource for irrigation of crops that feed our citizens and people all over the world, would be placed at such a high risk that this pipeline would present.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
1111	3	Blosser	D'Arcy		It is unconscionable that the aquifer ... a resource for irrigation of crops that feed our citizens and people all over the world, would be placed at such a high risk ...	Issues related to the High Plains Aquifer System are addressed in Consolidated Response AQF-1 through AQF-4. Consolidated Response AQF-3 provides information on hypothetical spills from the Project over two areas of the Northern High Plains Aquifer System.
107	1	Blue	Jesse	Grey Duck Hunting Club	Grey Duck Hunting Club owns approx. 1400 acres in Liberty County, TX a part of which the proposed pipeline will cross. We hereby request the following items be considered: 1. As proposed the pipeline route is very close to our house. we request the pipeline be moved eastward away from the house. 2. The pipeline will cross a road (our main road) which on occasion has very heavy equipment use on it. We request the pipeline be buried deeper at this road crossing. 3. We have a shooting/target range which we would prefer not be crossed. We have discussed these items with Mr. Jay McCulloch, a right of way agent for TransCanada and he is aware of the location of our property.	<p>Consolidated Response SAF-1 describes the regulatory requirements that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project. It also describes the inspections and reviews of the proposed Project that the Pipeline and Hazardous Materials Safety Administration would conduct to ensure compliance with those regulatory requirements. Those regulations and Special Conditions do not specify a minimum distance between a pipeline and a residence. For residences within 25 feet of a residence, Keystone would follow the special construction procedures presented in Section 4.14 of its Construction, Mitigation, and Reclamation Plan in Appendix I.</p> <p>If the route crosses the shooting/target range, after completion of construction, restoration, and reclamation, the current use could be continued; however, buildings could not be constructed in the permanent right-of-way.</p> <p>The commenter can work with Keystone to address potential minor realignments and other design measures, such as burying the pipe deeper than required by regulations, that can be made during final design, assuming the realignment and design changes are consistent with the requirements of environmental permits.</p>
1311	1	Blunt	Troy	Phillips County Commissioners	On behalf of Phillips County Montana we write in support of TransCanada's Keystone XL crude oil pipeline project and urge	Comment acknowledged.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					the department to grant a permit for the pipeline...Phillips County borders Canada and will be the first County the Pipeline will cross in the lower 48 States. Phillips County is no stranger to pipelines; we have the Northern Border Gas Pipeline that comes from Canada to the US. This is a 48 Inch gas pipeline with 1400 psi that was built in 1978. We have not had any major problems with this fine in the 32 years.	
1311	2	Blunt	Troy	Phillips County Commissioners	If a person didn't know where this line was you couldn't find it. The reclamation that was done has actually improved many areas along the right of way.	Comment acknowledged
1311	3	Blunt	Troy	Phillips County Commissioners	Along with Northern Border we have hundreds of miles of gathering and flow lines across the county and we truly believe this is the safest and best way to transport oil and gas from the well to market.	Comment acknowledged.
1311	5	Blunt	Troy	Phillips County Commissioners	Besides this project being a vital link to secure energy supplies for the United States, it will be a substantial benefit to the many electric Co-ops across the route of the pipeline. These benefits will ultimately translate into direct benefits for the rate payers. We believe the Montana DEQ and the EPA has done a very good job in ensuring that every precaution has been taken and that this project will not only benefit Phillips County but the entire Country as well. We urge you to grant the permit for the Keystone Project without further delay. We thank you for the opportunity to comment.	Comment acknowledged.
178	2	Bly	Kristy	World Wildlife Fund-U.S.	Two studies, one involving WWF, BLM, University of Calgary, and MT FWP on pronghorn (<i>Antilocarpa Americana</i>), and a second WWF-supported University of Montana study of greater sage-grouse (<i>Centrocercus urophasianus</i>), have recently identified important migration corridors and habitat for pronghorn and sage grouse that will be bisected by the pipeline corridor. While our data are preliminary, we would request that to the extent possible the proponents consult with the relevant biologists on these projects and describe in their analysis how construction and operation of the pipeline will not interfere with these critical wildlife corridors. WWF will be happy to facilitate contacts with the appropriate agencies and experts.	The proposed Project would not cross the Grasslands National park/Bitter Creek area with winter range for pronghorns. Construction may temporarily delay movements of pronghorns, but after construction the pipeline corridor would not alter pronghorn movements or migrations. Movement corridors for pronghorns were not identified during discussions with agency biologists. Section 3.8.1.2 addresses potential impacts to sage-grouse and their habitats. Keystone has had extensive consultations with state and federal agency biologists concerning potential Project-related impacts to the greater sage-grouse including potential impacts to the sage brush habitats upon which they rely and disturbance to occupied lek habitats.
178	3	Bly	Kristy	World Wildlife Fund-U.S.	Pronghorn migrate long distances (up to 500 miles or greater) between winter and fawning/summer range. Long-distance migration is an essential ecological process in the life cycle of a pronghorn and they require unobstructed movement corridors to make these critical migrations. Truncation of migration by anthropogenic features and landscape change are two leading threats to migratory populations. Long-distance migration is sensitive to human infrastructure and activities in crucial habitats, including natural gas development and associated fragmentation from infrastructure (Berger et al. 2007). Because the Grasslands National Park/Bitter Creek area provides winter range and critical corridors for thousands of pronghorn, development of this area may have adverse impacts on these populations.	The proposed Project would not cross the Grasslands National park/Bitter Creek area with winter range for pronghorns. Construction may temporarily delay movements of pronghorns, but after construction the pipeline corridor would not alter pronghorn movements or migrations. Pronghorn movement corridors potentially crossed by the Project were not identified during discussions with agency biologists.
178	4	Bly	Kristy	World Wildlife Fund-U.S.	Greater sage-grouse populations have been declining for many decades (Hornaday 1916, Patterson 1952, Autenreith	Section 3.8.1.2 of the EIS addresses potential impacts to sage-grouse and their habitats. Keystone has had extensive

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					1981, Connelly and Braun 1997). A candidate species under the Endangered Species Act (ESA), the USFWS recently determined the species warranted for listing as threatened or endangered under the ESA, but precluded by higher priority actions (USFWS 2010). Sage-grouse populations are negatively affected by energy development (i.e., oil, gas, and coal-bed methane) and associated activities, especially those that degrade important sagebrush habitat, even when mitigative measures are implemented (Naugle et al. 2006, Naugle et al. In Press). Impacts can result from direct habitat loss, fragmentation of important habitats by roads, pipelines and power lines, and direct human disturbance (Kaiser 2006). The negative effects of energy development are cumulative with other human development impacts resulting in declines in greater sage-grouse populations (Naugle et al. In Press).	consultations with state and federal agency biologists concerning potential Project-related impacts to the greater sage-grouse, including potential impacts to the sage brush habitats upon which they rely and disturbance to occupied lek habitats.
178	5	Bly	Kristy	World Wildlife Fund-U.S.	The pipeline route passes directly through a federally designated sage grouse core area in Montana (core area 1; NRCS 2009). Given the sensitive status of greater sage-grouse, we recommend that siting of pipeline is re-routed away from core sage grouse habitats. For information on the location of the core areas, please go to: http://www.mt.nrcs.usda.gov/technical/ecs/biology/sagegrouse/sagegrouse_strategy.html . It is imperative that protective measures are in place to protect this imperiled species and the sagebrush habitat that it, and many other grassland species, depends on for survival.	Section 3.8.1.2 addresses potential impacts to sage-grouse and their habitats. Keystone has had extensive consultations with state and federal agency biologists concerning proposed Project-related impacts to the greater sage-grouse, including potential impacts to the sage brush habitats upon which they rely and disturbance to occupied lek habitats.
178	6	Bly	Kristy	World Wildlife Fund-U.S.	Finally, it is important to know whether the proposal involves only belowground pipe, or whether XL anticipates aboveground electric transmission to support its operation. Aboveground transmission may pose unique impacts to ground-nesting birds due to the use of power transmission poles as raptor perches. Also, the amount and kind of activity needed to maintain and support the pipeline should be discussed in specificity with regard to the impacts to swift fox, sage grouse, and other activity-sensitive species.	As described in Section 2.0 of the EIS, the proposed pipeline would be buried. Section 2.5 provides information on the electrical distribution lines and the Big Ben to Witten 230 kilovolt electrical transmission line, all of which would be above ground. Potential impacts of those facilities are described in Section 3.7, 3.8 and the Biological Assessment (see Appendix T) based on information available at the time the final EIS was prepared. There would be no vegetation maintenance of the pipeline in Montana: sage brush habitats would be allowed to re-establish. Routine surveillance monitoring during pipeline operations is described in Sections 3.6 and 3.8.
379	1	Blythe	John	Jones-Blythe Construction Co.	Recently a number of advocacy groups sent a letter seeking suspension of the permitting of the Keystone XL pipeline. I encourage you to reject the request and to continue to review the proposed project.	Comment acknowledged.
379	3	Blythe	John	Jones-Blythe Construction Co.	At the same time, construction of this project stands to bring significant economic benefits to the areas where it will be built.	Comment acknowledged.
379	5	Blythe	John	Jones-Blythe Construction Co.	I write in support of TransCanada's Keystone XL crude oil pipeline project and urge the department to grant a permit for the pipeline.	Comment acknowledged.
379	9	Blythe	John	Jones-Blythe Construction Co.	Pipelines are the safest, most reliable, economical and environmentally favorable way to transport oil and petroleum products, as well as other energy liquids, throughout the U.S. America depends on the more than 168,000 miles of liquid pipelines to move energy and raw materials our country relies	Comment acknowledged.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					on. Additional pipeline capacity will help consumers and businesses throughout the United States.	
379	10	Blythe	John	Jones-Blythe Construction Co.	This project also stands to provide a powerful private sector economic stimulus. During construction, Keystone XL will create more than 13,000 jobs funded with private investment. Jones-Blythe Construction Co. is an 80 year old union construction company. We helped construct the Phase 1 Keystone Pipeline. The economic impact during this recessionary time has been of great benefit to thousands of working men and women and their families. In addition, local governments will have a steady source of income from economic activity associated with construction and from property taxes the pipeline company will pay.	Consolidated Response ECO-1 addresses potential socioeconomic impacts, and Consolidated Response TAX-1 addresses concerns regarding taxes.
379	11	Blythe	John	Jones-Blythe Construction Co.	Rejection of the permit or suspension of the review would sacrifice the significant economic benefits this project stands to deliver and force U.S. consumers to rely on other sources of crude oil not economically and politically allied with U.S. interests. This would be a mistake. I strongly urge the granting of the permit. Thank you for the opportunity to comment.	Comment acknowledged.
1166	1	bobilu2@aol.com			The Sunday edition of the Journal Star had an article about the history of pipelines near/over the Ogallala Aquifer which is interesting.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
1166	3	bobilu2@aol.com			Where are the environmental folks on this one? They were all over ANWR where there is far less risk to resources.	The commenter's opinion is noted.
294	1	Boddicker	Ron		This may or may not have been your intent, but holding the public meetings in relatively small towns (instead of Houston which will be most directly impacted via increased air pollution) and with only limited publicity gives the impression the decision is already made (due to political pressure) or you really do not want to hear about the strong and widespread opposition to the project. This is very disappointing and does not give the impression of objectivity.	Consolidated Response CMT-2 addresses issues related to comment meetings on the draft EIS and requests for additional public involvement.
1554	1	Boddicker	Ron		I guess this is the kind of project that at least from my perspective, I don't want in my backyard and I wouldn't think many folks would want it in their backyard	The commenter's opinion is noted.
1554	2	Boddicker	Ron		[recreation - hunting and fishing - concerns] I understand that this crosses 91 streams, 32 in Texas, and it can't be of benefit to a stream to have a pipeline that's going over it. 22,400 acres I understand of wildlife habitat is going to be negatively impacted, and with those kinds of numbers it is pretty inevitable that hunting and fishing would be impacted in a negative fashion.	Section 3 of the EIS addresses the impacts of construction and operation of the proposed Project. Section 3.13 of the EIS addresses the risk and environmental impacts of a crude oil spill from the proposed Project.
1554	4	Boddicker	Ron		A lot of our drinking water comes from surface waters, and so anytime you spill in a stream or river or whatever, it has the potential, very potential negative effects on our drinking water, off from those sources, and then there are other issues.	Section 3.13 of the EIS addresses reliability and safety issues, including calculations of the probability of a spill from the proposed Project and the potential environmental impacts associated with spills.
1554	5	Boddicker	Ron		Air Pollution. My understanding is the tar sand oil is a very heavy crude, and a very dirty crude, so it requires more refining of course in order to become gasoline grade, and therefore there is going to be more air pollution, acid rain, that sort of thing, which will also affect our backyard.	As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries. Consolidated Response OIL-4 also addresses the composition

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
						of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils.
1554	6	Boddicker	Ron		My understanding is at this point the Alberta tar sands have impacted approximately 200 square miles. And the impact on those 200 square miles, at least from the aerial photographs I've seen, is devastation....if this pipeline is approved, the conjecture is that they will go from destruction of 200 square miles to a vastly larger area, that if the tar sand approximately covers the area equivalent to the state of Wisconsin or Florida, and that is dramatic.Now unfortunately this area is where there are I believe a convergence of 3 different primary, North American flyways for birds. And basically this area represents sort of a birdlike deathtrap. Just fairly recently there was 1 tailings pond where they counted 1600 dead ducks.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information on current and future production. As noted in that Consolidated Response, without the proposed Project, oil sands development would continue at or above the current level until at least 2020, with or without the proposed Project. Consolidated Response ENV-4 addresses issues related to oil sands production and migratory birds.
1554	7	Boddicker	Ron		The estimates I've read is that literally millions of birds are going to be impacted, and down here actually the birds and the migrants are quite an economic benefit. High Island, along the Gulf Coast, upwards, there's a lot of folks who come to see the migrants, and of course that's to say nothing of their benefit for insect control and all that sort of thing.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project. Consolidated Response ENV-4 addresses issues related to oil sands production and migratory birds.
1554	8	Boddicker	Ron		why build this long pipeline, when there is such a short distance from the section in Manitoba to Lake Superior, ...I'm just 1 of those Americans who would much prefer if they did not use and abuse my backyard.	Keystone has proposed the Project to meet a need for heavy crude oil in the Gulf Coast of the U.S. as described in Consolidated Response P&N-1 and in Section 1.4.2 of the EIS. Consolidated Response P&N-8 addresses issues related to shipping Canadian crude oil to delivery points closer to the source of oil.
883	1	Bodnard	Stephen	Bodnar, Consultant	Strongly favor this & all USA-Canada land based oil exploration & production projects.	Comment acknowledged.
1047	2	Bolte	Pat		We are nature lovers, and we also like to drink water. We do not want to run even a minute chance that the Ogallala Aquifer could be damaged by this pipeline. Please leave this area of Nebraska as untouched by civilization as it is today, June 2010.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
678	3	Bomberg	Anne		The [Ogallala is the] Midwest's most important aquifer. Does the EIS include appropriate and realistic provisions and plans to address these inevitable occurrences? We expect the federal government, who has been given extraordinary powers on our behalf, to protect our natural resources, not exploit them to their own advantage.	Consolidated Response AQF-3 provides information on hypothetical spills from the Project over two areas of the Northern High Plains Aquifer System and also addresses response actions.
381	1	Bones	Amy		Please do not grant a permit to TransCanada. Nebraskans cannot risk an oil leak in our water or huge damage to the environment of the Sandhills.	Issues related to the Sand Hills area are addressed in Consolidated Response ERO-1. Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. Section 3.13 of the EIS addresses reliability and safety issues, including calculations of the probability of a spill from the proposed Project and the potential environmental impacts associated with spills.
381	3	Bones	Amy		Please tell TransCanada "no" on their permit request.	Consolidated Response ENR-1 provides information on the Department of State's environmental review process, the National Interest Determination process, and the need to complete those reviews before approving or denying the

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
						Presidential permit for the proposed Project.
47	1	Bonnheim	Joanna		There are so many reasons why this is a terrible plan: 1)Extracting oil from tar sands is an extremely polluting process, and clearly an unwise choice when we should be focusing attention on developing clean energy...	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project.
47	2	Bonnheim	Joanna		There are so many reasons why this is a terrible plan:... 2)There are risks of pipeline breakages destroying property in the US. At a time when our country is currently battling an oil spill, it should be evident that we need to be eliminating this risk, not opening up new ones...	Consolidated Response SAF-1 describes the regulatory requirements and Project-specific Special Conditions that Keystone would comply with to construct, operate, maintain, inspect, and monitor the proposed Project. It also describes the monitoring, inspections, and reviews of the proposed Project that the Pipeline and Hazardous Materials Safety Administration would conduct to ensure compliance with those regulatory requirements.
47	3	Bonnheim	Joanna		There are so many reasons why this is a terrible plan: ...3)The creation of this oil uses 3 barrels of water for every barrel of oil. Water is an increasingly diminishing and precious resource which we should be protecting, not wasting on energy production. Humans may want energy, but they require clean water. These are only a few key reasons why this pipeline should not be permitted. Oil is a finite resource, but the land where we live will be with us forever if we take care of it. Please consider the destruction that will inevitably take place if this project is allowed to go forward and make your decision accordingly. The American people of generations to come will thank you.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project.
1553	1	Booth	Don	Pipefitters Local 211	I would like to urge this project to go union, so it would be safer traveling through your neighborhoods.	Comment acknowledged.
1553	3	Booth	Don	Pipefitters Local 211	we need to position the U.S. for a secure future that includes a strong middle-class, and that depends on jobs and production. Most of the problems raised that I heard last night have or can be solved, so no is not the answer.	Comment acknowledged.
1554	28	Booth	Don	Pipefitters Local 211	oil is oil. It is black crude, this is oil no different than any other oil. It will pass through your neighborhoods, it will be buried about 4 foot deep, but as far as I can tell by reading through the impact statement, it's going to be a very negligible, if any, impact. Pipelines are inherently safe, safer than shipping by freighter, or shipping by trucks, or barges.	Consolidated Response OIL-4 addresses the composition of the Canadian crude oil that would be transported by the proposed Project, including concerns relative to the corrosivity and erosivity of the crude oil. As noted in that Consolidated Response, that crude oil is similar in composition and properties to other heavy crude oils that are currently transported within the U.S. pipeline system and similar in composition and properties to other heavy crude oils that are currently refined in PADD III.
1554	29	Booth	Don	Pipefitters Local 212	The refineries that are going to refine this oil already have to meet the federal air and water standards, and as far as I can tell from the information that I've gone over, that's not going to change. So there won't be any other impact to the air and water.	As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries.
1554	30	Booth	Don	Pipefitters Local 213	Now the water tailings in Canada, water can be purified, land can be remediated. What Canada does up there with their tailing ponds is a process of production. I'm not here to speak on that, other than to say, that is not an issue that is going to affect this pipeline.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information on current and future production. As noted in that Consolidated Response, without the proposed Project, oil sands development would continue at or above the current level until at least 2020, with or without the proposed Project.
1554	31	Booth	Don	Pipefitters Local	This pipeline is going to be safe going through your	Consolidated Response SAF-1 describes the regulatory

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
				214	neighborhoods, so long as it is installed right, coated properly and I believe the company has got plans in there for the remediation of contours and all of the land back the way it was once the grass grows back.	requirements that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project in a manner that protects the health and safety of the public and the environment.
1554	32	Booth	Don	Pipefitters Local 215	I would urge for the sake of safety, that I'd like to see this pipeline built with trained union craftsman. As I understand it, there is a project labor agreement all the way from the border of Canada to the state border of Texas. I would like to see here in Texas that you have that same quality of pipeline through your neighborhoods.	Consolidated Response SAF-1 describes the regulatory requirements that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project in a manner that protects the health and safety of the public and the environment. It also describes the inspections and reviews of the proposed Project that the Pipeline and Hazardous Materials Safety Administration would conduct to ensure compliance with those regulatory requirements.
1518	1	Borg	Rick	Great Plains Laborer's Dist Council Local 430	The South Dakota Building Trades Council respectfully requests the State Department to proceed give all final and necessary approvals for the Keystone XL pipeline project. This project will create up to 13,000 construction jobs. In addition, this project is critical to delivering North American crude from Alberta's Oil Sands. The hard-working people of South Dakota believe that project .like Keystone XL will stimulate further energy development projects and job growth. Please help South Dakota's workers by approving this project.	Comment acknowledged.
475	1	Borgjalli	Carol		Oppose. There is sure to be a leak or break in the pipeline which will spill into the aquifer and contaminate the whole area's water supply. Protect the Aquifer!	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
477	1	Borgjalli	Mike		I do not want them running a pipeline through the Ogallala Aquifer. This affects a huge drinking water supply in the Midwest. We've already seen how well the oil companies have taken care of problems in the gulf--poorly. What a disastrous mess! 2 of the Gulf oil company's contingency plans in the Gulf were based on a guy's plans that had been dead for 5 years. We don't need any more incompetent bureaucratic oil spills in the gulf, the seas, the shores, or Nebraska. It would be especially stupid to run this pipeline across the water aquifer of Nebraska. Move the pipeline up or down a state.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. Consolidated Response ALT-1 addresses potential alternative routes, including routes that would avoid much of the Northern High Plains Aquifer system. As described in Consolidated Response GLF-1, the risks associated with the proposed Project are substantially different from those associated with the BP Deepwater Horizon Project.
1521	2	Borgstrom	Carol	DOE	<p>1.2.2.1. Overview of the Crude Oil Market The Draft EIS cites two Energy Information Administration (EIA) outlook reports (2009 Annual Energy Outlook and 2009 International Energy Outlook) as points of reference to support the conclusion that "there is general consensus that the volume of crude oil consumed worldwide, as well as the volume consumed domestically, is unlikely to decrease substantially over the next 30 years."</p> <p>The Draft EIS refers to the EIA Annual Energy Outlook as a forecast, which would indicate that the underlying analysis assesses likely futures. Outlooks produced by EIA are not forecasts and do not imply a probabilistic assessment of the future. Instead, the Reference case cited in the Draft EIS reflects a projection of what might happen given known technology and technological and demographic trends persisting over a longterm time horizon under current laws and regulations. Uncertainties regarding policy changes may be less important for the future of oil use and oil</p>	Section 1.0 of the EIS was reorganized, and information on market demand referred to by the commenter is presented in Section 1.4 of the EIS. That section has been revised in response to this comment.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					prices than uncertainties related to economic growth rates and access to petroleum resources. The Draft EIS statement above suggests that the EIA reports extend to 2040. However, both the Annual Energy Outlook cited and the International Energy Outlook cited extend to 2030. Please change the EIS accordingly.	
1521	3	Borgstrom	Carol	DOE	1.2.2.2 Supply of Heavy Crude Oil from the WCSBA. Please see comments above for 1.2.2.1B. Sections 1.2.2.1 cites the 2009 Annual Energy Outlook. The 2010 Annual Energy Outlook is now available as an updated data source and point of reference for the Final EIS.	Section 1.0 of the EIS was reorganized, and information on market demand referred to by the commenter is presented in Section 1.4 of the EIS. References in that section have been updated to provide the most recent data available at the time that the final EIS was prepared.
1521	4	Borgstrom	Carol	DOE	B. The Draft EIS cites a Council on Foreign Relations (CFR) article (page 1-6) as the source of a statement that exports of crude oil from Venezuela to the U.S. as a portion of Venezuela's total output have decreased. Venezuelan total oil production and total US oil imports from Venezuela are shown in the table below, provided by EIA. US imports from Venezuela, which were over 50 percent of Venezuela's production in 2004 and 2005, fell to about 40 percent of that country's production in 2008 and 2009. Consider whether you want to add this information to the EIS.	The EIS was revised in response to this comment.
1521	5	Borgstrom	Carol	DOE	C. The CFR article referenced also cites a U.S. Government Accountability Office report that says Venezuela's exports of crude oil to the US have been relatively stable with the exception of the strike period. Please take into account the data provided in the above comment when considering the analysis in the GAO report. The GAO report says the sudden loss of Venezuelan oil in the world market would raise world oil prices. If this impact would occur whether or not the US took physical delivery of crude oil from Venezuela, please so state in the EIS.	The analysis of need in the EIS is based on supply and demand and does not address the price of crude oil.
1521	6	Borgstrom	Carol	DOE	1.2.2.4 Transport of Crude Oil from the WCSB to PADD IIIA. The Draft EIS states that (a) the Enbridge Pipeline System and the Kinder Morgan Express Project have a combined capacity of approximately 2.1 million bpd to deliver crude oil from Canada to the U.S." Please clarify.	Section 1.0 of the EIS was reorganized, and information on market demand referred to by the commenter is presented in Section 1.4 of the EIS. Section 1.4.3 of the EIS includes updated information on pipelines transporting WCSB crude oil into the U.S. and provides the clarification requested.
1521	7	Borgstrom	Carol	DOE	B. The Enbridge Pipeline and the Kinder Morgan Express pipelines address delivery of 1.323 millionbpd of heavy crude to the U.S. (63% of 2.1 million bpd) (page 1-7). However, in section 1.2.2.2 on the supply of heavy crude, the same source is credited with with a statistic that indicates total projected heavy crude production in the WCSB was less than 0.9 million bpd in 2008. Please clarify.	The EIS was revised in response to this comment.
1521	8	Borgstrom	Carol	DOE	1.2.2.5 Future Scenarios Outlook without the Proposed Project A. For your use in EIS revision, EIA publishes high and low oil price cases in addition to the Reference case. However, the Reference case prices from EIS, as well as the quite similar reference case prices from the International Energy Agency, are often used as the starting point for policy analyses.	Comment acknowledged.
1521	11	Borgstrom	Carol	DOE	PADD III Crude Oil Supplies Under the No Action Alternative When the world experienced an oil price shock in 2008, Canada sold crude oil to the US at a price linked to the global	The commenter is correct in noting that Canadian producers (and nearly all other foreign and domestic producers) supply their particular crude oil at the maximum price that the market

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					market price, not at below market rates. The Draft EIS includes a statement (page 4-3) that would lead to a different expectation: "Oil shocks arise through unstable crude oil supplies and would be more likely to occur under the No Action Alternative, as compared to the proposed Project, since crude oil supplies would continue to be sought from unstable foreign sources in the near term." Oil price shocks can arise when the margins between supply and demand are tight, even if supply is stable. In the case of a manipulation of supply to create price shock conditions, the Keystone XL pipeline would not eliminate the instruments that market participants may use to exercise market power. The Keystone XL pipeline would also not eliminate US demand in the international market or its exposure to price shocks propagating through that market, which affect the prices charged for supply by producers in Alberta as well. Therefore, this statement needs further examination.	will bear. However, this does not alter the conclusion that increasing access to a major crude oil producer would mitigate the magnitude and duration of future price shocks.
1521	13	Borgstrom	Carol	DOE	B Some producers (or their investors) may seek access to Asian markets regardless of whether the US issues a Presidential Permit for the Keystone XL pipeline. With different investors and stakeholders supporting each project, it seems that issuance of a Presidential Permit for the Keystone XL pipeline will not foreclose an option others may be pursuing to establish a pipeline to the West Coast. That is, it appears that these two pipelines are not mutually exclusive. 1. It would be helpful to clarify the following statement (page 4-4) that suggests a direct trade-off between the pipelines: "Producers in Canada have indicated that if the US market is not available to them, much of the crude would be shipped outside of North America, particularly to Japan, China and India..." 1. What is the scale of the primary proposed pipeline to the West Coast compared to the Keystone XL pipeline?	Section 4.1 of the EIS describes the potential pipeline projects that could transport crude oil from the Canadian oil sands to the West Coast of Canada.
1521	14	Borgstrom	Carol	DOE	3.14.3.14 Air Quality, Greenhouse Gases, and Climate Change A. The draft EIS suggests (page 3.14-29) that "...deliveries of oil via the Project could theoretically either replace dwindling oil processed at these refineries, supplant existing supplies that are less stable or more costly, increase the total volume of oil processed, or result in a combination of these scenarios." It would be helpful to clarify this option set in a prominent part of the EIS. Pesnetly, the Draft EIS frames some informaiton in the context of one possible outcome and then another.	Language in the DEIS has been substantially revised in the FEIS.
1521	15	Borgstrom	Carol	DOE	B. The EIS states in separate parts of the EIS that TransCanada has reported a successful open season for securing binding commitments to ship oil and that no refinery has yet signed a commitment to take delivery. It would be informative to present these two points together in the EIS.	Comment acknowledged.
1521	17	Borgstrom	Carol	DOE	1. 70-mile or 80-mile line. The Draft EIS refers to the proposed 230-kV transmission line as 80 miles-long on page ES-3 and 70 miles-long on page 1-3. Please revise as appropriate to be consistent.	The EIS was revised in response to this comment.
1521	18	Borgstrom	Carol	DOE	2. Presentation of the connected actions. Page ES-3, ES.2.2, Connected Actions. Change the sentence that says: "Additionally, Western has determined that due to load	The Executive Summary has been revised substantially.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					forecasts associated with proposed pump stations in South Dakota, a new 230-kV transmission line would need to be added to the existing electrical grid system; as a result Western has proposed construction and operation of the 80-mile-long Lower Brule to Witten transmission line.” to “Additionally, Western has determined that due to load forecasts associated with proposed pump station in South Dakota, a new 230-kV transmission line would need to be added to the existing electrical grid system; as a result Western has identified the need for the new 230-kV Lower Brule to Witten transmission line and Basin Electric Power Cooperative has proposed construction and operation of that line. Also, Western has proposed construction and operation of a 2.1-mile double circuit 230-kv transmission line from Big Bend to Lower Brule and construction of the proposed Lower Brule substation.”	
1521	19	Borgstrom	Carol	DOE	3. Future NEPA. The EIS is inconsistent with regard to what additional NEPA will be required, as page ES-3 refers to “an additional and separate NEPA environmental assessment” and page 2-5 says “an additional and separate NEPA environmental review” (different than EA indicated on page ES-3). The EIS should be consistent with regard to future NEPA for the line, rather than suggesting an EA in one chapter and referring to environmental review more generally in another chapter.	The Executive Summary has been revised substantially and is consistent with Section 2.5.2 of the EIS.
1521	20	Borgstrom	Carol	DOE	4. Description of Western Area Power Administration. Section 1.3.2.9., page 1-12,second paragraph. Please change the sentence that says “Western is the networkbalancing authority” to “Western is the network balancing authority and as such is required to perform joint system engineering studies to determine the effects that additional facilities or services might have on system reliability and stability.”	The EIS was revised in response to this comment.
1521	21	Borgstrom	Carol	DOE	5. Western’s involvement with proposing alternative routes and corridors for the 230-kv transmission line. The EIS describes two proposed corridors and nine alternativerroute options for the 230-kV transmission line. In describing the corridors and alternative route options, the text implies that Western is directly involved. All of the EIS text and tables/figures explain that Western has proposed one of the particular alternative route options under Corridor A. One route is labeled Western in figures - see page 2-54; page 3.4-16 - Table 3.4.5-3; page 3.5-43; Figure 4.4-1; and page 4-22 and 4-23, etc.) (There is no indication that an agency other than Western is responsible for this line, e.g., no mention of RUS involvement.)	Section 2.5.2 of the EIS was revised in response to this comment and explains the involvement of RUS.
1521	22	Borgstrom	Carol	DOE	6. Unsubstantiated statements of negligible impacts for connected actions -- the 2.1-mile transmission line and the Lower Brule substation (Western’s actions) and the230-k V transmission line. In Section 3, for most of the resource areas the EIS says “Theconstruction and operation of electrical	The assessment of potential impacts due to construction and operation of the Big Bend to Witten (formerly the Lower Brule to Witten) 230-kV transmission in the EIS is based on the information for the proposed project that was available at the time the EIS was prepared. Additionally, as a result of a

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					distribution lines and substations associated with the proposed pump stations, and the Lower Brule to Witten 230-kV electrical transmission line would have negligible effects on [INSERT RESOURCE]" without any explanation or justification for the statement.	request for financing from Basin Electric Power Cooperative to the Rural Utilities Service (RUS) of the U.S. Department of Agriculture for the transmission line compliance with NEPA, Section 106 of the NHPA, and other environmental review requirements will be the responsibility of the RUS as the lead federal agency.
1521	23	Borgstrom	Carol	DOE	7. EIS does not indicate the presence or absence of floodplains or wetlands for the proposed 2.1-mile transmission line and Lower Brule substation (Western's actions)(consideration of 10 CFR 1022 isn't mentioned in the Draft EIS). See Section 3.3.1.3.	As stated in Section 2.5 of the EIS: "Although the permit applications for these projects would be reviewed and acted on by other agencies, the potential impacts of these projects have been analyzed based on currently available information and are addressed in Section 3.0. However, in some cases only limited information was available on the design, construction, and operation of the projects." As noted in Section 2.4.2.1 of the EIS, RUS would prepare an Environmental Assessment (EA) for the Big Bend to Witten 230-kV Transmission Line (formerly named the Lower Brule to Witten 230-kV Transmission Line) that would address the impacts associated with construction and operation of the transmission line. DOS anticipates that RUS would address relevant issues related to 10 CFR 1022 in the EA.
1521	24	Borgstrom	Carol	DOE	8. Editorial. Page 4-22 change Western Area Power Authority to Western Area Power Administration.	The EIS was revised in response to this comment. Note that the EIS has been revised to move alternative alignments for the Big Bend to Witten 230-kV Transmission Line from Section 4.0 of the EIS to Section 2.5.2.
922	1	Boschult	Mary		I am writing to oppose the proposed route of the Keystone XL Pipeline through the Nebraska Sandhills and the Ogallala Aquifer. Pumping tar sands oil through this pipeline route would be a significant and unnecessary risk to the Nebraska Sandhills, a one-of-a-kind natural ecosystem and would be contrary to the public interest in preserving and protecting clean drinking water.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
278	1	Bowdish	Kate		Please no pipeline through the Ogallala Aquifer. Nothing good can come from that!	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
620	1	Bower	Dean		There is much evidence that pipelines leak. Keystone cannot absolutely guarantee the XL pipeline will not leak. Therefore the Keystone XL pipeline should be routed far away from the Ogallala Aquifer.	Consolidated Response OIL-1 addresses the likelihood of spills from the Project.
1548	15	Bowker	Frank		I got to see how TransCanada works, I got to see all their safety procedures, their environmental procedures; every single detail on that job I got to see. And I have to tell you right now honestly, just as one person to another, that it was one of the best operations that I've ever taken part in.	Comment acknowledged.
1548	16	Bowker	Frank		As far as safety, they just absolutely overkill on safety. People are concerned about safety issues. And I have to tell you that they did some things that I thought was crazy, but it was their policy in safety. And the environmental program, the contractor has an environmental department and the pipeline company has an environmental department, and they both work together; and they take care of every single, smallest detail of wildlife issues, water issues, every single issue that can come up on that project. And when they leave, when they're finished building that pipeline, you go back there and look, and you cannot even tell that it's been there except for	Comment acknowledged.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					the width of the right-of-way.	
1548	17	Bowker	Frank		And really all I wanted to do was to say that this pipeline is using North American crude oil to pipe to North American refineries so we can use it; everyone came here in a car, I'm sure, everyone uses gas and oil, farmers use fertilizer, there will be fertilizer made from this, and I guess what my point is would we rather bring this down through this method of transportation to use North American crude oil, or would we rather give our money to the Middle East to import oil so we can support their terrorism and their drug dealings and all the evil things that go on there, or send our money down to Manuel Noriega with his communist regime, to get this crude oil from them? Or can we bring it down from Canada, build a safe pipeline, and use it here, and create jobs in America?	Comment acknowledged.
1134	1	Bowman	Chuck		I agree with Senator Johanns that we have to protect our States greatest resource. How can the guarantee that a leak or spill will not occur?	Section 3.13 of the EIS addresses reliability and safety issues, including calculations of the probability of a spill from the Project and the potential environmental impacts associated with spills, including discussions of surface water and groundwater. As noted in that section, the likelihood of a spill from the Project is low, but it is not zero.
1235	1	Boyce	Robert	Wachiska Audubon Society	Thank you for expressing concern about the Keystone XL Pipeline. Many Nebraskans share your concern, including the board of Wachiska Audubon Society, which has submitted a detailed comment on the dangers of adverse effects on Nebraska wildlife.	Section 3 of the EIS addresses the impacts of construction and operation of the proposed Project. Section 3.13 of the EIS addresses the risk and environmental impacts of a crude oil spill from the proposed Project.
1235	3	Boyce	Robert	Wachiska Audubon Society	I have read that with the two pipelines already approved, TransCanada has enough capacity to handle all the foreseeable shipments of dirty sands oil for the next twenty years, if not more. Why should we permit another pipeline?	Consolidated Response P&N-1 addresses the need that the Project has been proposed to meet. As noted in that response, the Project has been proposed to meet the heavy crude oil needs of refineries in the Gulf Coast area, not for the U.S. in general. In addition, the Alberta Clipper and existing Keystone pipeline projects serve other markets and do not meet the demands of the Gulf Coast refineries.
1332	1	Brandt	Diane	Glasgow Area Chamber of Commerce & Agriculture	The Glasgow Area Chamber of Commerce & Agriculture supports TransCanada's Keystone XL crude oil pipeline project and urges the department to grant a permit for the pipeline.	Comment acknowledged.
1332	2	Brandt	Diane	Glasgow Area Chamber of Commerce & Agriculture	Glasgow is a rural community in Northeastern MT, with a population of 3300 residents. The positive economic impacts of the TransCanada project construction, property taxes and jobs created will benefit our small businesses, tax base and outlying communities.	Comment acknowledged.
1332	3	Brandt	Diane	Glasgow Area Chamber of Commerce & Agriculture	We live in an area which is rich in Agriculture production, outdoor recreation, ranching and many small family owned businesses. We pride ourselves in our Quality of life and reasonable cost of living. Our small town provides quality education for our children and we have excellent medical and eldercare facilities. We know that the TransCanada project will not have a negative impact on the quality of life which we value so much.	Comment acknowledged.
1332	5	Brandt	Diane	Glasgow Area Chamber of Commerce &	The environmental benefits of Keystone XL should not be overlooked. Within the spectrum of viable options, it is appropriate to seek a growing role for oil resources that are	Comment acknowledged.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
				Agriculture	land based, North American; and, transported by pipeline. Tiils project meets each of these criteria.	
1332	6	Brandt	Diane	Glasgow Area Chamber of Commerce & Agriculture	This project also stands to provide a powerful private sector economic stimulus. During construction, Keystone XL will create more than 13,000 jobs funded with private investment. In addition, local governments will have a steady source of income from economic activity associated with construction	Consolidated Response ECO-1 and Section 3.10.2.2 of the EIS address the potential socioeconomic impacts of the proposed Project.
1332	7	Brandt	Diane	Glasgow Area Chamber of Commerce & Agriculture	and from property taxes the pipeline company will pay.	Comment acknowledged.
1332	8	Brandt	Diane	Glasgow Area Chamber of Commerce & Agriculture	Rejection of the permit or suspension of the review would sacrifice the significant economic benefits this project stands to deliver for Montana, the states where it is constructed, and U.S. consumers.	Comment acknowledged.
1332	9	Brandt	Diane	Glasgow Area Chamber of Commerce & Agriculture	I urge the granting of the permit; On behalf Of the 200 members of the Glasgow Area Chamber of Commerce ' & Agriculture I urge the granting of the TransCanada permit. Thank you for the opportunity to comment.	Comment acknowledged.
720	1	Brass	Judy		Keep this pipeline away from the Nebraska Sand Hills. They are too fragile to take this risk.	Identification of sensitive environments crossed by the proposed Project is discussed in Consolidated Response ENV-1 and ENV-3. Issues related to the Sand Hills area are addressed in Consolidated Response ERO-1. Consolidated Response ALT-1 addresses potential alternative routes, including routes that would avoid much of the Northern High Plains Aquifer system and the Sand Hills area.
720	2	Brass	Judy		...Oil companies promise that nothing will be damaged, but they do not deliver.	The commenter's opinion is noted.
178	1	Breckenridge	Russ	United Association of Plumbers, Pipefitters, Pipe Liners, Sprinkler Fitters, Welders, and Service Technicians	Keystone will generate \$486,000,000 in tax revenue for state governments and 99.1 million for local taxing entities.	Consolidated Response ECO-1 and Section 3.10.2.2 of the EIS address the potential socioeconomic impacts of the proposed Project.
1546	174	Breckenridge	Russ	United Association of Plumbers, Pipefitters, Pipe Liners, Sprinkler Fitters, Welders, and Service Technicians	Currently members are facing 20% unemployment, in some areas of the country, 40%. Keystone will create jobs with benefits and worker protections. It's anticipated 13,000 construction jobs will be associated with the project.	Consolidated Response ECO-1 and Section 3.10.2.2 of the EIS address the potential socioeconomic impacts of the proposed Project.
1546	177	Breckenridge	Russ	United Association of Plumbers, Pipefitters, Pipe Liners, Sprinkler Fitters, Welders, and Service Technicians	Project will help spur the economies of communities desperate for revenue.	Comment acknowledged.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
1417	1	Breigenzer	Karen		I encourage you to continue to review the proposed Keystone XL pipeline project and to grant a permit for the pipeline... I urge you reject the request of advocacy groups that seek suspension of the permitting of the Keystone XL pipeline. As the wife of a wheat farmer in northeast Montana, I am of the opinion that the pipeline is a smart, progressive step toward energy security for our country and economic recovery for this area. Thank you for the opportunity to submit comments on this project.	Comment acknowledged.
1417	2	Breigenzer	Karen		The project has significant potential for positive economic impacts in northeast Montana and the surrounding areas. The pipeline project would boost the sagging economy of the area with private investments. The construction of the pipeline and the associated power supply would create several well-paying jobs for the citizens of this area. Local governments and school districts would benefit from the property taxes that the pipeline company would pay... the pipeline is a smart, progressive step toward energy security for our country and economic recovery for this area	Comment acknowledged.
1417	3	Breigenzer	Karen		Pipelines are a safe, reliable, environmentally favorable way to transport oil and petroleum products.	Comment acknowledged.
543	1	Brennan	Marilyn		I do not want this pipeline going across Nebraska's greatest treasure, the Ogallala Aquifer.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
543	3	Brennan	Marilyn		They plan to go through natural prairies & a wetland on my own property near Central City, NE.	The impacts associated with implementation of the proposed Project are addressed in Section 3.0 of the EIS. As noted in that section, construction and normal operation the proposed Project would not result in significant environmental impacts. Section 3.5 addresses prairies and Section 3.4 addresses wetlands.
1560	10	Brennan	Marilyn		Concerned about the pipeline running through the Ogallala Aquifer. This is an aquifer that cannot be contaminated.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
1560	11	Brennan	Marilyn		Also concerned that pipeline will go through her property near where her cattle drink. She asked TransCanada to move it to her fenceline, but they refused.	Keystone would reclaim all lands affected by construction to pre-construction to the extent practicable and described in Sections 2.3.2.8 and 2.3.2.9 of the EIS and in the Keystone Construction, Mitigation, and Reclamation Plan (presented in Appendix B of the EIS) unless the landowner and Keystone agree to an alternate restoration. Consolidated Response FRM-1 addresses potential ranch of farmland impacts, including compensation for lost crops. As noted in the EIS, after construction is complete, farming can continue over the pipeline. If there is a spill from the proposed Project, Keystone or the incident response team would inform all landowners in the vicinity of the spill that the release had occurred and advise the landowners of the appropriate precautions. Keystone would be liable for all costs associated with cleanup and restoration as well as other compensations, as noted in Consolidated Response LIA-1. If a stockpond, well, or stream used as a source of water for cattle is affected, Keystone would provide water until the affected water is proven to be acceptable for use.
1560	12	Brennan	Marilyn		TransCanada hasn't said how they will clean up any leaks.	Consolidated Response RES-1 addresses issues related to preparation and review of emergency response plans for the proposed Project.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
835	1	Bridges	Sherry		This project proposes too big of a risk to the Ogallala Aquifer. Please don't route this pipeline over one of the biggest water sources for the central United States.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. and ALT-1.
835	2	Bridges	Sherry		Better yet, build a refinery in Canada.	Consolidated Response P&N-8 addresses issues related to shipping Canadian crude oil to refineries that are closer to the source of oil.
929	1	Bridges	Laurie	Oregon State University	Back in 1991-1996 I attended the University of Nebraska as an undergraduate and took a class, "Anthropology of the great plains." I remember learning about the Ogallala Aquifer and how important it is to our well-being. Do not build this pipeline! Future generations will thank you. If the aquifer is damaged we are all in big trouble!	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
1451	1	Brill	MaryElizabeth		I'm opposed to the Keystone XL pipeline extension for the following reasons: 1) the toxic tar sands extraction sludge in their water has caused increased cancer rates in the indigenous peoples in Canada.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information on current and future production. As noted in that Consolidated Response, without the proposed Project, oil sands development would continue at or above the current level until at least 2020, with or without the proposed Project.
1451	3	Brill	MaryElizabeth		3. Tar sands oil is expensive and trees are destroyed along pipeline routes.	The need for the proposed Project is discussed in Section 1.4 of the EIS and in Consolidated Response P&N-1. Forested habitat would require clearing for construction of the proposed Project. The area of forest that would be cleared is presented in Section 3.5.5 of the EIS. Previously forested habitats within the temporary construction right-of-way would be allowed to regenerate through succession as described in Section 3.5.5 of the EIS. Mitigation developed specifically for forested habitats are described in the Construction, Mitigation, and Restoration Plan, which is in Appendix B of the EIS, and Section 3.5.5 of the EIS.
1451	4	Brill	MaryElizabeth		4. Pumping tar sands uses an excess of electricity - probably supplied by coal	Consolidated Response ELE-1 addresses issues regarding the potential need for additional energy sources to provide electrical power for the pump stations and mainline valves.
1451	5	Brill	MaryElizabeth		Big oil companies expect to make millions from tar sands but haven't set up clean-up funds.	Consolidated Response LIA-1 addresses Keystone's liability if there is a spill of hazardous materials or fuel during construction and from a spill of crude oil from the Project. Consolidated Response LIA-2 addresses the issue of bonding or setting up a fund for damages associated with construction or operation of the proposed Project.
568	1	Briney	Beth		As a native Nebraskan, I am very concerned about the proposed route of the Keystone pipeline. While others may not know much about the Ogallala Aquifer, those of us who live above it or near it cherish this rich, fragile resource. This aquifer with its pure, easily accessed water has provided the water that enabled the native peoples of the Great Plains, the early European settlers, the farmers who feed the world, and those of us who are their descendants to live and prosper here in the plains states. The same characteristics that allowed this resource to be used are those that make it very vulnerable to destruction through pollution---it is close to the surface of the earth & is encased in very porous material. Please examine the extent of the aquifer, noting all of the states and citizens that are touched by the Ogallala aquifer. There is no fail-safe way to protect against a failure that would destroy the aquifer.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					Please do not allow this pipeline route to endanger this aquifer. We can live without oil. We cannot live without water. I implore you to deny permission for the Keystone pipeline's proposed route.	
568	2	Briney	Beth		A leak from an oil pipeline would damage this fantastic water resource forever. This isn't just about Nebraska. The risk of a leak, however small, is too great.	Consolidated Response ALT-1 addresses potential alternative routes, including routes that would avoid much of the Northern High Plains Aquifer System and the Sand Hills area. Issues related to the Northern High Plains Aquifer System are addressed in Consolidated Responses AQF-1 through AQF-4. Consolidated Response AQF-3 provides information on hypothetical spills from the Project over two areas of the Northern High Plains Aquifer System.
1427	2	Bringelson	Richard		The political and financial power behind this project will allow them to shape any decision they need for their best interests. It feels pretty overwhelming to us on main street and byways of the country. I have moderate concern for my personal safety because I have submitted these comments. Thank you for your process allowing public input	Consolidated Response ENR-1 provides information on the Department of State's environmental review process, the National Interest Determination process, and the need to complete those reviews before approving or denying the Presidential permit for the proposed Project.
850	1	Brink	Katrina		Please do not allow construction of the pipeline to carry oil from the tar sands from Alberta to Texas. The last thing we need to do as a country right now is invest in more dirty energy, as we have seen in the Gulf of Mexico. It is now time to seriously invest in clean energy sources.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information on current and future production. As noted in that Consolidated Response, without the proposed Project, oil sands development would continue at or above the current level until at least 2020, with or without the proposed Project. Consolidated Response P&N-5 addresses issues related to investments in other technologies. As described in Consolidated Response GLF-1, the risks associated with the proposed Project are substantially different from those associated with the BP Deepwater Horizon Project.
850	2	Brink	Katrina		This pipeline would have serious negative impacts if it ever contaminated water supplies for people in the Great Plains. Please consider the people who could be affected by this and let's put our country on a track for renewable energy that our children will inherit.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. Consolidated Response ALT-2 addresses the use of alternative technologies, alternative energy sources, and conservation of energy.
1419	1	Bristol	David&Charlene		We are very concerned about the environmental impact as the Keystone XL Pipeline passes through the Ogallala Aquifer ...	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
1419	2	Bristol	David&Charlene		We are very concerned about the environmental impact as the Keystone XL Pipeline passes through [the Ogallala Aquifer and] the Sandhills.[If anything should happen as it did in the gulf, it would contaminate our water supply. Nebraska has nothing to gain by this, but a lot to lose!]	Identification of sensitive environments crossed by the proposed Project is discussed in Consolidated Response ENV-1 and ENV-3. Issues related to the Sand Hills area are addressed in Consolidated Response ERO-1. Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. Consolidated Response AQF-3 provides information on hypothetical spills from the Project over two areas of the Northern High Plains Aquifer System and also addresses response actions. As described in Consolidated Response GLF-1, the risks associated with the proposed Project are substantially different from those associated with the BP Deepwater Horizon Project.
1419	3	Bristol	David&Charlene		[We are very concerned about the environmental impact as the Keystone XL Pipeline passes through the Ogallala Aquifer and the Sandhills.] If anything should happen as it did in the Gulf, it would contaminate our water supply. [Nebraska has	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. As described in Consolidated Response GLF-1, the risks associated with the proposed Project are substantially different

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					nothing to gain by this, but a lot to lose!]	from those associated with the BP Deepwater Horizon Project.
1419	4	Bristol	David&Charlene		[We are very concerned about the environmental impact as the Keystone XL Pipeline passes through the Ogallala Aquifer and the sandhills.] If anything should happen as it did in the gulf, it would contaminate our water supply.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. Issues related to the Sand Hills area are addressed in Consolidated Response ERO-1.
1419	5	Bristol	David&Charlene		Nebraska has nothing to gain by this, but a lot to lose!	Consolidated Response ECO-1 addresses potential socioeconomic impacts, and Consolidated Response TAX-1 addresses concerns regarding taxes.
1454	1	Bristol	David		Farmers who raise hogs and cattle have to go through several regulations to line their pits so they won't leak into the aquifer. It looks to me like if this project goes through the least we could expect is that they put a liner around this pipe!	Consolidated Response SAF-1 describes the regulatory requirements that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project in a manner that protects the health and safety of the public and the environment. Those requirements do not include installation of a line under or around the pipe. Such a liner would not prevent released crude oil from entering into the environment, and the liner would affect hydrological conditions along the proposed route.
172	1	Brodie	Jack		No to the oil pipeline crossing the Ogallala Aquifer, Nebraska's greatest natural attribute! Art Hovey: "they could have chosen a better route than through the Sandhills." The smallest leak could destroy the Aquifer, the smallest leak would be difficult to find in the Sandhills! The oilers are already, discussing making the pipeline walls thinner!	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. Consolidated Response ALT-1 addresses potential alternative routes, including routes that would avoid much of the Northern High Plains Aquifer system. Keystone has withdrawn its application for a Special Permit as described in Consolidated Response REG-1.
1322	1	Brooke	MaryKathryn		The Department of State should not give permits for pipelines importing the world's dirtiest fuel while the rest of the country fights to prevent catastrophic climate change.	Consolidated Response OIL-4 also addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils being processed in Gulf Coast refineries. As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries.
1322	2	Brooke	MaryKathryn		I urge you to fulfill your role as protector of our country and say no to tar sands. Tar sands will increase our transportation emissions, counteract existing efforts to fight global warming, and undermine U.S. energy independence by continuing our dependence on foreign oil. By expanding the U.S. market for tar sands oil, this pipeline will increase air pollution at American refineries and spur further expansion of the tar sands industry in Canada an industry that has caused severe water and air contamination and destroyed hundreds of square miles of wetlands and forest.	Consolidated Response P&N-1 addresses the need for the proposed Project. As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries. Consolidated Response GHG-2 addresses the potential causal connection of implementation of the proposed Project and expanded oil sands production in Alberta and increases in refining. Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project.
1322	3	Brooke	MaryKathryn		The Keystone XL pipelines cross the Ogallala Aquifer, which is one of the world's largest aquifers and is located here in the Great Plains of the United States of America. This water supply is vital to our country. In the event a tar sands pipeline leaks or breaks, the damage to our much needed water supply	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					will be devastating.	
1322	5	Brooke	MaryKathryn		I call upon you to protect the resources of our country by saying NO to tar sands. Tying our future to toxic tar sands will never be in our national interest. Please consider the true impact of this pipeline by including the devastating effects of mining, refining, and burning this fuel, and the potential for fouling the Ogallala aquifer when you make your decision. Again, I am asking you to fulfill your role as protector of our country and say no to tar sands.	Comment acknowledged.
894	2	Brooks	Terron		And also I'm just not so thrilled about a pipeline carrying the dirtiest form of oil our through our land and water.	Consolidated Response OIL-4 addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils.
1338	1	Brosi	Amy		I am a resident of Huntsville, Texas, which is located in Walker County. I submit the following statement regarding the XL Keystone Pipeline. There are several reasons for this project to not be approved. I will however, begin with the most obvious which is public health and safety. This pipeline undermines the people's right to live in an environment that is free from contamination and pollution.	The impacts associated with implementation of the proposed Project are addressed in Section 3.0 of the EIS. As noted in that section, the proposed Project would not result in significant environmental impacts and would have a negligible impact on public health and safety. Section 3.13 of the EIS addresses reliability and safety issues, including calculations of the probability of a spill from the proposed Project and the potential environmental impacts associated with spills.
1338	2	Brosi	Amy		At some point the pipeline will leak. It may be a large, obvious leak or it may be a small one that is difficult to locate or it may never even be noticed at the surface. Nonetheless it will pollute our environment. Our land here in Texas is more important to us and I will not let a private company justify polluting the land and water, especially with tar sand oil.	Section 3.13 of the EIS addresses reliability and safety issues, including calculations of the probability of a spill from the Project and the potential environmental impacts associated with spills. Consolidated Response OIL-3 and Section 3.13.5 of the EIS describe the leak detection system for the Project. Consolidated Response OIL-4 addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils.
1338	3	Brosi	Amy		TransCanada will also not pay for the health effects from air pollution from the burning of this type of fuel and undoubtedly there will be health problems at a later date from this expansion project.	As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries. Consolidated Response OIL-4 also addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils.
1338	4	Brosi	Amy		Our global environment is simply being exploited and abused for a profit. TransCanada not only justifies this action, but wants to spread the pollution from the horrible extraction site to get it to Houston. I believe we already pay a heavy price with our loss of natural habitats, global warming effects, chronic health problems, water and air pollution with our current oil hungry and capitalist society. I will not accept that his company can operate the pipeline without polluting and I believe it is not economically feasible due to the cost of extraction and continued cost of public health and safety.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information on current and future production. As noted in that Consolidated Response, without the proposed Project, oil sands development would continue at or above the current level until at least 2020, with or without the proposed Project. Consolidated Responses GHG-1 through GHG-5 address concerns related to greenhouse gas, climate change, alternative energy considerations, and approach to assessment of GHG emissions.
1338	5	Brosi	Amy		Secondly, TransCanada's stating that this expansion pipeline project will be an economic engine by creating lots of jobs. It	The commenter's opinion is noted.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					will also provide oil for North America which provides for better national security. These arguments might be true, however it lacks foresight, integrity, and accountability.	
1338	6	Brosi	Amy		Extracting tar sand oil is the most devastating I have ever seen. All of that destruction and environmental impact just so people can drive their vehicles, etc for just a little while longer. There will be a time soon that TransCanada will no longer be able to economically extract this oil and then the pipeline will not be needed. All of this destruction, dangerous and hard work, pollution will be for a quick profit. I believe that not only is the tar sand oil the dirtiest crude oil, but it really speaks to the desperation for oil and low morale of this country.	The proposed Project would transport crude oil. Neither Keystone nor its parent company, TransCanada, are involved in oil sands development projects. Consolidated Response OIL-4 addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils. Also see Consolidated Response CAN-1.
1338	8	Brosi	Amy		This is not the time for a pipeline to support the flow of the dirtiest oil on our planet. We already know the implications of global warming and Texas will be hard hit. We are already seeing these effects. TransCanada may try and make the environmental impact minimal, but the bottom line is that it's still polluting, shortsighted, and the major consequences far out way the benefits.	Consolidated Response GHG-1 addresses the greenhouse gas life-cycle analyses presented in the revised EIS. Consolidated Response OIL-4 also addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils being processed in Gulf Coast refineries.
1338	9	Brosi	Amy		There are other means for jobs and national security, such as cleaner energy and efficiency, mass transportation, and local agriculture. We do not need to settle for the same old justification from the oil companies. If you support this pipeline you will be supporting the most destructive and dirtiest form of energy. Please do not approve this permit. it's not in the interests of the people of Texas or of the global community. Thank you for this chance to comment on this project.	Consolidated Response ALT-2 addresses the use of alternative technologies, alternative energy sources, and conservation of energy. Consolidated Response ENR-1 provides information on the Department of State (DOS) environmental review process, the National Interest Determination process, and the need to complete those reviews before approving or denying the Presidential permit for the proposed Project. As noted in that response, DOS is neither a proponent nor an opponent of the proposed Project.
299	1	Broweleit	Bob		Why is this pipeline being allowed to cross the Ogallala Aquifer, a stabilizing resource in this region of the United States? The water is far more valuable to our economy and should be protected at all costs.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
299	2	Broweleit	Bob		If one overlays a map of the aquifer, we can see that the original pipeline avoided much more of the highly productive portions of the aquifer. One easily sees the reason TransCanada wants to use the proposed route. It will cut off hundreds of miles of pipeline, rather than putting it close to the original Keystone pipeline or avoiding the aquifer completely. If more pipeline capacity is needed, the pipeline should go around the aquifer.	Consolidated Response ALT-1 and Section 4.3 address potential alternative routes, including following the existing Keystone Oil Pipeline System route to minimize the distance the proposed Project would extend across the Northern High Plains Aquifer system.
153	1	Brown	Don		For one thing, the Emergency Response Plan is far from being completed. If something should go wrong with the pipeline, our local emergency personnel and landowners need to know what plan to execute, and our communities must be reassured that it will work. We are seeing right now in the Gulf, how a lack of emergency preparation can quickly become a disaster.	Consolidated Response RES-1 addresses issues related to preparation and review of the emergency response plan for the proposed Project.
331	1	Brown	Webb		This project makes sense to me. I believe TransCanada can do this project in a safe and efficient manner, bringing great economic benefits and energy security, while protecting the environment we cherish in Big Sky Country. Please help move this project forward.	Comment acknowledged.
683	1	Brown	Dave		Please take time to redirect the pipeline so that it doesn't go	Issues related to the Northern High Plains Aquifer system are

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					over the aquifer. Please consider the “what ifs” before they happen.	addressed in Consolidated Responses AQF-1 through AQF-4. Consolidated Response ALT-1 addresses potential alternative routes, including routes that would avoid much of the Northern High Plains Aquifer system.
984	1	Brown	Joann		I am opposed to the pipeline that will run through the precious Nebraska aquifer. Please do not allow this project to continue.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
1428	1	Brown	Webb	Montana Chamber of Commerce	The Montana Chamber of Commerce, representing a variety of businesses large and small across Montana, supports the increase in energy supply that the TransCanada Keystone XL (KXL) project provides. The elements of this project meet our principles from an economic and environmental standpoint. We urge you to move KXL forward in the process... At this point, we can see no justifiable reason for you to halt this process.	Comment acknowledged.
1428	3	Brown	Webb	Montana Chamber of Commerce	Passing through six northeast Montana counties, the project will bring significant and positive economic returns, such as \$1 billion in construction outlays, over 1,000 jobs, and huge Montana expenditures. Ongoing operation should provide further employment opportunities and revenue return. KXL also has the potential to boost Montana production, with reduced regional pipeline congestion and a possible “on-ramp” location in Montana. That could mean even more tax revenue for Montana, on top of the estimated \$2 billion over the life of the project.	Consolidated Response ECO-1 addresses potential socioeconomic impacts, and Consolidated Response TAX-1 addresses concerns regarding taxes. Consolidated Response ALT-3 addresses issues related to a potential pipeline connection to the proposed Project in Montana.
1428	4	Brown	Webb	Montana Chamber of Commerce	TransCanada has proven itself to be a good Montana corporate citizen, operating the Northern Border gas pipeline, with construction to begin soon on the Bison gas pipeline. They are members in good standing of our organization and have always been ready to help with speakers on this topic... Your Department has run a comprehensive permitting process in full compliance with NEPA... I would be happy to provide any further comment or any answer any questions. Please contact me if necessary.	Comment acknowledged.
1428	5	Brown	Webb	Montana Chamber of Commerce	Environmentally, pipelines are one of the most secure and safe methods of transporting oil.	Comment acknowledged.
1428	6	Brown	Webb	Montana Chamber of Commerce	There has been significant public participation during the DEIS process. We expect this will continue during the process to complete a final EIS.	Comment acknowledged.
1428	6	Brown	Webb	Montana Chamber of Commerce	There has been significant public participation during the DEIS process. We expect this will continue during the process to complete a final EIS.	Comment acknowledged.
104	2	Brown,Jr.	Augustus	Upper Big Blue Natural Resource District	I was surprised by the number of people that made comments about the pipeline running through the Ogallala Aquifer here at York. The aquifer here is in the Quaternary formation and not the Ogallala formation. The Ogallala formation ends about 50 miles to the West of York. The Quaternary formation is in the lower half of the pipeline path in Nebraska. The Quaternary formation runs to about 25 miles to the East of York. I also was surprised how misinformed some of the speakers were on what happens when the aquifer gets contaminated. We have experience of two such cases here at York that involved the	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. Required emergency response plans for the proposed Project are discussed in Consolidated Response RES-1. As discussed in Section 3.13 of the EIS, federal, state, and local agencies would participate in response activities and soil, surface water, and groundwater cleanup consistent with their authorities and duties under applicable regulations and consistent with the requirements of the Emergency Response Plan and the Pipeline Spill Response Plan. A list of applicable

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					Federal Government. The first involves a government grain bin site that in the 1950's was used to store grain and the grain was fumigated to prevent spoilage. The chemical used leached into the ground and has contaminated the ground water in that area. The discovery went undetected for several decades. The extent of the contamination extends about one mile to the South-east of the site. The finding is that the narrow plume moves at a very slow rate with the gradient on the aquifer measured in feet per year. The gradients of the aquifers in Nebraska are generally to the south-east. The government grain bin site at Utica Nebraska and I am sure other government bins sites are experiencing the same thing. The second is a military missile site to the North East of York that was constructed in the early 1960's and was in use for just a few years. At that site they used a solvent that leached into the aquifer. This is also a narrow plume that has traveled about two miles. Again, the movement is measured in feet per year. This was also undetected for several years. Currently the federal government is using a system of wells to decontaminate the aquifer. In the case of an oil spill the probably on contaminating the aquifer when detected early should be very low if at all.	regulations relative to remediation of crude oil spill contamination at the federal and state level is provided in Table 3.13.5-10. Required mitigation for crude oil or oil products spill impacts would be determined by these agencies. Consolidated Response OIL-4 addresses the composition of the Canadian crude oil that would be transported by the proposed Project, including concerns relative to the corrosivity and erosivity of the crude oil. As noted in that Consolidated Response, that crude oil is similar in composition and properties to other heavy crude oils that are currently transported within the U.S. pipeline system and similar in composition and properties to other heavy crude oils that are currently refined in PADD III.
104	3	Brown,Jr.	Augustus	Upper Big Blue Natural Resource District	I feel that this pipeline is very much needed to develop a reliable supply of crude oil for our county. I also feel that a pipeline is a very efficient and a low hazard method of transporting crude oil. In view of recent events in the Gulf of Mexico, that just could not happen with a pipeline. I believe that Trans Canada is following all the latest requirements of the Pipeline Hazardous Materials Administration and with the oversight of the Environmental Protection Agency the issues of pipeline safety will be met. I am acquainted with a number of the property owners in the York area and some in the Seward area where a pipeline was built last year. This acquaintance is from my days in the banking business and I can tell you most of the property owners I know are well satisfied with the easement settlements they have received and in the Seward area with the way the land was left after the pipeline was installed. I believe the Department of State should issue the required permits.	Consolidated Response SAF-1 describes the regulatory requirements and Project-specific Special Conditions that Keystone would comply with to construct, operate, maintain, inspect, and monitor the proposed Project. It also describes the monitoring, inspections, and reviews of the proposed Project that the Pipeline and Hazardous Materials Safety Administration would conduct to ensure compliance with those regulatory requirements.
104	1	Brown,Jr.	Augustus	Upper Big Blue Natural Resource District	I live in York Nebraska and retired from banking. Currently I am an elected director for the Upper Big Blue Natural Resource District for which I have served for almost Twelve years and I am also an elected County Commissioner for the last five years. I attended the hearing in York but was unable to stay long enough to comment.	Comment acknowledged.
1473	1	Brownback	Sam	US Senate	The U.S. Department of State has the opportunity to approve an energy infrastructure project that not only will strengthen long-term energy security, but also will provide a powerful, private sector economic stimulus to the states and localities along the pipeline route, including my home state of Kansas, during its construction at a time when the economy continues to struggle. As we understand it, Keystone XL will create more than 13,000 high-wage construction and manufacturing jobs during the project's 2011-2012 construction schedule. The	Consolidated Response ECO-1 addresses potential socioeconomic impacts, and Consolidated Response TAX-1 addresses concerns regarding taxes.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					direct investment in Kansas of about \$1 billion for the construction and development of the pipeline will lead to gains in business activity in the state of Kansas of an estimated \$683.2 million in total expenditures, \$486.5 million in gross output, and 6,721 person-years of employment. This increase in economic activity during construction will generate tax receipts of an estimated \$15 million to the State and \$2.9 million to local entities.	
1473	2	Brownback	Sam	US Senate	We encourage the Department of State to carefully consider the benefits found in the Draft Environmental Impact Statement, which states that the proposed Keystone XL Pipeline would have "limited adverse environmental impact during construction and operation," and issue a Final Environmental Impact Statement that will allow the project to move forward, creating jobs and stimulating the state and local economies along the pipeline route.	Comment acknowledged.
1323	1	Bruce	Larry		I write in support of TransCanada's Keystone XL crude oil pipeline project and urge the department to grant a permit for the pipeline.	Comment acknowledged.
1323	3	Bruce	Larry		The environmental benefits of Keystone XL should not be overlooked. The current tragedy in the Gulf underscores the importance of a diverse portfolio of energy supplies. Within the spectrum of viable options, it is appropriate to seek a growing role for oil resources that are: • Land-based; • North American; and, • Transported by pipeline. This project meets each of these criteria. Securing stable and affordable energy from our North American allies through projects such as the Keystone pipeline is in the national interest. Considering the economic and energy security benefits of these vital resources, we should continue to expand America's access to safe, affordable energy to help ensure improved domestic and global energy security and stable prices for consumers.	As described in Consolidated Response GLF-1, the risks associated with the proposed Project are substantially different from those associated with the BP Deepwater Horizon Project.
1323	4	Bruce	Larry		Pipelines are the safest, most reliable, economical and environmentally favorable way to transport oil and petroleum products, as well as other energy liquids, throughout the U.S. America depends on the more than 168,000 miles of liquid pipelines to move energy and raw materials our country relies on.	Comment acknowledged.
1323	5	Bruce	Larry		Additional pipeline capacity will help consumers and businesses throughout the United States. This project also stands to provide a powerful private sector economic stimulus. During construction, Keystone XL will create more than 13,000 jobs funded with private investment. In addition, local governments will have a steady source of income from economic activity associated with construction.	Consolidated Response ECO-1 and Section 3.10.2.2 of the EIS address the potential socioeconomic impacts of the proposed Project.
1323	6	Bruce	Larry		and from property taxes the pipeline company will pay.	Comment acknowledged.
1323	7	Bruce	Larry		Rejection of the permit or suspension of the review would sacrifice the significant economic benefits this project stands to deliver and force U.S. consumers to rely on other sources of crude oil not economically and politically allied with U.S. interests. This would be a mistake. I urge the granting of the permit. Thank you for the opportunity to comment.	Comment acknowledged.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
1546	13	Brune	Michael	Sierra Club	DEIS grossly underestimates the negative impact of KXL. Fails to adequately assess the air and health impacts of refining tar sands in the U.S.	As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries. Consolidated Response OIL-4 also addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils.
1546	14	Brune	Michael	Sierra Club	DEIS includes improper analysis of the global warming pollution of oil from tar sands.	Consolidated Response GHG-1 addresses the greenhouse gas life-cycle analyses presented in the revised EIS.
1546	15	Brune	Michael	Sierra Club	DEIS fails to assess this pipeline's ability to drive the expansion of the environmental Armageddon occurring in Canada.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project. Consolidated Response GHG-2 addresses the potential causal connection of implementation of the proposed Project and expanded oil sands production in Alberta and increases in refining.
1546	16	Brune	Michael	Sierra Club	Tar sands oil contains more sulfur, nitrogen, lead, nickel, and arsenic than conventional crude, which poses risks to communities surrounding refineries in the form of lung and respiratory problems such as bronchitis, asthma, respiratory infections, and decreased lung function.	As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries. Consolidated Response OIL-4 also addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils.
1546	17	Brune	Michael	Sierra Club	Metals such as mercury released from refineries are neurotoxins.	Section 3.12.1.2 includes a discussion of all regulations that the Project is required to comply with in order to minimize impacts to air quality, including health effects. Consolidated Response CAN-1 addresses development of Canadian oil sands.
1546	18	Brune	Michael	Sierra Club	Volatile organic compounds emitted by refineries can be carcinogenic.	Section 3.12.1.2 includes a discussion of all regulations that the Project is required to comply with in order to minimize impacts to air quality, including health effects. Consolidated Response CAN-1 addresses development of Canadian oil sands.
1546	22	Brune	Michael	Sierra Club	Executive Order 12898 directs every federal agency, "To the greatest extent practicable, and permitted by law, to make achieving environmental justice part of its mission, by identifying and addressing as appropriate, disproportionately high and adverse human health of environmental effects of its programs, policies, and activities on minority populations and low income populations in the United States and its territories and possessions." No federal programs, policies, or activities will have a higher or more adverse impact on human health and the environment in Port Arthur than the additional cumulative impacts of tar sands.	As discussed in the EnSys 2010 report, the quantity of crude oil refined in PADD III is driven by market conditions and is independent of the existence of the proposed Project. The proposed Project would provide access to WCSB crude oil in PADD III refineries that would supplant supplies from other sources, including Venezuela and Mexico. As discussed in Section 3.13.5.1 of the EIS and Consolidated Response OIL-4, the composition of WCSB crude oils that could be transported by the proposed Project is not dissimilar from other heavy crude oils currently refined in PADD III. There is therefore no credible evidence that implementation of the proposed Project would lead to disproportionate adverse impacts on minority and low income populations near PADD III refineries.
1546	23	Brune	Michael	Sierra Club	Both the tar sands industry and the scientific community agree that over its entire life cycle, tar sands oil emits 15 to 20%	Consolidated Response GHG-1 addresses the greenhouse gas life-cycle analyses presented in the revised EIS.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					more global warming pollution than the conventional oil that we already use.	
1546	24	Brune	Michael	Sierra Club	Building this one pipeline...would result in approximately 38 million metric tons of additional greenhouse gas emissions per year. The equivalent of adding 6,000,000 cars to the road.	Consolidated Response GHG-2 addresses the potential causal connection of implementation of the proposed Project and expanded oil sands production in Canada and increases in refining. Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project. Consolidated Response GHG-1 addresses the greenhouse gas life-cycle analyses presented in the revised EIS.
1546	25	Brune	Michael	Sierra Club	DEIS fails to recognize that pipeline will drive massive environmental degradation in Canada.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project. Consolidated Response GHG-2 addresses the potential causal connection of implementation of the proposed Project and expanded oil sands production in Alberta and increases in refining.
1546	26	Brune	Michael	Sierra Club	Already the United States has more tar sands pipeline capacity than existing Canadian tar sands production. Therefore, to drill the 900,000 million barrels per day of additional capacity, Keystone XL will require the expansion of tar sands oil production.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project. Consolidated Response GHG-2 addresses the potential causal connection of implementation of the proposed Project and expanded oil sands production in Alberta and increases in refining.
1546	27	Brune	Michael	Sierra Club	And by 19 opening up an international shipping port to tar sands oil, this pipeline will spur additional expansion of the tar sands industry, due to overseas demand.	The demand for crude oil and refined product in other parts of the world is not related to the number of available port facilities. Although there are likely pipeline connections from the delivery points in Texas to ports along the Gulf Coast, it is not likely that crude oil transported by the proposed Project would be exported using those pathways. Consolidated Response P&N-2 provides information on the export of refined product from Gulf Coast refineries as well as exporting WCSB crude oil from the Gulf Coast. As noted in Consolidated Response P&N-1 and in Section 1.4 of the EIS, the crude oil that would be shipped by the proposed Project would primarily replace existing sources of crude oil that are declining. Consolidated Response GHG-2 addresses the expansion of oil sands production activity in relation to the proposed Project.
1546	29	Brune	Michael	Sierra Club	Dept. of State should delay permitting until the White House Council for Environmental Quality releases new guidance on climate change and greenhouse gas emissions. Specific guidance is needed on projects such as KXL, which have large climate change implications.	Although no GHG thresholds currently exist relevant to the proposed Project, the DOS assessment of GHG emissions was conducted in accordance with CEQ guidance, including CEQ's draft guidance for GHG. The CEQ regulations for implementing NEPA do not require delaying NEPA environmental reviews for the completion of promulgation of regulations that are in draft form during the review period.
1546	30	Brune	Michael	Sierra Club	EIS should include full life cycle analysis of the GHG emissions associated with a barrel of tar sands oil, accounting for the energy required to extract tar sands from the ground and process it into synthetic crude and the destruction to the Boreal forests.	Consolidated Response GHG-1 addresses the greenhouse gas life-cycle analyses presented in the revised EIS. Consolidated Response GHG-4 addresses potential loss of boreal forests and peat bogs.
1546	31	Brune	Michael	Sierra Club	Urges the Department of State to immediately incorporate environmental justice considerations.	Consolidated Response JUS-1 and Section 3.10.1.2 of the EIS describe the counties in the project area with higher

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
						<p>populations of minority and low-income groups that may be impacted by the project. This analysis is in accordance with Council on Environmental Quality guidance for analysis of potential environmental justice effects. As noted in Section 3.10 of the EIS, implementation of the proposed Project is not expected to result in adverse impacts that would fall disproportionately on minority or low-income populations located along the pipeline route. Moreover, project-related spending and tax revenues would result in substantial socioeconomic benefits in the region of influence, which may positively affect low-income and minority populations and Native American tribes through increased employment opportunities, income benefits, and improved public service levels.</p> <p>As discussed in the EnSys 2010 report, the quantity of crude oil refined in PADD III is driven by market conditions and is independent of the existence of the proposed Project. The proposed Project would provide access to WCSB crude oil in PADD III refineries that would supplant supplies from other sources, including Venezuela and Mexico. As discussed in Section 3.13.5.1 of the EIS and Consolidated Response OIL-4, the composition of WCSB crude oils that could be transported by the proposed Project is not dissimilar from other heavy crude oils currently refined in PADD III. There is therefore no credible evidence that implementation of the proposed Project would lead to disproportionate adverse impacts on minority and low income populations near PADD III refineries.</p>
956	1	Brunken	Jed		I believe this pipeline should be built [if necessary] in an alternate location. We DO NOT need to endanger one of this country's most precious resources....water.	Consolidated Response ALT-1 and Section 4.3 of the EIS address potential alternative routes, including routes that would avoid much of the Northern High Plains Aquifer system.
956	2	Brunken	Jed		I feel the pipeline could be a target for terrorism if located over the Aquifer.	Consolidated Response TER-1 addresses potential terrorism associated with the proposed Project.
1546	151	Bruno	Kenny	Corporate Ethics International	Keystone 1 and XL are strategic parts of the rapid and reckless expansion of the "destructive megaproject," developing tar sands.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information on current and future production. As noted in that Consolidated Response, without the proposed Project, oil sands development would continue at or above the current level until at least 2020, with or without the proposed Project.
1546	152	Bruno	Kenny	Corporate Ethics International	The State Department has not looked deeply enough at energy security, the claims of enhancement through tar sands development are exaggerated. Tar sands carries no spare capacity, and are the most expensive on earth.	As described in Consolidated Response P&N-9, energy security will be addressed in the National Interest Determination process. Section 1.4 of the EIS addresses the volume of the reserves in the Canadian oil sands fields and projected production from those fields.
1546	153	Bruno	Kenny	Corporate Ethics International	Because of over-capacity, pipeline might even cause higher gas prices.	An analysis of the potential U.S. macro-economic impacts of the pipeline capacities and use are outside of the scope of this EIS.
1546	155	Bruno	Kenny	Corporate Ethics International	The major benefit of the pipeline goes to refineries in TX, not to the national interest.	Consolidated Response P&N-9 describes the National Interest Determination process.
1546	158	Bruno	Kenny	Corporate Ethics	Good news that oil consumption is falling, but the Keystone pipeline would require a massive investment which would	Consolidated Response P&N-1 addresses the need that the Project has been proposed to meet.

				International	"lock us into this dirty infrastructure for decades."	
590	1	Bryan	George		The Ogallala Aquifer is a key fresh water resource for multiple states. Allowing an oil company pipeline to cross thru the Sandhills of Nebraska creates a situation with a high probability that a leak will occur at some point and pollute the aquifer. Pollution of the aquifer will be impossible to treat or correct. It is irresponsible of our leaders and government officials to allow this water resource to be placed at risk when alternatives, regardless of the cost to the profitability of the oil company, are available. I urge the regulating body to act responsibly for future generations and deny the company access to run the pipeline thru Nebraska's Sandhills, or over any part of the aquifer.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. Issues related to the Sand Hills area are addressed in Consolidated Response ERO-1. Consolidated Response OIL-1 addresses the likelihood of spills from the Project.
462	1	Bryant	Miles		I urge all involved in plotting the route of this pipeline to avoid the Ogallala Aquifer in Nebraska. The attributes of this precious water supply and the ease with which it could be permanently damaged by spills and leaks suggest it would be folly to run a pipe line across it.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. and ALT-1.
1424	2	Budd-Falen	Karen	Budd-Falen Law Offices, LLC	These landowner groups believe that the DEIS fails to adequately consider the [appropriate mitigation requirements of the proposed Keystone XL pipeline, as well as the] socioeconomic impacts of a potential crude oil spill, as mandated by the National Environmental Policy Act of 1969, 55 U.S.C. §§ 4321, et seq. ("NEPA")... B. The Department Failed to Adequately Analyze the Environmental and Socioeconomic Impacts of Abandonment and/or Decommissioning of the Keystone XL Pipeline. The members' comments including requiring TransCanada to post a bond to ensure that the Keystone XL Pipeline will be decommissioned or abandoned in the most environmentally sound manner. However, the Department's so-called analysis of the impacts of abandonment and/or decommissioning of the Keystone XL Pipeline and potential mitigation of those issues is woefully inadequate. The Department merely stated: The proposed Project is expected to operate for 50 years or more. At this time, Keystone has not submitted plans for abandonment of the facilities at the end of the Project's operational life. Abandonment plans would be submitted to the appropriate agencies for review and approval prior to abandonment of the Project facilities Dept. of State, Draft Environmental Impact Statement: Keystone XL Oil Pipeline Project, 2-56 (April 16, 2010) (hereinafter, "Keystone XL DEIS"). Thus, even though the Department received specific comments on decommissioning mitigation measures, it completely failed to address and analyze such issues in its DEIS for the Keystone XL Pipeline Project. The NEPA process is formulated to consider every potential alternative and significant effect on the human environment. By putting off the consideration of the environmental and socioeconomic impacts of the Keystone XL Pipeline, the Department shirked its responsibilities under NEPA.	Revised Section 3.13.6.7 of the EIS addresses the potential socioeconomic impacts of a spill from the proposed Project. Issues related to taking the Project out of service at the end of the life of the Project are presented in Consolidated Response DEC-1. Consolidated Response LIA-1 addresses Keystone's liability if there is a spill of hazardous materials or fuel during construction and from a spill of crude oil from the Project. Consolidated Response LIA-2 addresses the issue of bonding for the proposed Project.
1424	5	Budd-Falen	Karen	Budd-Falen Law Offices, LLC	These comments included, among other things, for TransCanada to be required to indemnify and hold harmless landowners for environmental contamination associated with	Indemnification and hold harmless issues are not a part of the NEPA environmental review process and would be addressed in easement negotiations between landowners and Keystone.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					the Pipeline, ... The Department failed to address any of these comments raised by these landowner groups.	As noted in Consolidated Response EAS-2, easement negotiations are state issues and the Department of State has no authority to intervene in those matters.
1424	8	Budd-Falen	Karen	Budd-Falen Law Offices, LLC	The Department Failed to Adequately Analyze the Environmental and Socioeconomic Impacts of Potential Landowner Liability Additionally, the scoping comments submitted by members of these landowner groups included issues such as landowner liability and indemnification by TransCanada for spills on private property. Nevertheless, the Department completely failed to address these comments submitted by landowners who will be impacted by not only the construction and operation of the Keystone XL Pipeline, but also the liability that is inherently associated with having a crude oil pipeline traverse one's property. These issues directly relate to the socioeconomic factors that the Department must analyze under NEPA.	NEPA environmental reviews do not require addressing indemnification, liability, and other legal issues; therefore, those issues were therefore not addressed in the EIS. Easement agreements are the instruments for providing liability limits and indemnification. Consolidated Response EAS-2 addresses issues related to easement negotiations. As noted in that response, DOS has no legal authority in the easement negotiation process. Consolidated Response LIA-1 addresses Keystone's liability if there is a spill of hazardous materials or fuel during construction or a spill of crude oil from the proposed Project. Potential socioeconomic impacts associated with a spill from the proposed Project, including potential impacts to property values, are addressed in Section 3.13.6.7 of the EIS.
1424	9	Budd-Falen	Karen	Budd-Falen Law Offices, LLC	III. Conclusion. Because the Department failed to respond to specific comments made by landowners, and because the Department failed to analyze important and applicable environmental and socioeconomic impacts of the Keystone XL Pipeline Project, the Department has failed to meet its required duty under NEPA. Therefore, we respectfully request that the Department address these comments and concerns in a Supplemental Environmental Impact Statement. Thank you for your consideration of the foregoing matters. [FOOTNOTES:] I Protect South Dakota Resources, Landowner for Fairness, and Eastern Montana Landowners Group are three groups organized to represent landowners whose properties will be impacted by the TransCanada Keystone XL Pipeline Project in South Dakota, Nebraska, and Montana, respectively.	The EIS addresses all substantive issues raised during the scoping process. Table 1.7.1-1 of the EIS lists the comments received and the sections of the EIS in which they area addressed. Consolidated Response P&N-6 addresses requests for a supplemental draft EIS. As noted in Consolidated Response ENR-1, the environmental review, including preparation of this EIS, has been conducted consistent with the DOS regulations pertaining to NEPA (22 CFR Part 161) as well as the Council on Environmental Quality (CEQ) regulations for implementing NEPA (40 CFR Part 1500). As a result, DOS considers the EIS to be consistent with the requirements of a NEPA environmental review.
1425	2	Budd-Falen	Karen	Budd-Falen Law Offices, LLC	The DEIS fails to adequately consider the appropriate mitigation requirements of the proposed Keystone XL pipeline, ..., as mandated by the National Environmental Policy Act of 1969, 55 U.S.C. §§ 4321, et seq. ("NEPA")... I. Statutory Requirements to Consider Mitigation Measures under NEPA Mitigation strategies must be fully and adequately analyzed under NEPA. See 40 C.F.R. § 1502.14. The entire environmental impact statement is to be "[b]ased on the information and analysis presented in the sections on the Affected Environment (§ 1502.15) and the Environmental Consequences (§ 1502.16) " 40 C.F.R. § 1502.14. Under these regulations, agencies are required to include in their environmental analyses "appropriate mitigation measures not already included in the proposed action or alternatives." 40 C.F.R. § 1502.14(t). "[A]n environmental impact statement must include a discussion of possible mitigation measures to avoid adverse environmental impacts. Such discussion must be 'reasonably complete' in order to 'properly evaluate the severity of the adverse effects' of a proposed project prior to making a final decision. It is not enough merely to list possible mitigation measures." Colorado Environmental Coalition v.	Mitigation measures that would be required by permitting agencies are addressed in the resource portions of Section 3.0. The EIS addresses all substantive issues that relate to the NEPA environmental review process that were raised during the scoping process. Table 1.7.1-1 of the EIS lists the comments received and the sections of the EIS in which they area addressed. Consolidated Response EAS-2 addresses issues related to easement negotiations. As noted in that response, DOS has no legal authority in the easement negotiation process.

					Dombeck, 185 F.3d 1162, 1173 (10th Cir. 1999) (citations omitted) (emphasis added). "Mitigation must 'be discussed in sufficient detail to ensure that environmental consequences have been fairly evaluated.'" Carmel-by-the-Sea v. U.S. Dep't of Transp., 123 F.3d 1142, 1154 (9th Cir. 1997) quoting Robertson v. Methow Valley Citizens Council, 490 U.S. 332, 353 (1989).... The Department Failed to Adequately Consider and Analyze Issues Raised in Scoping Comments made by Local County Governments in Impacted States During the scoping period for the Environmental Impact Statement ("EIS") for the Keystone XL Pipeline Project, numerous local governments submitted comments to the Department. These comments included, among other things:... 9. The permit should require that the pipeline company provide an annual payment to the affected landowners, including the county, to provide sufficient funds to pay for the increased cost of insurance, if applicable, and provide a reasonable return to the landowner for the use of the land.	
1425	3	Budd-Falen	Karen	Budd-Falen Law Offices, LLC	The DEIS fails to adequately consider the ... socioeconomic impacts of a potential crude oil spill, as mandated by the National Environmental Policy Act of 1969,55 U.S.C. §§ 4321, et seq. ("NEPA").	Revised Section 3.13.6.7 of the EIS addresses the potential socioeconomic impacts of a spill from the proposed Project.
1425	4	Budd-Falen	Karen	Budd-Falen Law Offices, LLC	The DEIS fails to adequately consider the ... socioeconomic impacts of a potential crude oil spill, as mandated by the National Environmental Policy Act of 1969,55 U.S.C. §§ 4321, et seq. ("NEPA").	Section 3.13.6.7 of the EIS addresses the potential socioeconomic impacts associated with a spills from the Project. DOS considers this assessment to be in compliance with NEPA environmental review requirements.
1425	5	Budd-Falen	Karen	Budd-Falen Law Offices, LLC	The Department Failed to Adequately Consider and Analyze Issues Raised in Scoping Comments made by Local County Governments in Impacted States During the scoping period for the Environmental Impact Statement ("EIS") for the Keystone XL Pipeline Project, numerous local governments submitted comments to the Department. These comments included, among other things: 1. The landowners across whose land the pipeline will be installed, including the county, should not be required to assume any liability for any damage caused by the pipeline to any third party. Failure to limit this liability could result in direct costs to the county and affected landowners, as well as indirect costs via a decrease in tax base associated with the affected properties. 2. The pipeline company should be required to assume all liability of the landowners, including the county, with regard to any damage caused by the installation or future maintenance of the pipeline.	NEPA environmental reviews do not require addressing liability and other legal issues and those issues were therefore not addressed in the EIS. Potential socioeconomic impacts of the proposed Project are addressed in Section 3.10 of the EIS, including increases in the tax base due to implementation of the proposed Project. Easement agreements are the instruments for providing liability limits for landowners. Consolidated Response EAS-2 addresses issues related to easement negotiations. As noted in that response, DOS has no legal authority in the easement negotiation process. Consolidated Response LIA-1 addresses Keystone's liability if there is a spill of hazardous materials or fuel during construction or a spill of crude oil from the proposed Project.
1425	7	Budd-Falen	Karen	Budd-Falen Law Offices, LLC	The Department Failed to Adequately Consider and Analyze Issues Raised in Scoping Comments made by Local County Governments in Impacted States During the scoping period for the Environmental Impact Statement ("EIS") for the Keystone XL Pipeline Project, numerous local governments submitted comments to the Department. These comments included, among other things:... 4. The Keystone XL pipeline should be required to post a reclamation bond to assure that funds are available to provide for payment of damages and subsequent clean up of any oil spill or other accident.	The EIS addresses all substantive issues raised during the scoping process. Table 1.9.1-1 of the EIS lists the comments received and the sections of the EIS in which they area addressed. As noted in Consolidated Response LIA-2, which addresses the issue of bonding for the proposed Project, the Department of State does not have regulatory authority to require that Keystone provide a letter of credit or a bond to pay for damage to property during construction, cleanup of a spill of oil, removal and disposal of the pipelines once the Project's useful life is over, or other potential costs that Keystone may incur related to construction or operation of the Project.
1425	9	Budd-Falen	Karen	Budd-Falen Law	The Department Failed to Adequately Consider and Analyze	The Department of State (DOS) is reviewing Keystone's

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
				Offices, LLC	Issues Raised in Scoping Comments made by Local County Governments in Impacted States During the scoping period for the Environmental Impact Statement ("EIS") for the Keystone XL Pipeline Project, numerous local governments submitted comments to the Department. These comments included, among other things:... 6. The permit should be issued only for one pipeline in the associated easement and only for the purpose of transporting crude oil from and to the locations established in the original permit. ...8. The permit should require that Keystone XL acquire easements only on the parcel of land required for construction and maintenance of the pipeline, and not on any additional land owned by the affected landowners... 13. The permit should require that the pipeline company disclose to the landowners, including the county, any land surface restrictions which will be necessary as a result of the installation of the pipeline. This could include such items as load limits on roads, correction of drainage issues, building of structures and any other activity which could take place in the area affected by the easement.	application for a Presidential permit for a single pipeline that would deliver oil to the delivery points described in the EIS for the purpose stated in the EIS. As noted in Consolidated Response EAS-2, easement negotiations and final agreements are private business concerns between the landowners and Keystone, and DOS has no legal authority or ability to intervene in the proceedings. We anticipate that restrictions to land use would be included in easement agreements.
1425	10	Budd-Falen	Karen	Budd-Falen Law Offices, LLC	The Department failed to adequately consider and analyze issues raised in scoping comments made by local county governments in Impacted States. During the scoping period for the Environmental Impact Statement ("EIS") for the Keystone XL Pipeline Project, numerous local governments submitted comments to the Department. These comments included, among other things:... 7. There should be a sunset clause in the permit to disallow any further use of the pipeline if the company applying for the original permit for the Keystone XL pipeline ceases to use the pipeline for its original purpose.	Presidential permits authorize the construction and maintenance of certain facilities at the international border. The operation and maintenance of those facilities is typically conditioned upon the certain factors enumerated in the Presidential Permit and associated Record of Decision. A permittee must seek an amendment to a permit or a new permit prior to making changes to those facilities such as operating them for a purpose other than that described in the Presidential Permit.
1425	11	Budd-Falen	Karen	Budd-Falen Law Offices, LLC	The Department Failed to Adequately Consider and Analyze Issues Raised in Scoping Comments made by Local County Governments in Impacted States During the scoping period for the Environmental Impact Statement ("EIS") for the Keystone XL Pipeline Project, numerous local governments submitted comments to the Department. These comments included, among other things: 10. Fillmore County, Nebraska contains limited environmentally sensitive land. The permit should require that the pipeline avoid environmentally sensitive ecosystems such as unplowed native prairies, riparian woodlands and wetlands, where possible.	All substantive scoping comments relevant to a NEPA environmental review that were received during the scoping period were addressed in the EIS (see Table 1.9.1-1). Identification of sensitive environments crossed by the proposed Project is discussed in Consolidated Response ENV-1 and ENV-3. As noted in Consolidated Response ENR-1, the environmental review, including preparation of this EIS, has been conducted consistent with the DOS regulations pertaining to NEPA (22 CFR Part 161) as well as the Council on Environmental Quality (CEQ) regulations for implementing NEPA (40 CFR Part 1500). As a result, DOS considers the EIS to be consistent with the requirements of a NEPA environmental review.
1425	14	Budd-Falen	Karen	Budd-Falen Law Offices, LLC	The Department failed to address any of these comments, save for number 10. III. Conclusion Because the Department failed to respond to specific comments made by landowners, and because the Department failed to analyze important and applicable environmental and socioeconomic impacts of the Keystone XL Pipeline Project, the Department has failed to meet its required duty under NEPA. Therefore, we respectfully request that the Department address these comments and concerns in a Supplemental Environmental Impact Statement. Thank you for your consideration of the foregoing matters.	The EIS addresses all substantive issues raised during the scoping process. Table 1.7.1-1 of the EIS lists the comments received and the sections of the EIS in which they are addressed. Consolidated Response P&N-6 addresses requests for a supplemental draft EIS. As noted in Consolidated Response ENR-1, the environmental review, including preparation of this EIS, has been conducted consistent with the DOS regulations pertaining to NEPA (22 CFR Part 161) as well as the Council on Environmental Quality (CEQ) regulations for implementing NEPA (40 CFR Part 1500). As a result, DOS considers the EIS to be

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
						consistent with the requirements of a NEPA environmental review.
219	1	Buffalo	Jonathan	Sac and Fox of the Mississippi of Iowa	At this time the Historical Preservation department of the Sac and Fox of the Mississippi in Iowa has determined that the above listed has no objections. However, if human skeletal remains and/or any objects falling under NAGPRA are uncovered during construction, Please stop immediately and notify the NAGPRA Representative)	Comment acknowledged. As noted in Stipulation VI.C of the Programmatic Agreement, Keystone or an RUS applicant are required to contact the applicable federal land manager should human remains be identified during construction on federal lands. The applicable federal land managing agency will assume responsibility for complying with NAGPRA.
1546	202	Bugala	Paul	Calvert Asset Management	If the Department of State were to permit the Keystone XL Pipeline without fully assessing and disclosing the project's assets on climate change and greenhouse gas emissions, it may introduce greater uncertainty into the assessment of carbon-related risks. For example, companies sourcing western Canadian sedimentary basin crude from the Keystone pipeline may have greater difficulty marketing products economically, if low carbon fuel standards are implemented in the United States and Canada.	Consolidated Response GHG-1 addresses the greenhouse gas life-cycle analyses presented in the revised EIS. The DOS assessment of GHG emissions was conducted in accordance with CEQ guidance, including CEQ's draft guidance for GHG. The CEQ regulations for implementing NEPA do not require NEPA environmental reviews for plans, regulations, or goals that are in speculative.
1546	203	Bugala	Paul	Calvert Asset Management	Requests the effects of climate change and greenhouse gas emissions be applied to the permitting of the pipeline.	DOS will consider the potential GHG emissions and global warming impacts in its review of the application for a Presidential Permit for the proposed Project.
793	2	Buoy	Lynda		1. For each barrel of oil produced from the tar sands, between 2 and 4.5 barrels of water is required. An estimated 82% of this water comes from the Athabasca River.... Financial impact Dr Wally N'Dow whom the Los Angeles Times described as "the world's foremost specialist on cities" says bluntly: "In the past fifty years nations have gone to war over oil. In the next fifty we are going to go to war over water. 1. Water is currently selling for \$1.39 for a 20 ounce bottle... In 1998 United Nations authorities underscored that with this simple statistic: 9,500 children a day die either because of lack of water or, more frequently, because of diseases caused by polluted water. If one 747 plane filled with 350 children were to crash, killing all on board we would be mesmerized by the television and radio reports, and the story would fill the front pages of our newspapers. Yet sixteen times that many children die each day from water related reasons.	Consolidated Response P&N-1 addresses the need that the Project has been proposed to meet, including information on crude oil supply and demand from an analysis specific to the proposed Project.
793	3	Buoy	Lynda		Turning tar sands into usable oil involves mining bitumen a mixture of sand, clay and a heavy crude oil. To get the oil out of the ground, the tar is superheated in "cookers" with steam to make the oil flow. Extraction requires substantial energy and water and creates sprawling tailing ponds that some analysts estimate are leaking three million gallons of contaminated waste into the ground each day, endangering wildlife and perhaps public health...3. The tar sand is buried beneath the boreal forests in Alberta(10.6 million acres), an area the size of Florida, tar sand is a mixture of sand, clay and a heavy crude oil, or tarry substance called bitumen. To get the oil out of the ground, the tar is superheated in "cookers" with steam to make the oil flow. The extracted bitumen is later processed in industrial facilities called up graders into synthetic crude oil to be piped to the U.S. for refining. These up grader facilities look like "refinery cities" with smoke stacks bellowing polluting emissions and wastewater emptied into toxic tailing ponds. Lately, in-situ	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information on current and future production. As noted in that Consolidated Response, without the proposed Project, oil sands development would continue at or above the current level until at least 2020, with or without the proposed Project.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					technology is being used to pump steam under the earth making the bitumen to flow through wells using steam or solvents. By 2010, the industry is projected to generate 8 billion tons of waste sand and 1 billion cubic meters of wastewater – enough to fill 400,000 Olympic-sized swimming pools. Some of these toxic-tailing ponds are located next to the Athabasca River, a major tributary in northern Alberta.	
793	4	Buoy	Lynda		...Emissions from the tar sands are a major source of greenhouse gas emissions and a major contributor to climate change and global warming...	Consolidated Response GHG-1 addresses the greenhouse gas life-cycle analyses presented in the revised EIS. Climate change is addressed in Section 3.14.3.14. As noted in that Section, implementation of the proposed Project is unlikely to result in a measureable climate change.
793	5	Buoy	Lynda		The TransCanada Keystone XL pipeline route would cross the Sand Hills, an area of water tables and fragile sandy soil that overlies the massive Ogallala Aquifer. If this pipeline can't be stopped, then it at least must be moved beyond the delicate environment of the Sand Hills.	Identification of sensitive environments crossed by the proposed Project is discussed in Consolidated Response ENV-1 and ENV-3. Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. Issues related to the Sand Hills area are addressed in Consolidated Response ERO-1. Consolidated Response ALT-1 addresses potential alternative routes, including routes that would avoid much of the Northern High Plains Aquifer system and the Sand Hills area.
793	6	Buoy	Lynda		...1. TransCanada is already requesting to utilize thinner piping and pump crude oil at higher pressures from the tar sand deposits of western Canada to refineries in the southern United States. Yes they will have the thick wall pipe in sensitive areas. A sensitive area is a population of more than 50,000 people not the Ogallala Aquifer.... 4. The Plains Justice report, Use of Substandard Steel by the U.S. Pipeline Industry, 2007 to 2009, documents a pattern of production and use of substandard pipe steel in large new pipelines during a major boom in pipeline construction. As the report describes, during a pipeline building boom in 2007-2009, a number of pipe manufacturers produced pipe that was too weak and failed to meet federal safety standards. Many of the pipes containing defective steel were manufactured by Welspun, an Indian steel pipe manufacturer, using steel from Essar, an Indian steel mill. The Keystone pipeline was constructed using 47% Welspun pipe at approximately the same time that Welspun produced pipe for five other pipelines that were later found to contain defective pipe. The extent of the problem was discovered only after a number of pipelines burst during safety tests and PHMSA ordered special testing to determine if pipeline companies used weak steel during construction. To protect the public all construction should be immediately halted. All pipeline currently in use should be inspected using a high-resolution caliper test. This is a special test that is different than ones that companies typically do before starting to operate pipelines...	Keystone has withdrawn its application for a Special Permit as described in Consolidated Response REG-1. As described in Consolidated Response SAF-1, the Pipeline and Hazardous Materials Safety Administration (PHMSA) has regulatory requirements that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project. In addition, PHMSA developed 57 Project-specific Special Conditions that Keystone has agreed to implement. Incorporation of those conditions would result in a Project that would have a degree of safety over any other typically constructed domestic oil pipeline system under current code and a degree of safety along the entire length of the pipeline system similar to that which is required in HCAs as defined in 49 CFR 195.450. The Northern High Plains Aquifer System crossed by the proposed route has been identified as a high consequence area and heavier-walled pipe would be installed in that portion of the proposed route (see Table 2.3.1-1). Consolidated Response PIP-1 addresses the issue of purchasing pipe for the proposed Project, including inspections at the manufacturing facility.
793	7	Buoy	Lynda		As the high water table fluctuates in the Sandhills of Nebraska sinkholes (sudden drop of the earth) are a frequent occurrence. The area they are intending to cross varies from sand to clay further endangering the integrity of the pipeline....	Issues related to the Sand Hills area are addressed in Consolidated Response ERO-1. Issues related to the Northern High Plains Aquifer System are addressed in Consolidated Responses AQF-1 through AQF-4.
793	8	Buoy	Lynda		The proposed area is also seeing an increase of small earthquakes further endangering the proposed pipeline.	Consolidated Response GEO-2 addresses potential seismic hazards.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
793	9	Buoy	Lynda		The oil in the 36-inch pipe with a 1700-PSI pressure will be approximately 200 degrees. If the grass will not grow on top of the pipeline a plan needs to be in place to keep a mulch or artificial cover on the pipeline in areas subject to wind erosion.	As stated in Sepcial Conditions 15: "Normal pump discharge temperatures should remain at or below 120° Fahrenheit (°F)." See Consolidated Response ENV-2 for a discussion regarding soil temperature increases as a result of the proposed Project and Consolidated Response ERO-1 for a summary of reclamation and revegetation activities that would be employed in the Sand Hills region.
793	11	Buoy	Lynda		...A superfund provided by the oil company and administered by the US government should be in place to compensation land owners who have their water contaminated by leaking oil or suffer any loses from the oil or pipeline...	Consolidated Response LIA-1 addresses Keystone's liability if there is a spill of hazardous materials or fuel during construction and from a spill of crude oil from the Project. Consolidated Response LIA-2 addresses the issue of bonding for the proposed Project.
793	12	Buoy	Lynda		The Ogallala Aquifer is one of the most valuable resources in this country. It should be protected at all costs. This pipeline should never be allowed to carry water from the Ogallala Aquifer out of any state and that should be understood from the beginning.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
1224	1	Buoy	LeRoy&Loranda		Please keep Keystone out of our Nebraska Sandhills. We are over the Ogallala Aquifer.. a most precious resource. A blowout would cause tremendous damage to our area for generations to come.	Issues related to the Sand Hills area are addressed in Consolidated Response ERO-1. Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
1542	27	Burdine	Doug	Pipeliners Local 798	I would encourage union labor on this project. On a pipeline project they have operating engineers which are union, and also laborers and teamsters. Each and every one of these groups is specially trained to do a superb job and we can do good quality work on this project. I want to encourage you all to go for the union. We are well trained and we know what we're doing.	Consolidated Response ECO-1 and Section 3.10.2.2 of the EIS address potential socioeconomic impacts.
27	1	Burke	Jane		Attached is a photo copy of the envelope we received in the mail; the envelope was open and nothing was inside the envelope. Please re-send the information.	Consolidated Response REQ-2 provides information for request of locations of paper copies of the EIS and that copies of the draft EIS, other specific information, or references be sent directly to the commenter. As noted in that response, all stakeholders who specifically requested paper copies were accommodated.
206	1	Burke	Jane		I own 158 acres in Oklahoma and understand that you are planning on installing pipes through my property. I have not been contacted, nor granted any approval, or received anything in writing nor any compensation. I spoke to our adjoining neighbor and they have already signed the necessary documents and have received their payment for this project. At this point, NO ONE is authorized to do any work on this property until written negotiation or receipt of written authorization from me.	Consolidated Response EAS-2 addresses issues related to easement negotiations. As noted in that Consolidated Response, DOS has no legal authority over negotiating easement agreements, no legal status to enforce the conditions of an easement agreement, and no legal authority over Keystone representatives who gain access to private property.
1066	1	Burke	Rosella		We should be screaming and yelling to stop this from happening!!! Why are our senators just "studying" the issue. Can't imagine after the events in the Gulf, the inability of our congressman to make themselves heard. Our most valuable resource is our water, let us pray for its preservation!	As described in Consolidated Response GLF-1, the risks associated with the proposed Project are substantially different from those associated with the BP Deepwater Horizon Project.
206	1	Burke	Jane		I own 158 acres in Oklahoma and understand that you are planning on installing pipes through my property. I have not been contacted, nor granted any approval, or received anything in writing nor any compensation. 					adjoining neighbor and they have already signed the necessary documents and have received their payment for this project. At this point, NO ONE is authorized to do any work on this property until written negotiation or receipt of written authorization from me.	conditions of an easement agreement, and no legal authority over Keystone representatives who gain access to private property.
648	1	Burley	David		There are certainly better ways of economic development and to deliver energy than this. It is imperative that this plan not go through and we develop better ways of doing things.	Consolidated Response ECO-1 addresses potential socioeconomic impacts associated with construction and normal operation of the proposed Project. Consolidated Response ALT-1 addresses potential alternative routes and system alternatives, including rail and barge networks.
1559	62	Butler	Holley		Landowner and has been treated well by TransCanada. Has other pipelines crossing his land and has not had any trouble from them.	Comment acknowledged.
1559	64	Butler	Holley		Confident that pipeline will be built well to ensure it doesn't damage our lands. Oil is a fact of life and we can't stand in the way of progress, and it is better than a nuclear power plant.	Comment acknowledged.
1012	1	Butterfield	Phillip&Natalie		I am concerned that the Keystone Pipeline will have an environmental impact that cannot be adequately foreseen and so cannot be mitigated. The potential for catastrophic contamination of the Ogallala Aquifer is too high and I am unconvinced that sufficient safeguards can be put in place.	As described in Consolidated Response GLF-1, the risks associated with the proposed Project are substantially different from those associated with the BP Deepwater Horizon Project. Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
1326	1	Buxbaum	Douglas	Dawson County Commissioners	We write in support of TransCanada's Keystone XL crude oil pipeline project and urge the department to grant a permit for the pipeline.	Comment acknowledged.
1326	3	Buxbaum	Douglas	Dawson County Commissioners	The environmental benefits of Keystone XL should not be overlooked. The current tragedy in the Gulf underscores the importance of a diverse portfolio of energy supplies. Within the spectrum of viable options, it is appropriate to seek a growing role for oil resources that are: <ul style="list-style-type: none"> • Land-based; • North American; and, • Transported by pipeline. This project meets each of these criteria.	Comment acknowledged.
1326	4	Buxbaum	Douglas	Dawson County Commissioners	In addition to providing stable and affordable energy through Keystones project, it will provide economic stimulus to Dawson County. This project also stands to provide a powerful private sector economic stimulus. During construction, Keystone XL will create more than 13,000 jobs funded with private investment. In addition, local governments will have a steady source of income from economic activity associated with construction	Consolidated Response ECO-1 and Section 3.10.2.2 of the EIS address the potential socioeconomic impacts of the proposed Project.
1326	5	Buxbaum	Douglas	Dawson County Commissioners	and from property taxes the pipeline company will pay.	Comment acknowledged.
1326	6	Buxbaum	Douglas	Dawson County Commissioners	Rejection of the permit or suspension of the review would sacrifice the significant economic benefits this project stands to deliver and force U.S. consumers to rely on other sources of crude oil not economically and politically allied with U.S. interests. This would be a mistake. We urge the granting of the permit. Thank you for the opportunity to comment.	Comment acknowledged.
977	1	Buzek	Jan		I urge you to deny the permit for construction of the Keystone-XL pipeline.	Comment acknowledged.
977	2	Buzek	Jan		It's been argued that the Alberta tar sands will provide a	Issues related to development of oil sands projects in Canada

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					reliable source of energy from a friendly nation. Sounds good initially. But this is the dirtiest form of oil possible.	are addressed in Consolidated Response CAN-1, including information on current and future production. As noted in that Consolidated Response, without the proposed Project, oil sands development would continue at or above the current level until at least 2020, with or without the proposed Project. Consolidated Response OIL-4 addresses the composition of the Canadian crude oil that would be transported by the proposed Project, including concerns relative to the corrosivity and erosivity of the crude oil. As noted in that Consolidated Response, that crude oil is similar in composition and properties to other heavy crude oils that are currently transported within the U.S. pipeline system and similar in composition and properties to other heavy crude oils that are currently refined in PADD III.
977	4	Buzek	Jan		Down the line it would put at risk the Ogallala Aquifer, many rivers, much farm and ranch land, city water supplies and the livelihood of anyone in its path.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
977	7	Buzek	Jan		Many citizens now despair that regulatory capture has rendered our government incapable of serving its citizens. Government is seen as nothing more than an easily bought, bumbling sidekick for corporations.	The commenter's opinion is noted.
977	9	Buzek	Jan		Thinner pipe in "low consequence" areas? There are no low consequence areas. Every bit of the land along this route is lovingly owned and tended to by good Americans. The low consequence designation is merely a way for TransCanada to build this on the cheap and assume they will come out ahead by abusing low population areas. Tell me, how does the low consequence designation not violate the 14th amendment--you know--equal protection under the law?	Keystone has withdrawn its application for a special permit for thinner pipe. As described in Consolidated Response SAF-1, the Pipeline and Hazardous Materials Safety Administration (PHMSA) has regulatory requirements that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project. In addition, PHMSA developed 57 Project-specific Special Conditions that Keystone has agreed to implement. Incorporation of those conditions would result in a Project that would have a degree of safety over any other typically constructed domestic oil pipeline system under current code and a degree of safety along the entire length of the pipeline system similar to that which is required in high consequence areas (HCAs) as defined in 49 CFR 195.450. Keystone has not defined high consequence or low consequence areas. PHMSA regulations define high consequence area (HCAs) based on population levels and environmentally sensitive areas. Keystone is required to identify what areas along the proposed route are HCAs.
362	1	Bybee	Janice		The pipeline will be disruptive to natural habitats.	Consolidated Response ENV-1 addresses concerns related to sensitive and fragile environmental and ecosystems. Consolidated Response ENV-3 addresses concerns regarding potential impacts to native grasslands and prairies. Consolidated Response WAT-2 addresses concerns regarding a compensatory mitigation plan for jurisdictional wetlands and potential impacts to non-jurisdictional wetlands.
362	2	Bybee	Janice		The pipeline will be a danger to the aquifer.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
362	3	Bybee	Janice		The pipeline will cause increased pollution in Texas.	As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
						changed refinery emissions in Gulf Coast refineries. Consolidated Response OIL-4 also addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils.
362	5	Bybee	Janice		In many respects this project will be harmful to the environment and our health.	Section 3 of the EIS addresses the impacts of construction and operation of the proposed Project. Section 3.13 of the EIS addresses the risk and environmental impacts of a crude oil spill from the proposed Project.
350	1	Byers	Bruce	FMC Technologies	I write in support of TransCanada's Keystone XL crude oil pipeline project and urge the department to grant a permit for the pipeline.	Comment acknowledged.
350	4	Byers	Bruce	FMC Technologies	This project also stands to provide a powerful private sector economic stimulus. During construction, Keystone XL will create more than 13,000 jobs funded with private investment. In addition local governments will have a steady source of income from economic activity associated with construction and from property taxes the pipeline company will pay.	Consolidated Response ECO-1 addresses potential socioeconomic impacts, and Consolidated Response TAX-1 addresses concerns regarding taxes.
350	7	Byers	Bruce	FMC Technologies	The Keystone project will have the added benefit of potential links to growing domestic supplies of crude oil in Montana and North and South Dakota.	Consolidated Response ALT-3 addresses issues related to transportation of crude oil from the Williston Basin.
350	8	Byers	Bruce	FMC Technologies	Rejection of the permit or suspension of the review would sacrifice the significant economic benefits this, project stands to deliver and force U.S. consumers to rely on other sources of crude oil not economically and politically allied with U.S. interests. This would be a mistake. I urge the granting of the permit.	Comment acknowledged.
1519	1	Byers	Bruce	FMC Technologies	Recently a number of advocacy groups sent a letter seeking suspension of the permitting of the Keystone XL pipeline. I encourage you to reject the request and to continue to review the proposed project. The project has the potential to deliver Significant energy security benefits to the United States, increasing access to Significant land-based sources of oil from a trading partner with whom we are closely allied, At the same time, construction of this project stands to bring significant economic benefits to the areas where it will be built. Provided it has limited impact on the environment, this project could be an Important part of the solution to our energy supplies. The permitting processes in place are appropriate and should proceed so that a final determination can be made about the Impacts of the project and whether it is in the national interest. Please reject the request to suspend the process and continue with the review.	Comment acknowledged.
350	7	Byers	Bruce	FMC Technologies	The Keystone project will have the added benefit of potential links to growing domestic supplies of crude oil in Montana and North and South Dakota.	Consolidated Response ALT-3 addresses issues related to transportation of crude oil from the Williston Basin.
1542	69	Cadell	David		If I have a choice between the pipeline, poverty, high gasoline prices and doing without air-conditioning, I'm going with the pipeline. I believe if you don't have this pipeline that is what's going to happen.	The commenter's opinion is noted.
1542	71	Cadell	David		If we don't build the pipeline, they are going to ship it in, which causes the same problems, only we don't benefit as much	Consolidated Response ALT-1 addresses potential alternative routes and system alternatives, including rail and barge

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					because it costs more to ship it than to send it by the pipeline.	networks.
1542	72	Cadell	David		If we don't do it here, they are going to do it in some other part of the world, and the air pollution will come over here anyway.	As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries.
1542	73	Cadell	David		I am for the pipeline. It is good for this area, and it's good for the nation.	Comment acknowledged.
1377	1	Caefr	Dick&Bonnie	Valley Seed Co.	Recently a number of advocacy groups sent a letter seeking suspension of the permitting of the Keystone XL pipeline. I encourage you to reject the request and to continue to review the proposed project... The permitting processes in place are appropriate and should proceed so that a final determination can be made about the impacts of the project and whether it is in the national interest. Please reject the request to suspend the process and continue with the review.	Comment acknowledged.
1377	4	Caefr	Dick&Bonnie	Valley Seed Co.	At the same time, construction of this project stands to bring significant economic benefits to the areas where it will be built.	Comment acknowledged.
201	1	Cagle	Anderson		I encourage you to completely reject this proposed pipeline for the following reasons.Saying yes to this pipeline says YES to continued (petroleum induced) cluster cancer among the first nations population living downstream of the Athabasca oil sands (Alberta)...	Consolidated Response CAN-1 and Section 3.14.4 of the EIS address issues related to development of oil sands projects in Canada.
201	2	Cagle	Anderson		I encourage you to completely reject this proposed pipeline for the following reasons....Saying yes to this pipeline says YES to increased air and water pollution at both ends of this "Pipe" ...	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project. Consolidated Response GHG-1 addresses GHG life-cycle analyses. Potential impacts of the proposed Project on water quality and air quality are addressed in Sections 3.3 and 3.12 of the EIS, respectively. As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries.
201	3	Cagle	Anderson		I encourage you to completely reject this proposed pipeline for the following reasons....Saying yes to this pipeline , says YES to sea level rise, global warming and the associated alterations of the hydrologic cycle, el Niño, and perhaps even ocean circulation. ...	Consolidated Response GHG-1 addresses the greenhouse gas life-cycle analyses presented in the revised EIS. Section 3.14.3.14 of the EIS includes potential mitigation measures to reduce GHG, and Consolidated Response GHG-3 addresses the decreased rate of GHG gas emissions from oil sands production in Canada. Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project. As noted in that section, production in the Canadian oil sands would not be increased by implementation of the proposed Project. Climate change is addressed in Section 3.14.3.14. AAs noted in that Section, implementation of the proposed Project is unlikely to result in a measureable climate change.
201	4	Cagle	Anderson		I encourage you to completely reject this proposed pipeline for the following reasons....Saying yes to the Keystone pipeline	Consolidated Response GHG-1 addresses the greenhouse gas life-cycle analyses presented in the revised EIS. Section

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					says ... Montana wants to facilitate anthropogenic greenhouse warming of the planet, which will result in unimaginable consequences with great financial costs.	3.14.3.14 of the EIS includes potential mitigation measures to reduce GHG, and Consolidated Response GHG-3 addresses the decreased rate of GHG gas emissions from oil sands production in Canada. Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project. As noted in that section, production in the Canadian oil sands would not be increased by implementation of the proposed Project. Climate change is addressed in Section 3.14.3.14. As noted in that Section, implementation of the proposed Project is unlikely to result in a measureable climate change.
51	1	Camacho	Zahn		Spending money on carbon fuels is like investing today in carbon copy paper and typewriters. We passionately oppose tar sands oil, and TransCanada's plan for the Keystone XL pipeline to the Gulf Coast.	Consolidated Response ALT-2 addresses the use of alternative technologies, alternative energy sources, and conservation of energy. Consolidated Response P&N-5 addresses issues related to investments in other technologies.
814	1	Campbell	Christina		Please don't! Oil sands produce the world's most harmful type of oil for the atmosphere, emitting high volumes of greenhouse gases during development, which contribute to global warming. Oil sands extraction uses significant amounts of water (2-4.5 barrels per barrel of oil produced), which ends up in toxic tailings lagoons that have never been successfully reclaimed. Huge amounts of energy to process. This is a bad idea.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project. Consolidated Response GHG-1 addresses GHG life-cycle analyses.
1152	2	Campbell	Ellen		[I'm a citizen of Merrick County through which the proposed pipeline is projected to pass, but I speak for all Nebraskans.] It would be complete folly for the XL pipeline to pass over any part of our precious Ogallala aquifer. The oil industry has a poor record of preventing leaks, and what a disaster it would be for an oil leak to spill into our aquifer.	Issues related to the Northern High Plains Aquifer System are addressed in Consolidated Responses AQF-1 through AQF-4. Consolidated Response AQF-3 provides information on hypothetical spills from the Project over two areas of the Northern High Plains Aquifer System.
394	1	Camplair	Natalie		I am deeply opposed to this project. It is irresponsible and unjust for the US and Utah governments to allow it to proceed. Instead, we should pursue energy solutions that do not harm our communities, environment and economy. We will all pay a high price if the Keystone XL pipeline is realized, and all for a reward that is trivial and worthless in comparison	The proposed Project does not extend through Utah.
1399	1	Cantillon	Rich	Ponca City Chamber of Commerce	As President of the Ponca City Area Chamber of Commerce from the State of Oklahoma, we strongly encourage the U.S. Department of State to approve an energy infrastructure project [that not only will strengthen long-term energy security in the United States, but also will provide a powerful private sector economic stimulus to the communities along the pipeline route during its construction at a time when our economy continues to struggle.] ... We enthusiastically support the Keystone XL Pipeline Project and encourage the Department of State to confirm the findings of the Draft Environmental Impact Statement, which found that the proposed Keystone XL Pipeline would have "limited adverse environmental impact during construction and operation." We look forward to the issuance of a Final Environmental Impact Statement followed by a Presidential Permit that allows the construction of Keystone XL and enables our counties, the State of Oklahoma, and the United States to collect the	Comment acknowledged.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					substantial economic benefits Keystone XL would create.	
1399	2	Cantillon	Rich	Ponca City Chamber of Commerce	As President of the Ponca City Area Chamber of Commerce from the State of Oklahoma, we strongly encourage the U.S. Department of State to approve an energy infrastructure project that [not only will strengthen long-term energy security in the United States, but also] will provide a powerful private sector economic stimulus to the communities along the pipeline route during its construction at a time when our economy continues to struggle... As we understand it, Keystone XL will create more than 13,000 high-wage construction and manufacturing jobs during the project's 2011-2012 construction schedules. Many of those jobs will be created in Oklahoma and in our counties, where too many of our residents continue to find it difficult to find good jobs. In addition to the jobs Keystone XL will create, the project will generate substantial economic benefits for the United States and in states and communities along the proposed route. Like our counties, in many cases these are areas where economic performance has stagnated or is shrinking. It is our understanding that TransCanada commissioned a study to measure the project's economic stimulus to the U.S. and the states along the route. The study found that in the U.S. Keystone XL would generate \$20.9 billion in total expenditures, \$9.6 billion in output (gross product), personal income of \$6.5 billion and 118,935 person years of employment (jobs). In addition, the report concluded that during construction, Keystone XL would generate \$486.36 million in tax revenue for state governments along the route and \$99.1 million for local taxing entities where the pipeline is located. In Oklahoma, the study found Keystone XL expenditures during construction would total \$1.2 billion and generate an economic gross product of nearly \$1.1 billion, Keystone XL construction also would generate more than \$7.6 million in tax revenue for local government and \$31.4 million for state government... We look forward to the issuance of a Final Environmental Impact Statement followed by a Presidential Permit that allows the construction of Keystone XL and enables our counties, the State of Oklahoma, and the United States to collect the substantial economic benefits Keystone XL would create.	Consolidated Response ECO-1 addresses potential socioeconomic impacts, and Consolidated Response TAX-1 addresses concerns regarding taxes.
1399	4	Cantillon	Rich	Ponca City Chamber of Commerce	Furthermore, the delivery of secure and affordable supplies of Canadian energy to American consumers would have minimal impacts on the environment.	Comment acknowledged.
1399	6	Cantillon	Rich	Ponca City Chamber of Commerce	Oil sands account for more than 97% of that vast reserve: 170 billion barrels of oil with the potential for more than 100 years of production.	Comment acknowledged.
319	1	Cantrell	Jennifer		I am against the Keystone pipeline due to the chance of contamination to the Ogallala Aquifer.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. Consolidated Response OIL-1 addresses the likelihood of spills from the Project.
28	1	Capozzelli	J.		I am writing because I am deeply concerned about the impacts that the proposed Keystone XL pipeline would have on climate and communities. I urgently ask you to deny a permit for this pipeline... I urge you to stand up to Big Oil and	Consolidated Response ENR-1 provides information on the Department of State's environmental review process, the National Interest Determination process, and the need to complete those reviews before approving or denying the

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					protect the public interest by rejecting the permit for the Keystone XL pipeline. Thank you.	Presidential permit for the proposed Project.
28	2	Capozzelli	J.		Tar sands oil is dirtier than conventional oil, causing three times more greenhouse gas emissions than regular gasoline. The 900,000 barrels of dirty oil that would be pumped through this pipeline every day would add 38 million tons of carbon dioxide to the atmosphere annually, which is equal to adding six million new cars to the road.	Consolidated Response GHG-2 addresses the potential causal connection of implementation of the proposed Project and expanded oil sands production in Canada and increases in refining. Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project. Consolidated Response GHG-3 addresses the decreased rate of GHG gas emissions from oil sands production in Canada.
28	3	Capozzelli	J.		The draft environmental impact statement ignores how this pipeline would make global warming worse, a serious oversight that must be amended.	Consolidated Responses GHG-1 through GHG-5 address concerns related to greenhouse gas, climate change, alternative energy considerations, and approach to assessment of GHG emissions.
28	4	Capozzelli	J.		The expanded production of tar sands oil enabled by this pipeline would also result in more destructive strip mining and drilling in Canada and bring more air pollution to refinery communities in Texas.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project. As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries. Consolidated Response GHG-1 addresses GHG life-cycle analyses.
256	2	Carey	John	State Representative OK District 21	As we understand it, Keystone XL will create more than 13,000 high-wage construction and manufacturing jobs during the project's 2011-2012 construction schedule. Many of those jobs will be created in rural, and in our districts, where too many of our residents continue to find it difficult to find good jobs. With Keystone XL, they will have an opportunity to work on the project for businesses that provide supplies, goods and services for its construction and operation.	Consolidated Response ECO-1 addresses potential socioeconomic impacts, and Consolidated Response TAX-1 addresses concerns regarding taxes.
256	3	Carey	John	State Representative OK District 21	In addition to the jobs Keystone XL will create, the project will generate substantial economic benefits for the United States and in states and communities along the proposed route. Like our counties, in many cases these are areas where economic performance has stagnated or is shrinking. It is our understanding that TransCanada commissioned a study to measure the project's economic stimulus to the U.S. and the states along the route. The study found that in the U.S., Keystone XL would, generate \$20.9 billion in total expenditures, \$9.6- billion .in output (gross product), personal income of \$6~5 billion and 118,935 person years of employment (jobs).	Consolidated Response ECO-1 addresses potential socioeconomic impacts, and Consolidated Response TAX-1 addresses concerns regarding taxes.
256	4	Carey	John	State Representative OK District 21	In addition, the report concluded that during construction, Keystone XL would generate \$486.36 million in tax revenue for state governments along the route and \$99.1 million for local taxing entities where the pipeline is located. In Oklahoma, the study found Keystone XL expenditures during construction would total \$1.2 billion and generate an economic gross product of nearly \$1.1 billion. Keystone XL construction also would generate more than \$7.7 million in tax revenue for	Consolidated Responses TAX-1 and ECO-1 address the estimated increases in the tax base and the jobs generated by the proposed Project. Also see the revisions to Sections 3.10.2.3 and 3.10.2.4 of the EIS.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					local government and \$31.4 million for state government.	
256	8	Carey	John	State Representative OK District 21	We enthusiastically support the Keystone XL Pipeline Project and encourage the Department of State to confirm the findings of the Draft Environmental Impact Statement, which found that the proposed Keystone XL Pipeline would have "limited adverse environmental impact during construction and operation."	Comment acknowledged.
1306	1	Carey	M.Timothy	CRC-EvansPipeline International, Inc.	CRC-Evans Pipeline International provides a broad scope of equipment and services used on pipelines such as the TransCanada's Keystone XL crude 2011 pipeline project that is presently pending approval. We are writing in support of this project and urge the department to grant a permit for the pipeline.	Comment acknowledged.
1306	2	Carey	M.Timothy	CRC-EvansPipeline International, Inc.	This project is not only of significance to us in terms of continued business activity and work for our employees but also stands to provide a powerful private sector economic stimulus. During construction, it is estimated that Keystone XL will create more than 13,000 jobs funded with private investment.	Consolidated Response ECO-1 and Section 3.10.2.2 address potential socioeconomic impacts.
1306	3	Carey	M.Timothy	CRC-EvansPipeline International, Inc.	in addition, local governments will have a steady source of income from economic activity associated with construction and from property taxes the pipeline company will pay.	Comment acknowledged.
1306	5	Carey	M.Timothy	CRC-EvansPipeline International, Inc.	No one can overlook the tragedy in the Gulf, but we believe Keystone XL is environmentally well-founded and provides an important diversification to our portfolio of energy supplies, as it is: Land-based; ...North American; and, ...Transported by pipeline. We are confident that pipelines are among the safest, most reliable, economical and environmentally favorable ways to transport oil and petroleum products. Today, America depends on the more than 168,000 miles of liquid pipelines to move oil, petroleum products and other raw materials to markets throughout the country.	Comment acknowledged.
1306	6	Carey	M.Timothy	CRC-EvansPipeline International, Inc.	Additional pipeline capacity like Keystone XL will help consumers and businesses throughout the United States by building upon this network. We believe rejection of the permit or suspension of the review would be a mistake and would sacrifice the significant economic, security and other benefits that Keystone XL stands to deliver. We at CRC-Evans Pipeline International urge the granting of the permit. We also appreciate the opportunity to affirm our support for this project.	Comment acknowledged.
373	2	Carlini	John		I live in Nebraska and I am adamantly against the proposed route of the Keystone pipeline thru the USA and thru Nebraska.	Consolidated Response ALT-1 addresses potential alternative routes, including routes that would avoid much of the Northern High Plains Aquifer system and the Sand Hills area.
373	3	Carlini	John		We have the huge Ogallala Aquifer that is a vast reservoir of fresh water and a Leak or "spill" would have consequences I don't even want to ponder.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
373	4	Carlini	John		For the sake of our country's future stop this pipeline and say "NO" to tar sands.	Consolidated Response ENR-1 provides information on the Department of State's environmental review process, the National Interest Determination process, and the need to complete those reviews before approving or denying the Presidential permit for the proposed Project.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
373	5	Carlini	John		Tar sands will increase our transportation emissions, counteract existing efforts to fight global warming, and undermine U.S. energy independence by continuing our dependence on foreign oil. By expanding the U.S. market for tar sands oil, this pipeline will increase air pollution at American refineries and spur further expansion of the tar sands industry in Canada an industry that has caused severe water and air contamination and destroyed hundreds of square miles of wetlands and forest. Tying our future to toxic tar sands will never be in our national interest. Please consider the true impact of this pipeline by including the devastating effects of mining, refining, and burning this fuel when you make your decision. I am asking you to fulfill your role as protector of our country and say no to tar sands.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project. Consolidated Response GHG-1 addresses GHG life-cycle analyses. Consolidated Response GHG-2 addresses the potential causal connection of implementation of the proposed Project and expanded oil sands production in Alberta and increases in refining. As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries. As described in Section 1.4 of the EIS, and in Consolidated Response P&N-1 much of the oil transported by the proposed Project would replace the heavy crude oil traditionally processed due to the continuing decrease in the supply of heavy crude oil from Mexico, Venezuela, and other sources.
455	1	Carlson	Mike		I support the Keystone pipeline project as it passes through Eastern Montana. It know it will cause temporary disturbance on rural lands but feel these areas can be successfully reclaimed. I hope the thinner walled pipe to be used is engineered well and meets all federal pipeline requirements. This pipeline will help a lot of our small rural counties with an improved tax base. I believe a strong majority of our citizens support this project with the adequate safeguards in place for long term oil spill protection. I am also pleased to see added the ability to be able to add some of our local oil production into this line at Baker, Mt. I believe this project will help meet the USA's future oil/energy needs.	Consolidated Response ALT-3 addresses issues related to transportation of crude oil from the Williston Basin.
1223	1	Carlson	Todd		Why would the State Department be involved with a pipeline in Nebraska or for that matter anywhere inside the borders of this country? Does this mean the Secretary of the Interior or the EPA should be traveling abroad to visit foreign heads of state? This doesn't make any reasonable sense to me.	Consolidated Response REG-2 addresses issues related to concerns about the Department of State being the lead federal agency for the NEPA environmental review.
141	1	Carman	William&Elean or		This plan to transport sand tar oil from Canada to the Gulf Coast is not a practical, eco-efficient, or profitable manner for providing fossil fuels into the market. The carbon print is more then three times normal production from oil wells.	Consolidated Response P&N-1 addresses the need that the Project has been proposed to meet. Consolidated Response GHG-1 addresses the greenhouse gas life-cycle analyses presented in the revised EIS.
1321	1	Carnes	Donald		I have been reading and hearing about the proposed pipeline to send "dirty" oil to the Gulf coast by the Canadian Pipeline Company. This pipeline is being proposed to cross several American states, including Nebraska, down to the Gulf coast. I am especially concerned that it would cross some areas in these states that are especially susceptible to damage from an oil spill. I am especially concerned about areas that overlay the Ogallala Aquifer. This underground body of water took millions of years to develop and was instrumental in the opening of the plains states to farming and ranching. If there were a break in the pipe line, this could do tremendous damage to agriculture in this area.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. Consolidated Response OIL-4 addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils.
1321	2	Carnes	Donald		If they disturb the thin sod in the Sand Hills of Nebraska, as we have found out in previous years, the wind will blow that sand and take many years for it to repair itself, if ever. That	Issues related to the Sand Hills area are addressed in Consolidated Response ERO-1.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					was brought to our attention during the settlement days when people tried to convert that area to row crops, and also during the drought of the 30's. I was born and raised in the area in north central Nebraska and have seen what disturbing the sandy soil in that area will do.	
1321	3	Carnes	Donald		I also do not understand how a Canadian company can be given. the right of eminent domain to cross part of the United States.Please urge President Obama not to sign the permit.	As described in Section 1.0 of the EIS, TransCanada-Keystone Pipeline LP (Keystone) is not a foreign corporation. It is a limited partnership organized under the laws of the state of Delaware. Keystone has the same rights as other pipeline companies in the U.S. to propose projects. If Keystone obtains all necessary permits and authorizations (see Table 1.8-1 of the EIS) it will have the right to construct, operate, and maintain the Project. If easement negotiations with landowners are not successful, Keystone would initiate eminent domain proceedings (see Consolidated Response EAS-2). Consolidated Response ENR-1 provides information on the Department of State's environmental review process, the National Interest Determination process, and the need to complete those reviews before approving or denying the Presidential permit for the proposed Project.
1158	1	Carr	Virgel		I, as a citizen of Nebraska, too, am quite disturbed by the planned pipeline across our Sandhills.	Identification of sensitive environments crossed by the proposed Project is discussed in Consolidated Response ENV-1 and ENV-3. Issues related to the Sand Hills area are addressed in Consolidated Response ERO-1.
1158	3	Carr	Virgel		The Ogallalla Aquifer is far to great a treasure to risk ruining with an oil leak!	Issues related to the Northern High Plains Aquifer System are addressed in Consolidated Responses AQF-1 through AQF-4. Consolidated Response AQF-3 provides information on hypothetical spills from the Project over two areas of the Northern High Plains Aquifer System.
1158	4	Carr	Virgel		Because the Aquifer is so large it almost suggests that to protect the Aquifer from pollution that it would be more feasible to build a refinery closer to the source of the oil rather than to transport the oil to the southern U.S. to an existing refinery. Our capacity to refine the crude that we are getting now is somewhat diminished from what it should be. We should concentrate on building a new refinery to take the pressure off of those refineries that are now in operation and aging to a point that they are less efficient than they once were. It would be just common sense to build a new refinery somewhere closer to the source of the oil and in an area that could also facilitate any production from the oil shale in Wyoming and Colorado rather than pipe the crude to an existing facility and risk a major spill that could conceivably ruin the aquifer that it crosses.	Consolidated Response P&N-8 addresses issues related to shipping Canadian crude oil to refineries that are closer to the source of oil. Consolidated Response P&N-1 addresses the need that the Project has been proposed to meet; transporting Canadian crude oil in the Keystone XL Project to refineries outside of the Gulf Coast region would not meet the current and near-term crude oil needs of those refineries. Issues related to the Northern High Plains Aquifer System are addressed in Consolidated Responses AQF-1 through AQF-4.
1158	5	Carr	Virgel		I have very little confidence that the government oversite would be adequate to deal with a major spill; ala the Gulf of Mexico disaster!	As described in Consolidated Response GLF-1, the risks associated with the proposed Project are substantially different from those associated with the BP Deepwater Horizon Project.
1158	6	Carr	Virgel		Please consider not allowing the pipeline to cross Nebraska.	Consolidated Response ALT-1 addresses potential alternative routes, including routes that would avoid much of the Northern High Plains Aquifer system.
1158	7	Carr	Virgel		I know that it would produce jobs and affect many economies, but common sense tells me that if the government is in charge	As noted in Consolidated Response OIL-5, crude oil pipelines do not explode and it is highly unlikely that there would be an

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					that it would sooner than later blowup and cause a major disaster in epic proportions!	explosion in a pump station.
411	1	Carraher	Pat		Please do not approve this new pipeline.	Comment acknowledged.
411	2	Carraher	Pat		The Ogallala Aquifer is a treasure that should not be put at risk!!!	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
348	1	Carrels	Peter	Sierra Club, South Dakota Chapter	The Sierra Club is the nation's oldest and largest organization devoted to protecting the natural environment and related public health matters, and encouraging stewardship and conservation of natural resources. We have over 1.3 million members and supporters across the United States. In South Dakota we have over 900 members in three groups and in one statewide chapter. At a time in our nation's history when we should be discouraging and decreasing our use of fossil fuel energy sources, the development of the XL pipeline does just the opposite. We contend that the development of the XL pipeline and the ongoing development of tar sands crude oil delays and damages the development of the clean energy sector, and represents an unwelcome and inappropriate expansion of fossil fuels development.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information on current and future production. As noted in that Consolidated Response, without the proposed Project, oil sands development would continue at or above the current level until at least 2020, with or without the proposed Project. Consolidated Response ALT-2 addresses the use of alternative technologies, alternative energy sources, and conservation of energy.
348	3	Carrels	Peter	Sierra Club, South Dakota Chapter	By allowing this pipeline to be built we are boosting the future prospects of tar sands crude oil, and this is possibly the dirtiest, most polluting crude oil on the planet.	Consolidated Response OIL-4 addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils.
348	6	Carrels	Peter	Sierra Club, South Dakota Chapter	We are worried that leaks and spills from the XL system after it is operational are inevitable, and that prompt reaction to such accidents is problematic. Language in the DEIS does not calm that worry. The document states that the response time to deal with XL pipeline leaks will be hampered by factors such as remoteness of the location, the existence of snow on the ground, and challenging weather conditions. These factors are common in western South Dakota, and these issues portend a potential for catastrophe that allows the pipeline's operators to hide behind the cover of the factors just noted. The only way to assure that no accidents happen is to avoid building this pipeline in the first place. This is the only "no accident" alternative, and it should be listed as such.	Consolidated Response RES-1 addresses issues related to preparation and review of the Emergency Response Plan for the proposed Project. The ERP would include a detailed description of response actions, equipment, and methods that would be implemented under a wide range of conditions, including those identified in this comment. The "no accident" alternative is essentially a subset of the No Action Alternative presented in Section 4.1 of the EIS.
348	8	Carrels	Peter	Sierra Club, South Dakota Chapter	The DEIS must consider and assess the impact of this pipeline on the future prospects of developing tar sands crude oil. The DEIS treats the XL pipeline as if it is a stand-alone project, and that its impacts begin at the U.S.-Canada border. This is a misrepresentation of the relationship linking the XL pipeline and tar sands development. The XL pipeline relies on and supports ongoing production of tar sands mining operations. That relationship must be recognized, explained and integrated into the final EIS. James Hansen, director of the NASA Goddard Institute for Space Studies and one of the leading scientists studying global warming, wrote the following about the impacts of tar sands on global warming: "[t]he tar sands of Canada constitute one of our planet's greatest threats. They are a double-barreled threat. First, producing oil from tar sands emits two to three times the global warming pollution of conventional oil. But the process also diminishes one of the best carbon reduction tools on the planet -Canada's	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information on current and future production. As noted in that Consolidated Response, without the proposed Project, oil sands development would continue at or above the current level until at least 2020, with or without the proposed Project. Consolidated Responses GHG-1 through GHG-5 address concerns related to greenhouse gas, climate change, alternative energy considerations, and approach to assessment of GHG emissions.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					Boreal Forest."	
348	8	Carrels	Peter	Sierra Club, South Dakota Chapter	The DEIS must consider and assess the impact of this pipeline on the future prospects of developing tar sands crude oil. The DEIS treats the XL pipeline as if it is a stand-alone project, and that its impacts begin at the U.S.-Canada border. This is a misrepresentation of the relationship linking the XL pipeline and tar sands development. The XL pipeline relies on and supports ongoing production of tar sands mining operations. That relationship must be recognized, explained and integrated into the final EIS. James Hansen, director of the NASA Goddard Institute for Space Studies and one of the leading scientists studying global warming, wrote the following about the impacts of tar sands on global warming: "[t]he tar sands of Canada constitute one of our planet's greatest threats. They are a double-barreled threat. First, producing oil from tar sands emits two to three times the global warming pollution of conventional oil. But the process also diminishes one of the best carbon reduction tools on the planet -Canada's Boreal Forest."	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project. Consolidated Response GHG-1 addresses GHG life-cycle analyses. Consolidated Response GHG-2 addresses the potential causal connection of implementation of the proposed Project and expanded oil sands production in Alberta and increases in refining.
348	9	Carrels	Peter	Sierra Club, South Dakota Chapter	The DEIS underestimates the climate change impacts of the XL pipeline in three critical ways. First, the DEIS includes an improper analysis of tar sands oil. Second, it fails to adequately assess the air and health impacts of refining tar sands in the United States, and third, it fails to consider the implications of the expanding environmental disaster occurring in Canada due to tar sands mining.	Consolidated Response OIL-4 addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils. As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries. Consolidated Response GHG-1 addresses the greenhouse gas life-cycle analyses presented in the revised EIS. Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project.
348	10	Carrels	Peter	Sierra Club, South Dakota Chapter	The DEIS incorrectly assumes that the XL pipeline will be importing and transporting similar oil to the oil currently being refined in the United States. The reality is that the production of oil from tar sands bitumen produces, as was Comment Acknowledged by Dr. Hansen, at least twice the greenhouse gas pollution as conventional oil production. As a result, the global warming pollution contribution from this project is enormous. Building this one pipeline would result in approximately 38 million metric tons of additional greenhouse gas emissions per year, the equivalent of adding over 6 million cars to the road. The U.S transportation sector already accounts for one third of our global warming emissions. We cannot afford to increase these emissions through the importation and use of tar sands oil. The failure by the State Department to cite the massive greenhouse gas increase due to the XL pipeline is a shortcoming of the DEIS.	Consolidated Response OIL-4 addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils. Consolidated Response GHG-1 addresses the greenhouse gas life-cycle analyses presented in the revised EIS. Consolidated Response GHG-3 addresses the decreased rate of GHG gas emissions from oil sands production in Canada.
348	11	Carrels	Peter	Sierra Club, South Dakota Chapter	The DEIS limits its greenhouse gas analysis to the pipeline's construction impacts and fails to consider the impacts on U.S. communities where tar sands oil will be refined. Without the XL pipeline, some refineries will not be able to access and	Consolidated Response GHG-1 addresses the greenhouse gas life-cycle analyses presented in the revised EIS. As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					refine tar sands crude oil. The extra pollution caused by refining tar sands oils instead of conventional crude oil sources must be quantified in the final EIS. Why are there concerns about refining tar sands crude oil? Tar sands crude is a heavy crude that contains more sulfur, nitrogen, mercury, lead, nickel, and arsenic than conventional crude oils. These pollutants are environmentally destructive and harmful to human health. Sulfur dioxide, nitrogen oxide, and particulate matter cause lung and respiratory problems such as bronchitis, asthma, respiratory infections, and decreased lung function. Many of the metals released into the air by an oil refinery, such as mercury, are neurotoxin, and some of the volatile organic compounds emitted by refineries are carcinogenic. Sulfur dioxide causes acid rain, and volatile organic compounds and nitrogen oxide create smog and haze. The DEIS fails to adequately consider the air and health impacts of refining tar sands crude in U.S. refineries as part of the impacts of this pipeline.	would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries. Consolidated Response OIL-4 also addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils.
348	12	Carrels	Peter	Sierra Club, South Dakota Chapter	Completion of the XL pipeline would give the tar sands industry access to consumers across the U.S., to the largest concentration of refineries in our country, and it would open up the international shipping ports along the Gulf Coast to Canadian tar sands. Today, tar sands make up 4% of U.S. fuel supply. If the Keystone XL pipeline is added to other recently permitted tar sands pipelines (Keystone 1 and Alberta Clipper), tar sands will make up 15% of the U.S. fuel supply. By opening up the U.S. market to more tar sands oil we are supporting further expansion of the destructive tar sands industry in Canada, an industry that has already destroyed more than 200 square miles of native forest and other natural resources, and has plans to expand operations across an area the size of Florida. Tar sands development and its associated mining operations are decimating the landscape in Alberta, Canada and creating one of the largest environmental disasters on earth. If left unchecked, tar sands development will destroy one of the largest forest wetland ecosystems on the planet and dewater and poison freshwater resources.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project. Consolidated Response GHG-2 addresses the potential causal connection of implementation of the proposed Project and expanded oil sands production in Alberta and increases in refining. Consolidated Response P&N-2 provides information on the export of refined product from Gulf Coast refineries as well as exporting WCSB crude oil from the Gulf Coast.
348	13	Carrels	Peter	Sierra Club, South Dakota Chapter	Tar sands extraction uses significant amounts of water (2 to 4.5 barrels of water per barrel of oil produced), which ends up in countless, toxic wastewater lagoons and lakes strewn across the landscape that have never been successfully reclaimed. It is estimated that these contaminated bodies of wastewater have already leaked over a billion gallons of poisoned water into the environment each year. Altogether these toxic lakes cover an area of about fifty square miles, and this area is growing in size by the day, and these poisoned water bodies are killing thousands of migratory birds and other wildlife. Local air and water is being contaminated with heavy metals and other pollutants. Nearby communities are reporting abnormally high rates of cancer and researchers are seeing deformities in local fish. These are the real environmental and human effects of this project, and we believe it is unethical for Americans to support this destructive industry by expanding our use of tar sands oil.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
348	14	Carrels	Peter	Sierra Club, South Dakota Chapter	Tar sands operations currently use over half a billion cubic feet of natural gas each day. If tar sands extractions operations grow, as allowed by developing new pipelines such as the XL, that level could rise to two billion cubic feet per day by 2012. Among fossil fuels, natural gas is a genuine bridge energy to be used in the transition to other, cleaner energy sources, and its use is better served in that capacity than as a means to produce more dirty tar sands oil.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project.
348	15	Carrels	Peter	Sierra Club, South Dakota Chapter	Questions have arisen regarding the genuine “need” for this pipeline. We know that the oil refinery industry in the U.S. is consolidating and oil/gas use is flattening with predicted shrinking. From its height of about 300 refineries in 1982, the industry is now at about 150 refining facilities today. We expect that the implementation of increasingly effective conservation and efficiency measures plus the availability of hybrid and electric vehicles portends a decreasing demand for oil/gas in the U.S. We know that tar sands oil is likely the world’s most expensive oil to extract and produce. We also have learned that tar sands pipelines might be the most expensive pipelines in the world to operate. It has been reported that tar sands pipelines may already be built to capacity, and that adding the XL to the system could financially stress the system. Some experts are saying that past development rates in Canada and current economic trends indicate that much of the XL’s capacity will not be needed for years, possibly not until well after 2020, with the result that per barrel pipeline shipping rates will be much higher than estimated. Recently, we have seen news that three of TransCanada’s shippers have alleged that TransCanada sent a letter to them in 2008 reporting a 145% project cost increase in Canada and a 92% cost increase in the U.S. We have also seen news from a number of notable oil companies, including British Petroleum, Imperial Oil and Suncor, claiming that the XL pipeline is not needed. We have read analysis that indicates that the U.S. would be better served if existing pipelines and infrastructure were more efficiently utilized, and that precludes building new infrastructure. The bottom line is that there are creditable and mixed signals that cast doubt on the validity of TransCanada’s XL business plan.	Consolidated Response P&N-1 addresses the need that the Project has been proposed to meet. As noted in that response, the existing infrastructure, including the Alberta Clipper and Keystone Oil Pipeline projects, is not sufficient to meet the heavy crude oil need of Gulf Coast refineries.
348	16	Carrels	Peter	Sierra Club, South Dakota Chapter	The State Department must be confident that the business plan presented by TransCanada justifying construction of this pipeline is prudent, thorough and far-reaching. The Sierra Club also contends that the oil industry’s continued development of fossil fuel – oil resources, including tar sands oil, suppresses the advancement of clean energy sources as well as the economic benefits of a clean energy industry. It has been estimated that oil companies are poised to invest some \$379 billion into tar sands development. This money would be better served if invested in clean energy. Tar sands development is not a sustainable answer to U.S. energy needs. It is being pursued, and the XL pipeline enables it to be pursued, at the expense of better energy alternatives. This is a classic case of an entrenched industry -the oil industry trying to protect and expand its own reach and profitability despite	Consolidated Response P&N-1 addresses the need that the Project has been proposed to meet. Consolidated Response P&N-5 addresses issues related to investments in other technologies.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					the negative consequences to that aim, and also despite the existence of superior energy sources that truly warrant our support.	
348	18	Carrels	Peter	Sierra Club, South Dakota Chapter	We believe the idea of serving the public good is a fundamental question the State Department must ask and answer as it assembles a final impact statement on the XL pipeline. Is the ultimate and sustaining value of this project in the best interests of the American public? Does this project advance the best interests of the American public? In whose best interest is this pipeline? The Sierra Club suggests that this pipeline is being built because the oil industry is less interested in clean, renewable energy sources, and is focused, instead, on protecting and expanding its financial interests, irrespective of what's in the best interests of the public. The State Department is the representative of the public, and not the oil industry. Decisions by the State Department must elevate the public's interest above those of the oil industry. If the State Department is guided by the public interest, we are confident this agency will rule that this pipeline is unnecessary and that it is not in the best interests of the public. It is time to draw a line in the sand and say no to the dangers and problems inherent with tar sands oil. It is time for our government to officially recognize that prolonging our dependence on inherently dangerous energy sources such as tar sands oil is detrimental to the emerging clean energy sector, and that by approving this pipeline they are, in fact, prolonging our dependence on oil and discouraging clean, renewable energy development.	Consolidated Response P&N-1 addresses the need that the Project has been proposed to meet.
1550	53	Carrels	Peter	Sierra Club	there is a tremendous potential for leaks and spills from this pipeline and any pipeline, and I just wanted to read something that I saw in the Environmental Impact Statement that was worrisome to me. The document states that after the XL system is operational that prompt reaction to leaks or spills are problematic. Language in this document does not -- the document states that the response time to deal with XL Pipeline leaks will be hampered by factors such as remoteness of the location, the existence of snow on the ground, and challenging weather conditions.	Response to a spill from the Project would be as prompt as possible and would be done in accordance with Keystone's Emergency Response Plan (ERP) and its Spill Prevention, Control, and Countermeasure (SPCC) plans. Consolidated Response RES-1 addresses issues related to preparation and review of the ERP for the proposed Project. SPCC plans are addressed in Sections 2.3 and 3.13.5 of the EIS and in the Construction, Mitigation, and Reclamation Plan presented in Appendix B of the EIS.
1550	54	Carrels	Peter	Sierra Club	The only way to assure that no accidents happen is to avoid building this pipeline in the first place, and this would be a no accident alternative and it should be listed as such in the final impact statement.	The concept of a "no accident alternative" is essentially a subset of the No Action Alternative presented in the EIS and does not merit inclusion in the EIS as a separate alternative.
1556	27	Carrels	Peter	South Dakota Chapter of the Sierra Club	By allowing this pipeline to be built, we are boosting the future prospects of tar sands crude oil, and this is possibly the dirtiest crude oil on the planet.	Consolidated Response OIL-4 addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils. Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project. Consolidated Response GHG-2 addresses the potential causal connection of implementation of the proposed Project and expanded oil sands production in Alberta and increases in refining.
1556	28	Carrels	Peter	South Dakota	you private landowners should be paying attention to what	Consolidated Response EAS-2 addresses issues related to

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
				Chapter of the Sierra Club	happened already in eastern South Dakota.	easement negotiations and eminent domain. DOS has no legal authority in the easement negotiations or in eminent domain proceedings. According to PHMSA technical staff (2011), the incidents experienced on the existing Keystone pipeline are not unusual start-up issues that occur on pipelines and are not unique. However, the number of incidents that has occurred prompted PHMSA to take action by issuing a temporary Corrective Action Order that has subsequently been lifted. According to PHMSA technical staff, there is no evidence that any of these incidents resulted from internal corrosion or erosion issues (PHMSA Pers. Comm. 2011).
1556	31	Carrels	Peter	South Dakota Chapter of the Sierra Club	The draft limits its greenhouse gas analysis to the pipeline's construction impacts and fails to consider the impacts on U.S. communities where tar sands oil will be refined. Without the XL Pipeline, some of these refineries will not be able to access and refine tar sands crude. So the extra pollution caused by refining tar sands oil instead of conventional crude oil must be quantified in the environmental impact statement.	Consolidated Response GHG-1 addresses the greenhouse gas life-cycle analyses presented in the revised EIS. Consolidated Response OIL-4 also addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils being processed in Gulf Coast refineries. As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries.
1556	33	Carrels	Peter	South Dakota Chapter of the Sierra Club	Recently, we have seen news that three of TransCanada's shippers have alleged that TransCanada sent a letter to them in 2008 reporting a 145 percent project cost increase in Canada and a 92 percent cost increase in the U.S. We've also seen news from a number of notable oil companies, including Imperial Oil and Sun Core, claiming that the XL Pipeline is not needed. We've read analysis that indicates that the U.S. would be better served if existing pipelines and infrastructure were more efficiently utilized and that precludes building new infrastructure. The bottom line is that there are credible and mixed signals that cast doubt on the validity of TransCanada's XL business plan.	As noted in Consolidated Response P&N-1, the Project has been proposed to meet the heavy crude oil needs of refineries in the Gulf Coast area, not for the U.S. in general. There is not sufficient pipeline capacity to that location. The Alberta Clipper and existing Keystone pipeline projects serve other markets and do not meet the demands of the Gulf Coast refineries. Section 4.2 of the EIS addresses the use of existing planned and proposed pipelines as system alternatives to the proposed Project.
1556	35	Carrels	Peter	South Dakota Chapter of the Sierra Club	It is time to transition away from fossil fuels, not establish deeper ties to them. Construction of the XL Pipeline in Canada and the United States and ongoing tar sands mining in Canada represent a step backwards, not forwards in the overall evolution of a progressive energy policy in this country.	Consolidated Response P&N-1 addresses the need for the proposed Project.
1556	36	Carrels	Peter	South Dakota Chapter of the Sierra Club	We believe the idea of serving the public good is a fundamental question the State Department must ask and answer as it assembles a final impact statement on this pipeline. Is the ultimate and sustaining value of this project in the best interest of the American public? Does this project advance the best interest of the American public? Is it worth inconveniencing and threatening local landowners and their resources for a project of questionable need? So I think it's time to draw a line in the sand and say no to the dangers and problems inherent with tar sands oil. It is time for our government to officially recognize that prolonging our dependence on inherently dangerous energy sources such as tar sands oil is detrimental to the emerging clean energy sector, and that by approving this pipeline our government is,	Consolidated Response ENR-1 provides information on the Department of State's environmental review process, the National Interest Determination process, and the need to complete those reviews before approving or denying the Presidential permit for the proposed Project.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					in fact, prolong our dependence on oil and discouraging clean, renewable energy development.	
886	1	Castro	Delores		Please do not proceed. There is already too much environmental disaster.	Consolidated Response ENR-1 provides information on the Department of State's environmental review process, the National Interest Determination process, and the need to complete those reviews before approving or denying the Presidential permit for the proposed Project.
791	1	Cavanaugh	Kathleen		Please consider that the Keystone XL Pipeline Project will affect Nebraska. I am against it. I appreciate the opportunity to voice this opinion...	Comment acknowledged.
1057	1	cb.1@windstream.net	Carol		Oppose. There is sure to be a leak or break in the pipeline which will spill into the aquifer and contaminate the whole area's water supply. Protect the Aquifer!	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
336	1	Cederlind	Amy		Please do not allow TransCanada to put this pipeline across Nebraska and especially through our aquifer. The people of Nebraska depend on that aquifer for their water source and here in Nebraska water is one of our most precious resources. Not only do we need it for our own lives but also our livelihoods, which for the most part is farming. It irrigates our crops so that we can feed the rest of the country. If oil happened to leak into our aquifer, which is very likely to happen at some point, it would be ruined and we'd lose our ability to provide food and to drink pure clean water. It is crucial that this pipeline does not go through our aquifer.	Issues related to the High Plains Aquifer System are addressed in Consolidated Response AQF-1 through AQF-4. Consolidated Response AQF-3 provides information on hypothetical spills from the Project over two areas of the Northern High Plains Aquifer System. Consolidated Response ALT-1 addresses potential alternative routes, including routes that would avoid much of the Northern High Plains Aquifer system.
336	2	Cederlind	Amy		After the disaster in the gulf, the oil leaks in the oil pipelines through Minnesota and Utah recently, I would think that you would be getting the strong message from the Universe that putting a dirty oil pipeline through our main water source is a very BAD idea. Please listen to the citizens of Nebraska and to your heart, which I'm hoping is in the right place, in making your decision on this.	Issues related to the Northern High Plains Aquifer System are addressed in Consolidated Responses AQF-1 through AQF-4.
1080	1	Cederlind	Leon		As a resident of Hamilton County, Nebraska, I am very concerned about the safety of the Keystone XL pipeline going through Nebraska, especially due to the route over the Ogallala Aquifer. If it were to break and spill oil into the aquifer, it would make the BP oil spill into the Gulf of Mexico seem small in comparison.	As described in Consolidated Response GLF-1, the risks associated with the proposed Project are substantially different from those associated with the BP Deepwater Horizon Project. Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. As described in Consolidated Response GLF-1, the risks associated with the proposed Project are substantially different from those associated with the BP Deepwater Horizon Project.
1080	3	Cederlind	Leon		I don't think there can be enough precautions to protect the aquifer, but I am wondering what requirements there are for protecting our environment.	Consolidated Response SAF-1 describes the regulatory requirements that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project. It also describes the inspections and reviews of the proposed Project that the Pipeline and Hazardous Materials Safety Administration would conduct to ensure compliance with those regulatory requirements.
1090	1	Celli	Vicki		Although this pipeline may be important to our country's energy needs, we must be absolutely certain that this project will in no way harm Nebraska's greatest resource, the Ogallala Aquifer. To place our resources in jeopardy to advance another's resources is insanity. If guarantees cannot be put in place that would protect the aquifer from contamination, you	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					must rethink this project.	
1544	235	Ceray	Gary		This generation, my generation and the generation before me, have been very fortunate. They flipped the switch and the lights came on. If we start tying the hands of the energy companies on all forms of energy, then our grandchildren won't be that fortunate.	The commenter's opinion is noted.
1544	237	Ceray	Gary		A lot of people overseas do not like America. The only reason they keep the spigot on is economic reasons. As China gets bigger, Brazil, India, and they start taking up more of the oil and that energy, I can promise you they'll turn the spigots off as soon as possible.	The commenter's opinion is noted.
225	1	Cervantes	Frances		Tar sands oil production puts out too much carbon dioxide! Oklahoma, along with the rest of the world suffers. The Obama administration is downplaying the importance of this carbon dioxide, but I protest! Oklahoma isn't just oil business. Our farmers and farming land are valuable and even more valuable, may I say, than TransCanada's pipeline and TransCanada profits. Oklahoma shouldn't be trashed by this pipeline with unusually thin pipes and extra high pressure. Oklahoma doesn't want hazardous liquids leaking into our soil! We know that tar sands pipelines have leaked more than four million gallons of hazardous liquids since 1973. This is a bad record! The keystone XL Pipeline is not wanted in Oklahoma!	Consolidated Response GHG-1 addresses the greenhouse gas life-cycle analyses presented in the revised EIS. Keystone has withdrawn its application for a Special Permit as described in Consolidated Response REG-1. As described in Consolidated Response SAF-1, the Pipeline and Hazardous Materials Safety Administration (PHMSA) has regulatory requirements that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project in a manner that protects the health and safety of the public and the environment. In addition, PHMSA developed 57 Project-specific Special Conditions that Keystone has agreed to implement. Incorporation of those conditions would result in a Project that would have a degree of safety over any other typically constructed domestic oil pipeline system under current code and a degree of safety along the entire length of the pipeline system similar to that which is required in high consequence areas as defined in 49 CFR 195.450. Section 3.13 of the EIS addresses reliability and safety issues, including calculations of the probability of a spill from the proposed Project and the potential environmental impacts associated with spills.
772	1	Chaney	Ann		we have always been outside most of the political problems of major companies raping our land. once something is in placed, it stays. i don't want Nebraska to have to deal with that.	The commenter's opinion is noted.
1213	1	Chapo	Tracie		As an Environmental Studies teacher and the 2009 recipient of the Nebraska Outstanding Biology Teacher Award, I would like to express my concern about any route for this pipeline that would cross the Nebraska Sandhills.	Alternatives are addressed in Section 4.0 of the EIS. Issues related to the Sand Hills area are addressed in Consolidated Response ERO-1.
1213	2	Chapo	Tracie		The aquifer's proximity to the surface in that area, combined with the extremely porous nature of the Sandhill soils, means that a pipeline leak would have the very real potential to cause immediate and widespread harm.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
1232	1	Chard	Sherron		Thank you for working to keep our aquifer safe! This, indeed, is a great natural resource for our state and needs to be protected!	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
615	1	Charles	Terry		Oil companies have demonstrated that they cannot be trusted to protect our fragile environment. An oil spill in Nebraska, home to the Ogallala Aquifer would be a disaster we cannot afford. Please stop the Keystone pipeline through the Nebraska Sand Hills.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
896	1	Cherrington	Nancy		Please don't put our state soil and water resources at risk with this pipeline!	Comment acknowledged.
896	2	Cherrington	Nancy		It's just too risky when there are other sources of energy that can be developed such as wind and solar power.	Consolidated Response ALT-2 addresses the use of alternative technologies and alternative energy sources. Section 3.13 of the EIS addresses reliability and safety issues, including calculations of the probability of a spill from the Project.
1469	1	Cheveldayoff	Ken	Minister of Enterprise, Saskatchewan	As Minister of Enterprise and Minister of Trade for the Province of Saskatchewan, I am writing to express support for TransCanada's Keystone XL crude oil pipeline project. I am sure you are aware that the United States of America (US) is the top trading partner for Saskatchewan both in terms of imports and exports. You may not be aware that Saskatchewan supplies more oil to the US than Kuwait. As such, any infrastructure project that enhances the movement of our abundant resources in an efficient and environmentally sound method will have substantive economic benefits for the US and Canada and, more specifically for our province. Since 2004, our government has facilitated the exploration of oil sands in northwestern Saskatchewan. This initiative has the potential to be of significant benefit to the local economy which includes several First Nations communities. I can assure you that all development is required to comply with strict and comprehensive environmental guidelines and regulations established at the federal, provincial and local levels. As you know, the National Energy Board (NEB) has already approved the Keystone project. The NEB is an independent federal agency that promotes safety and security, environmental protection, and efficient energy infrastructure in the Canadian public interest. I would encourage you to continue your own permitting process in a prudent but expeditious manner.	Comment acknowledged.
1299	1	Chieply	Martha	DEPARTMENT OF THE ARMY	There is no mention of potential pipeline re-routes within the draft EIS. Pipeline re-routes could be caused by many presently unforeseen factors such as right-of-way negotiations and construction related issues. A discussion about how re-routes will be addressed; including how tribal, state, and federal agencies will be notified of route changes, should be included in the Alternatives Analysis section.	Keystone would have the ability to make minor adjustments to the route provided that they are in compliance with all applicable federal, state, and local regulatory requirements. Prior to making the route changes, Keystone would have to contact all permitting agencies with jurisdiction over the route segment it would propose to change as well as any tribes that might be affected by the change.
1299	2	Chieply	Martha	DEPARTMENT OF THE ARMY	The comments submitted by the Corps for the Preliminary Draft Environmental Impact Statement were sufficiently addressed in the DEIS.	Comment acknowledged.
1479	1	Child	Christopher		I am writing to express deep concern about the proposed Keystone XL pipeline. The profound impact of expanded production and use of tar sands oil should dictate that the Department of State not grant a permit for this project.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project. Consolidated Response OIL-4 addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils. As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
1479	2	Child	Christopher		From mining to refining to burning, from air and water pollution to impacts on local communities to global climate effects, tar sands oil is a threat. Please bend every effort to prevent the construction of this pipeline.	Consolidated Response ENR-1 provides information on the Department of State (DOS) environmental review process, the National Interest Determination process, and the need to complete those reviews before approving or denying the Presidential permit for the proposed Project. As noted in that response, DOS is neither a proponent nor an opponent of the proposed Project.
1560	1	Christensen	Graham		Concerned about having too much carbon dioxide in the air already. Shouldn't cut down the Boreal Forest.	Consolidated Response GHG-1 addresses the greenhouse gas life-cycle analyses presented in the revised EIS. Consolidated Response GHG-4 addresses potential loss of boreal forests and peat bogs.
1560	58	Christensen	Graham		Concerned about liability issues of farmers.	Consolidated Response LIA-1 addresses Keystone's liability if there is a spill of hazardous materials or fuel during construction or a spill of crude oil from the proposed Project. Consolidated Response EAS-2 addresses issues related to easement negotiations. As noted in that response, DOS has no legal authority in the easement negotiation process.
1560	59	Christensen	Graham		Concerned about Ogallala Aquifer. Should not go through it.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
1331	1	Christian	Wayne	Texas Conservative Coalition	We strongly encourage the U.S. Department of State to approve the Keystone XL pipeline project. Keystone XL is a vital energy infrastructure project that will strengthen long-term energy security in the United States	Comment acknowledged.
1331	2	Christian	Wayne	Texas Conservative Coalition	and provide job opportunities in the mostly rural communities along the pipeline route during the construction process. The Keystone XL project could create more than 13,000 high-wage construction and manufacturing jobs during the project's 2011-2012 construction schedule. Many of those jobs will be created in rural Texas; where economic development is imperative. With Keystone XL, Texans will have an opportunity to work on the project or for businesses that provide supplies, goods and services for its construction and operation. TransCanada commissioned a study to measure the project's economic stimulus to the U.S. and the states along the route. The study found that Keystone XL expenditures in Texas during construction would total \$5.4 billion and generate an economic gross product of nearly \$2.86 billion.	Consolidated Response ECO-1 and Section 3.10.2.2 of the EIS address the potential socioeconomic impacts of the proposed Project.
1331	3	Christian	Wayne	Texas Conservative Coalition	Keystone XL construction also would generate more than \$64.5 million in tax revenue for local governments in Texas and \$152 million for the State of Texas.	Consolidated Response TAX-1 and revisions to Section 3.10.2.4 of the EIS address concerns regarding taxes associated with implementation of the proposed Project.
1331	4	Christian	Wayne	Texas Conservative Coalition	Given the Administration's recent actions regarding oil & gas production in the Gulf of Mexico and Alaska, the delivery of secure and affordable supplies of Canadian energy to American consumers will strengthen U.S. energy security and reduce our dependence on sources of oil from unstable, hostile or dictatorial regimes such as Venezuela. Construction of additional pipeline facilities - such as the Keystone XL Project - to transport oil sands production to the vitally important Gulf Coast area is critical. These refineries also have excess capacity as a result of reduced production from Mexico, where heavy oil production is in steep decline, and Venezuela, which is moving to other markets. Turning to Canada for a secure oil supply is a logical step.	Comment acknowledged.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
1331	5	Christian	Wayne	Texas Conservative Coalition	Given Texas' successful and long-standing development of natural resources, we support the Keystone XL Pipeline Project and encourage the Department of State to confirm the findings of the Draft Environmental Impact Statement, which found that the proposed Keystone XL Pipeline would have limited adverse environmental impact during construction and operation." We look forward to the issuance of a Final Environmental Impact Statement followed by a Presidential Permit that allows the construction of Keystone XL and enables our districts, the State of Texas, and the United States to collect the substantial economic benefits Keystone XL would create.	Comment acknowledged.
1456	1	Christian	Wayne	Texas House of Representatives	As members of the Texas House of Representatives, we strongly encourage the U.S. Department of State to approve an energy infrastructure project that not only will strengthen long-term energy security in the United States, but also will provide a powerful private sector economic stimulus to the mostly rural communities along the pipeline route during its construction at a time when our economy continues to struggle. We are proud to represent the house districts along the proposed Keystone XL route from the point it enters Texas to its final destination.	Comment acknowledged.
1456	2	Christian	Wayne	Texas House of Representatives	Texas is a proud leader in the development and movement of hydrocarbons in a safe and environmentally sound manner. Like you we expect this project, and its operator to meet high expectations regarding the environment and safety standards: As stewards of the land and as private property advocates, we also expect TransCanada to be a good neighbor as they develop this project and treat property owners fair and square.	Comment acknowledged.
1456	4	Christian	Wayne	Texas House of Representatives	In addition to the jobs Keystone XL will create, the project will generate substantial economic benefits for the United States and in states and communities along the proposed route. Like our counties, in many cases these are areas where economic performance has stagnated or is shrinking. It is our understanding that TransCanada commissioned a study to measure the project's economic stimulus to the U.S. and the states along the route. The study found that in the U.S., Keystone XL would generate \$20.9 billion in total expenditures, \$9.6 billion in output (gross product), personal income of \$6.5 billion and 118,935 person years of employment (jobs). In addition, the report concluded that during construction, Keystone XL would generate \$486.36 million in tax revenue for state governments along the route and \$99.1 million for local taxing entities where the pipeline is located.	Consolidated Response ECO-1 addresses potential socioeconomic impacts, and Consolidated Response TAX-1 addresses concerns regarding taxes.
1456	5	Christian	Wayne	Texas House of Representatives	In Texas, the study found Keystone XL expenditures during construction would total \$5.4 billion and generate an economic gross product of nearly \$2.86 billion. Keystone XL construction also would generate more than \$64.5 million in tax revenue for local government and \$152 million for state government.	Consolidated Response ECO-1 addresses potential socioeconomic impacts, and Consolidated Response TAX-1 addresses concerns regarding taxes.
1456	6	Christian	Wayne	Texas House of Representatives	Furthermore, the delivery of secure and affordable supplies of Canadian energy to American consumers would have minimal impacts on the environment. This is a vital project that will strengthen U.S. energy security and reduce our dependence	Comment acknowledged.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					on unstable foreign sources of oil. Canada is already the largest supplier of energy to the United States, meeting 12 percent of current U.S. petroleum-consumption needs and representing 18 percent of U.S. petroleum imports. Canadian oil sands production is a growing source of reliable crude oil supply for the United States. Canada's 175 billion barrels of oil reserves is second only to Saudi Arabia. Oil sands account for more than 97 percent of that vast reserve: 170 billion barrels of oil with the potential for more than 100 years of production. Canada has more than 50 percent of the non-state controlled reserves in the world. Long-term supply is critical in a world where supply risks are growing, whether due to declining production from a once-reliable source, an unstable geo-political climate, or uncertainties in key oil producing regions. Construction of additional pipeline facilities such as the Keystone XL Project, to transport oil sands production to the vitally important Gulf Coast area is critical. These refineries also have excess capacity as a result of reduced production from Mexico, where heavy oil production is in steep decline, and Venezuela, which is moving to other markets. Turning to Canada for a secure oil supply is a logical step. We enthusiastically support the Keystone XL Pipeline Project and encourage the Department of State to confirm the findings of the Draft Environmental Impact Statement, which found that the proposed Keystone XL Pipeline would have "limited adverse environmental impact during construction and operation."	
1456	7	Christian	Wayne	Texas House of Representatives	We look forward to the issuance of a Final Environmental Impact Statement followed by a Presidential Permit that allows the construction of Keystone XL and enables our districts, the State of Texas, and the United States to collect the substantial economic benefits Keystone XL would create.	Comment acknowledged.
89	1	Churchill	Mark		In light of BP's recent/ongoing disaster in the Gulf of Mexico, I am one of many Nebraskans who are questioning the wisdom of a pipeline through the Great Plains, due to its proximity to the Ogallala Aquifer. I'm willing to grant that everyone involved in Keystone XL is well-intentioned, that TransCanada's surveyors and engineers and technicians are competent, that in all likelihood nothing will go wrong. But the nature of the petroleum industry is that no engineer, no corporate executive, and certainly no politician can guarantee nothing will go wrong. And the consequences of failure in this environment, even if the risk of failure is small, are simply too high. If oil gets into the Ogallala Aquifer, there will be no volunteers cleaning the beaches of tar balls, no Coast Guard to deploy oil-containment booms, no practical recourse at all that we can count on because the whole thing is underground.	As described in Consolidated Response GLF-1, the risks associated with the proposed Project are substantially different from those associated with the BP Deepwater Horizon Project. Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
89	2	Churchill	Mark		TransCanada will do its best to act (in public) like a good corporate citizen while (behind the scenes) seeking to limit its financial liability. Politicians will point fingers, convene hearings, and inevitably someone will describe the breach as "unforeseeable". And although everyone will agree in hindsight that the economic benefits of Keystone XL were not worth it, it will be too late.	The commenter's opinion is noted.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
89	3	Churchill	Mark		I would encourage TransCanada to consider an alternate route for the proposed Keystone XL pipeline, one that would avoid the Ogallala Aquifer.	Consolidated Response ALT-1 addresses potential alternative routes, including routes that would avoid much of the Northern High Plains Aquifer (NHPAQ) System, which includes the Ogallala aquifer. Consolidated Responses AQF-1 through AQF-4 address issues related to the NHPAQ system.
89	4	Churchill	Mark		If they are unwilling to do so, the U.S. government should protect its own interests and those of its citizens by denying permits for the project.	Consolidated Response ENR-1 provides information on the Department of State's environmental review process, the National Interest Determination process, and the need to complete those reviews before approving or denying the Presidential permit for the proposed Project.
930	1	Cilimburg	Amy	Montana Audubon	Montana Audubon believe the proposed Keystone Pipeline Project is in direct conflict with our mission and oppose the project.	The commenter's opinion is noted.
930	3	Cilimburg	Amy	Montana Audubon	Extracting energy from tar sands in the Boreal Forest exacerbates global climate change to unacceptable levels. Not only does oil from tar sands emit at least three times the global warming pollution of conventional oil, but we lose the stored carbon in the Boreal Forests and wetlands when the boreal forest is decimated and we lose the forest's ability to absorb new CO2. The DEIS doesn't analyze the full climate impacts of tar sands to be transported on the pipeline. The State Department should follow new guidelines from the Council on Environmental Quality on analyzing climate impacts of major federal actions, and it should ask the Environmental Protection Agency to conduct a full lifecycle analysis of tar sands.	Consolidated Response GHG-1 addresses the greenhouse gas life-cycle analyses presented in the revised EIS. Consolidated Response GHG-5 explains that the DOS assessment of GHG emissions was conducted in accordance with CEQ guidance. Consolidated Response GHG-4 addresses potential loss of boreal forests and peat bogs.
930	4	Cilimburg	Amy	Montana Audubon	Impacts to Wildlife Expansion of tar sands extraction in the Boreal Forest will have a significant direct impact on birds, many of which migrate between the U.S. and Canada. This mining causes habitat loss, tailing ponds kill birds, drilling fragments habitat, intensive water withdrawals harm wetlands, bioaccumulation of air and water toxins endanger bird health, and climate change threatens their habitats and food supplies.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project. Consolidated Response ENV-4 addresses issues related to oil sands production and migratory birds. Consolidated Response GHG-4 addresses concerns regarding the loss of boreal forest and peat bogs.
930	5	Cilimburg	Amy	Montana Audubon	The DEIS fails to analyze the impacts of the proposed Project to two bird species listed as Endangered by the U. S. and present in both the U.S. and Canada. The Whooping Crane and the Piping Plover are clearly affected by the proposed pipeline and any DOS approval of presidential permit allowing for the construction of the proposed pipeline. There is insufficient mention in the DEIS that required consultation with US FWS has occurred, is occurring or will occur. The potential impacts to the Whooping Crane are of particular concern because the only naturally remaining migratory population nests in the Wood Buffalo National Park just north of the tar sands mines. These birds migrate over the Boreal Forest and occasionally stop-over in wetlands. Significant water withdrawals for the extraction of the tar sands may eventually drain the wetlands on which the Whooping Cranes depend.	Both the whooping crane and piping plover are analyzed in Section 3.8.1 and in Biological assessment in Appendix T of the EIS. The requirement for consultation with U.S. Fish and Wildlife Service under the Endangered Species Act is described in Section 3.8 and consultation history is listed in the Biological Assessment presented in Appendix T of the EIS. Consultation with the U.S. Fish and Wildlife Service under Section 7 of the Endangered Species Act is expected to be completed at approximately the same time that the final EIS is issued. Section 3.14.4 of the EIS was revised to add information on impacts to the whooping crane and piping plover in the Canadian portion of the proposed Project. Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information on current and future production. As noted in that response, without the proposed Project, oil sands development would continue at or above the current level until at least 2020, with or without the proposed Project.
930	6	Cilimburg	Amy	Montana Audubon	The DEIS fails to properly detail the impact to wildlife caused by the construction of the pipeline in Montana. The direct and	The approach for wildlife assessments is discussed in Consolidated Response WIL-1. Additional information on

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					cumulative effects of wildlife habitat destruction and fragmentation are not adequately described in the DEIS. The proposed pipeline routes travel through a designated Audubon Important Bird Area (IBA), the North Valley Grasslands IBA. See: http://mtaudubon.org/birds/documents/northvalleygrasslands.web.pdf . The Important Bird Area Program is a global initiative to identify and conserve areas that are vital to birds.	direct and cumulative effects specific to Project in Montana are presented in Appendix I of the EIS. Section 3.6 of the EIS was revised to address the North Valley Grasslands Global Important Bird Area. DOS considers the EIS, including assessments of potential impacts to wildlife, to be consistent with the requirements of a NEPA environmental review.
930	7	Cilimburg	Amy	Montana Audubon	The mixed-grass prairie of northern Valley County (known locally as the "North Valley Grasslands") is one of the largest blocks of intact grasslands in Montana and has been described by botanists as "possibly the best intact site of a rare midgrass prairie remaining in the United States." This site supports 15 grassland species of State conservation concern, five of which also are globally threatened. Consequently, the site is an outstanding example of an IBA of Global significance. The proposed routes travel through the southern extent of this Important Bird Area. The DEIS does not adequately assess the impacts to the grassland birds of this area even though studies have been completed and data exists from the Montana Natural Heritage Program http://mtnhp.org/reports/MaltaFO_2007.pdf .	Data from the Montana Natural heritage Program was used in the development of list of species of concern that could be effected by the proposed Project. Grassland birds are discussed in Section 3.8.2 as Bureau of Land Management Sensitive Species additional discussions for Montana birds of conservation concern are included in Appendix I which addresses issues specific to Montana. A discussion of direct habitat impacts and fragmentation of grassland and sagebrush habitats is presented in that appendix.
930	8	Cilimburg	Amy	Montana Audubon	The DEIS does not adequately assess the impacts from electrical distribution or transmission lines, the DEIS states that "[p]otential impacts to wildlife from connected actions are direct mortality due to collision with or electrocution by electrical distribution and transmission lines, and reduced survival and reproduction for ground nesting birds due to the creation of perches for raptors in grassland and shrub land habitats. To reduce these impacts, power providers may incorporate standard, safe designs, as outlined in Suggested Practice for Avian Protection on Power Lines (issued by the Avian Power Line Interaction Committee [APLIC] in 2006) into the design of electrical distribution lines in areas of identified avian concern." Executive Summary pg 12. The use of the permissive word "may," as opposed to must or shall, will not adequately protect birds.	The approach for wildlife assessments is discussed in Consolidated Response WIL-1. The EIS was revised to state that the power distribution line to Pump Station 10 would cross the North Valley Grasslands IBA and may impact survival and reproduction for ground nesting grassland birds. DOS does not have authority to impose requirements on power providers for distribution lines to the pump stations, and as such can only make recommendations and describe appropriate mitigations. DOS considers the EIS, including assessments of potential impacts to wildlife, to be consistent with the requirements of a NEPA environmental review.
800	1	Cisney	Alene		(1) Tar sands oil is exceptionally dirty, dangerous, and expensive, as well as very bad for the environment (local and global). We should not be investing in Canadian tar sands at all. ...Please discard tar sands as a source of energy -- it's not worth the high cost or the probable outcomes in environmental destruction...	Consolidated Response OIL-4 addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils. Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project.
800	2	Cisney	Alene		To make it worse, this oil is intended to be transported long distances by pipeline across the United States, increasing the probability of disastrous leakages...	Section 3.13 of the EIS addresses reliability and safety issues, including calculations of the probability of a spill from the Project and the potential environmental impacts associated with spills.
800	4	Cisney	Alene		...Above all, don't yield to any corporation's bid to lower safety standards! And don't let corporations get away with any safety violations. After the Gulf of Mexico disaster, there is no excuse for this kind of risk-taking to the detriment of American lands and people.	Keystone has withdrawn its application for a Special Permit as described in Consolidated Response REG-1. Consolidated Response SAF-1, the Pipeline and Hazardous Materials Safety Administration (PHMSA) has regulatory requirements that Keystone must comply with to construct, operate,

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
						maintain, inspect, and monitor the proposed Project in a manner that protects the health and safety of the public and the environment. In addition, PHMSA developed 57 Project-specific Special Conditions that Keystone has agreed to implement. Incorporation of those conditions would result in a Project that would have a degree of safety over any other typically constructed domestic oil pipeline system under current code and a degree of safety along the entire length of the pipeline system similar to that which is required in HCAs as defined in 49 CFR 195.450. It also describes the inspections and reviews of the proposed Project that would be conducted to ensure compliance with those regulatory requirements.
916	1	Clanton	Bret		There is not a comprehensive oil spill response plan.	Consolidated Response RES-1 addresses issues related to preparation and review of the Emergency Response Plan for the proposed Project. Spill Prevention, Control, and Countermeasure plans are addressed in Sections 2.3 and 3.13.5 of the EIS and in the Construction, Mitigation, and Reclamation Plan presented in Appendix B of the EIS.
916	2	Clanton	Bret		There is not a plan to protect our paleontological and cultural resources.	Section 3.1.2 of the EIS addresses paleontological issues. Consolidated Response CUL-1 and Section 3.11 of the EIS address protection of historic properties and the consultations conducted in compliance with Section 106 of the National Historic Preservation Act, including consultation with Indian tribes.
1050	1	Clark	Mildred		Why in heaven's name are we laying a pipeline through miles and miles of water soaked land. If this pipeline develops a leak, we will be spilling directly into the Ogallala Aquifer. Isn't there anyone out there who is smart enough to think about what is about to happen?	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
1169	2	Clark	Rich		Don't do anything stupid, the aquifer is of much more value to Nebraska and the Nation than the cost of rerouting it away. This is one of, if not the largest source of fresh water in the world. Let's take good care of it.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. Consolidated Response ALT-1 addresses potential alternative routes, including routes that would avoid much of the Northern High Plains Aquifer system.
1543	18	Clarkson	Shirley		The reclamation is only as good as the operator.	Reclamation and revegetation would be enforced through the easement agreement as described in EAS-2. The U.S. Department of State has no legal authority over negotiations of easement agreements and has no legal status to enforce the conditions of an easement agreement. A landowner who considers Keystone to be out of compliance with an easement agreement would need to contact local law enforcement officials, or initiate legal proceedings.
1543	20	Clarkson	Shirley		There is no way we have to make the oil company responsible for these flow line leaks come in and bring the land back to grass-growing standards.	Consolidated Response LIA-1 addresses Keystone's liability if there is a spill of hazardous materials or fuel during construction or a spill of crude oil from the proposed Project.
1543	24	Clarkson	Shirley		When there's a spill and the state signs off saying there are no more hydrocarbons to worry about, then each and every landowner here is going to be stuck with black dirt that doesn't grow anything.	Consolidated Response LIA-1 addresses Keystone's liability if there is a spill of hazardous materials or fuel during construction and from a spill of crude oil from the proposed Project. The potential impacts to agricultural land from a spill from the proposed Project and subsequent response actions may last for one to a few years, depending upon the amount of oil, area impacted, and the type of cleanup actions taken by

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
						Keystone. In general, oil that remains on and/or in the soils after cleanup is weathered through biodegradation by micro-organisms, photodegradation by sunlight, and physical-chemical degradation. These basic processes generally reduce or eliminate the lighter fractions of oil that may be harmful to plants and/or animals and do so in a few months to a year or two. The heavier fractions of the oil may persist for longer periods of time but are not toxic to organisms. The response actions may disturb the soils and provide habitat for weeds, reduce or remove the native or agricultural vegetation, and otherwise have impacts that may persist for a year or more. However, the soil would be replaced or restored to assist in the restoration of agricultural production.
1543	25	Clarkson	Shirley		There's no teeth to make the reclamation happen.	The Presidential Permits granted by the Department of State are for construction and maintenance of facilities at the international border and are subject to the conditions specified in the permits, including the mitigation measures specified in the EIS. Bonding is addressed in Consolidated Response LIA-2.
309	1	Clawson	Rich	Grafix Studio	This has so many holes for clean up I do not know if I am looking at a piece of draft legislation or Swiss Cheese.	Consolidated Response RES-1 addresses issues related to preparation and review of the emergency response plan for the proposed Project.
941	1	Clements	Frances		I am opposed to the Keystone Pipeline. Do we want to risk the Ogallala Aquifer the same way we have ruined the Gulf Coast? I think not.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. As described in Consolidated Response GLF-1, the risks associated with the proposed Project are substantially different from those associated with the BP Deepwater Horizon Project.
1082	1	Clements	James		I am opposed to the Keystone Pipeline. Considering what is happening in the Gulf, I see no reason to risk another natural wonder (the Ogallala Aquifer) for the sake of saving the oil companies money.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. As described in Consolidated Response GLF-1, the risks associated with the proposed Project are substantially different from those associated with the BP Deepwater Horizon Project.
1171	1	Clements	Rosemary		I feel disheartened that our Federal Government seems unattentive to our concerns.	DOS takes seriously its responsibilities to thoroughly evaluate the environmental effects of its Presidential Permit decisions consistent with NEPA and other relevant laws and regulations. In conducting the environmental review of the proposed Project, DOS followed NEPA, Council on Environmental Quality regulations and guidance, and all other applicable laws and regulations. In addition, DOS was assisted by a third-party environmental contractor in the environmental review of the proposed Project. That contractor, Cardno ENTRIX, has conducted environmental impact assessments of nearly 30 proposed pipeline projects and has experience in such work throughout the U.S., including in the states along the proposed corridor. DOS also consulted extensively with other relevant federal agencies that have particular technical expertise and authority relevant to the proposed Project. As a result, DOS considers the EIS to be in full compliance with the requirements of a NEPA environmental review.
1171	2	Clements	Rosemary		Yes, I can see where we will end up with health issues over pipeline incidences.	Section 3.13 of the EIS addresses reliability and safety issues, including calculations of the probability of a spill from the Project and the potential environmental impacts associated with spills. As noted in that section, public health is typically

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
						not affected by a spill of crude oil from a pipeline.
1171	5	Clements	Rosemary		Where can we get information explaining where this Nebraska pipeline is going through our state?	Maps of the proposed route are included in the EIS. Consolidated Response REQ-1 addresses requests for additional information, including detailed maps of the proposed route.
408	1	Cline	Walker		Please do not destroy the Ogallala Aquifer with an oil pipeline.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
1407	1	Cline	Deanna		We the people of Nebraska do not want that Oil pipeline down in our Ogallala Aquifer or the High Plains Aquifer. We here in Nebraska have always had pure water. The pipeline for oil is important but water is more important than oil. You can't drink oil or water contaminated with oil. Please don't put that pipe down in our life supply of water. Please don't put the pipeline in our aquifer.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
1407	2	Cline	Deanna		We the people of Nebraska do not want that oil pipeline down in our Ogallala Aquifer or the High Plains Aquifer. Please don't put that pipe down in our life supply of water.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
1407	3	Cline	Deanna		...We here in Nebraska have always had pure water. The Pipeline for Oil is important but water is more important than oil. You can't drink oil or water contaminated with Oil. Please don't put that pipe down in our life supply of water.	Issues related to the High Plains Aquifer System are addressed in Consolidated Response AQF-1 through AQF-4. Consolidated Response AQF-3 provides information on hypothetical spills from the Project over two areas of the Northern High Plains Aquifer System.
852	1	Clymer	Jeff		I oppose this pipeline being directed through our state. It's not a matter of if, but when there will be a leak. The oil company reassures me that there is a possibility of a leak once every 7,200 years. Now, that's just insulting. They say if there is a leak the contaminants will float and would be removed by skimming. What about the other chemicals that are combined with the floaters? I bet they have a tendency to sink. I live in a small conservative town. This is the first time in my life that I have witnessed true anger and anxiousness towards an environmental issue from my community.	Section 3.13 of the EIS addresses reliability and safety issues, including calculations of the probability of a spill from the Project and the potential environmental impacts associated with spills. The likelihood of a spill is low for all but the small spills associated with construction activities. As discussed in more detail in Consolidated Response OIL-4 and Section 3.13.5 the oil and diluent, both of which are petroleum hydrocarbons, form a crude oil homogeneous mixture that would be transported by the Project. The components of the crude oil do not immediately separate when released. The heavy crude oil is less dense than water and would initially float on water if a spill reached groundwater or surface water. Other components of the crude oil such as sulphur and metals, are also mixed inseparably in the crude oil and do not settle out of the oil if it is released from the pipeline.
246	1	Coates	Harry	Senate OK District 28	As we understand it, Keystone XL will create more than 13,000 high-wage construction and manufacturing jobs during the project's 2011~2012 construction schedule. Many of those jobs will be created in rural and in my districts, where too many of our residents continue to find it difficult to find good jobs. With Keystone XL, they will have an opportunity to work on the project or for businesses that provide supplies, goods and services for its construction and operation.	Consolidated Response ECO-1 and Section 3.10.2.2 of the EIS address the potential socioeconomic impacts of the proposed Project.
246	2	Coates	Harry	Senate OK District 28	In addition to the jobs Keystone XL will create, the project will generate substantial economic benefits for the United States and in states and communities along the proposed route. Like our counties, in many cases these are areas where economic performance has stagnated or is shrinking. It is my understanding that TransCanada commissioned a study to measure the projects economic stimulus to the U.S. and the	Consolidated Response ECO-1 addresses potential socioeconomic impacts, and Consolidated Response TAX-1 addresses concerns regarding taxes.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					states along the route. The study found that in the U.S. Keystone XL would generate \$20.9 billion in total expenditures, \$9.6 billion in output (gross product), personal income of \$6.5 billion and 118,935 person years of employment (jobs).	
246	3	Coates	Harry	Senate OK District 28	the report concluded that during construction, Keystone XL would generate \$486.36 million in tax revenue for state governments along the route and \$99.1 million for local taxing entities where the pipeline is located.	Consolidated Response TAX-1 and revisions to Section 3.10.2.4 of the EIS address concerns regarding taxes associated with implementation of the proposed Project.
246	4	Coates	Harry	Senate OK District 28	In Oklahoma, the study found Keystone XL expenditures during construction would total \$1.2 billion and generate an economic gross product of nearly \$1.1 billion. Keystone 'XL construction also would generate more than \$7.7 million in tax revenue for local government and \$31.4 million for state government.	Consolidated Responses TAX-1 and ECO-1 address the estimated increases in the tax base and the jobs generated by the proposed Project. Also see the revisions to Sections 3.10.2.3 and 3.10.2.4 of the EIS.
246	7	Coates	Harry	Senate OK District 28	We enthusiastically support the Keystone XL Pipeline Project and encourage the Department of State to confirm the findings of the Draft Environmental Impact Statement, which found that the proposed Keystone XL Pipeline would have "limited adverse environmental impact during construction and operation."	Comment acknowledged.
246	8	Coates	Harry	Senate OK District 28	We look forward to the issuance of a Final Environmental Impact Statement followed by a Presidential Permit that allows the construction of Keystone XL and enables my districts, the State of Oklahoma, and the United States to collect the substantial economic benefits Keystone XL would create.	Comment acknowledged.
1540	54	Cobenais	Marty	Indigenous Environmental Network	TransCanada should be required to remove unused or old pipeline.	Responses related to the life of the proposed Project and taking the proposed Project out of service are presented in Consolidated Response DEC-1.
1540	56	Cobenais	Marty	Indigenous Environmental Network	Where would a person be able to get a list of addresses of landowners? TransCanada has all that information, but anyone else who's trying to work on this we can't even get a detailed map of where it's going through, which county or landowner.	Consolidated Response REQ-1 addresses requests for additional information, including detailed maps of the proposed route.
1540	57	Cobenais	Marty	Indigenous Environmental Network	What we would like to do is actually be able to go through and find out where allotment lands are for Native Americans, because that would require a lot more diligent work by the pipeline company to get those leases signed.	The proposed Project would not cross any Indian trust lands, allotments or reservations.
1540	62	Cobenais	Marty	Indigenous Environmental Network	The push/pull method used to get the pipeline to go under rivers damages the protective layering on the pipe meant to prevent corrosion, making the pipe prone to rusting.	Section 2.3.3.5 has been revised to provide additional information on the procedures Keystone would use to ensure protection and integrity are maintained during a horizontal directional drilling installation. These procedures include application of an abrasion-resistant overcoat to the fusion-bonded epoxy coat applied at the factory to avoid damage when the pipe is pulled through the hole, creation of a hole that is larger than the pipe diameter (42-inch-diameter hole or larger for the 36-inch-diameter pipe), bentonite drilling mud to reduce friction and provide lubrication and buoyancy for the pipe when it is pulled through, and the use of cathodic protection and in-line inspection surveys to determine if any damage may have resulted to the pipe coating during the construction process.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
1540	63	Cobenais	Marty	Indigenous Environmental Network	There is no need for this pipeline. Enbridge built the Alberta Clipper Pipeline, and they still cannot even start to fill it. Sun Core, the oil company in Canada started a legal proceeding against them because they were charging them outrageous amounts for a pipeline that wasn't even being used.	As noted in Consolidated Response P&N-1, the Project has been proposed to meet the heavy crude oil needs of refineries in the Gulf Coast area, not for the U.S. in general. There is not sufficient pipeline capacity to that location. The Alberta Clipper and existing Keystone pipeline projects serve other markets and do not meet the demands of the Gulf Coast refineries.
1540	66	Cobenais	Marty	Indigenous Environmental Network	The Pipeline Hazardous Material Safety people, the ones who are supposed to be watching over this, making sure there are no violations, admitted in a newspaper article that they're only on the line for nine days.	PHMSA would conduct on-site inspections through out the construction period.
1540	67	Cobenais	Marty	Indigenous Environmental Network	According to Pipeline Hazardous Material Safety, they are only required to smart pig and x-ray the pipe once every two years.	Keystone would be required to establish internal inspections at 5-year intervals, not to exceed 68 months, as required by 49 CFR 195.452. Additional inspection requirements are included in the PHMSA Special Conditions in Appendix U of the EIS.
1540	68	Cobenais	Marty	Indigenous Environmental Network	In response to the issue of eminent domain, The Leech Lake Tribal Council was paid \$10 million for a 20 year lease of 3 acres of land extending through 45 miles of reservation swamp land. Farmland is worth a lot more.	As noted in Consolidated Response EAS-2, state laws dictate under what circumstances eminent domain may be used and define the eminent domain process within the state. DOS has no legal authority in the easement negotiations or in eminent domain proceedings.
1540	69	Cobenais	Marty	Indigenous Environmental Network	We've proven that pipelines are not safe. There were deaths involved with the Enbridge Pipeline, people getting run over, accidents, etc.	Consolidated Response SAF-1 describes the regulatory requirements and Project-specific Special Conditions that Keystone would comply with to construct, operate, maintain, inspect, and monitor the proposed Project. It also describes the monitoring, inspections, and reviews of the proposed Project that the Pipeline and Hazardous Materials Safety Administration would conduct to ensure compliance with those regulatory requirements.
1540	70	Cobenais	Marty	Indigenous Environmental Network	During construction on the Alberta Clipper Pipeline, a major highway in Bemidji collapsed due to their drilling underneath the road. Later they had to close the highway completely to remove a rock from the path of the drilling. They had to close the highway for a week so they could go through, dig it up and disturb everyone else's life.	Consolidated Response RDS-1 addresses concerns about the condition of roadways and roadway structures associated with construction and operation of the proposed Project as well as traffic safety measures that would be incorporated into the Project.
1540	71	Cobenais	Marty	Indigenous Environmental Network	Two years ago there was a pipeline explosion in Leannard Minnesota. It killed two pipeline workers. They were working on a leak there, a third time at that specific site, in the wintertime. They left their truck running, the fumes built up, hit a spark from the truck and it exploded, killing them both instantly. This is what's going to be going on near somebody's house that's 500 or 100 feet away.	The incident referred to by the commenter consisted of a build up of fumes and a fire, not an explosion. As noted in Consolidated Response OIL-5, crude oil pipelines do not explode and it is highly unlikely that there would be an explosion in a pump station.
1540	72	Cobenais	Marty	Indigenous Environmental Network	In Bemidji, a local landowner was asked to go stay in a hotel for two nights while high pressure testing with just water, was done on the pipeline.	Comment acknowledged.
1546	120	Cobenais	Marty	Indigenous Environmental Network	Pipeline does not go through any traditional reservation lands, but it does go through traditional, cultural, historical lands.	The proposed Project would not cross any Indian tribal trust lands, allotments or reservations. DOS consultation with the Tribes has included the development of Traditional Cultural Property Studies by consulting Tribes. These studies, authored by tribes address issues relating impacts to traditional practices. The findings of these reports are confidential but the cultural resources section (3.11) of the

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
						DEIS summarizes the information contained in these reports.
1546	121	Cobenais	Marty	Indigenous Environmental Network	Tribal Councils from Montana, South Dakota, Oklahoma, and Nebraska are opposed.	Comment acknowledged.
1546	122	Cobenais	Marty	Indigenous Environmental Network	Also concerned about indigenous folks in Canada and the higher death rates along the pipelines from cancer.	Consolidated Response CAN-1 and Section 3.14.4 of the EIS address issues related to development of oil sands projects in Canada. Construction and operation of the proposed Project would not result in measurably higher death rates along the proposed pipeline route in the U.S.
1546	124	Cobenais	Marty	Indigenous Environmental Network	South Dakotan Uranium mines have contaminated the water there and putting a pipeline through creates conduits which will allow runoff to travel more easily.	Issues related to aquifers along the proposed Project corridor are addressed in Consolidated Responses AQF-1 through AQF-4.
1546	126	Cobenais	Marty	Indigenous Environmental Network	There needs to be a discussion about whether agriculture or oil is more important.	The commenter's opinion is noted.
1546	127	Cobenais	Marty	Indigenous Environmental Network	Pipeline Hazardous Material Safety Administration does not have oversight of the pipeline until oil is going through it. Question of who is overseeing it now?	Consolidated Response SAF-1 describes the PHMSA regulatory requirements that Keystone must comply with, including pipe manufacturing, design, construction, operation, maintenance, inspection, and monitoring.
1546	129	Cobenais	Marty	Indigenous Environmental Network	Pipeline monitoring is only effective if the leak causes over 1% of a decrease in pressure. Leaks in Oklahoma City and Northern MN weren't detected because they were small, slow leaks.	Consolidated Response OIL-3 addresses the leak detection capabilities of the proposed Project, including the SCADA system, supplementary leak detection methods, physical leak detection methods, and concerns related to smaller leaks from the pipeline that may be under the SCADA detection threshold.
1546	130	Cobenais	Marty	Indigenous Environmental Network	In tailing ponds in Alberta, there is a combined 11 billion gallons of toxic waste leaked every year.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information on current and future production. As noted in that Consolidated Response, without the proposed Project, oil sands development would continue at or above the current level until at least 2020, with or without the proposed Project.
1546	131	Cobenais	Marty	Indigenous Environmental Network	In Tailing Pond Tar Sands Number 1, located next to the Athabaska River, 67 liters per second are being leaked . . .	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information on current and future production. As noted in that Consolidated Response, without the proposed Project, oil sands development would continue at or above the current level until at least 2020, with or without the proposed Project.
1546	132	Cobenais	Marty	Indigenous Environmental Network	Job creation will be a short-term boom.	Consolidated Response ECO-1 and Section 3.10.2.2 of the EIS address the potential socioeconomic impacts of the proposed Project.
268	1	Cochnar	John	US Fish and Wildlife Service	Based on the information provided in the DBA and due to the proposed Project type, size, and location, the USFWS agrees with State that the proposed Keystone XL proposed Project may adversely affect the American burying beetle (ABB).	Consultation with the U.S. Fish and Wildlife Service under Section 7 of the Endangered Species Act is expected to be completed at approximately the same time that the final EIS is issued. Decisions and conservation measures related to the ABB are presented in Section 3.8 and in the Biological Assessment in Appendix T of the EIS.
268	2	Cochnar	John	US Fish and Wildlife Service	The USFWS does not agree with State's preliminary determination that the proposed Project will not likely adversely affect the Interior least tern, piping plover, whooping crane, and western prairie fringed orchid (WPFO). Therefore, we recommend that State initiate formal section 7 consultation	The Section 7 Endangered Species Act consultation with U.S. Fish and Wildlife Service was initiated and is expected to be completed by approximately the time the final EIS is issued. Potential effects to interior least tern, piping plover, whooping crane and western prairie fringed orchid are

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					with the USFWS to evaluate the effects of the proposed Keystone XL proposed Project as identified in the DBA on the Interior least tern, piping plover, whooping crane, and western prairie fringed orchid, in addition to the American burying beetle.	addressed in Section 3.8 and in the Biological Assessment in Appentix T of the EIS, including conservation measures that would result in a not likely to adversely affect determination for those species. In addition, there are concerns regarding the non-concurrence that is being addressed in USFWQ consultations with power providers for the distribution lines to the pump stations and timing and extent of pre-construction surveys.
268	3	Cochnar	John	US Fish and Wildlife Service	The USFWS concurs with your conclusion that the proposed Project will have no effect on the Texas trailing phlox, and is not likely to adversely affect the Texas prairie dawn flower. The habitat survey and species presence data for the Texas trailing phlox and Texas prairie dawn flower should be provided in the final biological assessment to enable adequate evaluation of impacts of the selected alternative on these endangered plants. At that time, we will determine whether they will be included in our recommendation for formal consultation.	An assessment of potentially suitable habitat that may occur along the proposed Project route in Polk and Hardin Counties, Texas was added to the Biological Assessment in Appendix T and in Section 3.8.1.7 of the EIS. No suitable soils (deep sandy to sandy-loam soils) that also contain suitable vegetation cover (open pine or mixed forest) would be crossed by the proposed Project. The determination has been revised from "no effect" to "not likely to adversely affect".
268	4	Cochnar	John	US Fish and Wildlife Service	The USFWS determinations are based on your draft documents. We may re-evaluate these determinations upon receipt of a final BA, particularly if the project design changes or additional information is provided.	Comment acknowledged.
268	5	Cochnar	John	US Fish and Wildlife Service	Our conclusion that the proposed Keystone XL pipeline may affect and is likely to adversely affect the whooping crane, interior least tern, piping plover and western prairie fringed orchid is based in part on the inclusion of the new distribution lines that will be built to deliver power to the pipeline pumping stations. These new power lines are part of the proposed Project, because their construction would not be necessary without (i.e., "but for") the construction of the proposed pipeline. Therefore, although the power lines are installed and operated by local power providers instead of Keystone, the effects of the new power lines on listed threatened and endangered species are included in the consultation along with the direct effects of the pipeline and other above ground facilities associated with the pipeline such as roads, pump stations and other ancillary facilities.	As discussed in the the Biological Assessment presented in Appendix T of the EIS and in Section 3.8.1.2, the power providers, not Keystone, would be responsible for construction and operation of the power distribution lines to the pump stations. A preliminary summary analysis of potential distribution line-related impacts to these species is provided in Sections 3.8.1.2 and 3.8.1.7 of the EIS and is also included within the Biological Assessment in Appendix T. The Biological Assessment also includes an appendix with letters from the responsible power providers to USFWS confirming their commitment to consult with the USFWS under the Endangered Species Act for construction and operation of the electrical distribution lines to the proposed pump stations.
268	6	Cochnar	John	US Fish and Wildlife Service	Another factor in our conclusion to recommend formal consultation for the above species is the lack of survey information for habitat and species presence in some areas and the need for species surveys to detect presence during or immediately prior to construction activities. In the case of Interior least terns, for example, surveys for the presence of breeding habitat were not conducted in Delta, Hopkins, Lamar, and Wood counties, in Texas. In addition, surveys for species presence up to two weeks prior to construction activities are inadequate to avoid adverse impacts to Whooping cranes, Interior least terns, and piping plovers that may, if present in the construction area, be harassed by construction activities. Therefore, conservation measures to avoid such potential disturbance of these avian species need to be described or revised to minimize potential of such disturbance.	Consultation with the U.S. Fish and Wildlife Service under Section 7 of the Endangered Species Act is expected to be completed at approximately the same time that the final EIS is issued. Surveys for interior least tern habitat were completed for Delta, Hopkins, Lamar, and Wood counties and this information has been incorporated into the EIS and the Biological Assessment. Conservation measures were revised to reflect the recommendations of USFWS to monitor for the presence of whooping cranes, interior least terns, and piping plovers during construction activities. Keystone was unable to complete surveys within all potentially suitable habitats for all federally-protected plants (western prairie fringed orchid, Texas prairie dawn-flower) because access to the right-of-way was denied by the landowners. For these plants Keystone has committed to complete surveys prior to construction during the appropriate flowering period and/or purchase conservation easements as conservation measures to prevent

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
						significant impacts to unknown populations of these plants that may be affected by construction and operation of the proposed Project.
268	7	Cochnar	John	US Fish and Wildlife Service	The Sprague's Pipit is a species recently petitioned for listing and is not addressed in the Draft Biological Assessment (DBA). This species can be found in the northwestern corner of South Dakota and Montana. Although this species is not yet proposed for listing, it would be prudent to conduct surveys for its presence. In addition, offsetting conservation measures should be developed for the loss of nesting habitat in grasslands destroyed during construction.	The status of the Sprague's pipit as a Candidate for federal protection has been revised and a discussion of potential Project-related impacts to this species has been added to Section 3.8.1.2 of the EIS. The Biological Assessment does not address federal Candidate species.
268	8	Cochnar	John	US Fish and Wildlife Service	Do we include FWS comments on the draft BA? If so, See Letter S:\Project\4124202 Keystone XL\Database\Completed\DEIS Comments\06.01.2010_Cochnar, John.doc	Comments and revisions to the draft Biological Assessment are addressed directly to the U.S. Fish and Wildlife Service.
1206	1	Cohen	Carl&Isabel		After what is happening in the Gulf of Mexico and continues to happen, I am surprised that there would be any sense in trying to move oil sands across Nebraska and the Ogallala Aquifer.	As described in Consolidated Response GLF-1, the risks associated with the proposed Project are substantially different from those associated with the BP Deepwater Horizon proposed Project. Section 3.13 of the EIS presents the probability of a spill from the proposed Project, cleanup procedures that would be conducted, and the impacts of such a release. Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. Issues related to the Sand Hills area are addressed in Consolidated Response ERO-1.
1206	2	Cohen	Carl&Isabel		This underground ocean is the most important resource for our farmers and ranchers and cities and towns across Nebraska who get their water from it.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
1206	3	Cohen	Carl&Isabel		Please reconsider and keep the Keystone XL away from our Ogallala Aquifer.	Consolidated Response ALT-1 and Section 4.3 of the EIS address potential alternative routes, including routes that would avoid much of the Northern High Plains Aquifer System.
113	1	Cokinos	Andre		I fully support the construction of the pipeline.	Comment acknowledged.
13	1	Colarulli	Kate	Sierra Club et. al.	We are writing to formally request an extension of the comment period on the Draft Environmental Impact Statement from 45 to 90 days. The Keystone XL pipeline will have significant environmental impacts, and is of great interest to our millions of members and supporters. Given the complexity of the issues surrounding tar sands and the permitting process for the pipeline and the sheer length of the DEIS itself, we feel a full 90-day comment period is warranted. Please consider our request for comment period extension, so that all stakeholders in this significant process be given adequate time to process the DEIS and respond accordingly. Thank you, we look forward to continuing to work with you throughout this process.	Consolidated Response CMT-1 addresses issues related to the length of the comment period for the draft EIS and supplemental draft EIS.
553	1	Cole	Kevin		I have been following the issues surrounding the Keystone XL Pipeline Project Draft Environmental Impact Statement from my local newspapers. The proposed pipeline will cross over 100 miles of the Nebraska Sandhills that overlie the Ogallala aquifer. The water in this aquifer is a precious resource that Nebraska, and the nation, cannot afford to risk. Surely another route can be found that will not threaten our source of water	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					for agriculture, Nebraska's economic lifeblood. Like petroleum, fresh water is a limited resource that should be conserved and used with care. Unlike petroleum, there is no substitute for fresh water for sustaining life. The petroleum industry, whose record of environmental damage speaks for itself, should not be allowed to risk the quality of the fresh water that we hold in trust for our children.	
1461	1	Cole	Dan	Denbury Resources Inc	On behalf of Encore Operating, a subsidiary of Denbury Resources Inc, I am writing to express my support for TransCanada's Keystone XL (KXL) crude oil pipeline, and to urge that the Department of State continue its permitting process for this important energy infrastructure project. KXL is important for America's domestic energy security, not only because it will deliver crude to US markets from our closest ally and neighbor, Canada,	Comment acknowledged.s
1461	2	Cole	Dan	Denbury Resources Inc	but because it will also facilitate the ongoing development of the Bakken formation within the Williston Basin in the United States of America. Energy independence is a national priority. The Bakken formation is one of the few land-based regions of the continental United States where oil production has been increasing in recent years. The U.S. Geological Survey estimates there are between 3 billion and 4 billion barrels of technically recoverable oil in the Bakken formation. This is a tremendous national resource that can displace imports from unfriendly or unstable nations. This resource will not be developed to its full potential without maximizing access to markets and additional pipeline capacity. Standing alone, KXL would alleviate some of the existing congestion in regional pipeline systems and therefore benefit domestic oil production. More importantly, TransCanada is actively working with Bakken producers in Montana and North Dakota to determine if there is sufficient interest and commercial support to prove a connection to KXL for Bakken producers. Such a connection would not only provide access to additional U.S. markets but increase domestic oil production, reduce dependence on foreign oil, increase jobs and increase tax revenues. I strongly encourage the Department of State to reject calls to halt its rigorous permitting process for this vital national energy infrastructure project. This process, fully compliant with the National Environmental Policy Act and under the auspices not only of the Department of State but an additional eleven cooperating agencies, is fully sufficient to determine whether or not this vital national energy infrastructure project will meet our rigorous environmental standards, and therefore believe the process should continue.	Consolidated Response ALT-3 addresses issues related to transportation of crude oil from the Williston Basin.
1560	1	Cole	Stephanie		Representing the Sierra Club. Tar sands oil emits more global warming pollution than conventional oil. The global warming pollution from this project is staggering. Need a full analysis of the greenhouse gas emissions from this project.	Consolidated Response GHG-1 addresses the greenhouse gas life-cycle analyses presented in the revised EIS.
1560	14	Cole	Stephanie		Tar sands contain more sulfur, nitrogen, mercury, lead, and arsenic pollutants that are harmful to human health.	Consolidated Response OIL-4 addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils. As described in Consolidated Responses P&N-1, P&N-3, and OIL-4,

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
						construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries.
1560	15	Cole	Stephanie		Ogallala Aquifer has been identified as the single most important source of water in the high plains region. Pipeline cannot contaminate this aquifer.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
1560	16	Cole	Stephanie		Forecasts indicate the U.S. oil demand has peaked, and will decline with new regulations. Thus, there is no need for tar sands oil.	Consolidated Response P&N-1 addresses the need for the Proposed Project, including information on crude oil supply and demand from a recent analysis specific to the proposed Project.
304	1	Collen	Jaime		The U.S. Department of State is currently considering the Keystone XL Oil Pipeline that will cross the heartland. I am opposed to building this tar sand oil pipeline but more specifically about building it across the Sand Hills of Nebraska.	Issues related to the Sand Hills area are addressed in Consolidated Response ERO-1.
304	2	Collen	Jaime		The pipeline will cross multiple scenic Nebraska rivers that provide habitat and wetlands for both local and migrating wildlife. The Platte River habitat provides the world with one of the most spectacular and populous migration stops for the Sandhill crane and is frequented by the endangered whooping crane.	Most large rivers will be crossed using the horizontal directional drilling method. River banks and channels are protected from disturbance using this method. The proposed Project does not cross rivers within any reaches that have been designated as federal Wild and Scenic Rivers nor does it cross any national parks or forests. Sandhill cranes are listed in Table 3.6.1-1 and whooping cranes are discussed in Section 3.8.1.2. Additional discussion of the identification of sensitive resources for the environmental review are provided in Consolidated Response ENV-1.
304	3	Collen	Jaime		As the pipeline crosses a large portion of the porous Nebraska Sand Hills it also crosses one of the nation's largest clean water aquifers, the Ogallala Aquifer that is shared with many states. It does not make sense to jeopardize one of our countries most precious resources, fresh water. The potential to pollute this priceless fresh water resource with a tar sand oil spill are not worth the risk. Any risk.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. Consolidated Response OIL-1 addresses the likelihood of spills from the Project.
733	1	Collier	Ray		Please do not allow this, or any, new pipeline to be built over the Ogallala Aquifer--and decommission any extant ones, if possible. This ancient reservoir gives Lincoln, Nebraska and many other communities, food-crop and biofuel-crop farms, and ranches one of the purest and abundant fresh water supplies extant within the United States, and the greatly increased possibility of its pollution with petroleum as a result of a potential pipeline mishap causes dread in me and everyone I have so far spoken with on the subject.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
733	2	Collier	Ray		[Breakage of the pipeline is a very real possibility because, among other reasons,] a geological fault runs through Nebraska.	Consolidated Response GEO-2 addresses potential seismic hazards.
733	4	Collier	Ray		...The economic and environmental damage could persist for generations, far outweighing the economic benefit of building the pipeline as planned, within or near the aquifer's perimeter...	Issues related to the High Plains Aquifer System are addressed in Consolidated Response AQF-1 through AQF-4. Consolidated Response AQF-3 provides information on hypothetical spills from the Project over two areas of the Northern High Plains Aquifer System.
1256	2	Colson	John	Quanta Services, Inc	We urge the department to grant a permit for the pipeline.	Comment acknowledged.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
1256	3	Colson	John	Quanta Services, Inc	The facts are clear. Oil and natural gas will continue to supply more than 50 percent of U.S. energy needs in 2030.	Comment acknowledged.
1256	4	Colson	John	Quanta Services, Inc	Canada is a valued trading partner and our most reliable supplier of foreign-based crude oil.	Comment acknowledged.
1256	5	Colson	John	Quanta Services, Inc	The project will provide potential links to growing domestic supplies of crude oil in Montana and North and South Dakota.	Consolidated Response ALT-3 addresses issues related to transportation of crude oil from the Williston Basin.
1256	7	Colson	John	Quanta Services, Inc	The environmental benefits of Keystone XL should not be overlooked. Within the spectrum of viable options, it is appropriate to seek a growing role for oil resources that are: Land-based, North American, Transported by pipeline. This project meets each of these criteria.	Comment acknowledged.
1256	8	Colson	John	Quanta Services, Inc	Projects such as the Keystone pipeline are in the interest of the nation.	Comment acknowledged.
1256	10	Colson	John	Quanta Services, Inc	Pipelines are the safest, most reliable, economical and environmentally favorable way to transport oil and petroleum products, as well as other energy liquids, throughout the United States. America depends on the more than 168,000 miles of liquid pipelines to move energy and raw materials on which our country relies.	Comment acknowledged.
1256	11	Colson	John	Quanta Services, Inc	Additional pipeline capacity will help consumers and businesses throughout the United States.	Comment acknowledged.
1256	12	Colson	John	Quanta Services, Inc	This project may also provide a powerful private sector economic stimulus. During construction, Keystone XL is projected to create more than 13,000 jobs funded with private investment.	Consolidated Response ECO-1 and Section 3.10.2.2 of the EIS address the potential socioeconomic impacts of the proposed Project.
1256	13	Colson	John	Quanta Services, Inc	Local governments will have a steady source of income from economic activity associated with construction and from property taxes the pipeline company will pay.	Comment acknowledged.
1256	14	Colson	John	Quanta Services, Inc	Rejection of the permit or suspension of the review would sacrifice the significant economic benefits this project stands to deliver and force U.S. consumers to rely on other sources of crude oil not economically and politically allied with U.S. interests. This would be a mistake.	Comment acknowledged.
1256	15	Colson	John	Quanta Services, Inc	I urge the granting of the permit.	Comment acknowledged.
699	1	Conces	Colin		I would like to ask that the proposed TransCanada Keystone Pipeline, which is to be built over the Ogallala Aquifer, be reconsidered. The pipeline would present an unnecessary risk to one of the world's largest aquifers and would create the potential for an agricultural calamity. The questions being asked should not focus on a hypothetical situation. At some point there will be a spill and we should ask ourselves if that is something that we want. If the environment is not on the agenda, then consider the economic impact of a poisoned aquifer. Is that something that this country is prepared for?	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
1221	1	Condon	Shirley		I am asking you not to grant the Presidential Permit for the 1700 mile TransCanada Keystone XL Pipeline, proposed to cross our country from the Canada border at Morgan, Montana to the Gulf Coast of Texas.	Comment acknowledged.
1221	2	Condon	Shirley		This pipeline could cause irreversible damage to our country's priceless wetlands and the Ogallala Aquifer, the largest	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					groundwater system in North America, which provides drinking water for more than 2 million people and 30% of all water used for farmland irrigation.	
1221	3	Condon	Shirley		The tar sand oil to be transported through the Keystone XL Pipeline is a very dirty fuel. It is extracted from the soil by strip mining, requiring the removal and dumping of 4 tons of sand and soil for each barrel of oil produced. To remove one barrel of oil from this slurry of sand and soil requires 3 barrels of water, and 90% of this water ends up as toxic waste.	Consolidated Response OIL-4 addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils. Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project.
1221	4	Condon	Shirley		TransCanada already has an existing Keystone pipeline crossing our state, which originates from the same point in Canada as the proposed Keystone XL, crosses the border in eastern North Dakota, and connects to the same point at the Nebraska-Kansas border as the proposed XL. Why should we now allow another pipeline to cross Montana, South Dakota and central Nebraska when one already exists to the east, connecting the same points?	Consolidated Response P&N-1 addresses the need that the Project has been proposed to meet. As noted in that response, the Project has been proposed to meet the heavy crude oil needs of refineries in the Gulf Coast area. The existing Keystone Oil Pipeline System serves other markets and does not meet the demands of the Gulf Coast refineries.
1221	5	Condon	Shirley		Its mere construction will cause irreparable damage, and even a small leak could spell disaster for the Ogallala Aquifer. Nebraska is home to the largest and deepest portion of the Ogallala Aquifer, which runs under parts of eight states. All 254 miles of proposed pipeline through Nebraska lies above this aquifer. A leak reaching the aquifer, even minor, would be a national tragedy.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
1221	6	Condon	Shirley		We have already had a foreign company's oil spill cause untold damage to our Gulf. Imagine this contamination occurring in the water used for drinking and irrigating in much of the central plains.	As described in Consolidated Response GLF-1, the risks associated with the proposed Project are substantially different from those associated with the BP Deepwater Horizon proposed Project. Section 3.13 of the EIS presents the probability of a spill from the proposed Project, cleanup procedures that would be conducted, and the impacts of such a release. Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4..
1221	7	Condon	Shirley		In my home state, the pipeline would cross through 112 miles of the Nebraska Sandhills, a unique and fragile ecosystem where the sandy soil has never been broken by a plow lest it blow away and where the water table is higher than the depressions between the "hills", making Nebraska's number of lakes second only to the "Land of 10,000 Lakes" of Minnesota. Holes dug for fence posts in this area quickly fill with water, and TransCanada has stated that they will likely have to hold the pipeline down with concrete weights to keep it from floating up out of the ground. Stabilizing the sand once a 110 foot wide swath of the thin skin of soil is excavated during construction will be nearly impossible.	Identification of sensitive environments crossed by the proposed Project is discussed in Consolidated Response ENV-1 and ENV-3. Issues related to the Sand Hills area are addressed in Consolidated Response ERO-1.
1221	8	Condon	Shirley		The proposed pipeline route continues on through Nebraska to the Platte River. This river crossing west to east through central Nebraska provides water for our two largest cities of Lincoln and Omaha. The Platte River valley is a broad sandy expanse with many river channels with large islands between. It is known as the river that is "a mile wide and an inch deep"	The Platte River would be crossed using the horizontal directional drilling method as described in Section 2.3.3.5 and Section 3.4 of the EIS. The depth of the Platte River crossing is shown in Appendix D of the EIS and would be approximately 40 feet below the river bed. Additional discussion of shallow groundwater areas crossed by the

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					because of its many channels and the fact that much of the river's water flows underground in the saturated sand. Many "gravel pits" are excavated in this area to obtain sand and gravel for roads and construction. These pits quickly fill with water and later become beautiful lakes with sandy beaches and lakeside homes, great for fishing, swimming, canoeing, and getting back to nature. Though the Platte River is only a few feet deep, the proposed pipeline must tunnel 65 feet below the river bed to get under the main channel. There is no mention of deviating from the proposed 4 foot depth of the pipeline under the other Platte River system channels.	proposed Project is provided in Consolidated Response AQF-2.
1221	9	Condon	Shirley		My family owns a parcel of land along a small channel of the Platte, to be crossed by the Keystone XL Pipeline. We have a beautiful sandpit lake teeming with bass, bluegill, and catfish. We have a cabin and get water from a well. We share our lake and adjacent pasture with deer, raccoons, turkeys, many kinds of ducks, geese, songbirds, and shorebirds, as well as many trees, beautiful wild flowers and prairie grasses. After crossing several channels of the Platte, the pipeline will cross the middle of our pasture, destroying the cattle pond, fencing, our windbreak, and many other trees on our property, as well as disrupting use of the pasture for several years while TransCanada attempts to replant the sandy soil of the pasture. TransCanada will not replace the trees, as trees are not allowed in the easement. It will then cross another channel of the Platte next to our property before continuing on south across our state.	Consolidated Response PVT-2 addresses concerns regarding the proximity of the proposed project to existing structures and facilities and routing concerns across private property.
1221	10	Condon	Shirley		TransCanada will retain the easement through our property in perpetuity, with a clause allowing them to abandon the pipeline in place should they cease its use. None of my family members are willing to sign the easement contract, but if the pipeline is approved, we will have no choice.	As noted in Consolidated Response EAS-2, state laws dictate under what circumstances eminent domain may be used and define the eminent domain process within the state. DOS has no legal authority in the easement negotiations or in eminent domain proceedings. Responses related to taking the Project out of service at the end of the life of the Project are presented in Consolidated Response DEC-1.
1221	11	Condon	Shirley		I believe the risks involved in the transport of dirty tar sand oil through the thin-walled, high pressure Keystone XL Pipeline is not worth any possible benefit.	Consolidated Response OIL-4 addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils. Keystone has withdrawn its application for a Special Permit as described in Consolidated Response REG-1. Consolidated Response SAF-1 describes the regulatory requirements that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project in a manner that protects the health and safety of the public and the environment.
1221	13	Condon	Shirley		Do not let this Presidential Permit gain approval.	Consolidated Response ENR-1 provides information on the Department of State's environmental review process, the National Interest Determination process, and the need to complete those reviews before approving or denying the Presidential permit for the proposed Project.
1560	1	Condon	Jim		Keystone doesn't work with property owners to minimize impacts.	Consolidated Response EAS-2 addresses issues related to easement negotiations. As noted in that response, DOS has no legal authority in the easement negotiation process.
1560	35	Condon	Jim		Concerned about the pipe thickness and leaks as it	Keystone has withdrawn its application for a Special Permit as

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					deteriorates over time. Need to use a double-walled pipe, especially through the aquifer.	described in Consolidated Response REG-1. As described in Consolidated Response SAF-1, the Pipeline and Hazardous Materials Safety Administration (PHMSA) has regulatory requirements that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project. In addition, PHMSA developed 57 Project-specific Special Conditions that Keystone has agreed to implement. Incorporation of those conditions would result in a Project that would have a degree of safety over any other typically constructed domestic oil pipeline system under current code and a degree of safety along the entire length of the pipeline system similar to that which is required in HCAs as defined in 49 CFR 195.450. Issues related to the Northern High Plains Aquifer System are addressed in Consolidated Responses AQF-1 through AQF-4. Heavier-walled pipe would be used through the portion of the route in the vicinity of the aquifer as indicated in Table 2.3.1-1 of the EIS. Consolidated Response SAF-1 describes the regulatory requirements that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project in a manner that protects the health and safety of the public and the environment. Those requirements do not include the use of double-walled pipe. Consolidated Response AQF-6 also addresses the potential for using double-walled or triple-walled pipe.
1560	36	Condon	Jim		Concerned about the Ogallala aquifer	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
266	1	Connell	Kevin		I do not want this pipeline running through the proposed planned route. There are other areas that it could go. Some areas would be to run it along the Keystone 1 east side of North Dakota, South Dakota and Nebraska or run it down Montana, Wyoming, Colorado, across Kansas and Oklahoma where is already crude oil pipelines where they could pick up more crude oil.	Consolidated Response ALT-1 and Section 4.3 address potential alternative routes, including routes that would avoid much of the Northern High Plains Aquifer System. Section 4.3 of the EIS addresses alternative routes and the reasons that some potential routes, such as routes through Wyoming and Colorado, were not considered reasonable alternatives.
266	2	Connell	Kevin		You need to take a harder look at whether this pipeline is actually Needed, the info that I have found is the Alberta Clipper and Keystone 1 is not filled to there capacity yet. There is overcapacity of pipelines and TransCanada assumes that the pipeline is needed. This pipeline is not needed.	Consolidated Response P&N-1 addresses the need that the Project has been proposed to meet. As noted in that response, the Project has been proposed to meet the heavy crude oil needs of refineries in the Gulf Coast area, not for the U.S. in general. In addition, the Alberta Clipper and existing Keystone pipeline projects serve other markets and do not meet the demands of the Gulf Coast refineries.
266	3	Connell	Kevin		This is not in the public's best interest if health and safety of rural communities and landowners along the route aren't fully protected.	Consolidated Response SAF-1 describes the regulatory requirements that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project in a manner that protects the health and safety of the public and the environment. The proposed route is in compliance with that regulation.
266	4	Connell	Kevin		The pipeline will be bored under two major rivers in this area, Keya Paha and Niobrara rivers. I don't really know hut they can keep the pipe from leaking the way are going to do boring and pulling the pipe though the ground without stressing the pipe to it to crack and leak, this area will be the highest pressure when going under the rivers. To me it would be 1800	Section 2.3.3.5 has been revised to provide additional information on the procedures Keystone would use to ensure protection and integrity are maintained during a horizontal directional drilling (HDD) installation. These procedures include application of an abrasion-resistant overcoat to the fusion-bonded epoxy coat applied at the factory to avoid

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					to 2000 psi at that time.	<p>damage when the pipe is pulled through the hole, creation of a the hole that is larger than the pipe diameter (42-inch-diameter hole or larger for the 36-inch-diameter pipe), bentonite drilling mud to reduce friction and provide lubrication and buoyancy for the pipe when it is pulled through, and the use of cathodic protection and in-line inspection surveys to determine if any damage may have resulted to the pipe coating during the construction process.</p> <p>As noted in Section 2.3.1 of the EIS, the maximum operating of the pipeline would be 1,330 pounds per square inch, gauge, and thick-walled pipe would be used at river crossings (see Table 2.3.1-1 of the EIS).</p>
266	6	Connell	Kevin		When it comes to crossing the Ogallala aquifer, the nation's biggest aquifer is huge concern to me. It supplies water to 70 to 80% people in Nebraska, irrigation to crops and cattle that feeds a lot of people around world besides the local people.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
266	7	Connell	Kevin		Does the Clean Water Act mean anything to anybody. We need to guarantee that we have clean water to drink for ourselves, irrigation for crops and livestock and the next generations to come.	Consolidated Response SAF-1 describes the regulatory requirements that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project in a manner that protects the health and safety of the public and the environment. Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
266	8	Connell	Kevin		There a many free flowing wells that might be stopped because the construction of this pipeline which would hurt local people for watering their livestock. More wells would have to drilled, more cost for somebody.	Free flowing wells are the result of a well screen being installed into a confined aquifer that is under pressure. Confining layers above a confined aquifer are generally located deeper than proposed installation depth. Installation of the proposed Project should not affect the characteristics of these wells.
266	9	Connell	Kevin		If there develops a leak and it is less than that can be detected, like under 1.5%, there will be a lot of crude oil in and on the ground. 1.5% of 500,000 barrels is 7500 barrels or 315,000 gallons of crude oil in or on the ground per day.	Consolidated Response OIL-3 and Section 3.13.5 of the EIS address the detection of small leaks.
266	11	Connell	Kevin		The information that I have found, oil sands doesn't float, it goes to the bottom. How would anybody clean that up in an aquifer as large as the Ogallala Aquifer? I need an answer.	Consolidated Response AQF-3 provides information on hypothetical spills from the Project over two areas of the Northern High Plains Aquifer System and also addresses response actions. Consolidated Response OIL-4 addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils.
266	12	Connell	Kevin		The water where the proposed route is going is 0 to 1000 feet or more for the depth. The proposed pipe will be laying in the aquifer for many miles off and on. There coating might not be good enough to keep it from rusting from the outside. If any nicks or imperfections in the coating will not be good.	Issues related to the Northern High Plains Aquifer System are addressed in Consolidated Responses AQF-1 through AQF-4. As described in Section 2.3.1 of the EIS and in Consolidated Response SAF-1, to avoid or minimize external corrosion, the entire pipeline would be coated pipe with a corrosion-protectant bond and the proposed Project would include a cathodic protection system. Keystone would conduct internal monitoring of the pipeline as a part of its Integrity Management Program and would replace sections of pipe that have unacceptable corrosion levels as defined by the Pipeline and Hazardous Materials Safety Administration.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
266	14	Connell	Kevin		The thousands of ponds and lakes replenish the Ogallala Aquifer, that feeds creeks and rivers. The lakes and ponds are sandy bottoms that provide water for the area cattle and aquatic species like the Sandhill Shiners that is only found here.	Section 3.7.3 of the EIS addresses potential Project-related impacts to fisheries and Section 3.3.2.1 of the EIS discusses potential Project-related impacts to groundwater resources. Additional discussions of project-related impacts to the shallow portions of Ogallala Aquifer are provided in Consolidated Response AQF-2 and the potential for contamination is discussed Consolidated Response in AQF-3.
266	15	Connell	Kevin		During construction when the thin top soil of the Sandhills region is removed in the 110 foot area, what is their plan for getting vegetation growing there again? Far as I know they have not talked to anybody from this area regarding this area. It will take special needs to reseed disturbed area.	The EIS was revised to include additional information on Keystone's construction and restoration techniques within the Sand Hills in Section 3.5. Additional information on Keystone's process for development of construction and restoration methods within the Sand Hills and other issues are discussed in Consolidated Responses ENV-1 and ERO-1 and additional construction and reclamation information specifics to the Sand Hills was added to Appendix H of the EIS.
266	16	Connell	Kevin		So, if the Sandhills get contaminated with the oil sands out of the Keystone XL pipeline from a leak that no one can control. Who will clean that up? WHY should I as Nebraska resident and a taxpayer in Keya Paha county, allow you to jeopardize this land that my late generation entrusted to me to take care of for the next generations.	Section 3.13 presents the systems and equipment that would be in place to limit the volume of a spill from the proposed Project. Onshore pipelines do not experience uncontrollable releases. Consolidated Response LIA-1 addresses Keystone's liability if there is a spill of hazardous materials or fuel during construction or a spill of crude oil from the proposed Project.
266	17	Connell	Kevin		Before this EIS goes any farther, Keystone XL pipeline needs to have an emergency plan in place before the Presidential permit is granted. Have the landowners in Montana, South Dakota and Nebraska review it so they know themselves that areas that will be ecology disaster will be taken care of by the owners of pipeline and oil sands oil. We should have the opportunity to comment on the TransCanada's emergency plan prior to issuance of permits and the approval of the plan.	Consolidated Response RES-1 addresses issues related to preparation and review of emergency response plans for the proposed Project.
266	19	Connell	Kevin		I do not want this pipeline anywhere around the Ogallala Aquifer or the Sandhills region because of the ecology disaster to the area.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. Issues related to the Sand Hills area are addressed in Consolidated Response ERO-1. Consolidated Response ALT-1 addresses potential alternative routes, including routes that would avoid much of the Northern High Plains Aquifer system.
266	23	Connell	Kevin		There needs to be MSDS (Material Safety Data Sheets) on the oil sands that is going to transported in the Keystone XL pipeline. Everything that is a hazard material has a MSDS. Why will the oil sands be any different. We, also need to know how it will diluted and pressured that will operated at in pipeline. I think that if it was going across your property you would like to now to.	Section 2.3.1 of the EIS provides the Project design information, including the maximum operating pressure. Consolidated Response OIL-4 addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils. if the proposed Project is approved and implemented, MSDS sheets will be available for the specific crude oils being transported at the time they are transported.
266	25	Connell	Kevin		WHO gives TransCanada the right to condemn land in The United States for this pipeline? This is a very important question that also needs to answered, because it is hard to negotiate with TransCanada representatives when they have eminent domain hanging over your head when you don't agree with there easement they have offered to you.	As noted in Consolidated Response EAS-2, state laws dictate under what circumstances eminent domain may be used and define the eminent domain process within the state. DOS has no legal authority in the easement negotiations or in eminent domain proceedings.
1329	1	Connell	Kevin		I know that you, yourself can't read all the scoping comments	As described in Section 1.0 of the EIS and in Consolidated

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					being sent in on this subject. You'll have hundreds going thru all the information and putting in some type of filing system. Pros/cons and what other area that you could put it in. Well, this letter will probably be to going to the other area I would say. I know that I don't have enough money or time to fight this pipeline project being proposed by a foreign country coming through the United States. When a foreign company comes in and says we are going to put a crude oil pipeline across your property whether you like it or not. WE have lost our right to freedom. You have a lot of information coming from anybody and groups that you arid your helper will have togo through,Here is my two cents worth. I don't want this crude oil pipeline going across my property, crossing through the Sandhills area and the Ogallala aquifer. That is plain and simple. SO you are going to have tofigure out WHO is more important. The rural people of United States or the foreign company telling us that we need this pipeline and tar sands crude oil. I, over the last year and half, have read a lot of infonnation about this project. This will not do me any good, help me or make my life better. It all comes down to is - GREED- who wants it more. I like my way of life in rural America, I don't need this pipeline, period. I don't need this possible mess that might or when it happens and it will happen. Make a decision from your heart and put yourself in our shoes in rural America. We have a beautiful land out here, we don't need a crude oil pipeline going across it messing it up. I don't live in a concrete city, that is my choice. So, you need to decide if this Keystone XL pipeline is the best interest to the nation or not. Yes, I use petroleum product every day and so do you in many ways that you and I don't even know that we do. SO, the final question to you from me is. Is this Keystone XL pipeline a national interest? I don't think it is, but I am simple person that lives in rural America that loves the land that I live on, so don't mess it up. By allowing a foreign company from shoving a crude oil pipeline down my throat. I don't want this pipeline across my property.	<p>Response RES-2, TransCanada-Keystone Pipeline LP (Keystone) is not a foreign corporation. It is a limited partnership organized under the laws of the state of Delaware. Keystone has the same rights as other pipeline companies in the U.S. to propose projects. Consolidated Response EAS-2 addresses issues related to easement negotiations. As noted in that response, DOS has no legal authority in the easement negotiation process.</p> <p>Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. Issues related to the Sand Hills area are addressed in Consolidated Response ERO-1.</p> <p>Consolidated Response P&N-9 describes the National Interest Determination process.</p>
1337	1	Connell	Karl		We have property that the TransCanada Keystone XL pipeline cross in Keya Paha County – which is across some pretty sandy soil – (Blow sand which moves pretty easy in the wind) and some wet ground that just about stands water. I have not seen or read your plan; TransCanada XL or even the State Department plan to control erosion on my property, to control wind erosion and get grass back in place and growing yet. Where is that plan?	Issues related to the Sand Hills area are addressed in Consolidated Response ERO-1.
1337	2	Connell	Karl		I have not seen or read TransCanada emergency plan that states how they are going to control and clean up a leak from their pipeline. Somebody should have seen that emergency plan by now. Have you seen the plan? Does the State Department have a emergency plan in place for such an accident of leakage from this pipe when its leaks into the High Plain Aquifer in the State of Nebraska. I need to read that plan??	Consolidated Response RES-1 addresses issues related to preparation and review of emergency response plans for the proposed Project. Consolidated Response AQF-3 addresses potential accidental releases of oil into the High Plains Aquifer System and the associated response procedures.
1337	4	Connell	Karl		Is the State Department going to have some responsibility for clean up and liability of leaks, clean up and abandonment, or	Consolidated Response LIA-1 addresses Keystone's liability if there is a spill of hazardous materials or fuel during

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					is TransCanada go to, physical on monetary “forever” just like our easement have been written for “in perpetuity”??	construction and from a spill of crude oil from the Project.
1337	5	Connell	Karl		The good faith negotiations with landowners and TransCanada have been called off by TransCanada. Why has that happened? Nobody seems to know? What is the problems? The State Department need to find out the reasons? Are they TransCanada going to eminent domain and condemn my property and steal it from me; is this the reason??	As noted in Consolidated Response EAS-2, state laws dictate under what circumstances eminent domain may be used and define the eminent domain process within the state. DOS has no legal authority in the easement negotiations or in eminent domain proceedings.
1337	6	Connell	Karl		The site where pumping station #22 in Nebraska this spring was under water from a few inches to a few feet. Not a good site for a pumping station; especially when in sets on top of the Ogallala High Plains Aquifer. The pipe run right thorough the aquifer. When you have a leak how are you going to clean it up? One of the greatest natural resources the state of Nebraska has which supplies fresh drinking water to 70% or more of the people of the state. The water supply for people and agriculture the livelihood of the state of Nebraska that supplies food and fiber to the rest of the people of the USA including you people in Washington DC.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
1337	8	Connell	Karl		I think the local NRDs in the state oppose the building and operation of this TransCanada Keystone XL pipeline because of the possible contamination of creek, rivers wet lands and ground water a leak from this pipeline might cause in the state. This pipeline is not considered to be of national interest at this time!!! We probably will get along with out it.	Section 3.13 of the EIS addresses reliability and safety issues, including calculations of the probability of an accidental release from the Project and the potential environmental impacts associated with accidental releases. Consolidated Response P&N-9 addresses the National Interest Determination process. Consolidated Response P&N-1 addresses the need for the proposed Project.
1337	9	Connell	Karl		The oil that is going to be shipped down this pipe belong to china going to gulf coast and hauled to china because come from their fields in Canada and they have 25% interest in this pipeline so 25% of crude belong to china!!!	Consolidated Response P&N-4 provides information on investments by Chinese companies in Canadian oil sands projects. As noted in that response, there is no Chinese ownership of the proposed Project; it is owned by TransCanada Keystone Pipeline, L.P. (Keystone), a U.S. corporation.
1540	16	Connell	Karl		How could I receive a hard copy of the EIS? I don't have a computer that will run a CD copy.	Consolidated Response REQ-2 provides information for request of locations of paper copies of the EIS and that copies of the draft EIS, other specific information, or references be sent directly to the commenter.
1540	18	Connell	Karl		It sounds like this pipeline is unnecessary. We have an overabundance of pipeline. They have just started putting oil in the east pipeline and they don't have it full yet. The tar sands industry is slowing because people are running out of money.	As noted in Consolidated Response P&N-1, the Project has been proposed to meet the heavy crude oil needs of refineries in the Gulf Coast area, not for the U.S. in general. The Alberta Clipper and existing Keystone pipeline projects serve other markets and do not meet the demands of the Gulf Coast refineries. As noted in Consolidated Response CAN-1, development of the Canadian oil sands projects has been increasing recently. That response provides current and future production information.
1540	19	Connell	Karl		I had thought I was going to have to deal with a 110 foot easement, but reading the information it has turned into a 300 foot corridor. I don't know what the corridor is for except people stomping around on my real estate. I've observed a few people doing research, and it appears that they're	Additional temporary workspaces are described in Section 2.2.7.1. As noted in Table 2.2.7-1, there are not 300-foot-wide-corridors and no areas along the construction right-of-way that are 1,000 feet wide. However, the construction staging areas would be about 470 feet square.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					scanning out over a 1000 foot wide chunk of real estate.	
1540	20	Connell	Karl		I would also like to know more details on the restoration. My pasture is mostly sand that goes across part of a hay meadow. I want to know what's going to happen to get this back into production as soon as possible with some of the native grasses.	Keystone would reclaim all lands affected by construction to pre-construction to the extent practicable and described in Sections 2.3.2.8 and 2.3.2.9 of the EIS and in the Keystone Construction, Mitigation, and Reclamation Plan (presented in Appendix B of the EIS) unless the landowner and Keystone agree to an alternate restoration.
1540	21	Connell	Karl		I also need to know what kind of controls are going to be put in place for erosion control. We get a gentle breeze and real estate does move. I think this area needs to be fenced in so the grass has an opportunity to get fully established so the cattle don't come chew it up.	Issues related to the Sand Hills area are addressed in Consolidated Response ERO-1.
1540	22	Connell	Karl		I want to know what the temperature of the soil is above the pipeline year round. If it's hot, it'll never freeze. Cattle are in there. It'll blow out in short order.	The temperature of the soil during operation of the pipeline is presented in Sections 3.5.5.1 and 3.6.2.2 of the EIS. Consolidated Response SAF-1 describes the regulatory requirements that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project in a manner that protects the health and safety of the public and the environment. It also describes the Project-specific Special Conditions for the proposed Project.
1540	23	Connell	Karl		How is TransCanada going to protect the groundwater during construction in my pasture and hay meadow. I've got wells there 1000 feet wide. How is TransCanada going to protect the creek wells from contamination east of my property and the pipeline yard that's on a hill?	Consolidated Response SAF-1 describes the regulatory requirements that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project in a manner that protects the health and safety of the public and the environment. Keystone would follow the procedures listed in Sections 2.3.2 and 2.3.3 of the EIS and in its Construction, Mitigation, and Reclamation Plan in Appendix B to avoid or reduce erosion and contamination during construction. It is not likely that wells used for domestic purposes, irrigation, and livestock would be affected during construction and normal operation of the proposed Project. However, if there is damage, Compensation to landowners is addressed in Consolidated Response FRM-1 and in Section 2.5 of the Keystone Construction, Mitigation, and Reclamation Plan in Appendix B of the EIS. If there is a spill from the proposed Project, Keystone or the incident response team would inform all landowners in the vicinity of the spill that the release had occurred and advise the landowners of the appropriate precautions. Keystone would be liable for all costs associated with cleanup and restoration as well as other compensations, as noted in Consolidated Response LIA-1. If a stock pond or a well used as a source of domestic or irrigation water is affected, Keystone would provide water until the affected water is proven to be acceptable for use.
1540	24	Connell	Karl		How are they going to protect the pipeline, or the well, from corrosion, contamination, oil leaks, spills?	Sections 2.3.1, 3.13.1, and 3.13.5 provide information on the design of the proposed Project, which does not include any wells. As noted in Consolidated Response SAF-1, the design, construction, operation, maintenance, monitoring, and inspection of the Project would have to be in compliance with federal regulations that were established to protect the health and safety of the public and the environment. Corrosion monitoring and the repair or replacement of corroded pipe is addressed in regulations of the Pipeline and Hazardous Materials Safety Administration (PHMSA) and in Project-

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
						specific Special Conditions developed by PHMSA (see Appendix U of the EIS).
1540	25	Connell	Karl		I've read about how the line welds rub against each other during the transportation of the pipe joints, fatiguing the pipe next to the weld. This is a good source for breakage and leakage into the ground, and with the Ogallala Aquifer so close, that's a major problem.	Keystone and PHMSA would conduct quality control inspections of pipe in the field after delivery and it is installed in the trench. The pipeline would be hydrostatically tested prior to operating the system, as required by PHMSA in its regulations presented in 49 CFR 195. Issues related to the Northern High Plains Aquifer System are addressed in Consolidated Responses AQF-1 through AQF-4.
1540	26	Connell	Karl		How are you going to keep the soil and the sand from blowing away in the pipe yard? How are we going to control the dust, the erosion in the work area where it lays?	Issues related to the Sand Hills area are addressed in Consolidated Response ERO-1. In addition, dust control measures are addressed in the Keystone Construction, Mitigation, and Reclamation Plan (see Appendix B of the EIS).
1540	27	Connell	Karl		How are we going to control the rainwater runoff, as far as sediment getting into creeks?	Keystone would follow the procedures listed in Sections 2.3.2 and 2.3.3 of the EIS and in its Construction, Mitigation, and Reclamation Plan in Appendix B to avoid or reduce erosion and contamination during construction. Issues related to the potential for erosion adjacent to streambanks and private land area are also addressed in Consolidated Response ERO-2.
1540	28	Connell	Karl		South of where I'm at there is a grove of trees, I'm assuming the trees are going to be removed. Where are you going to put them? There's a dollar value on those trees. I want to know what those trees are worth and what they can be used for? Where do I go find that out? I'm assuming they're not going to be able to be burned on the property, that they're going to have to be hauled off.	Keystone would compensate landowners for the loss of trees and will leave all cut timber with the landowner, if desired by the landowner. Trees would be allowed to naturally revegetate within the 110-foot-foot right-of-way except within 10 to 15 feet of the pipeline. An estimated 1,840 acres of upland forest and 281 acres of forested wetlands would be affected by construction, of which 937 acres would be within maintained rights-of-way where trees would not be allowed to become re-established. Where the pipeline route follows an existing right-of-way in forested areas, Keystone attempted to route the pipeline as close as practical to the existing right-of-way to minimize impacts to forested lands. The construction right-of-way at timber shelterbelts in agricultural areas would be reduced to the minimum necessary to construct the pipeline. Mitigation measures designed to minimize impact on forested lands are described in Keystone's Construction Mitigation and Reclamation Plan which is in Appendix B of the EIS. The plan also includes a section on landowner complaint resolution procedures. Tree wastes, stumps, tree crowns, brushes, branches and other forest debris would be either burned, chipped, or removed from the right-of-way.
1540	29	Connell	Karl		As this pipeline goes through my pasture, and I need water on the other side of the pipeline but do not have a well there, how am I going to get water on both sides of the pipeline work when they're in there working, digging, burying in the soil? Is TransCanada going to haul water for the number of days they're constructing the pipeline?	Consolidated Response PVT-2 addresses concerns related to the proximity of the proposed Project to existing structures and facilities.
1540	31	Connell	Karl		We're crossing wetlands, creeks, two rivers, the Keya Paha and Niobrara Rivers, and over the sand hills. Are these high consequence areas? No consequence areas? Why do we want to jeopardize our groundwater with a thin wall pipe?	Keystone has withdrawn its application for a Special Permit as described in Consolidated Response REG-1. As described in Consolidated Response SAF-1, the Pipeline and Hazardous Materials Safety Administration (PHMSA) has regulatory requirements that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project. In addition, PHMSA developed 57 Project-specific Special

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
						<p>Conditions that Keystone has agreed to implement. Incorporation of those conditions would result in a Project that would have a degree of safety over any other typically constructed domestic oil pipeline system under current code and a degree of safety along the entire length of the pipeline system similar to that which is required in HCAs as defined in 49 CFR 195.450.</p> <p>Both the Key Paha and Niobrara rivers would be crossed using the horizontal directional drilling method to avoid impacts to the rivers. Issues related to the Sand Hills area are addressed in Consolidated Response ERO-1.</p>
1540	33	Connell	Karl		The Ogallala Aquifer is the most valuable source of clean, safe drinking water in the United States. It is one of the greatest natural resources we have, but still the pipeline goes through it.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
1540	34	Connell	Karl		What is TransCanada going to do when they have a leak in this area, contaminating the water in the aquifer? This is heavy crude oil; it will not float. It will sink if there is a leak and you'll never be able to find it. Even if there are safety switches that will shut the pipeline down if there is a leak, I've calculated how many gallons of oil that would be in the pipes between pumping stations. It's got to bleed off that 1600 pounds of pressure.	Section 3.13.4 of the EIS describes potential spills from the proposed Project. Consolidated Response OIL-4 and Section 3.13.5 of the EIS describe the characteristics of the crude oil that would be transported by the proposed Project. As noted in the response and the EIS section, that crude oil would be similar to other heavy crude oils currently being refined in Gulf Coast refineries and elsewhere in the U.S. The crude oil would have a specific gravity that is less than that of water, which means crude oil released from the Project would initially float on water. If there is a spill from the Project, Keystone would implement the procedures of either its Emergency Response Plan (ERP) or its relevant Spill Prevention, Control, and Countermeasure Plan (SPCC), depending on the location of the release. Consolidated Response RES-1 addresses issues related to preparation and review of the ERP for the proposed Project. SPCC plans are addressed in Sections 2.3 and 3.13.5 of the EIS and in the Construction, Mitigation, and Reclamation Plan presented in Appendix B of the EIS.
1540	38	Connell	Karl		Does the EIS address the need for the pipeline at this time when we have plenty of pipeline capacity clear up until 2020?	As noted in Consolidated Response P&N-1, the Project has been proposed to meet the heavy crude oil needs of refineries in the Gulf Coast area, not for the U.S. in general. There is not sufficient pipeline capacity to that location. The Alberta Clipper and existing Keystone pipeline projects serve other markets and do not meet the demands of the Gulf Coast refineries.
1540	40	Connell	Karl		Does the EIS consider the greenhouse gas emission of the tar sands over its full life span, including from the time the trucks are digging it out of the ground in Canada until it's burned in my vehicle here?	Consolidated Response GHG-1 addresses the greenhouse gas life-cycle analyses presented in the revised EIS.
1540	41	Connell	Karl		Does the EIS address any useful information on liability plans?	Consolidated Response LIA-1 addresses Keystone's liability if there is a spill of hazardous materials or fuel during construction or a spill of crude oil from the proposed Project.
1540	43	Connell	Karl		Does the Department of State consider this project to be in the national interest of the people of the United States of America, especially when this oil is headed for China?	As noted in Consolidated Responses ENR-1 and P&N-9, the National Interest Determination will not be made until after the final EIS is issued. As described in Consolidated Responses P&N-1, P&N-2, and P&N-4, neither the oil nor the products refined for the oil are expected to be shipped from the Gulf

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
						Coast to China.
611	1	Cook	Ruth		Nebraska's Ogallala Aquifer is a precious resource. We do not want our Sandhills put in jeopardy by any pipeline. I do not trust oil companies to keep it safe.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
877	1	Coon	Sandra		We need to be utilizing clean energy not dirty energy. Have we learned nothing. No tar sands. Please please increase tax on oil to generate money to fund the green revolution. All of us can do with consuming less if we are just forced to. This is a necessity. It will happen weather it happens the easy way, when there are resources to generate green energy, or when there is nothing to fall back on. Limited resources will run out.	Consolidated Response ALT-2 addresses the use of alternative technologies and alternative energy sources. The Department of State does not have the authority to establish tax laws.
297	1	Coppinger	Joyce		The Ogallala Aquifer is part of Nebraska's greatest natural resource - underground fresh water. It is a vital resource for this region. The proposed Trans Canadian Keystone oil pipeline crossing beneath the ground, under rivers and in some places submerged in water puts this resource at great risk.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
297	2	Coppinger	Joyce		The pipeline route should be changed to avoid ALL precious resources in the area through which the pipeline would cross. Funding this project should be denied as should approval of the project in its current configuration.	Impacts associated with construction and normal operation of the proposed Project are presented in the resources sections of Section 3.0 of the EIS. As described in those sections, construction and normal operation of the proposed Project would not result in significant impacts. Consolidated Response ALT-1 addresses issues related to alternative routes. Funding for the Project would be private; this financing would be provided by the applicant (Keystone) and not DOS or other government agencies. Therefore, funding cannot be "denied" as requested by the commenter. Approval or denial of the Project will be determined after completion of the environmental review and the National Interest Determination (see Consolidated Responses ENR-1 and REG-2).
1049	1	Copple	Janine		This note is to express my continuing amazement and concern that the Keystone pipeline project is still even being considered. Anything buried in the Sandhills becomes a blowout in a couple of years.	Issues related to the Sand Hills area are addressed in Consolidated Response ERO-1.
1049	3	Copple	Janine		Any spillage passes straight through the sand into the water. Spillage has been common from the pipeline in Alaska. None of this is well considered or prudent.	Section 3.13 of the EIS addresses reliability and safety issues, including calculations of the probability of a spill from the Project and the potential environmental impacts associated with spills, including discussions of surface water and groundwater. Issues related to the High Plains Aquifer System are addressed in Consolidated Response AQF-1 through AQF-4. Consolidated Response AQF-3 provides information on hypothetical spills from the Project over two areas of the Northern High Plains Aquifer System. Issues related to the Sand Hills area are addressed in Consolidated Response ERO-1.
1049	4	Copple	Janine		The refining of tar sands at all is something we should have no part of. The whole project is an environmental trainwreck in slow motion.	As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries.
1049	5	Copple	Janine		Thank you for re-considering and blocking this ill-conceived project.	Consolidated Response ENR-1 provides information on the Department of State's environmental review process, the

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
						National Interest Determination process, and the need to complete those reviews before approving or denying the Presidential permit for the proposed Project.
1189	1	Corbit	Chris		I am very concerned about the pipeline running through NE. It has the potential to [destroy our ground water system] and contaminate the land as well.	<p>Section 3.13 of the EIS addresses reliability and safety issues, including calculations of the probability of a spill from the Project and the potential environmental impacts associated with spills.</p> <p>Issues related to the Northern High Plains Aquifer (NHPAQ) system are addressed in Consolidated Responses AQF-1 through AQF-4. Consolidated Response AQF-3 provides information on hypothetical spills from the Project over two areas of the Northern High Plains Aquifer System. As noted in those Responses, a spill from the proposed Project over the NHPAQ system would not destroy the ground water system.</p>
1546	159	Corcoan	Tom	Center for North American Energy Security	Canadians committed to building the pipeline in responsible, environmentally acceptable manner.	Comment acknowledged.
1546	161	Corcoan	Tom	Center for North American Energy Security	It would be against the law to take into account indirect GHG emissions except those caused by the action itself (40CFR 1508.8B.).	Consolidated Responses GHG-1 through GHG-5 address concerns related to greenhouse gas, climate change, alternative energy considerations, and approach to assessment of GHG emissions.
659	1	Corcoran	Tom	CNAES	<p>Dear Ms. Orlando: On behalf of the Center for North American Energy Security, I am writing in support of the Keystone Pipeline project. The Center for North American Energy Security (CNAES) is a non-partisan organization dedicated to environmentally sound development of oil sands, oil shale and similar so-called "unconventional" resources in North America. CNAES agrees with the State Department regarding the conclusions given by the Draft Environmental Impact Statement (DEIS) on the Keystone XL pipeline project. The DEIS evaluation studied the project's potential impact on various environmental matters, upon which it was found that the Keystone project would result in "limited adverse environmental impacts during both construction and operation". Once completed, the Keystone XL project would consist of three new pipelines that will span approximately 1,380 miles across the United States from Canada, with the capacity to carry about 700,000 barrels of crude oil per day initially with an eventual increased capacity of nearly 900,000 barrels in the long term. The environmental footprint for this project is minimal – in fact, the total disturbed area for the project will only be approximately 150 square miles. These secure energy supplies from the purposed pipeline will strengthen America's energy and economic security, as well as creating hundreds of high paying, family supporting jobs along the way. The Government of Alberta projects that U.S. imports of Canadian oil sands will increase from current amounts of about 1.5 million barrels daily to nearly 4.3 billion barrels a day over the next two decades in order to meet increasing demand. CNAES hopes that the benefits of such a project like the Keystone XL will be considered and fully supported by the federal government; especially at a time when we are importing more and more energy supplies from</p>	Comment acknowledged.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					places around the world that do not share our strategic interests. Despite efforts to develop alternatives, crude oil will remain a critical component of meeting America's energy needs for the foreseeable future. Ensuring access to affordable, reliable energy from our North American allies that provides economic and energy security benefits should be a national priority. Projects such as the Keystone pipeline ensure increased domestic energy security, stable prices for consumers, along with minimal environmental impacts. CNAES is committed to working cooperatively with the State Department, the Administration and Congress to ensure U.S. energy policy accurately reflects our growing needs to enhance U.S. energy security, properly protect our environment, expand our resource base, and work toward the thoughtful utilization of all energy resources which includes the benefits of the Keystone XL project.	
659	2	Corcoran	Tom	CNAES	CNAES believes that the Department of State should not include a lifecycle GHG analysis of the fuels that the Keystone Pipeline will move in the final Environmental Impact Statement. The Draft Environmental Impact Statement (DEIS) that has been prepared for this project properly evaluates the greenhouse gas emissions that will directly result from the project. Any evaluation of the indirect GHG emissions (such as from oil sands production or the transportation sector) would be purely speculative. Further, such an evaluation is precluded by the governing federal regulations, which limit "indirect effects" to those "which are caused by the action" (40 CFR 1508.8(b)).	Consolidated Responses GHG-1 through GHG-5 address concerns related to greenhouse gas, climate change, alternative energy considerations, and approach to assessment of GHG emissions.
1088	1	Cordes	Margret		I encourage you to do all you can to see that the oversight of the Keystone Pipeline is not with the State Department!	The Department of State (DOS) does not have regulatory control over the proposed Project. As described in Consolidated Response ENR-1, DOS is responsible for the review of Keystone's application of a Presidential permit and is the lead federal agency for the NEPA review of the proposed Project. Keystone would be under the regulatory jurisdiction of the Pipeline and Hazardous Materials Safety Administration (PHMSA), which is an agency of the U.S. Department of Transportation. Consolidated Response SAF-1 describes the regulatory requirements of PHMSA that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project. It also describes the inspections and reviews of the proposed Project that PHMSA would conduct to ensure compliance with those regulatory requirements.
1088	2	Cordes	Margret		In addition, I am concerned along with many Nebraskans about the potential danger to the Ogallala aquifer---Nebraska must maintain some control over quality and safety standards, of better yet, reroute the pipeline away from the aquifer.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. Consolidated Response ALT-1 addresses potential alternative routes, including routes that would avoid much of the Northern High Plains Aquifer system. As described in Consolidated Response GLF-1, the risks associated with the proposed Project are substantially different from those associated with the BP Deepwater Horizon Project.
1014	1	Cornelius	Dana		Water is the number one resource that we have in Nebraska it should be protected under all means.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
1086	1	Cornish	Janet		I am a resident of Nebraska and am wholly opposed to putting	Issues related to the Northern High Plains Aquifer system are

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					the pipeline close to the Ogallala Aquifer. There is not	addressed in Consolidated Responses AQF-1 through AQF-4.
1476	1	Corruccini	Rebecca		I vehemently oppose the Department of State issuing permits for pipelines to import tar sands, which are the world's DIRTIEST and possibly MOST EXPENSIVE fuel. The Dept. of State's duty is to thoroughly consider the devastating environmental and greenhouse gas effects of Canadian tar sands mines and expanding the US' reliance on this egregious fuel. Tar sands oil IS NOT equitable to conventional oil.	Consolidated Response OIL-4 addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils. Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project. Consolidated Response GHG-1 addresses GHG life-cycle analyses.
1476	2	Corruccini	Rebecca		It emits AT LEAST 20% more global warming pollution – this single pipeline would cause an extra 38 million metric tons of additional greenhouse gas emissions annually!	Consolidated Response GHG-1 addresses the greenhouse gas life-cycle analyses presented in the revised EIS.
1476	4	Corruccini	Rebecca		Furthermore, tar sands DO NOT promote US energy security – US demand drives up prices, benefitting our enemies even when we get our oil from the friendliest countries. Tar sands threaten our national security as well as our climate security. Please, PLEASE do NOT give permits for pipelines such as Keystone XL. It would be a HUGE mistake.	Consolidated Response P&N-1 addresses the need that the Project has been proposed to meet, including information on crude oil supply and demand from an analysis specific to the proposed Project. Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project. Consolidated Response GHG-1 addresses GHG life-cycle analyses. Consolidated Response P&N-9 describes the National Interest Determination process.
1550	34	Covenais	Marty	Indigenous Environmental Network out of Bemidji, Minnesota	yes, we do have 60- year old pipe. We also have a 20-year lease on that pipe again. So that's 80 years that that pipe is going to be in the ground. There is no life cycle in Pipeline Safety Administration's glossary for how long the life cycle is for a pipe.	Responses related to the life of the Project and taking the Project out of service at the end of the life of the Project are presented in Consolidated Response DEC-1.
1550	35	Covenais	Marty	Indigenous Environmental Network out of Bemidji, Minnesota	hey also don't have an abandonment plan. Well, they do have an abandonment plan. It's in their glossary. And in their glossary it says that they will purge the lines, fill them with water or some other chemicals, and leave them in the ground.	As noted in Consolidated Response DEC-1, the Pipeline and Hazardous Materials Safety Administration requires "purging of combustibles, and sealing abandoned facilities left in place to minimize safety and environmental hazards" when abandoning pipelines. The agency does not require that the lines be filled with water or chemicals.
1550	37	Covenais	Marty	Indigenous Environmental Network out of Bemidji, Minnesota	there's issues with the administration that oversee it. Three-quarters of the people on the steering committee are made up of industry people. So it's like the fox watching the hens. The other four people that are on there is one is a fireman and the other three work for pipeline safety type environmental groups that go out and do presentations on pipeline safety, on how safe they are.	Consolidated Response SAF-1 describes the regulatory requirements and Project-specific Special Conditions that Keystone would comply with to construct, operate, maintain, inspect, and monitor the proposed Project. It also describes the monitoring, inspections, and reviews of the proposed Project that the Pipeline and Hazardous Materials Safety Administration would conduct to ensure compliance with those regulatory requirements.
1550	38	Covenais	Marty	Indigenous Environmental Network out of Bemidji, Minnesota	The oil isn't the problem here. When it leaks the oil is not the problem. The oil belongs in the ground already. It's the chemicals they put in the oil to make it flow through the lines. It's the diluents. Those are gas-like chemicals.	Consolidated Response OIL-4 addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils. Section 3.13.5 of the EIS discusses the potential toxicity of the oil in the environment.
1550	39	Covenais	Marty	Indigenous Environmental Network out of Bemidji,	There is actually no need for this oil also. If you look at the U.S. population consumption of oil is actually on a down trend. China is now the number one consumer in oil, and it's increasing its amount. So when we say that this oil is going	Consolidated Response P&N-1 addresses the need for the Proposed Project. As noted in that response, the Project has been proposed to meet the heavy crude oil needs of refineries in the Gulf Coast area, not for the U.S. in general.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
				Minnesota	down to Houston. It's going down to Houston. It's going overseas, and it's already going overseas.	Consolidated Response P&N-2 provides information on the export of refined product from Gulf Coast refineries.
1550	40	Covenais	Marty	Indigenous Environmental Network out of Bemidji, Minnesota	The need issue, we have Enbridge Pipeline saying we don't need the Keystone XL. We have Sun Core, the oil companies in Canada saying we didn't even need the Alberta Clipper up in northern Minnesota.	As noted in Consolidated Response P&N-1, the Project has been proposed to meet the heavy crude oil needs of refineries in the Gulf Coast area, not for the U.S. in general. There is not sufficient pipeline capacity to that location. The Alberta Clipper and existing Keystone pipeline projects serve other markets and do not meet the demands of the Gulf Coast refineries.
1550	41	Covenais	Marty	Indigenous Environmental Network out of Bemidji, Minnesota	There are sacred sites all along this route, all the way through Buffalo and everywhere else.	Consolidated Response CUL-1 and Section 3.11.1.2 of the EIS address properties of religious and cultural significance to Indian tribes, including Traditional Cultural Properties. Also, Section 3.11.4.3 of the EIS addresses the consultation process between DOS and Indian tribes. The consultation process included the development of Traditional Cultural Property studies that discuss traditional activities and land use by Indian tribes who have traditionally used lands in the vicinity of the proposed Project.
1556	44	Covenais	Marty	Indigenous Environmental Network	Pipeline safety, the pipeline safety is a government agency that is made of steering committee members that oversee it and make the rules. The steering committee is three-quarters industry people. The other quarter, there's four of them, are made up of people that -- one of them is a firefighter and the other three work with the industry in creating trainings to come out to give people to say this is how pipelines work.	DOS is not aware of the safety steering committee the commenter is referring to. As described in Consolidated Response SAF-1, the Pipeline and Hazardous Materials Safety Administration (PHMSA) has regulatory requirements that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project in a manner that protects the health and safety of the public and the environment. In addition, PHMSA developed 57 Project-specific Special Conditions that Keystone has agreed to implement. Incorporation of those conditions would result in a Project that would have a degree of safety over any other typically constructed domestic oil pipeline system under current code and a degree of safety along the entire length of the pipeline system similar to that which is required in HCAs as defined in 49 CFR 195.450.
1556	48	Covenais	Marty	Indigenous Environmental Network	The EIS does not address diluents. Diluents that are the chemicals they put in the oil to make it flow through the pipeline. Those are known human carcinogens. They get into the waters. Those are dangerous.	Consolidated Response OIL-4 and Section 3.13.5.1 of the EIS address the composition of the Canadian crude oils that would be transported by the proposed Project. As noted in that response the EIS section, the Canadian crude oil that would be transported is similar in composition to other heavy crude oils.
1556	51	Covenais	Marty	Indigenous Environmental Network	These jobs are short- term and most of them are not going to be skilled jobs	Consolidated Response ECO-1 addresses potential socioeconomic impacts associated with construction and normal operation of the proposed Project.
1556	53	Covenais	Marty	Indigenous Environmental Network	NEPA is a great idea. It's a wonderful federal idea. I have to say probably one of the few. The problem is, is they set the guidelines but they don't set the details on how to get the information. So some people can do it this way. Others can do it this way. There's no conformity in that.	Consolidated Response ENR-1 provides information on the Department of State's environmental review process, the National Interest Determination process, and the need to complete those reviews before approving or denying the Presidential permit for the proposed Project.
1556	54	Covenais	Marty	Indigenous Environmental Network	This will not create cheaper gas for us. The tar sands that came here that they're bringing through these pipelines, and someone else talked about how much there is, over half of the oil that is the ground is not feasible to reach unless the oil prices reach \$140 a barrel. When we were at \$4 a barrel, we're at \$120 a barrel, so gas prices will increase because it's	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project. Consolidated Response ECO-1 and Section 3.10.2.2 of the EIS address potential socioeconomic impacts. An analysis of the potential U.S.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					not feasible for them to even get that oil.	macro-economic impacts of the pipeline capacities and use are outside of the scope of this EIS.
753	1	Covintree	Winifred		The Keystone XL Pipeline Project is a disturbing proposal to build a pipeline to transport tar sands from Canada to Texas...The major considerations are: (1) The oil would be exceptionally dirty and therefore doesn't meet U.S. standards...	Consolidated Response OIL-4 addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils.
753	2	Covintree	Winifred		...Why do we want to do anything to gear up for an big expansion of the very dirty tar sands industry, which would pretty much blow any climate targets that the U.S. or Canada was trying to set...	Consolidated Response P&N-1 addresses the need that the Project has been proposed to meet.
753	3	Covintree	Winifred		I hope it or anything like it does not succeed in becoming a reality.	Comment acknowledged.
753	4	Covintree	Winifred		I have questions about whether enough safety precautions could guarantee that groundwater in the Ogallala Aquifer would not be at risk.	As described in Consolidated Response SAF-1, the Pipeline and Hazardous Materials Safety Administration (PHMSA) has regulatory requirements that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project in a manner that protects the health and safety of the public and the environment. In addition, PHMSA developed 57 Project-specific Special Conditions that Keystone has agreed to implement. Incorporation of those conditions would result in a Project that would have a degree of safety over any other typically constructed domestic oil pipeline system under current code and a degree of safety along the entire length of the pipeline system similar to that which is required in HCAs as defined in 49 CFR 195.450. Issues related to the High Plains Aquifer System are addressed in Consolidated Responses AQF-1 through AQF-4. As noted in Section 3.13 of the EIS, even with stringent safety measures imposed and the risk of a spill is small, it is impossible to guarantee that a spill would not occur.
753	8	Covintree	Winifred		The major considerations are: ... (4) Many people are dependent on the Great Plains for corn, beef, wheat, sunflowers, etc., -- the water that is being risked in this venture supports those agricultural products -- from the Dakotas to Texas.	The impacts associated with implementation of the proposed Project are addressed in Section 3.0 of the EIS. As noted in that section, construction and normal operation the proposed Project would not result in significant environmental impacts. Section 3.13 of the EIS addresses reliability and safety issues, including calculations of the probability of a spill from the proposed Project and the potential environmental impacts associated with spills. Issues related to the High Plains Aquifer System are addressed in Consolidated Response AQF-1 through AQF-4. Consolidated Response AQF-3 provides information on hypothetical spills from the Project over two areas of the Northern High Plains Aquifer System.
418	1	Cowdrey	Anthony		With the gusher spewing in the gulf, now is the time to look at a clean energy future WITHOUT this dirty oil!	Consolidated Response ALT-2 addresses the use of alternative technologies, alternative energy sources, and conservation of energy.
99	1	Cox	Larry		I am opposed to this project ruining the Ogallala Aquifers.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
1194	1	Coyne	Lelia		Just say no!	Comment acknowledged.
1194	2	Coyne	Lelia		There exists no adequate technology to safeguard it absolutely and the loss is too great to risk.	Consolidated Response SAF-1 describes the regulatory requirements and Project-specific Special Conditions that Keystone would comply with to construct, operate, maintain,

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
						inspect, and monitor the proposed Project. It also describes the monitoring, inspections, and reviews of the proposed Project that the Pipeline and Hazardous Materials Safety Administration would conduct to ensure compliance with those regulatory requirements.
260	2	Crabtree	Lloyd	County officials TX	As we understand it, Keystone XL will create more than 13,000 high-wage construction and manufacturing jobs during the project's 2011-2012 construction schedule. Many of those jobs will be created in Texas and in our county, where too many of our residents continue to find it difficult to find good jobs. Additionally, the Keystone XL project will benefit businesses that provide supplies, goods and services for its construction and operation.	Consolidated Response ECO-1 addresses potential socioeconomic impacts, and Consolidated Response TAX-1 addresses concerns regarding taxes.
260	3	Crabtree	Lloyd	County officials TX	In addition to the jobs Keystone XL will create, the project will generate substantial economic benefits for the United States and in states and communities along the proposed route. Like our counties, in many cases these are areas where economic performance has stagnated or is shrinking. It is our understanding that TransCanada commissioned a study to measure the project's economic stimulus to the U.S. and the states along the route. The study found that in the U.S., Keystone XL would generate \$20.9 billion in total expenditures, \$9.6 billion in output of (gross product), personal income of \$6.5 billion and 118,935 person years of employment (jobs).	Consolidated Response ECO-1 addresses potential socioeconomic impacts, and Consolidated Response TAX-1 addresses concerns regarding taxes.
260	4	Crabtree	Lloyd	County officials TX	In addition, the report concluded that during construction Keystone XL would generate \$486.36 million in tax revenue for state governments along the route and \$99.1 million for local taxing entities where the pipeline is located. In Texas, the study found Keystone XL expenditures during construction would total \$5.4 billion and generate an economic gross product of nearly \$2.86 billion. Keystone XL construction also would generate more than \$64.5 million in tax revenue for local government and \$152 million for state government.	Consolidated Responses TAX-1 and ECO-1 address the estimated increases in the tax base and the jobs generated by the proposed Project. Also see the revisions to Sections 3.10.2.3 and 3.10.2.4 of the EIS.
260	8	Crabtree	Lloyd	County officials TX	We enthusiastically support the Keystone XL Pipeline Project and encourage the Department of State to confirm the findings of the Draft Environmental Impact Statement, which found that the proposed Keystone XL Pipeline would have "limited adverse environmental impact during construction and operation."	Comment acknowledged.
895	1	Crabtree	John		The Keystone pipeline is an ill-conceived effort to bring tar sand oil to the American market. Little or no consideration has been given to the impact this pipeline and the potential environmental problems will have on family farmers, ranchers and rural communities in it's path. Please stop this venture, at least until all these issues have been dealt with. If the catastrophe in the gulf has any silver lining, clearly it must be that we learn from our mistakes and do not hurry through these processes for the sake of short term energy gain and oil company profits.	Section 3.0 of the EIS addresses the potential environmental impacts of the proposed Project. Consolidated Responses ENR-1 and P&N-9 provide information on the DOS environmental review process, the National Interest Determination process, and the need to complete those reviews before approving or denying the Presidential permit for the proposed Project.
639	1	Crawford	Tanja&Troy&Timothy		We don't want your pipelines in Nebraska (or anywhere else in the US or the world!!!)	Comment acknowledged.
1557	8	Crawford	Rosemary		Communication has been very poor. Bobby Wegner at the	Consolidated Response CMT-2 addresses issues related to

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					Oklahoma Secretary of State of Energy and J.D. Strong form the Oklahoma Secretary of the Environment and their staff memebers knew NOTHING about this meeting. Tribal nations from Cushing to Durant all knew nothing about this meeting.	comment meetings on the draft EIS and requests for additional public involvement. Consolidated Response INT-1 addresses concerns related to the Notice of Intent (NOI) to prepare an EIS for the proposed Project. Consolidated Response CUL-1 and Section 3.11.4.3 of the EIS address the consultation process between DOS and Indian tribes. As noted in Consolidated Response CUL-1, a Programmatic Agreement (PA) has been developed for the Project under Section 106 of the National Historic Preservation Act. The PA includes mitigation measures for known adverse effects and provides a process for ongoing surveys to be conducted in areas where access was not granted during the EIS process. The Traditional Cultural Property (TCP) reports (noted in Section 3.11.4-3 of the EIS) may not be disclosed due to concerns regarding confidentiality. Potential impacts to cultural resources are addressed in Section 3.11.3.1 of the EIS. DOS considers this assessment to be in compliance with NEPA environmental review requirements.
1557	9	Crawford	Rosemary		Did not find sufficient descriptions on the environmental impacts of catastrophic events from the pipeline. Not enough information in the DEIS on how to protect the environment.	Sections 3.13.5.6, including Table 1.13.5-10, and 3.13.6 of the EIS, address potential impacts, including catastrophic impacts, of many spill sizes, including a maximum spill volume. The impacts associated with implementation of the proposed Project, as well as recommended mitigation measures, are addressed in the resource portions of Section 3.0 of the EIS. As noted in that section, construction an dnormal operation of the proposed Project would not result in significant environmental impacts.
1557	10	Crawford	Rosemary		Pipeline doesn't support local development of crude oil or new companies promoting alternative energy.	Consolidated Response P&N-1 addresses the need for heavy crude oil in the Gulf Coast refineries that the Project has been proposed to meet. At the present time there is not sufficient pipeline capacity to ship heavy crude oil from the Cushing area to the Gulf Coast refineries. The proposed Cushing Marketlink Project described in Section 2.5.4 of the EIS would provide an opportunity for producers in the general area of Cushing to ship crude oil to Gulf Coast refineries via the proposed Project. Consolidated Response P&N-5 addresses issues related to investments in other technologies.
1557	8	Crawford	Rosemary		Communication has been very poor. Bobby Wegner at the Oklahoma Secretary of State of Energy and J.D. Strong form the Oklahoma Secretary of the Environment and their staff members knew NOTHING about this meeting. Tribal nations from Cushing to Durant all knew nothing about this meeting.	Consolidated Response INT-1 addresses concerns related to the Notice of Intent (NOI) to prepare an EIS for the proposed Project. Consolidated Response CMT-3 addresses the level of information provided to the public regarding the proposed Project and the draft EIS scoping meeting locations and schedules. Consolidated Response CUL-1 and Section 3.11.4.3 of the EIS address the consultation process between DOS and Indian tribes. As noted in Consolidated Response CUL-1, a Programmatic Agreement (PA) has been developed for the Project under Section 106 of the National Historic Preservation Act. The PA includes mitigation measures for known adverse effects and provides a process for ongoing surveys to be conducted in areas where access was not granted during the EIS process. The Traditional Cultural Property (TCP) reports (noted in Section 3.11.4-3 of the EIS) may not be disclosed due to concerns regarding

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
						confidentiality. Potential impacts to cultural resources are addressed in Section 3.11.3.1 of the EIS. DOS considers this assessment to be in compliance with NEPA environmental review requirements.
763	1	Crayne	Kim		This pipeline should not be allowed to run across the Sandhills of Nebraska...	Identification of sensitive environments crossed by the proposed Project is discussed in Consolidated Response ENV-1 and ENV-3. Issues related to the Sand Hills area are addressed in Consolidated Response ERO-1.
763	2	Crayne	Kim		...Unfortunately, there is bound to be an accident and the consequences of polluting the aquifer are too disastrous to contemplate...I am disgusted that our state leaders cannot see the severe consequences of a mistake in this issue-especially based on the recent history of not only the Gulf oil spill, but numerous spills around the country...	Section 3.13 of the EIS addresses reliability and safety issues, including calculations of the probability of a spill from the Project. Issues related to the Northern High Plains Aquifer System are addressed in Consolidated Responses AQF-1 through AQF-4.
763	3	Crayne	Kim		...There definitely should be NO relaxation of any regulations for safety--in fact-they should be strengthened if this is allowed across the Sandhills...	Keystone has withdrawn its application for a Special Permit as described in Consolidated Response REG-1. As described in Consolidated Response SAF-1, the Pipeline and Hazardous Materials Safety Administration (PHMSA) has regulatory requirements that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project in a manner that protects the health and safety of the public and the environment. In addition, PHMSA developed 57 Project-specific Special Conditions that Keystone has agreed to implement. Incorporation of those conditions would result in a Project that would have a degree of safety over any other typically constructed domestic oil pipeline system under current code and a degree of safety along the entire length of the pipeline system similar to that which is required in HCAs as defined in 49 CFR 195.450.
763	4	Crayne	Kim		...This should be a no-brainer to deny this oil company the right to cross our state with an oil pipeline.	The commenter's opinion is noted.
764	1	Crayne	Casey		This pipeline should not be allowed to run across the Sandhills of Nebraska...	Identification of sensitive environments crossed by the proposed Project is discussed in Consolidated Response ENV-1 and ENV-3. Issues related to the Sand Hills area are addressed in Consolidated Response ERO-1.
764	2	Crayne	Casey		...Unfortunately, there is bound to be an accident and the consequences of polluting the aquifer are too disastrous to contemplate...I am disgusted that our state leaders cannot see the severe consequences of a mistake in this issue-especially based on the recent history of not only the Gulf oil spill, but numerous spills around the country...	Section 3.13 of the EIS addresses reliability and safety issues, including calculations of the probability of a spill from the Project. Issues related to the Northern High Plains Aquifer System are addressed in Consolidated Responses AQF-1 through AQF-4.
764	3	Crayne	Casey		...There definitely should be NO relaxation of any regulations for safety--in fact-they should be strengthened if this is allowed across the Sandhills...	Keystone has withdrawn its application for a Special Permit as described in Consolidated Response REG-1. As described in Consolidated Response SAF-1, the Pipeline and Hazardous Materials Safety Administration (PHMSA) has regulatory requirements that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project in a manner that protects the health and safety of the public and the environment. In addition, PHMSA developed 57 Project-specific Special Conditions that Keystone has agreed to implement. Incorporation of those conditions would result in a Project that would have a degree of safety over any other typically constructed domestic oil pipeline system under

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
						current code and a degree of safety along the entire length of the pipeline system similar to that which is required in HCAs as defined in 49 CFR 195.450.
764	4	Crayne	Casey		...This should be a no-brainer to deny this oil company the right to cross our state with an oil pipeline.	The commenter's opinion is noted.
1404	1	Crays	Don&Sheila		Does TransCanada have and will they follow a better plan of action for an oil clean up than BP did with their oil spill in the gulf. How soon will it take TransCanada to find a oil spill in their pipeline especially after the pipes have been in the ground for several years... What happens if there is an oil spill and the oil gets into the Ogallala Aquifer and contaminates it.	Consolidated Response RES-1 addresses issues related to preparation and review of the Emergency Response Plan (ERP) for the proposed Project. Spill Prevention, Control, and Countermeasure plans are addressed in Sections 2.3 and 3.13.5 of the EIS and in the Construction, Mitigation, and Reclamation Plan presented in Appendix B of the EIS. Specific measures for responding to spills that reach groundwater would be included in the response plans.
1404	2	Crays	Don&Sheila		We are concerned about our water supply. What about our wells for domestic use, irrigation and livestock	It is not likely that wells used for domestic purposes, irrigation, and livestock would be affected during construction and normal operation of the proposed Project. However, if there is damage, Compensation to landowners is addressed in Consolidated Response FRM-1 and in Section 2.5 of the Keystone Construction, Mitigation, and Reclamation Plan in Appendix B of the EIS. If there is a spill from the proposed Project, Keystone or the incident response team would inform all landowners in the vicinity of the spill that the release had occurred and advise the landowners of the appropriate precautions. Keystone would be liable for all costs associated with cleanup and restoration as well as other compensations, as noted in Consolidated Response LIA-1. If a stock pond or a well used as a source of domestic or irrigation water is affected, Keystone would provide water until the affected water is proven to be acceptable for use.
1404	3	Crays	Don&Sheila		What happens if there is an oil spill and the oil gets into the Ogallala Aquifer and contaminates it?	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
608	1	Cronin	Carol		I am adamantly opposed to the Keystone XL pipeline. Nebraska has a fragile ecosystem, particularly in the Sandhills,	Identification of sensitive environments crossed by the proposed Project is discussed in Consolidated Response ENV-1 and ENV-3. Issues related to the Sand Hills area are addressed in Consolidated Response ERO-1.
608	2	Cronin	Carol		The Ogallala Aquifer is unique.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
608	3	Cronin	Carol		NO ONE EXPECTED THE BP LEAK in the gulf. I believe that no one can anticipate a leak of the pipeline in Nebraska or the Oglalla aquifer. The pipeline is premature and the risk has not been fully explored.	Consolidated Response P&N-1 addresses the need for the proposed Project. Consolidated Response OIL-1 addresses the likelihood of spills from the Project. Section 3.13 of the EIS was revised to update spill incident statistics and projections, provide additional information on composition of the crude oil that would be transported by the proposed Project, additional information on potential impacts to the Northern High Plains Aquifer system, and other key information. This section addresses reliability and safety issues, including calculations of the probability of a spill from the proposed Project and the potential environmental impacts associated with spills. Appendix P of the EIS presents a risk assessment for the proposed Project.
608	4	Cronin	Carol		There are earthquakes in this area and the Missouri fault line was the location of the largest earthquake in America!	Consolidated Response GEO-2 addresses potential seismic hazards.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
608	5	Cronin	Carol		Throw on that the Sandhill cranes,	Construction and operation of the proposed Project would not infringe on or disrupt the migration of sandhill cranes. Most wetland habitats altered by construction would be restored. River roosting habitats would be crossed using the horizontal directional drilling (HDD) method and there would be no surface damage to these habitats. HDD is described in Section 2.3.3.5 of the EIS.
608	6	Cronin	Carol		I am adamantly opposed to the keystone xl pipeline. Nebraska has a fragile ecosystem, particularly in the Sandhills, and the Oglalla aquifer is unique. NO ONE EXPECTED THE BP LEAK in the gulf. I believe that no one can anticipate a leak of the pipeline in Nebraska or the Oglalla aquifer. The pipeline is premature and the risk has not been fully explored. There are earthquakes in this area and the Missouri faultline was the location of the largest earthquake in America! Throw on that the Sandhill cranes, nebraska's agriculture economic system, and the fact that this is benefitting Canada....it's just not worth it.	As described in Consolidated Response GLF-1, the risks associated with the proposed Project are substantially different from those associated with the BP Deepwater Horizon Project. Consolidated Response GEO-2 addresses potential fault and seismicity hazards along the proposed Project corridor. Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. Issues related to the Sand Hills area are addressed in Consolidated Response ERO-1. Section 3.13 of the EIS addresses reliability and safety issues, including calculations of the probability of a spill from the proposed Project and the potential environmental impacts associated with spills.
608	7	Cronin	Carol		and the fact that this is benefitting Canada....it's just not worth it.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information on current and future production. As noted in that Consolidated Response, without the proposed Project, oil sands development would continue at or above the current level until at least 2020, with or without the proposed Project.
1544	36	Crozat-Williams	Madeline	Code Pink Houston	We should not be refining tar sands at all.	The commenter's opinion is noted.
1544	37	Crozat-Williams	Madeline	Code Pink Houston	We wish the government would not give a permit for this pipeline.	Comment acknowledged.
1544	38	Crozat-Williams	Madeline	Code Pink Houston	Refining coal tar crude is squeezing blood out of the turnip. It's a very poor source of crude. It requires a very large amount of energy to extract this crude, compared to the energy that tar sands crude generates.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information on current and future production. As noted in that Consolidated Response, without the proposed Project, oil sands development would continue at or above the current level until at least 2020, with or without the proposed Project.
1544	39	Crozat-Williams	Madeline	Code Pink Houston	The refining process of the tar sand crude will cause heavy pollution,	Consolidated Response OIL-4 addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils. As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries.
1544	40	Crozat-Williams	Madeline	Code Pink Houston	Tar sands crude has sulfur and polycyclic aromatic hydrocarbons. That translates to sulfur dioxides and volatile organic compounds, both of which are very bad for health and for the environment.	Consolidated Response OIL-4 addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils. As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
1544	41	Crozat-Williams	Madeline	Code Pink Houston	We already have enough problems meeting air quality standards in Harris County. We don't need to add more when we refine this.	As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries. Consolidated Response OIL-4 also addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils.
1544	43	Crozat-Williams	Madeline	Code Pink Houston	Please don't approve this permit. It takes us in the wrong direction, backwards instead of forward.	The commenter's opinion is noted.
295	1	Cuddy	T.		I am against building this pipeline.	Comment acknowledged.
1005	1	Cummins	A.W.		We cannot find any alternative than to place it near the U.S.'s largest supply of fresh water – are you freaking kidding me?	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. Consolidated Response ALT-1 addresses potential alternative routes, including routes that would avoid much of the Northern High Plains Aquifer system.
1363	1	Cupp	Ronn	The State Chamber of Oklahoma	The State Chamber of Oklahoma is in support of TransCanada's Keystone XL crude oil pipeline project and we urge the department to grant a permit for the pipeline... We urge the granting of the permit. Thank you for the opportunity to comment.	Comment acknowledged.
1363	5	Cupp	Ronn	The State Chamber of Oklahoma	Securing stable and affordable energy from our North American allies through projects such as the Keystone pipeline is in the national interest. Considering the economic [and energy security] benefits of these vital resources, we should continue to expand America's access to safe, affordable energy to help ensure [improved domestic and global energy security and] stable prices for consumers..... This project also stands to provide a powerful private sector economic stimulus. During construction, Keystone XL will create more than 13,000 jobs funded with private investment. In addition, local governments will have a steady source of income from economic activity associated with construction and from property taxes the pipeline company will pay... Rejection of the permit or suspension of the review would sacrifice the significant economic benefits this project stands to deliver ... This would be a mistake.	Consolidated Response ECO-1 addresses potential socioeconomic impacts, and Consolidated Response TAX-1 addresses concerns regarding taxes.
1363	6	Cupp	Ronn	The State Chamber of Oklahoma	Pipelines are the safest, most reliable, economical and environmentally favorable way to transport oil and petroleum products, as well as other energy liquids, throughout the U.S. America depends on the more than 168,000 miles of liquid pipelines to move energy and raw materials our country relies on. Additional pipeline capacity will help consumers and businesses throughout the United States.	Comment acknowledged.
681	1	Cure	David		The granting of this special permit is a grave mistake. The track record of oil companies in this area is bleak. A major catastrophe would be waiting to happen. The overlying sand of the Ogallala Aquifer is more of a sponge than a barrier to any spillage and the contamination of the aquifer would be another sad legacy our generation would be leaving for future inhabitants of this area. Please don't let this happen	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
274	1	Curran	Gregory		Recently a number of advocacy groups sent a letter seeking suspension of the permitting of the Keystone XL pipeline. I encourage you to reject the request and to continue to review the proposed project.	Comment acknowledged.
274	3	Curran	Gregory		Construction of this project stands to bring significant economic benefits, not only to the areas where it will be built but all across America.	Comment acknowledged.
274	5	Curran	Gregory		The permitting processes in place are appropriate and should proceed so that a final determination can be made about the impacts of the project and whether it is in the national interest.	Comment acknowledged.
274	6	Curran	Gregory		Please reject the request to suspend the process and continue with the review.	Comment acknowledged.
1390	1	Curran	Gregory	U.S.Pipeline, Inc	I write in support of TransCanada's Keystone XL crude oil pipeline project and urge the department to grant a permit for the pipeline... I urge the granting of the permit. Thank you for the opportunity to comment.	Comment acknowledged.
1390	2	Curran	Gregory	U.S.Pipeline, Inc	My company is a major contractor engaged in the construction of mainline pipeline projects across the U.S.	Comment acknowledged.
1390	6	Curran	Gregory	U.S.Pipeline, Inc	Pipelines are the safest, most reliable, economical and environmentally favorable way to transport oil and petroleum products, as well as other energy liquids, throughout the U.S.	Comment acknowledged.
1390	7	Curran	Gregory	U.S.Pipeline, Inc	This project also stands to provide a powerful private sector economic stimulus. During construction, Keystone XL will create more than 13,000 jobs funded with private investment. In addition, local governments will have a steady source of income from economic activity associated with construction and from property taxes the pipeline company will pay. US Pipeline employs several hundred craft laborers from many different geographic locations throughout the U.S. and also sources equipment and other materials and supplies from diverse U.S. based companies. The economic impact of constructing a project such as Keystone, particularly at this time of ongoing economic softness, cannot be overstated... Considering the short and long term economic [and energy security benefits] of these vital resources, we should continue to expand America's access to safe, affordable energy. Rejection of the permit or suspension of the review would sacrifice the significant economic benefits this project stands to deliver This would be a mistake....	Consolidated Response ECO-1 addresses potential socioeconomic impacts, and Consolidated Response TAX-1 addresses concerns regarding taxes.
893	1	Curry	Buck		Please I am urging you to stop the Keystone XL pipeline. This type of oil production is not sustainable and environmentally unsound. If not for us then for our children and grandchildren.	Consolidated Response ENR-1 provides information on the Department of State's environmental review process, the National Interest Determination process, and the need to complete those reviews before approving or denying the Presidential permit for the proposed Project.
288	1	Curtis	Mary		To put a pipeline of oil directly through the Ogallala Aquifer is insanity! It is the drinking water for most of the Plains states. I live over the top of it. If this mess in the Gulf right now does not make you rethink this, then you have proved beyond a shadow of a doubt that Washington is filled with greedy idiots. Please do not do this!	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. As described in Consolidated Response GLF-1, the risks associated with the proposed Project are substantially different from those associated with the BP Deepwater Horizon Project.
1369	1	Curtiss	Jerry	Curtiss Repair, Inc	Recently a number of advocacy groups sent a letter seeking suspension of the permitting of the Keystone XL pipeline. I	Comment acknowledged.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					encourage you to reject the request and to continue to review the proposed project... The permitting processes in place are appropriate and should proceed so that a final determination can be made about the impacts of the project and whether it is in the national interest... Please reject the request to suspend the process and continue with the review.	
1369	4	Curtiss	Jerry	Curtiss Repair, Inc	At the same time, construction of this project stands to bring significant economic benefits to the areas where it will be built.	Comment acknowledged.
805	1	Dahle	Kim		Please stop...find a new way. The more "crap" we put in, and on this planet is just getting crazy. Give our Earth a Break. "NO TAR SANDS"!!!!	The commenter's opinion is noted.
129	1	Dale	Brenda		I work for an oil service company, and I believe that most companies in the industry are environmentally responsible. However, some activities simply create more pollution than others. This is true for tar sands refining. My concern is that the pollution created through the use of tar sands will negate, at least in part, the progress the US has been making over recent years in reducing various emissions.	Consolidated Response GHG-1 addresses the greenhouse gas life-cycle analyses presented in the revised EIS.
818	1	Dambrosi	Anthony		The spread of refineries processing tar sands oil is a problem because the synthetic heavy crude produced from tar sands is laden with more toxics than conventional oil. Communities adjacent to tar sands oil refineries face increased carbon dioxide emissions, and increased exposure to heavy metals, and sulfurs.	Consolidated Response OIL-4 addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils. As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries.
1027	1	Damgaard	Marshall&Patty		I'd like to know why you aren't making this information public through TV and radio. Personally, I think putting this pipeline directly over a major source of water is stupid! Who, in their right mind, would even consider doing this? Don't they project their thoughts into the future with the possibility of a leak or malfunction of equipment like the oil spill in the Gulf?	Consolidated Response CMT-3 addresses the level of information provided to the public regarding the proposed Project and the draft EIS scoping meeting locations and schedules. Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. As described in Consolidated Response GLF-1, the risks associated with the proposed Project are substantially different from those associated with the BP Deepwater Horizon Project.
632	1	Dana	S.		Is everybody crazy or just not paying attention? That pipeline would run under the Ogallala Aquifer which is the main natural water reservoir for five states in the middle of this country. If something should go wrong, as we now know it could, the whole middle section of the U.S. would be lost. Please use a little common sense and protect our country and our resources. We seem to have gone oil crazy.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
429	1	Danheux	Christophe		I think that the Keystone XL project pipeline is a terrible idea. It is not in the best strategic interest of the United States to encourage in any way shape or form the practice of extracting oil from tar sand. Overwhelming scientific evidence suggests that our climate is warming due to the accumulation of CO2 from fossil sources, and that disaster is awaiting us if we do not change course. Recent news of heat waves and devastating flooding seem to confirm these warnings. They are entirely in line with the scientific predictions, and it is just the beginning. The use of tar sand, in particular, is a step	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project. Consolidated Response GHG-1 addresses GHG life-cycle analyses. Consolidated Response GHG-2 addresses the potential causal connection of implementation of the proposed Project and expanded oil sands production in Alberta and increases in refining.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					backward because of the amount of water and energy it takes to produce usable oil from it, not to mention the impact on precious and fragile ecosystems. The future lies in renewable energy, mainly wind and solar, with natural gas helping with the transition, and that is what we should encourage.	
26	1	Darst	Jewell	Atoka County Chamber of Commerce	Thank you for your information regarding the pipeline through our area, Atoka, OK. We at the Atoka County Chamber of Commerce are excited that you will be in our area and would like to assist you and your employees in any way we can. Please feel free to use this information when you near our vicinity.	Comment acknowledged.
1436	1	Davenport	David		If TransCanada is not specifically required by the EIS to replant trees on the temporary work right-of-way, as implied from my conversation with Mr. Hudson and Mr. Beckmeyer, I am confident they would not which would leave, according to my estimation, approximately 2,994 acres of the United States to be cleared and not replanted and hence not reforested. What is the environment impact of that? I find that unfathomable. If there is language in the EIS requiring TransCanada to replant trees, I would like that pointed out to me specifically. Otherwise, I insist the United States government via United States Department of State, in its obligation to the people of the United States and future generations of the people of the United States, including language in the EIS that all forested areas of the 60 ft temporary workspace right of way be restored by replanting similar tree species to what was removed. Today, even the commercial timber companies that stripped our forests in the early 1900s have a more modern and environmentally responsible policy of replanting trees after a timber harvest than TransCanada would if allowed. What kind of response-confirmation can I expect to get on this issue and from whom?	Trees and shrubs would be allowed to re-establish within the temporary right-of-way and workspaces. In general, forested habitats were avoided to the extent practicable. Construction and reclamation through forested habitats including shelterbelts is discussed in the Construction, Mitigation, and Reclamation Plan, which is in Appendix B of the EIS. Keystone would acquire easements for construction of the pipeline. Keystone would compensate landowners for the loss of trees and would leave all cut timber with the landowner, if desired, for the landowner's use or disposition.
1436	3	Davenport	David		A common practice in the pipeline industry is to bury the trees and tops alongside the pipeline right of way leaving large sink holes for the land owners to deal with years later. At the Tyler Texas meeting on May 20, 2010, someone said that burying organic material such as trees and brush would not be allowed. However, under Appendix B 4.13, it mentions burial of trees, brush and stumps as a possible means of disposal. I request that language be included in the EIS that prohibits the burying of such organic materials so as not to leave sink holes for the land owners in the future. What kind of response-confirmation can I expect to get on this issue and from whom?	As stated in the Construction, Mitigation, and Reclamation plan, which is in Appendix B of the EIS, burial of trees and tops would not generally be used as a disposal method and would require prior landowner approval if Keystone is interested in using that disposal method.
1436	4	Davenport	David		I received information indicating that Universal Field Services intended to begin the condemnation process on June 1, 2010, by sending out letters of final offer. Is it ethical business practice to begin the condemnation process when the public comment period on the DEIS isn't over until June 16th? Wouldn't it be more appropriate and fair to allow landowners to evaluate the environmental impact statement after it has been completed to know how the land will be environmentally affected before you condemn their property?	As noted in Consolidated Response EAS-2, the eminent domain process cannot begin until easement negotiations end without an agreement in place. State laws dictate under what circumstances eminent domain may be used and define the eminent domain process within the state. DOS has no legal authority or ability to intervene in the proceedings.
1436	5	Davenport	David		In view of the aforementioned and un-clarified environmental concerns in conjunction with the current crisis in the Gulf of	As noted in Consolidated Response EAS-2, state laws dictate under what circumstances eminent domain may be used and

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					Mexico at the hands of the giant corporate oil companies, I must insist that the powers that be of the federal government and any other governmental agency having jurisdiction over this process that might hear my message forbid, legally, by an injunction or something similar, the beginning of any condemnation process by UFS and or TransCanada including letters of final offer until such environmental issues are cleared up and the EIS completed approved and adopted. What kind of response-confirmation can I expect to get on this issue and from whom?	define the eminent domain process within the state. DOS has no legal authority or ability to intervene in the easement negotiations or in eminent domain proceedings.
1436	6	Davenport	David		Early in the negotiations Universal Field Services was offering \$1500 per acre for timber and \$2000 an acre for lost hay production. Now they have backed up to \$1000-\$1200 per acre for "good timber" and \$1500 per acre for hay, but only if it is a specialty grass that has to re-sprigged. To begin with, a stand of mixed timber, of average quality, is worth \$2000 an acre and a premium or planted pine stand could easily be worth \$5000 per acre maybe more...maybe \$7000 an acre if market conditions are right. Why has UFS backed off of their initial damages offer? Do you think it is fair to offer landowners less than fair market value; or potential future fair market value for their lost timber? I have acquired cultivated and planted stands of Southern Yellow Pine for the last 10 years in hopes of funding my grandchildren's college educations. Do you think it is a fair and equitable business agreement between two parties to cut down my grandchildren's college fund pine trees before maturity and pay a land owner, myself or any other, for the timber as it exist in the form of maybe pulpwood, or maybe less, where as if allowed to mature into saw logs, the trees could easily be worth five times as much?	As noted in Consolidated Response EAS-2, state laws dictate under what circumstances eminent domain may be used and define the eminent domain process within the state. DOS has no legal authority in the easement negotiations or in eminent domain proceedings.
1436	7	Davenport	David		UFS and TransCanada are huge corporations with many lawyers and can take a land owner to condemnation court as a less expensive option than fairly compensating them for their land and timber? Do you think that is fair and equitable? Do you think it would be a more fair and equitable business agreement between two parties to pay for my grandchildren's trees or anyone else's based on the value that those trees would have achieved had you not removed them?	Consolidated Response EAS-2 addresses issues related to easement negotiations and eminent domain. DOS has no legal authority in the easement negotiations or in eminent domain proceedings.
1436	8	Davenport	David		The UFS agents are evidently forbidden from using the words eminent domain for some legal liability reason. They will however, liberally inform you that UFS's next move is to pass your file over to the legal department and rather than signing the easement agreement for some minimal offer, you could wind up owing the pipeline company money after the legal proceedings are over; which is the equivalent of using the term eminent domain. ... am familiar with a 40 something acre tract where they began by offering \$2000 an acre, they are now offering \$4000 an acre for the permanent easement for roughly 2.5 acres. In the area I am referring to, \$4000 an acre would certainly be about the price you would expect to pay for a 40 or 50 acre tract. However, in that same area the price for a 2.5 acre tract could easily be \$10,000 an acre....My point is there seems to be a VAST... VAST discrepancy between the price that would be paid to the landowner based solely on free	As noted in Consolidated Response EAS-2, state laws dictate under what circumstances eminent domain may be used and define the eminent domain process within the state. DOS has no legal authority in the easement negotiations or in eminent domain proceedings.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					enterprise economic principals versus the price that is being paid, or being proposed based on the army of lawyers that UFS and TransCanada has at its disposal and their ability to exercise eminent domain. Their offers; their prices; are based much more on the cost associated with taking the landowner to condemnation rather than the value of the land they are acquiring.	
1436	9	Davenport	David		Has UFS offered "Alternative Dispute Resolution" to any of their land owners as opposed to "going to court"? According to UFS's website, it states a Senior Vice President named Edward Opstein states, and I quote, "originated the concept of healthy negotiations". My experience, the experience of my family members and friends, with UFS would be accurately described as anything but healthy negotiations. It is certainly a good, positive sounding catch phrase but involving the experiences of myself, family members and friends, it seems like the negotiation process is only healthy for Universal Field Services and TransCanada and not at all healthy for the land owner.	As noted in Consolidated Response EAS-2, state laws dictate under what circumstances eminent domain may be used and define the eminent domain process within the state. The Department of State (DOS) has no authority to intervene in those processes, and therefore DOS is not aware of what UFS has offered to landowners.
1436	10	Davenport	David		In closing, I'd like to say this is simply a case of David versus Goliath. As opposed to the bible story, Goliath is using his size to intimidate and push the Davids all over the neighborhood. I just thought it was only right that I should expose this situation to the media and the United States Department of State and speak up for all the small time land owners who are being pushed around by Goliath aka Universal Field Services – agent for TransCanada Pipeline. Again, in view of what is happening off the coast of New Orleans, it would be blatantly obvious to me that the United States government needs to protect the environmental interests of all the small landowners in this venture.	Consolidated Response EAS-2 addresses issues related to easement negotiations and eminent domain. DOS has no legal authority in the easement negotiations or in eminent domain proceedings.
1559	1	Davenport	David		Wanted to note how many landowners in audience were currently negotiating with the UFS (12 raised hands) and how many were happy with the negotiations (only 1 raised hand)? Feels that UFS is going through East Texas bullying people.	Consolidated Response EAS-2 addresses issues related to easement negotiations. As noted in that response, DOS has no legal authority in the easement negotiation process.
1559	4	Davenport	David		Cousin has property with wetlands on it that have not been "officially declared wetlands". Language in the Wetland's Protection Act states that undeclared wetlands require mitigation. The UFS has informed his cousin that they do not have to mitigate his wetlands. How can the UFS justify this? How many acres of undeclared wetlands across the U.S. will UFS be crossing and not compensate?	All wetlands will receive construction mitigations as described in Keystone's Construction, Mitigation, and Reclamation Plan (Appendix B of the DEIS) and any other applicable guidance from the U.S. Army Corps of Engineers. Keystone has committed to follow the same construction, mitigation, and reclamation plan for all wetland crossings regardless of whether the wetland qualifies as jurisdictional under the U.S. Army Corps of Engineer Section 404 permits. The only difference would be the requirement for compensatory mitigation for permanent wetland losses. Most wetlands would be restored after pipeline construction. Permanent wetland impacts and requirements for compensatory mitigation will be determined during permitting under the U.S. Army Corps of Engineer Section 404 permits. See Section 3.4 of the EIS for further information on wetland impacts and mitigation.
159	1	Davis	Helen		Stop this pipeline from coming into the United States. We do not want the dirty tar sands coming here to be refined into a messy product for sale in Europe. Keep it up there in Canada and ruin the world's rain forests there if you must	Consolidated Response OIL-4 addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils. Consolidated

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
						Response P&N-8 addresses issues related to shipping Canadian crude oil to refineries that are closer to the source of oil.
177	1	Davis	Helen		This proposed pipeline should not be built in the United States. It will cause damage to the Canadian rainforest, increase pollution wherever it ends up, cause the destruction of virgin timberland in Texas and other places it goes through, and create more pollution in the Gulf Coast area of Texas which already has enough to deal with the existing oil company refinery plants and the BP oil spill in the Gulf of Mexico.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project. Consolidated Response WAT-2 addresses concerns regarding a compensatory mitigation plan for jurisdictional wetlands and potential impacts to non-jurisdictional wetlands. As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries. Potential impacts to terrestrial vegetation along the proposed route are addressed in Section 3.5 of the EIS.
177	2	Davis	Helen		The refining process to create the end product is nasty, dirty, wastes four times the amount of water to create the product, and is a health hazard for all who live and or work nearby, or who have to breathe the output of the waste and final product.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1.
177	3	Davis	Helen		We need a 60-day extension of the comment period to be able to voice these concerns.	Consolidated Response CMT-1 addresses issues related to the length of the comment period for the draft EIS and supplemental draft EIS.
346	1	Davis	Chris	Cherokee County Judge	As county officials from the State of Texas, we strongly encourage the U.S. Department of State to approve an energy infrastructure project that not only will strengthen long-term energy security in the United States, but also will provide a powerful private sector economic stimulus to the communities along the pipeline route during its construction at a time when our economy continues to struggle.	Comment acknowledged.
346	2	Davis	Chris	Cherokee County Judge	As we understand it, Keystone XL will directly create more than 13,000 high-wage construction and manufacturing jobs during the projects 2011-2012 construction schedule. Many of those jobs will be created in Texas and in our counties, where too many of our residents continue to find it difficult to find good jobs. With Keystone XL, they will have an opportunity to work on the project or for businesses that provide supplies, goods and services for its construction and operation. In addition to the jobs Keystone XL will create, the project will generate substantial economic benefits for the United States and in states and communities along the proposed route. Like our counties, in many cases these are areas where economic performance has stagnated or is shrinking. It is our understanding that TransCanada commissioned a study to measure the project's economic stimulus to the U.S. and the states along the route. The study found that in the U.S., Keystone XL would generate \$20.9 billion in total expenditures, \$9.6 billion in output (gross product), personal income of \$6.5 billion and 118,935 person years of employment (jobs).	Consolidated Response ECO-1 addresses potential socioeconomic impacts, and Consolidated Response TAX-1 addresses concerns regarding taxes.
346	3	Davis	Chris	Cherokee	In addition, the report concluded that during construction,	Consolidated Responses TAX-1 and ECO-1 address the

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
				County Judge	Keystone XL would generate \$486.36 million in tax revenue for state governments along the route and \$99.1 million for local taxing entities where the pipeline is located.	estimated increases in the tax base and the jobs generated by the proposed Project. Also see the revisions to Sections 3.10.2.3 and 3.10.2.4 of the EIS.
346	4	Davis	Chris	Cherokee County Judge	Moreover, in addition to the construction and manufacturing jobs Keystone XL will create during construction the economic stimulus provided by the pipeline's construction and development will lead to the creation of more than 100,000 additional jobs in the economy. In Texas, the study found Keystone XL expenditures during construction would total \$5.4 billion and generate an economic gross product of nearly \$2.86 billion. Keystone XL construction also would generate more than \$64.5 million in tax revenue for local government and \$152 million for state government	Consolidated Response ECO-1 addresses potential socioeconomic impacts, and Consolidated Response TAX-1 addresses concerns regarding taxes.
346	6	Davis	Chris	Cherokee County Judge	The Perryman study concluded that the long-term increase in stable oil supplies will add at least 250,000 permanent jobs to the U.S. economy, and add \$29 billion to the nation's gross annual product, conservatively estimated. Canada is already the largest supplier of energy to the United States, meeting 12 percent of current U.S. petroleum consumption needs and representing 18 percent of U.S. petroleum imports.	Consolidated Response ECO-1 addresses potential socioeconomic impacts, and Consolidated Response TAX-1 addresses concerns regarding taxes.
346	7	Davis	Chris	Cherokee County Judge	Canadian oil sands production is a growing source of reliable crude oil supply for the United States. Canada's 175 billion barrels of oil reserves is second only to Saudi Arabia. Oil sands account for more than 97 percent of that vast reserve: 170 billion barrels of oil with the potential for more than 100 years of production. Canada has more than 50 percent of the non-state controlled reserves in the world. Long-term supply is critical in a world where supply risks are growing, whether due to declining production from a once-reliable source, an unstable geo-political climate, or uncertainties in key oil producing regions. Construction of additional pipeline facilities such as the Keystone XL Project, to transport oil sands production to the vitally important Gulf Coast area is critical. These refineries also have excess capacity as a result of reduced production from Mexico, where heavy oil production is in steep decline, and Venezuela, which is moving to other markets. Turning to Canada for a secure oil supply is a logical step.	Comment acknowledged.
346	8	Davis	Chris	Cherokee County Judge	We enthusiastically support the Keystone XL Pipeline Project and encourage the Department of State to confirm the findings of the Draft Environmental Impact Statement, which found that the proposed Keystone XL Pipeline would have "limited adverse environmental impact during construction and operation." We look forward to the issuance of a Final Environmental Impact Statement followed by a Presidential Permit that allows the construction of Keystone XL and enables our counties, the State of Texas, and the United States to collect the Substantial economic benefits Keystone XL would create.	Comment acknowledged.
517	1	Davis	Kelsey		The Keystone XL project is not good for Nebraskans. As is painfully, disastrously obvious in the Gulf now, extraction and transportation of crude oil is dangerous. It is dangerous to the health of humans, and all other life on the planet. It is dangerous to the ecosystems that we really on for our very	Keystone has withdrawn its application for a Special Permit as described in Consolidated Response REG-1. Consolidated Response SAF-1 describes the regulatory requirements that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project in a manner that

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					survival. It is dangerous to the water we need to drink and use for many other purposes. The plans to use thinner piping and pump at higher pressure show a prioritization of profit over people. Right now, we should not be building up the oil industry. It's killing us and everything around us. It's destroying people's lifestyles. Instead, energy measures should focus on safe, renewable sources such as wind, solar, and hydroelectric power. Even nuclear power is safer and cleaner than fossil fuels! I am opposed to the building of this pipeline, as a Nebraskan, an American, a humanitarian, and as someone who lives on this planet.	protects the health and safety of the public and the environment. Consolidated Response ALT-2 addresses the use of alternative technologies, alternative energy sources, and conservation of energy.
535	1	Davis	Elizabeth		I am seriously concerned about this project, which will cross the Ogallala Aquifer. The pipeline will be vulnerable to everything from tornados to terrorists. The potential for contamination of the aquifer is simply too great.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. Consolidated Response AQF-5 addresses potential threats from terrorism and natural disasters, and Consolidated Response TER-1 addresses terrorism. AQF-5, Consolidated Response GEO-3 addresses geologic hazards.
748	1	Davis	Tim		No pipeline in the Nebraska sandhills...	Consolidated Response ALT-1 addresses potential alternative routes, including routes that would avoid much of the Northern High Plains Aquifer system and the Sand Hills area.
748	2	Davis	Tim		No pipeline ... within 250 miles of migratory bird routes...	As migratory birds use routes throughout the entire North American continent, this conservation measure would not be practicable.
748	4	Davis	Tim		...Tar sands oil production should only be used as a last resort.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information on current and future production. As noted in that Consolidated Response, without the proposed Project, oil sands development would continue at or above the current level until at least 2020, with or without the proposed Project.
827	1	Davis	Robin		Please do NOT allow this pipeline to go through the Sand Hills region. Pipelines WILL leak - consider Utah's Red Butte Creek, Minnesota's wetland leak, Louisiana's Delta National Wildlife Refuge leak, and the estimated 350 spills in the Kenai National Wildlife refuge in Alaska. We cannot afford this risk to the Ogallala Aquifer- it is too precious a resource.	Issues related to the Sand Hills area are addressed in Consolidated Response ERO-1. Section 3.13 of the EIS addresses reliability and safety issues, including calculations of the probability of a spill from the proposed Project and the potential environmental impacts associated with spills. Issues related to the Northern High Plains Aquifer System are addressed in Consolidated Responses AQF-1 through AQF-4.
1439	1	Davis	Jeff	Missouri Public Service Commission	Please accept this letter in support of TransCanada's permit application for the Keystone XL crude oil pipeline project. This country is married to crude oil and other fossil fuels for the next half century or longer whether we like it or not. A robust transmission system is important both in terms of energy and price. Projects like this are essential to enhancing reliability and increasing supply to lower prices. Further, this project will provide work for more than 13,000 people all over the Midwest, including Missouri. I have had cause to examine TransCanada several times during my six years on the Missouri PSC. The company has demonstrated itself to be a good corporate citizen. They pay their taxes, they buy electricity for their pipeline, they employ people to build the pipeline and then to maintain it. The taxes from that pipeline will provide some of the poorest counties in our state with economic activity and additional property taxes at a time they could really use the money. In conclusion, TransCanada's	Comment acknowledged.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					Keystone XL crude oil pipeline project is a good one and would benefit Missouri as well as several surrounding states. I urge you to grant their permit and thank you for your consideration in this matter.	
177	2	Davis	Helen		The refining process to create the end product is nasty, dirty, wastes four times the amount of water to create the product, and is a health hazard for all who live and or work nearby, or who have to breathe the output of the waste and final product.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information on current and future production. As noted in that Consolidated Response, without the proposed Project, oil sands development would continue at or above the current level until at least 2020, with or without the proposed Project.
1289	1	Dean	Joey	Little Rock Chamber of Commerce	I write to urge the Department to consider promptly a permit for TransCanada's Keystone XL (KXL) crude oil pipeline project as soon as possible.	Comment acknowledged.
1289	2	Dean	Joey	Little Rock Chamber of Commerce	This project serves as a vital step in Arkansas' road to economic recovery, as hundreds of Arkansans depend on major projects like KXL to keep their factories running. The prompt approval of this project will put people to work immediately making pipe and other materials for the project, jobs that Arkansas desperately needs.	Comment acknowledged.
1289	3	Dean	Joey	Little Rock Chamber of Commerce	These jobs will not only fuel the economy of the State; they will also help fund State and local government by providing taxes and consumer spending from manufacturing, construction and operation of the pipeline and related projects.	Comment acknowledged.
1289	4	Dean	Joey	Little Rock Chamber of Commerce	Further delay in the permit process could jeopardize the expected economic benefits.	Comment acknowledged.
1289	5	Dean	Joey	Little Rock Chamber of Commerce	The KXL project also has benefits for the entire country. During construction, the project will create more than 13,000 private sector jobs and generate some \$60 million in direct payrolls and millions more in indirect jobs.	Consolidated Response ECO-1 and Section 3.10.2.2 of the EIS address the potential socioeconomic impacts of the proposed Project.
1289	8	Dean	Joey	Little Rock Chamber of Commerce	We can help the economy and our security by building for a future of increased long-term energy security at stable prices for Americans.	Comment acknowledged.
1289	9	Dean	Joey	Little Rock Chamber of Commerce	Arkansans stand ready and willing to do their part. We need immediate action, as high unemployment serves as a continuing reminder of the costs attendant to delay in projects such as KXL. I therefore urge you to consider the permit application for the KXL project as quickly as possible so that hard-working Arkansans can get back to work for themselves and for America.	Comment acknowledged.
53	1	Decker	Hannah		I live in Texas and I am not happy to hear about the "Tar Sands" Pipeline coming to my state. The environmental damage is too great to allow this project to move forward. I urge you to stop the Keystone XL Pipeline.	The impacts associated with implementation of the proposed Project are addressed in Section 3.0 of the EIS. As noted in that section, construction and normal operation the proposed Project would not result in significant environmental impacts.
434	2	Decker	Karla		For God's Sake: Please, Please do not run that thing through our beautiful state. Have you learned nothing from the situation in the Gulf?	Consolidated Response ALT-1 addresses potential alternative routes and system alternatives, including rail and barge networks. As described in Consolidated Response GLF-1, the risks associated with the proposed Project are substantially different from those associated with the BP Deepwater Horizon Project.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
73	1	DeLaGarzaUndS enkel	Patrick		Tar sands are dirty oil. Tar sands oil emits three times more greenhouse gases during production than conventional gasoline. About three barrels of water are polluted and dumped in toxic pools (called tailing ponds) for every barrel of oil produced. Tar sands extraction requires strip mining huge tracts of pristine forest. An area the size of Florida is slated for extraction. The project harms the lives and health of indigenous people living downstream from the tar sands operations and has been connected to high rates of rare cancers, renal failure, lupus, and hyperthyroidism in the area.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project. Consolidated Response GHG-1 addresses GHG life-cycle analyses.
73	3	DeLaGarzaUndS enkel	Patrick		The Keystone XL Pipeline is dirty for our environment and harmful for us. Producing the oil for this pipeline will emit 11 million tons of carbon dioxide into the atmosphere annually, even before it gets to the U.S. for refining. This equals the annual emissions of 2.7 million cars.	Consolidated Response GHG-1 addresses the greenhouse gas life-cycle analyses presented in the revised EIS. As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries.
73	5	DeLaGarzaUndS enkel	Patrick		The pipeline will travel more than 1,700 miles through fragile ecosystems, such as the Missouri River.	Consolidated Response ENV-1 addresses concerns related to sensitive and fragile environmental and ecosystems.
73	8	DeLaGarzaUndS enkel	Patrick		The company is seeking a special permit to operate at this pressure from the Pipeline and Hazardous Materials Safety Administration.	Keystone has withdrawn its application for a Special Permit as described in Consolidated Response REG-1.
73	9	DeLaGarzaUndS enkel	Patrick		By connecting tar sands oil to the Gulf Coast, the Keystone XL will make our nation's fuels dirtier and undermine the clean energy solutions we need to avert catastrophic climate change.	Consolidated Response P&N-1 addresses the need that the Project has been proposed to meet, including information on crude oil supply and demand from an analysis specific to the proposed Project. As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries. Consolidated Response OIL-4 also addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils.
1360	1	Delay	Dobie	Dal-Har and Delay-Z Ranch	My father spent a good portion of his life working to preserve land in East Texas, which he purchased in 1957 as a legacy to leave to his children and grandchildren. I have spent the better part of my adult life working hard to purchase the surrounding lands to preserve the forest for posterity. Then to have the Keystone XL come along and want to destroy everything my father, sister, and I have worked for is a blow beyond measure. TransCanada intends to come right through the middle of the forest; destroying habitat, and waterways; and I cannot bear the thought of it.	The impacts associated with implementation of the proposed Project are addressed in Section 3.0 of the EIS. As noted in that section, the proposed Project would not result in significant environmental impacts. Although trees would not be allowed within the 50-foot-wide permanent right-of-way, reforestation of the remaining 60-foot-wide construction right-of-way would be permitted. Further, as described in Section 3.7 of the EIS, stream and river crossings would result in minor, temporary impacts that would last for the duration of the construction period for the individual waterbody crossing.
1360	2	Delay	Dobie	Dal-Har and Delay-Z Ranch	We had longstanding plans to create wetlands in this area to further enhance the protection of wildlife.	Consolidated Response EAS-2 addresses issues related to easement negotiations and eminent domain. DOS has no legal authority in the easement negotiations or in eminent domain proceedings.
1360	5	Delay	Dobie	Dal-Har and	Furthermore, by dissecting our nation with a potentially	As noted in Consolidated Response OIL-5, there is not a risk

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
				Delay-Z Ranch	explosive pipeline, our nation becomes at risk of being torn in half should our enemies target this pipeline and succeed. The resulting explosions would rival that of 9-11. The proposed route of this pipeline is on the Internet for all our enemies to see. How shall we possibly protect it from attack?	of explosions for crude oil pipelines. Consolidated Response TER-1 addresses potential terrorism associated with the proposed Project.
1360	6	Delay	Dobie	Dal-Har and Delay-Z Ranch	Secondly, TransCanada used the threat of "Eminent Domain" by partnering with Conoco Phillips so that many land owners in the East Texas area felt helpless to decline. After many land owners acquiesced, TransCanada then bought back all rights to the pipeline from Conoco. So now a foreign company is entitled to eminent domain against the property rights of American Citizens? This country was created to grant the right of private land ownership only to find out that the landowner really has no rights at all? If Big Business comes along, domestic or foreign, the land owner must submit? This is against every tenet our forefathers intended. And I believe the intent of the Fifth Amendment did not mean for this type of abuse to occur, and further I believe this would violate my right of due process under the fourteenth Amendment, as well.	As described in Section 1.0 of the EIS and in Consolidated Response RES-2, TransCanada-Keystone Pipeline LP (Keystone) is not a foreign corporation. It is a limited partnership organized under the laws of the state of Delaware. If easement negotiations with landowners are not successful, Keystone would initiate eminent domain proceedings. As noted in Consolidated Response EAS-2, state laws dictate under what circumstances eminent domain may be used and define the eminent domain process within the state. DOS has no legal authority in the easement negotiations or in eminent domain proceedings.
1360	7	Delay	Dobie	Dal-Har and Delay-Z Ranch	This pipeline will not benefit the American public or the citizens of Texas. It serves only to benefit the profit of TransCanada. The pipeline will produce no direct public benefit to the people at large. It is for the purpose of refining into grade 2 diesels, which cannot be sold in the US and so must be exported. The primary stakeholders in the pipeline stand to reap considerable economic benefit from it at the expense of the environment and the health and well-being of the surrounding citizenry.	Consolidated Response P&N-1 addresses the need that the Project has been proposed to meet. As noted in that response, the Project has been proposed to meet the heavy crude oil needs of refineries in the Gulf Coast area; that would provide consumers with a continued stream of the currently refined product from those refineries, which is a benefit to the public. Refineries in the Midwest and Gulf Coast are currently refining crude oil from the Canadian oil sands projects into products other than Grade 2 diesel, and refineries in the Gulf Coast region would produce products in addition to diesel fuel. As noted in Consolidated Response Oil-4, the Canadian crude oil that would be transported is similar in composition to other heavy crude oils.
1360	8	Delay	Dobie	Dal-Har and Delay-Z Ranch	Who will pay for the increase in cancer cases as the pipeline poisons the underground water supply?	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
1360	9	Delay	Dobie	Dal-Har and Delay-Z Ranch	Who will pay for the damages incurred when there are spills, leaks and explosions?	As described in Consolidated Response LIA-1, Keystone is responsible for damages resulting from accidents caused by construction or operation of the pipeline. As noted in Consolidated Response OIL-5, crude oil pipelines do not explode and it is highly unlikely that there would be an explosion in a pump station.
1360	11	Delay	Dobie	Dal-Har and Delay-Z Ranch	I beg you also to consider the consequence of allowing the creation of a pipeline that could render us vulnerable to attack by our enemies.	Consolidated Response TER-1 addresses potential terrorism associated with the proposed Project.
1360	12	Delay	Dobie	Dal-Har and Delay-Z Ranch	For myself, I am determined to continue to advocate against the TransCanada pipeline from destroying my forest and damaging the environment my father taught me to value, protect, and preserve.	The impacts associated with implementation of the proposed Project are addressed in Section 3.0 of the EIS. As noted in that section, the proposed Project would not result in significant environmental impacts. Although trees would not be allowed within the 50-foot-wide permanent ROW, reforestation of the remaining 60-foot-wide construction ROW would be permitted. Further, as described in Section 3.7 of the EIS, stream and river crossings would result in minor, temporary impacts that would last for the duration of the construction period for the individual waterbody crossing.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
						Consolidated Response PVT-2 addresses concerns regarding the proximity of the proposed project to existing structures and facilities and routing concerns across private property.
345	1	Delzer	Valerie		Please stop the Keystone XL pipeline project. It has more potential for harm to Americans than good. I do not want more pollution in my backyard (or anywhere in the US for that matter) but would instead prefer clean energy sources that benefit not only this current generation of Americans but for generations to come. Please rethink this one on a long-term scale.	Consolidated Response ALT-2 addresses the use of alternative technologies, alternative energy sources, and conservation of energy.
1015	1	DenBeste	David		As a resident of Nebraska, a lifelong resident of the Midwest, I'm strongly opposed to putting a pipeline through the heart of a primary water source. I would ask that this project be stopped. When the water is no longer usable our very existence will be threatened.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
389	1	Denherder-Thomas	Timothy	Summer of Solutions	I oppose this pipeline, it will take some of the dirtiest and most inefficient of fossil fuels and dump the toxins refined out of them in American communities. Please reject the proposed pipeline.	Consolidated Response OIL-4 addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils. Consolidated Response ENR-1 provides information on the Department of State's environmental review process, the National Interest Determination process, and the need to complete those reviews before approving or denying the Presidential permit for the proposed Project.
966	1	Denkler	Joan		Houston and its area will suffer a severe impediment from this heavier crude oil which, when refined, will lead to 38 million metric tons of additional greenhouse gas emissions per year. We, particularly children, will suffer additional health burdens for long periods from this crude. This pipeline and product should not be allowed.	Consolidated Response GHG-1 addresses the greenhouse gas life-cycle analyses presented in the revised EIS. Consolidated Response OIL-4 also addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils being processed in Gulf Coast refineries. As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries.
240	1	Denney	Lee	State Representative OK District 33	As an official from the State of Oklahoma, I strongly encourage the U.S. Department of State to approve an energy infrastructure project that not only will strengthen long-term energy security in the United States but also will provide a powerful private sector economic stimulus to the mostly rural communities along the pipeline route during its construction at a time when our economy continues to struggle. As I understand it, Keystone XL will create more than 13,000 high-wage construction and manufacturing jobs during the project's 2011-2012 construction schedule. Many of those jobs will be created in rural Oklahoma where too many of our residents continue to find it difficult to find good jobs. With Keystone XL they will have an opportunity to work on the project or for businesses that provide supplies, goods and services for its construction and operation.	Consolidated Response ECO-1 addresses potential socioeconomic impacts associated with construction and normal operation of the proposed Project.
240	2	Denney	Lee	State Representative	In addition to the jobs Keystone XL will create, the project will generate substantial economic benefits for the United States	Consolidated Response ECO-1 addresses potential socioeconomic impacts, and Consolidated Response TAX-1

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
				OK District 33	and in states and communities along the proposed route. Like our counties, in many cases these are areas where economic performance has stagnated or is shrinking. It is our understanding that TransCanada commissioned a study to measure the project's economic stimulus to the U.S. and the states along the route. The study found that in the U.S., Keystone XL would generate \$20.9 billion in total expenditures \$9.6 billion in output (gross product), personal income of \$6.5 billion and 118,935 person years of employment (jobs). In addition, the report concluded that during construction, Keystone XL would generate \$486.36 million in tax revenue for state governments along the route and \$99.1 million for local taxing entities where the pipeline is located. In Oklahoma, the study found Keystone XL expenditures during construction would total \$1.2 billion and generate an economic gross product of nearly \$1.1 billion, Keystone XL construction also would generate more than \$7.7 million in tax revenue for local government and \$31.4 million for state government.	addresses concerns regarding taxes.
240	3	Denney	Lee	State Representative OK District 33	Furthermore, the delivery of secure and affordable supplies of Canadian energy to American consumers would have minimal impacts on the environment. This is a vital project that will strengthen U.S. energy security and reduce our dependence on unstable foreign sources of oil. Canada has more than 50 percent of the non-state controlled reserves in the world. Long-term supply is critical in a world where supply risks are growing whether due to declining production from a once-reliable source, an unstable geo-political climate, or uncertainties in key oil producing regions.	Comment acknowledged.
240	4	Denney	Lee	State Representative OK District 33	Construction of additional pipeline facilities such as the Keystone XL Project, to transport oil sands production to the vitally important Gulf Coast area is critical. These refineries also have excess capacity as a result of reduced production from Mexico, where heavy oil production is in steep decline, and Venezuela, which is moving to other markets. Turning to Canada for a secure oil supply is a logical step.	Comment acknowledged.
1544	205	Dennis	Steven	Channelview School Board	Concerned around the welfare of his 9,000 students and would like a written guarantee the safety and welfare of those children will not be impacted by the pipeline.	The proposed route is approximately 2.5 miles from the Channelview school. As described in Consolidated Response SAF-1, the Pipeline and Hazardous Materials Safety Administration (PHMSA) has regulatory requirements that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project in a manner that protects the health and safety of the public and the environment. In addition, PHMSA developed 57 Project-specific Special Conditions that Keystone has agreed to implement. Incorporation of those conditions would result in a Project that would have a degree of safety over any other typically constructed domestic oil pipeline system under current code and a degree of safety along the entire length of the pipeline system similar to that which is required in HCAs as defined in 49 CFR 195.450. Although it is inconceivable that a crude oil pipeline that distant from the school and that could not explode (see Consolidated Response OIL-5) would affect the safety and welfare of the children at the Channelview school, for legal reasons it is not possible to

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
						provide a guarantee in writing.
1544	206	Dennis	Steven	Channelview School Board	It seems like the people who are supporting this thing are going to make a lot of money off of it. They don't live in my community.	The commenter's opinion is noted.
1544	207	Dennis	Mary		Saddened that her community is not represented, not aware of this meeting. As an unincorporated area, there is no governmental structure and this causes the population to be underrepresented. Meeting did not get adequate publicity.	Notification of the draft EIS comment meeting in Channelview was provided to landowners, public officials.
1544	208	Dennis	Mary		I have witnessed dozens of family members and friends who have suffered over the last several or many years in this east side of Houston where the refineries are where there are numerous pipelines already, who have suffered from cancer or other types of physical ailments that are a result of the pollution on this side of town.	As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries. Also see Consolidated Response JUS-1 which addresses potential impacts to minority and low-income populations.
902	2	Denton	Carole	Prairie Counseling	It appears that corporations have not honored their ethical and moral commitment to maintain the safety of the public and the environment. It goes on and on. The risk to our health and safety is too great.	The commenter's opinion is noted.
870	1	Desalvo	Jules		I oppose the proposed TransCanada pipeline in Nebraska.	Comment acknowledged.
1542	103	DesHotel	Joe		In our area, we are actually going to be dealing with the refining because we are at the end of the pipeline. That's what's really important to our community here, as far as pollution.	As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries. Consolidated Response OIL-4 also addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils.
1542	104	DesHotel	Joe		There will be minimal job creation.	Consolidated Response ECO-1 and Section 3.10.2.2 of the EIS address potential socioeconomic impacts.
1542	110	DesHotel	Joe		This is still foreign oil. Canada is still a foreign country. How much are we really benefitting from this? If we make 300 jobs that's great.	As described in Section 1.0 of the EIS and in Consolidated Response RES-2, TransCanada-Keystone Pipeline LP (Keystone) is not a foreign corporation. It is a limited partnership organized under the laws of the state of Delaware. Keystone has the same rights as other pipeline companies in the U.S. to propose projects. Consolidated Response ECO-1 and Section 3.10.2.2 of the EIS address potential socioeconomic impacts.
560	1	Deviney	Iris		Routing the oil pipeline over the Nebraskan Sandhills above the Ogallala Aquifer must be stopped! You don't have to be a rocket scientist to realize what a bad project this is. Has no one noticed how difficult it is to separate oil and water? How about when it is underground? There has already been a leak in Montana. When one reads about sinkholes caused by 30-year-old sewer pipes, concern only grows. We will still need our water supply in 30 years. Where is the wisdom to understand this needs to be rerouted over safer land? This is our water supply. Someone, please please stop this. Now.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
698	1	Devlin	Todd	Chair of the Prairie County Commissioners	I would like to take this opportunity to thank the Department of State on allowing locals and elected officials of locals from the Great State of Montana to testify on the Keystone XL project.	Comment acknowledged.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					<p>We hope that both the proponents and opponents gave you a better perspective on the legitimate concerns, positions, and how we feel the project in question will affect us. I hope that you also realized that the testimony given from Montana wasn't just about getting more revenue for local governments. We also see the energy need, safety, and security concerns of having a crude oil supply from a stable source. The main reason for this letter is to reprimand those and especially the Sierra Club and the Indigenous Environmental Network for taking way more than the State Department's time limits that were strongly suggested at the start of the meeting. These folks should need not to be corrected by the Department That was not right, and it was not the State Department's job to correct them. A little self control and mutual respect would have done the job. I believe that the intent of the Sierra Club and the Indigenous Environmental Network was to take as much time as they thought they could get away with and thereby hoping not to allow testimony from those with differencing of opinion on the TransCanada XL project. It was totally unprofessional and immature. It was disrespectful to both the State Department and their personnel. It was degrading to those of us wishing to testify no matter what our position that did attempt to honor the Department's request. I myself, shortened my testimony down due to the request in respect to both the personnel of the Department of State, the Department itself, and others commenting. This was the right and ethical action to take and the action taken by many others. Let it also be noted that the Sierra Club and the Indigenous Environmental Network did or could have handed in written testimony that was complete and given a verbal synopsis such as I and others. I also understand why the Department of State personnel running the meeting did not cut them off. The Sierra Club and the Indigenous Environmental Network would have screamed "foul". Again, I hope that the Department of State felt that all the testimony gave you insight and additional information to make an intelligent decision. Personally, this is a "no brainer" in the options of imported oil supply. Let us compare the XL pipeline to the Metro. How many people have been killed/injured vs. miles traveled with the Metro? And in that same area how many people have been killed/injured vs. miles traveled with automobile in the same area with the same time frame? It is obvious that the Metro is safer because you have fewer variables in a more controlled environment. The Keystone is the same as the Metro. It is a much safer way to transport oil.</p>	
1229	1	Devlin	Todd	Prairie County Commissioners	This is notification to our Congressional Delegation that Prairie County Commissioners of the Great State of Montana see need for the TransCanada XL project.	Comment acknowledged.
1229	2	Devlin	Todd	Prairie County Commissioners	It will bring jobs, reliable crude, and increased tax base.	Comment acknowledged.
1229	3	Devlin	Todd	Prairie County Commissioners	Prairie County is a county in which the TransCanada Keystone XL is going through. We have and will continue to make sure that our constituents and TransCanada are assured fairness in the process of addressing easements,	Comment acknowledged.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					liability, and environmental responsibility.	
1230	1	Devlin	Todd		As a Prairie County Commissioner in Montana, I find that the testimony from some about how dramatic the disturbance of the earth and how it will affect the wildlife habitat to be a non - issue.	Comment acknowledged
1230	3	Devlin	Todd		The pipeline burial process takes the top soil off and then when covering place the top soil back. Forage again grows after a few years. A county road however disturbs 6000 cubic yards of earth per mile of construction. The habitat deduction a county road is the road surface of 24 feet compared to zero after the pipeline is in place and grass is growing.	Consolidated Response RDS-1 addresses concerns about the condition of roadways and roadway structures associated with construction and operation of the proposed Project as well as traffic safety measures that would be incorporated into the Project.
1230	4	Devlin	Todd		A normal county road in my county would disturb 6000 cubic yards of soil of witch over 30,000 sq. feet is permanently disturbed and loss habitat. The TransCanada XL pipeline will disturb 12000 cubic yards per mile of construction and all of the soil is put back. My conclusion is that the permanent disturbance and loss of habitat is more for a county road than the pipeline.	Consolidated Response RDS-1 addresses concerns about the condition of roadways and roadway structures associated with construction and operation of the proposed Project as well as traffic safety measures that would be incorporated into the Project.
1230	5	Devlin	Todd		Prairie County has 650 miles of county roads that have disturbed 3.9 million cubic yards of soil and pasture. The TransCanada Keystone XL will disturb 240,000 cubic yards in Prairie County and all soils will be place back.	Consolidated Response RDS-1 addresses concerns about the condition of roadways and roadway structures associated with construction and operation of the proposed Project as well as traffic safety measures that would be incorporated into the Project.
1230	6	Devlin	Todd		The only issues of concern by my constituents are all connected to liability and cost of easement.	Consolidated Response LIA-1 addresses Keystone's liability if there is a spill of hazardous materials or fuel during construction or a spill of crude oil from the proposed Project. Consolidated Response EAS-2 addresses issues related to easement negotiations.
1313	1	Devlin	Todd	Prairie County Commissioners	Dear Ms. Orlando: Thank you for giving me this opportunity to testify on behalf of Prairie County, Montana. The proposed XL project will cross 20 plus miles of Prairie County, including one very major river..... the Yellowstone. I have already testified on noxious weed, bridge and road infrastructure, and stagnant tax base due to federal holdings. As a Board of Commissioners for Prairie County we take our Growth and Land Use Policy very seriously.	Comment acknowledged.
1313	3	Devlin	Todd	Prairie County Commissioners	To always look at the negative impacts and never consider the positive impacts is not healthy. With that mentality, mankind would be extinct because everyaction has possible negative impact and risk. But, a healthy thought pattern also takes positive impacts and opportunity into consideration. Economist call this"opportunity costs."	Comment acknowledged.
1313	5	Devlin	Todd	Prairie County Commissioners	What is not a reason for these hearings is the option of preservation. "Preservation" in this case, only dictates who defines "safe". Addressing environmental issues, however, means we define "safe" and not somebody else. Preservation can not be an option of alternatives when you look at the "Big Picture" on the TransCanada XL project. This pipeline, and probably others, will have to be built so that we have reliable crude from a politically stable county; but, just as important, then we have input on defining "safety".	As described in Consolidated Response SAF-1, the Pipeline and Hazardous Materials Safety Administration (PHMSA) has regulatory requirements that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project in a manner that protects the health and safety of the public and the environment. In addition, PHMSA developed 57 Project-specific Special Conditions that Keystone has agreed to implement. Incorporation of those conditions would result in a Project that would have a degree of safety over any other typically constructed domestic oil

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
						<p>pipeline system under current code and a degree of safety along the entire length of the pipeline system similar to that which is required in HCAs as defined in 49 CFR 195.450.</p> <p>Impacts associated with construction and normal operation of the proposed Project are presented in the resources sections of Section 3.0 of the EIS as required in a NEPA environmental review. As described in those sections, construction and normal operation of the proposed Project would not result in significant impacts.</p>
1546	34	Devlin	Todd	Prairie County Commissioner, State of MT	Oil sands in Alberta are on a world market and therefore will be developed regardless of the TransCanada pipeline. TransCanada allows U.S. Agencies and citizens to have input.	Comment acknowledged.
1546	35	Devlin	Todd	Prairie County Commissioner, State of MT	The other avenues for Canada to get their product out are truck, rail, ship, or other pipelines to the Pacific Rim. Due to the fact of topography and terrain, these options have higher risk factors than the TransCanada Pipeline by far.	Comment acknowledged.
1558	48	Devlin	Todd		It is our priority at the Board of Prairie County Commissioners that our constituents, the Prairie County landowners, are satisfied with the agreement with TransCanada. If everything goes well and our landowners are satisfied, this is a great opportunity for Prairie County so long as the constituents are satisfied.	Comment acknowledged.
1558	49	Devlin	Todd		Preliminary taxes that are supposed to come in to Prairie County total approximately \$5 million. We've got a stagnated tax base.	Consolidated Response TAX-1 and revisions to Section 3.10.2.4 of the EIS address concerns regarding taxes associated with implementation of the proposed Project.
1558	50	Devlin	Todd		We have a road budget that's about \$240,000 including our bridge fund. We operate and maintain 650 miles of road with that budget. Last year we bought our first new road blade in almost 20 years.	Consolidated Response RDS-1 addresses concerns about the condition of roadways and roadway structures associated with construction and operation of the proposed Project. As noted in that response, Keystone would be responsible for roadway improvements and restoration if damage occurs due to Project-related activities.
1558	51	Devlin	Todd		We're coming to a point where we have a threshold on our local taxpayers where we need to expand our tax base.	Comment acknowledged.
1558	52	Devlin	Todd		The number one complaint in our courthouse is about our roads, their maintenance and lack of funding.	Consolidated Response RDS-1 addresses concerns about the condition of roadways and roadway structures associated with construction and operation of the proposed Project. As noted in that response, Keystone would be responsible for roadway improvements and restoration if damage occurs due to Project-related activities.
1558	53	Devlin	Todd		When TransCanada came in, there was a lack of communication between the Department of Transportation and the State. We called the Department of Transportation a year ago and they didn't know this project was even on the books.	Consolidated Response EAS-2 addresses issues related to easement negotiations and eminent domain. DOS has no legal authority in the easement negotiations or in eminent domain proceedings.
1558	54	Devlin	Todd		We have bridges that have failed the Department of Transportation's inspections. How can we expect to have TransCanada come in and cave through a bridge that didn't meet the specs before they got here?	Consolidated Response RDS-1 addresses concerns about the condition of roadways and roadway structures associated with construction and operation of the proposed Project.
1558	55	Devlin	Todd		We really should work with the Department of Transportation to see if we can't get some type of acceleration on bridge replacement.	Consolidated Response RDS-1 addresses concerns about the condition of roadways and roadway structures associated with construction and operation of the proposed Project as well as

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
						traffic safety measures that would be incorporated into the Project.
1558	56	Devlin	Todd		When it comes to employment, I know they made the comment that 50 percent of the workforce will be local if they qualify. That's a big "if".	Consolidated Response ECO-1 and Section 3.10.2.2 of the EIS address potential socioeconomic impacts.
1558	53	Devlin	Todd		When TransCanada came in, there was a lack of communication between the Department of Transportation and the State. We called the Department of Transportation a year ago and they didn't know this project was even on the books.	Consolidated Response SAF-1 describes the regulatory requirements and Project-specific Special Conditions that Keystone would comply with to construct, operate, maintain, inspect, and monitor the proposed Project. It also describes the monitoring, inspections, and reviews of the proposed Project that the Pipeline and Hazardous Materials Safety Administration would conduct to ensure compliance with those regulatory requirements.
259	2	DeWitt	Dale	State Representative OK District 38	As I understand it, Keystone XL will create more than 13,000 high-wage construction and manufacturing jobs during the project's 2011-2012 construction schedule. Many of those jobs will be created in rural Oklahoma where too many of our residents continue to find it difficult to find good jobs. With Keystone XL they will have an opportunity to work on the project or for businesses that provide supplies, goods and services for its construction and operation.	Consolidated Response ECO-1 addresses potential socioeconomic impacts, and Consolidated Response TAX-1 addresses concerns regarding taxes.
259	3	DeWitt	Dale	State Representative OK District 38	In addition to the jobs Keystone XL will create, the project will generate substantial economic benefits for the United States and in states and communities along the proposed route. Like our counties, in many cases these are areas where economic performance has stagnated or is shrinking. It is our understanding that TransCanada commissioned a study to measure the project's economic stimulus to the U.S. and the states along the route. The study found that in the U.S., Keystone XL would generate \$20.9 billion in total expenditures \$9.6 billion in output (gross product), personal income of \$6.5 billion and 118,935 person years of employment (jobs).	Consolidated Response ECO-1 addresses potential socioeconomic impacts, and Consolidated Response TAX-1 addresses concerns regarding taxes.
259	4	DeWitt	Dale	State Representative OK District 38	In addition, the report concluded that during construction, Keystone XL would generate \$486.36 million in tax revenue for state governments along the route and \$99.1 million for local taxing entities where the pipeline is located. In Oklahoma, the study found Keystone XL expenditures during construction would total \$1.2 billion and generate an economic gross product of nearly \$1.1 billion. Keystone XL construction also would generate more than \$7.7 million in tax revenue for local government and \$31.4 million for state government.	Consolidated Responses TAX-1 and ECO-1 address the estimated increases in the tax base and the jobs generated by the proposed Project. Also see the revisions to Sections 3.10.2.3 and 3.10.2.4 of the EIS.
259	8	DeWitt	Dale	State Representative OK District 38	I enthusiastically support the Keystone XL Pipeline Project and encourage the Department of State to confirm the findings of the Draft Environmental Impact Statement which found that the proposed Keystone XL Pipeline would have "limited adverse environmental impact during construction and operation."	Comment acknowledged.
536	1	Dias	Kandee		Please reconsider building all other resources other than a transcontinental oil/gas pipeline. #1 -It's only a temporary job producer and the environmental impact is too great to justify this proposal. And speaking of jobs, the AMERICANS who need jobs will most likely be passed over for people who'll take less money for dangerous work (ie illegal immigrants.)	Consolidated Response ECO-1 addresses potential socioeconomic impacts associated with construction and normal operation of the proposed Project. Consolidated Response ALT-2 addresses the use of alternative technologies, alternative energy sources, and conservation of energy. Consolidated Response P&N-5 addresses issues

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					I've seen what's happened to major industry in this country. #2 - We've got to use our best and brightest minds to bring technology into the new millineum for oil production and consumption. We did the pipeline thing 40 years ago in Alaska. Has that ushered our country into a grand state of independence and prosperity? No. How has the royalty payments worked out for ALL of Alaska(ns)? #3 - Given the state of big business, regulation, and environmental justice, the American people always end up on the bottom. Look how many polluted towns we have, sick Americans from toxins. And how many folks who live in the shadow of these structures have good, safe jobs? This note feels like a rant, but, I'm tired of being told what's good for US when in the end, how much will my family benefit from it? I live in East Texas, and I don't want it to end up as one big Swamplot.	related to investments in other technologies.
413	1	Diegel	Julie		I am writing to express my opposition to the Keystone Pipeline project in Nebraska.	Comment acknowledged.
596	1	Dierks	Cap	Nebraska State Legialature	I attended your field hearing in Atkinson, Nebraska on May 11, 2010. I testified to the effect that I had introduced a bill in the 2010 Nebraska Legislature which would have provided some protection for property owners along the pipeline. That bill was killed. I hope that the U.S. Department of State understands the enormity of the problem that the pipeline is proposed to traverse many miles over the Ogallala Aquifer. There are many thousand acres of irrigated farm land all of which irrigates their crops from water taken from the aquifer. An oil leak or spill into the aquifer would be catastrophic. Please stop the project.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
1540	147	Dierks	Cap	Nebraska State Senator	I wonder what can be done to protect these landowners. If the federal government needs to look into something to provide protection for these landowners because we know there are problems with the pipelines. We know there are. They're in our history. We know it's there. There's got to be some way to protect these people from injury -- injuring their property. And there's got to be some way to help them at the time that the pipeline is forecloses, is closed up.	Keystone would be required to complete the reclamation committed to in the permits it receives, including the Presidential Permit. Those commitments are described in Section 2.3 of the EIS and in Keystone's Construction, Mitigation, and Reclamation Plan presented in Appendix B of the EIS. Consolidated Response LIA-1 addresses Keystone's liability if there is a spill of hazardous materials or fuel during construction and from a spill of crude oil from the proposed Project. As noted in that response, if there is a spill, no matter what the reason, Keystone would be liable for all costs associated with cleanup and restoration as well as other compensations. Responses related to taking the proposed Project out of service at the end of the life of the proposed Project are presented in Consolidated Response DEC-1.
921	1	Dietrich	W.		I oppose the proposed oil pipeline through Nebraska.	Comment acknowledged.
921	2	Dietrich	W.		The risk of a spill right over and into the Ogallala Aquifer is just too high. Our land and our water needs protected from this threat.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
1540	118	Dobrovoly	Stan	Landowners for Fairness in Nebraska,	We are also concerned with the fact that TransCanada has recently been downgraded in its financial position with Standard & Poors. That tells us that there is a possibility that	The occurrence suggested by the commenter is speculative and it is not possible to determine how such a situation would be addressed in the future. However, if a major accidental

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
				Protect South Dakota Resources in South Dakota, Eastern Montana Landowners Association	at some point in the future it might end up just like General Motors, or some of the other companies that were too big to fail. If that happens and at some point the Keystone XL Pipeline bled off into an empty LLC and they walk away from it, then who is going to be liable for the cleanup? Is that going to be the taxpayers, the landowners?	release occurs, the cleanup would be accomplished by the federal and state governments in accordance with regulatory requirements.
1540	120	Dobrovoly	Stan	Landowners for Fairness in Nebraska, Protect South Dakota Resources in South Dakota, Eastern Montana Landowners Association	We would like to see as a condition of permit that there will be a bond put in place, funded over numerous years or through the lifetime of the pipeline, for the removal and/or to take care of the problems that could arise with this pipeline, so it doesn't fall onto the landowner or the taxpayers. This way, at some point in the future if TransCanada does become insolvent and walks away, the taxpayers aren't left to clean up the mess.	Consolidated Response LIA-2 addresses the issue of bonding for the proposed Project.
653	1	Doer	Gary	Canadian Embassy	Attached, as mentioned, is a letter Ambassador Doer has written in support of Keystone XL. He requests that this be included in the federal register as part of the ongoing public comment process.	Comment acknowledged.
653	2	Doer	Gary	Canadian Embassy	'I am writing you in support of TransCanada's proposed Keystone Gulf Coast Expansion Project (Keystone XL) based on three major considerations. Canada is your largest and most secure supplier of energy,	Comment acknowledged.
653	4	Doer	Gary	Canadian Embassy	and the development of this project will create thousands of high-paying jobs in construction and manufacturing throughout the United States.	Consolidated Response ECO-1 and Section 3.10.2.2 of the EIS address the potential socioeconomic impacts of the proposed Project.
653	7	Doer	Gary	Canadian Embassy	Canada recognizes that developing its oil sands resource comes with environmental challenges. That is why we are investing heavily - at both the federal and provincial levels - in strong regulation and the development and deployment of technologies to ensure that our oil reserves are developed in a sustainable manner. Through our joint work on the Clean Energy Dialogue, we are seeking to put in place framework conditions that will further enable the rapid development and deployment of carbon capture and storage, to which Canadian governments have committed over \$3 billion to date. 'A sustainable oil industry is a benefit to both of our countries. The oil sands sector has already drawn billions of dollars of investment and has generated many thousands of high-paying jobs on both sides of the border. A recent study undertaken by the Canadian Energy Research Institute, projects that between 2011 and 2015, an upwards of 343,000 new U.S. jobs will be linked to oil sands activity, an injection of 434 billion in GDP into the U.S. economy over the same period. New pipelines are an important part of this economic picture. The construction of Keystone XL would create over 13,000 construction jobs over the 2011-2012 period according to TransCanada. Furthermore, some 90% of all of the equipment used for Keystone XL will be sourced within North America. In short, this project represents an important economic stimulus	Consolidated Response ECO-1 addresses potential socioeconomic impacts, and Consolidated Response TAX-1 addresses concerns regarding taxes.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					project with significant benefits for both countries.	
653	8	Doer	Gary	Canadian Embassy	The Keystone XL project will be good for energy security, it will be carried out within the context of a shared environmental agenda and it will create thousands of good new jobs at a time when our economy is still buffeted by economic headwinds. 'I thank you for the opportunity to comment and the attention that you are giving to this important matter.	Comment acknowledged.
1217	2	Dombrowski	Kathy		There is so much potential for severe harm if there were to be a major leak into the Ogallala Aquifer.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
1217	3	Dombrowski	Kathy		What an easy target for sabotage.	Consolidated Response TER-1 addresses potential terrorism associated with the proposed Project.
1217	4	Dombrowski	Kathy		This seems a reckless route.	Consolidated Response ALT-1 addresses potential alternative routes, including routes that would avoid much of the Northern High Plains Aquifer system.
385	2	Domeyer	Janelle		The pipeline would cross the Nebraska Sand Hills, a fragile and unique ecosystem that is easily damaged and difficult to repair	Issues related to the Sand Hills area are addressed in Consolidated Response ERO-1. Issues related to the High Plains Aquifer System are addressed in Consolidated Response AQF-1 and AQF-4. Section 3.13 of the EIS addresses reliability and safety issues, including calculations of the probability of a spill from the proposed Project and the potential environmental impacts associated with spills. Consolidated Response ALT-1 addresses potential alternative routes, including routes that would avoid much of the High Plains Aquifer System.
385	3	Domeyer	Janelle		It is a threat to the Ogallala Aquifer, one of the world's largest supplies of groundwater, and the primary source of groundwater for agriculture and domestic use in Nebraska. Once an aquifer is contaminated, it is expensive and difficult to clean up. Experience has taught us that most cleanup efforts have focused on containment rather than actual removal of contaminants.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
385	4	Domeyer	Janelle		Building the pipeline would provide oil companies more incentives for further development of the tar sands in Canada, an expensive and extremely environmentally damaging process that generates greenhouse gases, pollutes watersheds and destroys woodlands and other wildlife habitat.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project. Consolidated Response GHG-1 addresses GHG life-cycle analyses. Consolidated Response GHG-2 addresses the potential causal connection of implementation of the proposed Project and expanded oil sands production in Alberta and increases in refining.
180	1	Donahey	Leah	CREDO Action	On behalf of 663 concerned activists from all across America, we asked you to not to issue permits to Keystone XL or other pipelines. Here is a link to a document containing the lists of all 663 public comments: http://act.credoaction.com/campaign/keyston_xl_comments.pdf Thank you. If you have any questions about CREDO's position on this issue, please do not hesitate to contact me by phone at 415-369-2000.	Consolidated Response ENR-1 provides information on the Department of State's environmental review process, the National Interest Determination process, and the need to complete those reviews before approving or denying the Presidential permit for the proposed Project.
1560	30	Donovan	Susan		Have native prairie on property that the pipeline will go through. Native prairies are the threatened vegetative	Keystone attempted to avoid and minimize impacts to native prairie remnants where possible. The crossing location was

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					communities in the United States, why must it go through it? Also afraid the depth of the pipeline affects the root systems of native plants. Afraid Keystone will not restore, reestablish native prairie successfully.	reviewed further and inquiries were made. Keystone has committed to completing reclamation and to providing the landowner with the construction/reclamation plan for the tall grass prairie unit, which includes provisions for seeding with native tall grass prairie species. Reclamation procedures are presented in Sections 4.111 and 4.15 of the Keystone Construction, Mitigation, and Reclamation Plan presented in Appendix B of the EIS. Many commenters expressed concern about routing the proposed Project through the Sand Hills of Nebraska. Issues related to the Sand Hills area are addressed in Consolidated Response ERO-1.
1560	32	Donovan	Susan		Have been told an assessment of their property was made, but landowners cannot get a copy of what was found. Fear that if the survey was conducted at certain times of the year, they may not find native prairie.	Consolidated Response EAS-2 addresses issues related to easement negotiations and eminent domain. DOS has no legal authority in the easement negotiations or in eminent domain proceedings.
1560	33	Donovan	Susan		Will pipeline increase soil temperature? If so, how does this affect plants?	Consolidated Response ENV-2 addresses concerns related to pipeline temperature effects.
1560	34	Donovan	Susan		If pipeline increases soil temperature, how will that affect plants?	Heat dissipation and potential impacts on native vegetation and crops are discussed in Section 3.5.5 of the EIS. The EIS was revised to add discussions of temperature effects on native prairie grasses and crops in Section 3.5.5, and additional discussions of this issue are included in Consolidated Response ENV-2. Appendix L of the EIS illustrates modeled temperature effects of the pipeline from Montana to Texas and reviews effects of increased soil temperature on native prairie grasses and crops.
1560	32	Donovan	Susan		Have been told an assessment of their property was made, but landowners cannot get a copy of what was found. Fear that if the survey was conducted at certain times of the year, they may not find native prairie.	Consolidated Response EAS-2 addresses issues related to easement negotiations and eminent domain. DOS has no legal authority in the easement negotiations or in eminent domain proceedings. Consolidated Response ENV-3 addresses concerns regarding potential impacts to native grasslands and prairies.
112	1	Dorfler-Hederer	Cynthia		I really wish you would put a freeze on all oil drilling expansion, pipeline expansion etc until an emergency plan is set in place and is known to be effective. The current situation in the gulf of Mexico is a prime and excellent example why an emergency plan has to be in place before additional pipelines and wells are allowed.	Consolidated Response RES-1 addresses issues related to preparation and review of emergency response plans for the proposed Project.
325	1	Dostal	Daniel		What does this pipeline do for Americans? We don't need more oil. Projects of this magnitude need to be focused on new forms of energy, not the kind that ruin my state and my nation. If the Canadians want to let them drill in Canada, then let them keep it in Canada.	Consolidated Response P&N-1 addresses the need that the Project has been proposed to meet. Consolidated Response ALT-2 addresses the use of alternative technologies and alternative energy sources. Consolidated Response P&N-8 addresses issues related to shipping Canadian crude oil to refineries that are closer to the source of oil.
1429	45	Douglas Hayes	Douglas	Sierra Club et al	Even if a need for the U.S. to import more Canadian crude oil could be demonstrated, historical Canadian heavy crude oil production data show that it is highly unlikely that production capacity will increase in Canada in the foreseeable future to a level that a substantial portion of the Keystone XL Pipeline's export capacity will be utilized. Canadian production increased 52,495 barrels per day on average between 1993 and 2009, a period of 16 years [footnote, pg 21]. This increase in production is nearly linear with no indication of any long-term	Current information on production from Canadian oil sands projects, including data from a period of global recession, is presented in Section 1.4 of the EIS and in Consolidated Response CAN-1, including information from a recent report prepared under contract to the US DOE regarding development of oil sands projects with and without the proposed Project. As noted in that response, the production capacity of heavy crude oil from Canadian oil sands project is sufficient to supply the proposed Project, existing

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					trend of a greater rate of increase. The highest single-year increases were 131,000 bpd in 1997 and 127,000 bpd in 2008 [footnote, pg 22]. However, exports of heavy crude oil actually declined 28,952 barrels per day between 2008 and 2009 [footnote, pg 22]. If Canadian heavy oil exports increase at this historical pace, then the export capacity of the already constructed first Keystone Pipeline and Alberta Pipeline would not be fully utilized until almost 2036. Even if the rate of increase accelerated to the single year historical high of 131,000 barrels per day (and there is no evidence indicating that this will happen), these existing pipelines would not be fully utilized until almost 2021. There is simply no empirical evidence that Canada could increase exports to a point that the export capacity of the Keystone XL pipeline would be used in a reasonable timeframe. The tar sands industry is counting on an entirely infeasible acceleration in Canadian development, but current evidence indicates that development in the tar sands is still very slow. Recently, Royal Dutch Shell, one of the biggest players in the tar sands, indicated that it did not intend to resume substantial development in the tar sands until the price of oil is higher because the cost of development in the tar sands far exceeds the cost of development in other oil fields [footnote, pg 22].	transportation pipelines, and other proposed and planned pipelines.
1429	46	Douglas Hayes	Douglas	Sierra Club et al	The company's head of tar sands development stated, "[T]he oil sands have become one of the most costly places on earth to pursue oil projects [footnote, pg 22]. Referring to the company's recent \$14 billion expansion of its tar sands mining project he said that it represented, "some of the most expensive production that we have [footnote, pg 22]. In comparison, the Manifa Field in Saudi Arabia is estimated to cost \$15.75 billion to develop and is slated to produce 900,000 bpd of oil, as well as significant quantities of natural gas and condensate [footnote, pg 22]. In contrast, Shell's expansion in Canada cost \$14 billion but only added 100,000 bpd of crude oil capacity [footnote, pg 22]. While projects already under construction in the tar sands are proceeding at a slower pace, for the vast majority of the projects proposed during the boom years, the development schedule is "TBD" (To Be Determined) [footnote, pg 23] indicating that development of these projects is on indefinite hold.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information on current and future production. As noted in that Consolidated Response, without the proposed Project, oil sands development would continue at or above the current level until at least 2020, with or without the proposed Project.
1155	1	Dowding	Winnie		The Ogallala Aquifer is a precious asset of Nebraska. We have lived near two [pipeline] blow-outs in my life time and it would only take one to contaminate the whole aquifer.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
1155	2	Dowding	Winnie		I have lived in southeastern Nebraska for many many years where there are pipe-lines of gas running through our farms. I know that they have been installed with the greatest of care but I also know they can burst.	Consolidated Response SAF-1 describes the regulatory requirements and Project-specific Special Conditions that Keystone would comply with to construct, operate, maintain, inspect, and monitor the proposed Project. It also describes the monitoring, inspections, and reviews of the proposed Project that the Pipeline and Hazardous Materials Safety Administration would conduct to ensure compliance with those regulatory requirements.
1155	3	Dowding	Winnie		It is too risky and should never take place.	The commenter's opinion is noted.
1155	4	Dowding	Winnie		There is no way that anyone could promise that it would be built safely.	Consolidated Response SAF-1, the Pipeline and Hazardous Materials Safety Administration (PHMSA) has regulatory

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
						requirements that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project in a manner that protects the health and safety of the public and the environment. In addition, PHMSA developed 57 Project-specific Special Conditions that Keystone has agreed to implement. Incorporation of those conditions would result in a Project that would have a degree of safety over any other typically constructed domestic oil pipeline system under current code and a degree of safety along the entire length of the pipeline system similar to that which is required in HCAs as defined in 49 CFR 195.450. It also describes the inspections and reviews of the proposed Project that the Pipeline and Hazardous Materials Safety Administration would conduct to ensure compliance with those regulatory requirements.
1178	1	Dowling	Dale		Don't get me wrong, I'm all for new sources of energy and new supply lines but why does this line have to come down this far south. Could it not just come to a refinery into North Dakota or South Dakota? I understand that this country needs more Oil Refineries to reduce the impact on the public once any refinery has to stop production for a particular reason. Would it not make better sense to construct a refinery closer to the area of the source?	Consolidated Response P&N-8 addresses issues related to shipping Canadian crude oil to refineries that are closer to the source of oil. Consolidated Response P&N-1 addresses the need that the Project has been proposed to meet; transporting Canadian crude oil in the Keystone XL Project to refineries outside of the Gulf Coast region would not meet the current and near-term crude oil needs of those refineries.
1544	44	Dracoat	Steve		We always seem to end up having these hearings to talk about things that don't seem to have anything to do with the pipeline.	The commenter's opinion is noted.
1544	45	Dracoat	Steve		I understand there's a lot of desire to question the source or the end result of the product, but as far as the pipeline is concerned, TransCanada is one of the best companies I've ever worked with.	Comment acknowledged.
1544	46	Dracoat	Steve		If we're going to talk about other issues, there's a lot of issues where the money goes in the Middle East.	Comment acknowledged.
1544	47	Dracoat	Steve		I would say that if the governments that are allowing the oil sands to be developed in Canada, I know they have high standards and are doing the best they can to mitigate it.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information on current and future production. As noted in that Consolidated Response, without the proposed Project, oil sands development would continue at or above the current level until at least 2020, with or without the proposed Project.
1544	49	Dracoat	Steve		We see the interruption that we're experiencing with the Gulf of Mexico oil production. This could easily happen in Venezuela. I think it's vital to our nation that we have a diverse supply of oil, preferably from a stable ally.	As described in Consolidated Response GLF-1, the risks associated with the proposed Project are substantially different from those associated with the BP Deepwater Horizon Project.
1426	1	Dracos	J.Steve		Please reject recent requests for suspension of the permitting process for the Keystone XL pipeline... Please continue to proceed with the permit process.	Comment acknowledged.
1426	6	Dracos	J.Steve		The project... will bring good jobs to Americans.	Comment acknowledged.
1426	7	Dracos	J.Steve		Recent news reports of pipeline explosions show that both explosions were caused by third parties digging up the pipelines. I guess that says something about the minimal damages pipelines do to the environment. i.e. People digging who could be harmed due to hitting a pipeline could not tell where they were buried: minimal damage to the environment.	Consolidated Response SAF-1 describes the regulatory requirements and Project-specific Special Conditions that Keystone would comply with to construct, operate, maintain, inspect, and monitor the proposed Project. It also describes the monitoring, inspections, and reviews of the proposed Project that the Pipeline and Hazardous Materials Safety

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					With one call requirements in place it is said that these dig incidents occurred as they are avoidable accidents. As a retired Pipeline Engineer I am proud of my profession and know that this industry provides an environmentally friendly safe method of transport of energy products essential to our future.	Administration would conduct to ensure compliance with those regulatory requirements.
1367	1	Dreessen	Mark	Farmer's Elevator	Recently a number of advocacy groups sent a letter seeking suspension of the permitting of the Keystone XL pipeline. I encourage you to reject the request and to continue to review the proposed project... The permitting processes in place are appropriate and should proceed so that a final determination can be made about the impacts of the project and whether it is in the national interest....Please reject the request to suspend the process and continue with the review.	Comment acknowledged.
1367	4	Dreessen	Mark	Farmer's Elevator	At the same time, construction of this project stands to bring significant economic benefits to the areas where it will be built.	Comment acknowledged.
1163	1	Drenth	Sarah		I am from North West of Burwell, NE. I am opposed to the pipeline coming through the Sandhills. It will destroy the area!	Identification of sensitive environments crossed by the proposed Project is discussed in Consolidated Response ENV-1 and ENV-3. Issues related to the Sand Hills area are addressed in Consolidated Response ERO-1.
1163	2	Drenth	Sarah		Oil could potentially get into the Ogallala aquifer.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
1163	3	Drenth	Sarah		I am from North West of Burwell, NE. I am opposed to the pipeline coming through the sandhills. It will destroy the area! and could potentially get into the Ogallala aquifer. If that would happen it would harm the people and livestock that live here. Please move the pipeline to an area that would be better suited. For instance Western Nebraska or Wyoming where the soil has more clay and would not be disrupted so much.	Issues related to the Sand Hills area are addressed in Consolidated Response ERO-1. Issues related to the High Plains Aquifer System are addressed in Consolidated Response AQF-1 and AQF-4. Section 3.13 of the EIS addresses reliability and safety issues, including calculations of the probability of a spill from the proposed Project and the potential environmental impacts associated with spills. Consolidated Response ALT-1 addresses potential alternative routes, including routes that would avoid much of the High Plains Aquifer System and the Sand Hills area.
1163	4	Drenth	Sarah		If that would happen it [pipeline] would harm the people and livestock that live here.	Issues related to the High Plains Aquifer System are addressed in Consolidated Response AQF-1 through AQF-4. Consolidated Response AQF-3 provides information on hypothetical spills from the Project over two areas of the Northern High Plains Aquifer System.
1163	6	Drenth	Sarah		[Please move the pipeline to an area that would be better suited.] For instance Western Nebraska or Wyoming where the soil has more clay and would not be disrupted so much.	Consolidated Response ALT-1 addresses potential alternative routes, including routes that would avoid much of the Northern High Plains Aquifer system and the Sand Hills area.
892	1	Drew	Cody		From the environmental side of this question I believe that this pipeline can be built to the best standards possible and I believe the probability of a leak in this pipeline is very low. I believe that we as a country have some of the most stringent environmental laws and pipeline safety laws for workers, the environment, farmers and ranchers and citizens in the world.	Comment acknowledged.
892	2	Drew	Cody		My only concern is that the private company Trans Canada treat our citizens and our farmers and ranchers fairly and equitably, and that they be required to place bonding that will cover any unforeseen environmental impacts, reclamation costs or infrastructure costs to our taxpayers in small frontier counties like McCone County.	Consolidated Response LIA-2 addresses the issue of bonding for the proposed Project. Consolidated Response RDS-1 addresses concerns about the condition of roadways and roadway structures associated with construction and operation of the proposed Project as well as traffic safety measures that would be incorporated into the Project.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
892	3	Drew	Cody		I would also encourage that this private company not use eminent domain on any private landowners that do not want the pipeline crossing their lands but would instead investigate alternative routes in situations like that which could arise. I would also like to see more local involvement regarding routes from our land owners (farmers and ranchers, our local elected officials, and our local emergency response people.	As noted in Consolidated Response EAS-2, state laws dictate under what circumstances eminent domain may be used and define the eminent domain process within the state. DOS has no legal authority in the easement negotiations or in eminent domain proceedings. Alternative routes are addressed in Section 4.3 of the EIS, and pipeline routing in Montana is addressed in Consolidated Response EAS-1. The public has been invited to comment on the proposed Project from the initiation of the scoping period through the end of the comment period on the draft EIS.
892	4	Drew	Cody		Other than that I fully support this project, it will bring jobs to our local economy, it will reduce our dependence on oil from nations that are hostile to the American way of life, and it will generate tax dollars for our local schools, roads, and other infrastructure which is in need of repair or replacing. Also I see the potential to be able to move oil from the Bakken and Three Forks formations that are here in Eastern Montana and Western North Dakota that will give our oil producers more competitive markets for our crude oil energy products that are from American lands and involve American Labor.	Comment acknowledged.
1263	1	Droitsch	Danielle	The Pembina Institute	The Pembina Institute will direct its comments to one issue that was not satisfactorily addressed by the DEIS: The approval of this pipeline will likely result in additional upstream impacts to the Canadian environment and a net increase in North American GHG emissions.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project. Consolidated Response GHG-2 addresses the potential causal connection of implementation of the proposed Project and expanded oil sands production in Canada and increases in refining. Consolidated Response GHG-1 addresses the greenhouse gas life-cycle analyses presented in the revised EIS.
1263	2	Droitsch	Danielle	The Pembina Institute	It is unreasonable to assume that this pipeline would not necessarily lead to increased oil sands production in Alberta and the consequential increase of impacts to air, land, water, and increased GHG emissions.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project.
1263	3	Droitsch	Danielle	The Pembina Institute	It is improper for the DEIS to assume that the approval of the KXL pipeline would not result in increased and additive environmental impacts because the pipeline is specifically designed to access a new system of refineries that could further increase oil sands production. The purpose of the project (DEIS, Section 1.2.2.1) acknowledges that heavy crude production in the WCSB will increase and that the "bulk" of this will go to the U.S. market. As the DEIS states, this pipeline is to effectively open up oil sands supply to PADD III. According to the DEIS, the KXL pipeline will facilitate significant increased access to refineries in PADD III (58) and "...the proportion of imported oil to PADD III is expected to increase by 600,000 bpd by 2020 as domestic production decreases."	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including production from those projects with and without the proposed Keystone XL Project. Consolidated Response P&N-3 addresses refinery emissions.
1263	4	Droitsch	Danielle	The Pembina Institute	Another stated purpose of the pipeline is to replace other foreign sources of oil with Canadian oil sands. The approval of KXL could very well place a greater demand for Canadian oil sands over and above current exports to the U.S.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including production from those projects with and without the proposed Keystone XL Project.
1263	5	Droitsch	Danielle	The Pembina Institute	While the stated purpose of the pipeline under Section 1.2.1 is to "to transport WCSB crude oil from the border with Canada	The Project would replace dwindling supplies of heavy crude oil in PADD III from Mexico and Venezuela. Section 1.4 of the

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					to existing delivery points in PADD III" the DEIS also seems to suggest that the purpose of KXL is to meet increased crude oil demand in the United States or to replace other foreign oil such as from South America and the Middle East.	EIS addresses the market demand for oil, and the potential decreased reliance on oil from South America and the Middle East with implementation of the proposed Project.
1263	6	Droitsch	Danielle	The Pembina Institute	Section 1.2.2.3 states that because heavy crude from major suppliers such as Mexico, Venezuela, Nigeria, and Iraq and other countries are "declining and uncertain", PADD III refineries are modifying their facilities to allow for increased bitumen such as from Canadian oil sands. Numerous times, the DEIS refers to the fact that an increase in Canadian oil sands will offset use of oil from other countries. Section 1.2.2.5 states an "[i]ncrease the PADD II supply of crude oil from Canada would increase supplies from a stable and reliable ally and trading partner of the United States with which we have free trade agreements. It would also increase the supply of crude oil from a major source outside of the Organization of Petroleum Exporting Countries and augment the security of the energy supply."	The commentator has inaccurately stated what is in Section 1.2.2.3 of the DEIS (now Section 1.4 of the EIS). The statement is not specific to refinery changes to accept Canadian crude oil. The EIS states the following: "These declining and uncertain supply horizons have prompted some PADD III refineries to modify their existing facilities to allow the refinement of heavy crude oil . . ." In fact, the EIS does not refer to "increased bitumen" or similar terms for Canadian crude oil. Consolidated Responses Oil-4 and P&N-3 address the composition of the Canadian crude oils that would be transported by the proposed Project. As noted in those responses, the Canadian crude oil that would be transported is similar in composition to other heavy crude oils.
1263	7	Droitsch	Danielle	The Pembina Institute	The "replacement" of other foreign oil does not and cannot assume a reduction in foreign oil sources from other countries either to the United States or elsewhere. In fact, it would be presumptive to assume that the other oil exporting nations such as Saudi Arabia, Brazil, Mexico and Venezuela would abandon their sales to the US in the absence of policy preventing these sales. McCarthy, Shawn. "In Texas, oil sands firms fight for their share." Globe and Mail. Nov 6, 2009. http://www.theglobeandmail.com/report-on-business/industry-news/energy-and-resources/intexas-oil-sands-firms-fight-for-their-share/article1354643/ (accessed 1 July 2010).	As noted in Sections 1.2 and 1.4, production from Mexican oil wells is rapidly declining as has the volume of crude oil being shipped to the U.S. Sections 1.2 and 1.4 of the EIS address this issue, including updated information from EIA.
1263	8	Droitsch	Danielle	The Pembina Institute	Even if oil exports from other countries to the Gulf Coast were to decrease, it is presumptive to suggest that Canadian oil sands would fill the gap. For example, Saudi Arabia could increase exports to the US in a more responsive manner than oil sourced from the oil sands. This is because Saudi Arabia already has the infrastructure for refining and transport already in place, intentionally underutilized at the moment (McCarthy, Shawn. "In Texas, oil sands firms fight for their share." Globe and Mail. Nov 6, 2009. http://www.theglobeandmail.com/report-on-business/industry-news/energy-and-resources/intexas-oil-sands-firms-fight-for-their-share/article1354643/ (Accessed 1 July 2010). With the oil sands, however, production levels, refining and transport systems are not in place to move sufficient Canadian crude to the US Gulf Coast. Consequently, it is much easier for Saudi Arabia, whose production costs are significantly lower than Canada's, to 'turn on the tap' on their shipments of oil to the US Gulf Coast.	As noted in Consolidated Response CAN-1 and in Sections 1.2 and 1.4, production levels are in place to provide sufficient crude oil to continue to meet a substantial portion of the U.S. need for heavy crude oil. Refineries in the Gulf Coast and elsewhere are already refining heavy crude oil, including Canadian crude oil. As noted in Sections 1.2 and 1.4, cost is a key issue in determining which types of crude to import, and currently the cost differential between light and heavy crudes has led industry to focus more on heavy crude oil.
1263	10	Droitsch	Danielle	The Pembina Institute	It is possible that an increase of oil from the Middle East could easily offset the slight decrease in shipments from other Atlantic Basin countries (e.g. Angola, Mexico, Nigeria, Venezuela). There is uncertainty regarding the potential "over-supply of bitumen from both Alberta and other global sources producing similar grades, including Saudi Arabia, Mexico, and Venezuela." (Eurasia Group, Eurasia Group	The commentator is suggesting that lighter crudes from the Middle East could replace the heavy crude oil needs of the Gulf Coast refineries. Those refineries currently processing heavy crude and experiencing declining supplies from Mexico and Venezuela will not be able to process the light crude without changes to the refineries. Further, the cost of Middle East crude is greater than that of heavy crude, and refiners

					Outlook- OIL SANDS: Canada's unconventional oil mega-play faces new challenges and opportunities, 19 May 2010.)	are tending toward greater use of heavy crude oil.
1263	11	Droitsch	Danielle	The Pembina Institute	The purpose of KXL is to meet increased growth in the supply of Canadian oil sands. The National Energy Board decision for Keystone XL in Canada held that this pipeline would align and meet projected growth from the oil sands. Section 3.1 of the NEB decision approving KXL in Canada stated the project would help facilitate projected growth in Canadian oil sands. Indeed, KXL is "designed primarily to satisfy volume requirements in the USGC market" which currently accesses very little Canadian crude oil. The NEB decision acknowledged that KXL could deliver Canadian crudes to 15 refineries (see Section 3.3).	The commenter has incorrectly stated the purpose of the proposed Project. The purpose of the Project is stated in Section 1.2 of the EIS. Consolidated Response P&N-1 addresses the need that the Project has been proposed to meet.
1263	12	Droitsch	Danielle	The Pembina Institute	One argument made in the DEIS is that the KXL pipeline would not actually facilitate increased oil sands production because any increase in production would be shipped in any event to Asian markets via the Gateway pipeline and tankers. It is important to note the approval of the Gateway pipeline is highly uncertain and should not form the basis of any assumptions by the Department of State that the approval of KXL would not result in any increased impacts to Canada.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including production from those projects with and without the proposed Keystone XL Project.
1263	13	Droitsch	Danielle	The Pembina Institute	The fundamental assumption in the DEIS that any increase in production would be shipped in any event to Asian markets via the Gateway pipeline and tankers is flawed.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1.
1263	14	Droitsch	Danielle	The Pembina Institute	There is overwhelming public opposition to the Gateway pipeline by a majority of British Columbians. Opposition from a strong coalition of environmental, First Nations, and community groups suggest the regulatory process will be held up in court for years, and could create the political conditions for the project to be denied. (While a Joint Review Panel, convened by the National Energy Board and Canadian Environmental Assessment Agency, will issue a ruling on the application, it is a non-binding recommendation to the Federal cabinet. The ultimate decision is political.)	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1. Both the EnSys (2010) report and the EIS acknowledge opposition to, and regulatory obstacles faced by, the proposed pipeline projects to the Canadian West Coast. The EnSys report made conservative assumptions about the availability of additional transport capacity to the Canadian West Coast in light of those obstacles. Commenters state that in summary, "none of the proposed alternatives to Keystone XL are 'likely' to move forward, and if any did proceed, they would most likely be a long-term option (10+ years)." As noted in the Pembina Report, Exhibit O to the Sierra Club et al. comment letter, "Substantial growth in exports to Asian markets is unlikely as a short-term option (1-5 years); possible as a mid-term option (5-10 years), but only if certain issues are overcome; and most likely as a long-term option (10+ years)." These statements match the approach taken by EnSys in its analysis. In pipeline construction scenarios that included additional capacity to the Canadian West Coast, the EnSys modeling made the TMX 2&3 capacity available only in 2020, the Northern Gateway capacity available only in 2025, and the Northern Leg capacity available only in 2030.
1263	15	Droitsch	Danielle	The Pembina Institute	On May 26, 2010, a poll showed 80 percent of British Columbians support banning crude oil tankers in B.C.'s coastal waters, up from 72 percent in a similar 2008 poll. (The poll results are part of a Mustel Group omnibus random telephone survey of 500 British Columbians in May 2010. Results on a sample size of 500 random surveys are considered accurate to within +/- 4.5 percentage points, 19 times out of 20.) The poll's key findings: - 80 percent of British	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1. Both the EnSys (2010) report and the EIS acknowledge opposition to, and regulatory obstacles faced by, the proposed pipeline projects to the Canadian West Coast. The EnSys report made conservative assumptions about the availability of additional transport capacity to the Canadian West Coast in light of those obstacles. Commenters state that in summary, "none of the

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					Columbians support a crude oil tanker ban for B.C.'s coastal waters, while 15 percent think tanker traffic should be allowed. - Significantly more British Columbians oppose the Enbridge Northern Gateway pipeline (51 percent), than support it (34 percent). - British Columbians who strongly oppose Enbridge's pipeline (31.7 percent) outnumber strong supporters (8.1 percent) nearly four to one.	proposed alternatives to Keystone XL are 'likely' to move forward, and if any did proceed, they would most likely be a long-term option (10+ years)." As noted in the Pembina Report, Exhibit O to the Sierra Club et al. comment letter, "Substantial growth in exports to Asian markets is unlikely as a short-term option (1-5 years); possible as a mid-term option (5-10 years), but only if certain issues are overcome; and most likely as a long-term option (10+ years)." These statements match the approach taken by EnSys in its analysis. In pipeline construction scenarios that included additional capacity to the Canadian West Coast, the EnSys modeling made the TMX 2&3 capacity available only in 2020, the Northern Gateway capacity available only in 2025, and the Northern Leg capacity available only in 2030.
1263	16	Droitsch	Danielle	The Pembina Institute	This public opposition to the Gateway pipeline has also led the federal Member of Parliament for Skeena- Bulkley Valley (The Skeena-Bulkley Valley riding covers northwestern BC. The proposed Gateway pipeline would pass through this riding and terminate at a port in Kitimat. Associated tankers would pass through waters and island chains that also form part of the riding. http://www.elections.ca/scripts/pss/Map.aspx?L=e&ED=59025&EV=99), Nathan Cullen, to assert his opposition to the Gateway pipeline and to launch an "oil and water" tour to unite opposition (Nathan Cullen (Member of Canadian Parliament), "Preventing disaster requires new thinking: Gulf Coast disaster a warning for oil-tanker traffic in B.C. water," Times Colonist, May 27, 2010. http://www.timescolonist.com/business/Preventing+disaster+requies+thinking/3076817/story.html (accessed July 2, 2010).	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1. Both the EnSys (2010) report and the EIS acknowledge opposition to, and regulatory obstacles faced by, the proposed pipeline projects to the Canadian West Coast. The EnSys report made conservative assumptions about the availability of additional transport capacity to the Canadian West Coast in light of those obstacles. 						2&3 capacity available only in 2020, the Northern Gateway capacity available only in 2025, and the Northern Leg capacity available only in 2030.
1263	18	Droitsch	Danielle	The Pembina Institute	First Nations who have aboriginal rights and title have indicated they will fight the Gateway pipeline potentially holding up the pipeline in court for years. On March 2010, all nine Coastal First Nations declared, "oil tankers carrying crude oil from the Alberta tar sands will not be allowed to transit our lands and waters." (See, for example, 'It's going to be bigger than Clayoquot Sounds,' Globe and Mail, March 27, 2010. http://www.theglobeandmail.com/news/national/british-columbia/its-going-to-be-biggerthan-clayoquot-sound/article1514573/?cid=olym10/quote (accessed July 1, 2010).	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1. Both the EnSys (2010) report and the EIS acknowledge opposition to, and regulatory obstacles faced by, the proposed pipeline projects to the Canadian West Coast. The EnSys report made conservative assumptions about the availability of additional transport capacity to the Canadian West Coast in light of those obstacles. Commenters state that in summary, "none of the proposed alternatives to Keystone XL are 'likely' to move forward, and if any did proceed, they would most likely be a long-term option (10+ years)." As noted in the Pembina Report, Exhibit O to the Sierra Club et al. comment letter, "Substantial growth in exports to Asian markets is unlikely as a short-term option (1-5 years); possible as a mid-term option (5-10 years), but only if certain issues are overcome; and most likely as a long-term option (10+ years)." These statements match the approach taken by EnSys in its analysis. In pipeline construction scenarios that included additional capacity to the Canadian West Coast, the EnSys modeling made the TMX 2&3 capacity available only in 2020, the Northern Gateway capacity available only in 2025, and the Northern Leg capacity available only in 2030.
1263	19	Droitsch	Danielle	The Pembina Institute	This First Nations tanker ban covers all possible shipping routes to and from Northern BC ports. It is a significant "shot over the bow" in the campaign to stop the Enbridge pipeline as the Coastal First Nations have a tradition of exercising their aboriginal title and rights aggressively where need be (including in the Courts), and some of their leaders have clearly stated that they will get in boats and blockade the coast should the need arise.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1. Both the EnSys (2010) report and the EIS acknowledge opposition to, and regulatory obstacles faced by, the proposed pipeline projects to the Canadian West Coast. The EnSys report made conservative assumptions about the availability of additional transport capacity to the Canadian West Coast in light of those obstacles. Commenters state that in summary, "none of the proposed alternatives to Keystone XL are 'likely' to move forward, and if any did proceed, they would most likely be a long-term option (10+ years)." As noted in the Pembina Report, Exhibit O to the Sierra Club et al. comment letter, "Substantial growth in exports to Asian markets is unlikely as a short-term option (1-5 years); possible as a mid-term option (5-10 years), but only if certain issues are overcome; and most likely as a long-term option (10+ years)." These statements match the approach taken by EnSys in its analysis. In pipeline construction scenarios that included additional capacity to the Canadian West Coast, the EnSys modeling made the TMX 2&3 capacity available only in 2020, the Northern Gateway capacity available only in 2025, and the Northern Leg capacity available only in 2030.
1263	20	Droitsch	Danielle	The Pembina Institute	Strong First Nations opposition to the Gateway pipeline and the likelihood of regulatory and legal delays and challenges are undercutting the "certainty" that producers and investors alike are seeking.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1.
1263	21	Droitsch	Danielle	The Pembina Institute	According to Eurasia Group, a global political risk research and consulting firm, "[t]here are major doubts, however, regarding the pipeline's viability. The Gateway project will face	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1. Both the EnSys (2010) report and the EIS acknowledge opposition to,

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					great pressure from environmental and native groups in northern British Columbia." (Eurasia Group, Eurasia Group Outlook- OIL SANDS: Canada's Robert Johnston, "Canada's unconventional oil mega-play faces new challenges and opportunities, 19," Eurasia Group, May 19, 2010., p. 5. 11 Eurasia Group, Eurasia Group) Eurasia cited a lengthy review process, environmental concerns using the port of Kitimat especially in face of the oil spill in the Gulf of Mexico, and confusion over the presence of a legal federal tanker exclusion.	and regulatory obstacles faced by, the proposed pipeline projects to the Canadian West Coast. The EnSys report made conservative assumptions about the availability of additional transport capacity to the Canadian West Coast in light of those obstacles. Commenters state that in summary, "none of the proposed alternatives to Keystone XL are 'likely' to move forward, and if any did proceed, they would most likely be a long-term option (10+ years)." As noted in the Pembina Report, Exhibit O to the Sierra Club et al. comment letter, "Substantial growth in exports to Asian markets is unlikely as a short-term option (1-5 years); possible as a mid-term option (5-10 years), but only if certain issues are overcome; and most likely as a long-term option (10+ years)." These statements match the approach taken by EnSys in its analysis. In pipeline construction scenarios that included additional capacity to the Canadian West Coast, the EnSys modeling made the TMX 2&3 capacity available only in 2020, the Northern Gateway capacity available only in 2025, and the Northern Leg capacity available only in 2030.
1263	22	Droitsch	Danielle	The Pembina Institute	Eurasia commented that "First Nations groups have still pending land claims and earlier court rulings have established a high bar that Enbridge and regulators must satisfy in meeting their 'duty to consult' with those indigenous groups whose territory the project will cross. Coastal First Nations have declared unequivocally that they will not allow tanker traffic." (Robert Johnston. "Outlook- OIL SANDS: Canada's unconventional: Oil Sands, Canada Unconventional oil mega-play faces new challenges and opportunities, 19," Eurasia Group, May 19, 2010).	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1. Both the EnSys (2010) report and the EIS acknowledge opposition to, and regulatory obstacles faced by, the proposed pipeline projects to the Canadian West Coast. The EnSys report made conservative assumptions about the availability of additional transport capacity to the Canadian West Coast in light of those obstacles. Commenters state that in summary, "none of the proposed alternatives to Keystone XL are 'likely' to move forward, and if any did proceed, they would most likely be a long-term option (10+ years)." As noted in the Pembina Report, Exhibit O to the Sierra Club et al. comment letter, "Substantial growth in exports to Asian markets is unlikely as a short-term option (1-5 years); possible as a mid-term option (5-10 years), but only if certain issues are overcome; and most likely as a long-term option (10+ years)." Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					July 2010.)	(5-10 years), but only if certain issues are overcome; and most likely as a long-term option (10+ years)." These statements match the approach taken by EnSys in its analysis. In pipeline construction scenarios that included additional capacity to the Canadian West Coast, the EnSys modeling made the TMX 2&3 capacity available only in 2020, the Northern Gateway capacity available only in 2025, and the Northern Leg capacity available only in 2030.
1263	24	Droitsch	Danielle	The Pembina Institute	One oil sands producer said that the Asia market would only make sense when the US market is saturated. (Eurasia Group, Eurasia Group Outlook- OIL SANDS: Canada's unconventional oil mega-play faces new challenges and opportunities, 19 May 2010.) Others producers in Alberta see the Asian market as a long-term option at best, with competition from the Persian Gulf and increasing volumes of oil from Russia due to the opening of the East Siberia Pacific Ocean pipeline. (Eurasia Group, Eurasia Group Outlook- OIL SANDS: Canada's unconventional oil mega-play faces new challenges and opportunities, 19 May 2010).	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1. Both the EnSys (2010) report and the EIS acknowledge opposition to, and regulatory obstacles faced by, the proposed pipeline projects to the Canadian West Coast. The EnSys report made conservative assumptions about the availability of additional transport capacity to the Canadian West Coast in light of those obstacles. Commenters state that in summary, "none of the proposed alternatives to Keystone XL are 'likely' to move forward, and if any did proceed, they would most likely be a long-term option (10+ years)." As noted in the Pembina Report, Exhibit O to the Sierra Club et al. comment letter, "Substantial growth in exports to Asian markets is unlikely as a short-term option (1-5 years); possible as a mid-term option (5-10 years), but only if certain issues are overcome; and most likely as a long-term option (10+ years)." These statements match the approach taken by EnSys in its analysis. In pipeline construction scenarios that included additional capacity to the Canadian West Coast, the EnSys modeling made the TMX 2&3 capacity available only in 2020, the Northern Gateway capacity available only in 2025, and the Northern Leg capacity available only in 2030.
1263	25	Droitsch	Danielle	The Pembina Institute	Some see the recent expansion of Chinese investment a sign that China would like to ship oil sands crude to China. However, Professor Wenran Jiang of the University of Alberta has noted that recent Chinese investment in oil sands demonstrates that [Chinese national oil companies] are "behaving more like a Western multinational, more interested in earning a return on its investment than showing a preference for a specific market for the crude" (McCarthy, Shaun and Gordon Pitts. "Oilsands deal gives China veto on exports." Globe and Mail. 13 April 2010. http://www.theglobeandmail.com/report-on-business/industry-news/energyand-resources/oil-sands-deal-gives-china-crucial-veto-on-exports/article1533681/ Accessed 2 July 2010.)	Consolidated Response P&N-4 provides information on investments by Chinese companies in Canadian oil sands projects. The investments of Chinese firms in oil sands projects would have no effect on the ability of the proposed Project to provide the heavy crude oil needed in the Gulf Coast area.
1263	26	Droitsch	Danielle	The Pembina Institute	Other access points to Asian markets via the West Coast are questionable.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1. Transportation to Asian markets is addressed in Section 4.1.2.2.
1263	27	Droitsch	Danielle	The Pembina Institute	Two other options to access the Asian markets include the KinderMorgan TransMountain Express oil pipeline and a bitumen-by-rail alternative. The expansion of the TransMountain Express (TMX) that would open up markets on the US West Coast and possibly Asia, faces considerable problems. The existing TMX ships both crude oil and refined	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1. Both the EnSys (2010) report and the EIS acknowledge opposition to, and regulatory obstacles faced by, the proposed pipeline projects to the Canadian West Coast. The EnSys report made conservative assumptions about the availability of additional

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					products from Edmonton, Alberta to a variety of terminals in central BC, coastal BC and Washington. While the pipeline was upgraded a few years ago with an eye towards increasing shipments to both the US and potentially to overseas market, only the Westridge terminal (a marine/mainline terminus in Vancouver) can be used for marketing products overseas.	transport capacity to the Canadian West Coast in light of those obstacles. Commenters state that in summary, "none of the proposed alternatives to Keystone XL are 'likely' to move forward, and if any did proceed, they would most likely be a long-term option (10+ years)." As noted in the Pembina Report, Exhibit O to the Sierra Club et al. comment letter, "Substantial growth in exports to Asian markets is unlikely as a short-term option (1-5 years); possible as a mid-term option (5-10 years), but only if certain issues are overcome; and most likely as a long-term option (10+ years)." These statements match the approach taken by EnSys in its analysis. In pipeline construction scenarios that included additional capacity to the Canadian West Coast, the EnSys modeling made the TMX 2&3 capacity available only in 2020, the Northern Gateway capacity available only in 2025, and the Northern Leg capacity available only in 2030.
1263	28	Droitsch	Danielle	The Pembina Institute	The major constraint for increasing overseas exports from the Westridge terminal on the TMX is not pipeline capacity (which could be readily increased), but the relatively small size of ships that can access the terminal (100,000 dead weight tons). However, the terminal in Kitimat (terminus of Gateway) could accommodate "supertankers," which are up to 320,000 deadweight tons allowing for access to Asian markets but to do so, it would require government approvals to dredge the channels, significant opposition to tanker traffic into the Port of Vancouver. (Mitchell Adams, "Big Jump in Oil Tankers in Vancouver's Port," The Tyee, June 3, 2010. http://thetyee.ca/News/2010/06/03/VancouverOilTankers/ Accessed July 2, 2010).	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1. Both the EnSys (2010) report and the EIS acknowledge opposition to, and regulatory obstacles faced by, the proposed pipeline projects to the Canadian West Coast. The EnSys report made conservative assumptions about the availability of additional transport capacity to the Canadian West Coast in light of those obstacles. Commenters state that in summary, "none of the proposed alternatives to Keystone XL are 'likely' to move forward, and if any did proceed, they would most likely be a long-term option (10+ years)." As noted in the Pembina Report, Exhibit O to the Sierra Club et al. comment letter, "Substantial growth in exports to Asian markets is unlikely as a short-term option (1-5 years); possible as a mid-term option (5-10 years), but only if certain issues are overcome; and most likely as a long-term option (10+ years)." These statements match the approach taken by EnSys in its analysis. In pipeline construction scenarios that included additional capacity to the Canadian West Coast, the EnSys modeling made the TMX 2&3 capacity available only in 2020, the Northern Gateway capacity available only in 2025, and the Northern Leg capacity available only in 2030.
1263	29	Droitsch	Danielle	The Pembina Institute	The alternative to ship bitumen in rail cars to the Pacific Coast can only transport a relatively small amount of bitumen (10,000 – 20,000 bpd). (Canadian Association of Petroleum Producers. 2010 Crude Oil Forecasts, Markets and Pipelines Report.) It remains an unproven method of economically transporting bitumen.	Additional examination of the potential for rail and other modes of transport to carry WCSB crude oil throughout North America is included in Section 4.1.2.1 of the EIS. In situations where pipeline capacity is restricted rail is a transport option that can add significant capacity very quickly, as evidenced by developments in the Williston Basin in North Dakota (EnSys 2011).
1263	30	Droitsch	Danielle	The Pembina Institute	The recent, June 21 2010, announcement by the Canada's Liberal Party calling for a ban on tanker traffic on British Columbia's northwest coast would essentially prevent the possibility of a pipeline with Asian-bound oil tankers. (Ebner, David. "Ignatieff supports tanker ban of B.C. coast." Globe and Mail. 21 June 2010. http://www.theglobeandmail.com/news/national/british-columbia/ignatieff-supports-oil-tanker-banoff-bc-coast/article1612512/?cmpid=rss1 Accessed 2 July 2010.)	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1. Both the EnSys (2010) report and the EIS acknowledge opposition to, and regulatory obstacles faced by, the proposed pipeline projects to the Canadian West Coast. The EnSys report made conservative assumptions about the availability of additional transport capacity to the Canadian West Coast in light of those obstacles. Commenters state that in summary, "none of the proposed alternatives to Keystone XL are 'likely' to move

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					Given the limited rule of the minority Conservative government, the Liberal Party decision brings considerable influence on the viability of the Northern Gateway. This ban would formalize the current 38-year moratorium on tanker traffic in Northwest B.C.	forward, and if any did proceed, they would most likely be a long-term option (10+ years)." As noted in the Pembina Report, Exhibit O to the Sierra Club et al. comment letter, "Substantial growth in exports to Asian markets is unlikely as a short-term option (1-5 years); possible as a mid-term option (5-10 years), but only if certain issues are overcome; and most likely as a long-term option (10+ years)." These statements match the approach taken by EnSys in its analysis. In pipeline construction scenarios that included additional capacity to the Canadian West Coast, the EnSys modeling made the TMX 2&3 capacity available only in 2020, the Northern Gateway capacity available only in 2025, and the Northern Leg capacity available only in 2030.
1263	31	Droitsch	Danielle	The Pembina Institute	As a policy matter, the United States should consider the long-term implications that could occur with approving major pipelines such as Keystone XL and the corresponding increase in GHG emissions in North America.	The potential for long-term impacts from the proposed Project, including increases in GHG emissions, will be considered during the review of the application for a Presidential Permit for the proposed Project and during the determination of national interest.
1263	34	Droitsch	Danielle	The Pembina Institute	The DEIS as a matter US policy should consider the GHG lifecycle emissions that will result from KXL. The DEIS did not sufficiently address the issue of greenhouse gas intensity from oil sands production as compared with conventional oil production.	Consolidated Response GHG-1 addresses the greenhouse gas life-cycle analyses presented in the revised EIS.
1263	35	Droitsch	Danielle	The Pembina Institute	The DEIS did not consider the additive GHG emissions that would be emitted as a result of sourcing either synthetic crude oil or raw bitumen from the Canadian oil sands. For oil sands mining this includes greenhouse gas emissions from electricity and heat production, tailings ponds and trucks. For in situ drilling of oil sands, emissions are primarily from natural gas combustion for steam generation.	Consolidated Response GHG-1 addresses the greenhouse gas life-cycle analyses presented in the revised EIS.
1263	36	Droitsch	Danielle	The Pembina Institute	Section 3.14.3.14 addressing air quality and GHG emissions in particular failed to address the resulting increase in GHG emissions result from the use of a barrel of oil sands versus use of a conventional barrel of oil.	Consolidated Response GHG-1 addresses the greenhouse gas life-cycle analyses presented in the revised EIS.
1263	37	Droitsch	Danielle	The Pembina Institute	The DEIS considers GHG emissions associated with refining a single barrel of heavy crude but did not consider the lifecycle impacts.	Consolidated Response GHG-1 addresses the greenhouse gas life-cycle analyses presented in the revised EIS.
1263	38	Droitsch	Danielle	The Pembina Institute	The administration's commitment to considering lifecycle impacts as demonstrated by the Executive Order 13514 and the long-term implications of considerably increasing GHG emissions as a result of replacing heavy crude with that of Canadian oil sands merits a more comprehensive analysis by the DEIS. (U.S. Government. "Federal Leadership in Environmental, Energy, and Economic Performance." Executive Order 13514, October 6, 2009. http://www.whitehouse.gov/assets/documents/2009fedleader_eo_rel.pdf ; see also Office of the Press Secretary. The White House. Press Conference Statement. May 26, 2010.	Consolidated Response GHG-1 addresses the greenhouse gas life-cycle analyses presented in the revised EIS.
1263	43	Droitsch	Danielle	The Pembina Institute	Even considering a lifecycle analysis, oil sands production (including transportation emissions which is constant for both sources) are considerably higher than a baseline of 2005 based on an evaluation by the U.S. National Energy Technology Laboratory. [Kristen Gerdes and Timothy Skone,	Consolidated Response GHG-1 addresses the greenhouse gas life-cycle analyses presented in the revised EIS.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					An Evaluation of the Extraction Transport and Refining of Imported Crude Oil and the Impact on Life Cycle Greenhouse Gas Emissions, March 27, 2009 (DOE/NETL-2009/1362)].	
1263	46	Droitsch	Danielle	The Pembina Institute	In light of the fact that the vast majority of oil sands deposits can only be accessed by in situ drilling, an increasing proportion of oil sands production will rely upon this technology and the average GHG intensity of oil sands production will increase.	Consolidated Response GHG-3 addresses the decreased rate of greenhouse gas emissions from oil sands production in Canada.
945	1	Dropinski	Nicholas		I fully oppose the pipeline. Period.	Comment acknowledged.
1542	47	Drury	Bruce	Big Thicket Association	The EPA has several serious concerns with the proposed Keystone pipeline.	DOS has prepared the EIS in consultation with EPA, DOE, and the other cooperating agencies. Section 3 of the EIS addresses the impacts of construction and operation of the proposed Project. Section 3.13 of the EIS addresses the risk and environmental impacts of a crude oil spill from the proposed Project.
1542	48	Drury	Bruce	Big Thicket Association	The pipeline facilitates the destruction of a huge area of boreal forest in Canada.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project. Consolidated Response GHG-4 addresses concerns regarding the loss of boreal forest and peat bogs.
1542	49	Drury	Bruce	Big Thicket Association	Thousands of square miles of pristine habitat for a large number of organisms will be destroyed.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project.
1542	50	Drury	Bruce	Big Thicket Association	That will be accompanied by significant air pollution that would affect an even larger area.	As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries. Consolidated Response OIL-4 also addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils.
1542	51	Drury	Bruce	Big Thicket Association	The pipeline facilitates the pollution of the water in Canada.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project.
1542	52	Drury	Bruce	Big Thicket Association	As citizens of the world, BTA members cannot acquiesce to the rape of the environment.	The impacts associated with implementation of the proposed Project are addressed in Section 3.0 of the EIS. As noted in that section, construction and normal operation the proposed Project would not result in significant environmental impacts.
1542	53	Drury	Bruce	Big Thicket Association	The construction of the pipeline will cause environmental destruction along its path through Oklahoma and Texas.	The impacts associated with implementation of the proposed Project are addressed in Section 3.0 of the EIS. As noted in that section, construction and normal operation the proposed Project would not result in significant environmental impacts.
1542	54	Drury	Bruce	Big Thicket Association	The route the pipeline takes, especially the crossing of Menard Creek, is adjacent to the Big Thicket National Preserve separated only by a small gap caused by a housing development that the pipeline is using to avoid crossing federal land.	Comment acknowledged.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
1542	55	Drury	Bruce	Big Thicket Association	The pipeline presents an ultimate danger to the preserve.	The proposed route does not cross the Big Thicket National Preserve on federal lands but crosses the portion of the Menard Creek unit along a roadway and existing utility corridor.
1542	56	Drury	Bruce	Big Thicket Association	The construction of the Keystone pipeline goes against the Big Thicket Association's desire to protect all the floodplains in the Big Thicket National Preserve.	The proposed route does not cross the Big Thicket National Preserve on federal lands but crosses the portion of the Menard Creek unit along a roadway and existing utility corridor.
1542	57	Drury	Bruce	Big Thicket Association	We have great concern about the use of tar sands in the refineries of the region.	Consolidated Response OIL-4 addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils. Consolidated Response P&N-3 addresses issues related to As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries.
1542	58	Drury	Bruce	Big Thicket Association	Southeast Texas is not currently in compliance with clean air standards and the processing of what we are told will be very dirty crude oil will put the region further out of compliance.	As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries. Consolidated Response OIL-4 also addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils.
1542	59	Drury	Bruce	Big Thicket Association	In addition to the air pollution, the processing of tar sands will generate large amounts of petroleum coke, some of which will find its way into streams, estuaries and the Gulf of Mexico.	Petroleum coke is either sold by the refineries or stored in accordance with applicable regulatory requirements to avoid impacts to water quality.
1542	60	Drury	Bruce	Big Thicket Association	The proposed Keystone pipeline raises international, national, state and local concerns of great significance. The Big Thicket Association hopes that the US Department of State will protect all concerned from this unnecessary and very dangerous project.	There is a demonstrated need for the proposed Project as described in Consolidated Response P&N-1 and in Section 1.4 of the EIS. Section 3.13 of the EIS addresses reliability and safety issues, including calculations of the probability of a spill from the proposed Project and the potential environmental impacts associated with spills. Consolidated Responses ENR-1 and REG-2 provide information on the DOS environmental review process, the National Interest Determination process, and the need to complete those reviews before approving or denying the Presidential permit for the proposed Project.
1542	61	Drury	Bruce	Big Thicket Association	We hope that the money being put up for this particular project would go into far more environmentally useful projects.	Consolidated Response P&N-5 addresses issues related to investments in other technologies.
1542	62	Drury	Bruce	Big Thicket Association	The money being used for this project should go into farm more economically useful projects.	Consolidated Response P&N-5 addresses issues related to other investments.
230	1	Dubreuil	Michael	Project Talent Acquisition Group	The Keystone XL project has the potential to deliver significant energy security benefits to the United States, increasing access to substantial land-based sources of oil from our long term reliable trading partner, Canada, with whom we are closely allied. At the same time, construction of the Keystone XL project stands to bring significant economic benefits to the areas where it will be built. The Keystone XL project is an important part of the solution to the US's energy supplies. The	Comment acknowledged.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					permitting processes underway are appropriate and should proceed so that a final determination can be made about the positive and negative impacts of the project and whether it is in the national interest. As a note: here at PTAG in Houston this project already has created 8 full-time high paying jobs with the prospect of creating dozens more if the project goes thru.	
1282	1	Dubreuil	Michael	Project Talent Acquisition Group, Inc.	We write in support of TransCanada's strategic Keystone XL crude oil pipeline project and urge the department to grant a permit for this strategic pipeline.	Comment acknowledged.
1282	7	Dubreuil	Michael	Project Talent Acquisition Group, Inc.	Considering the economic and energy security benefits of these vital resources, we should continue to expand America's access to safe, affordable energy to help ensure improved domestic and global energy security and stable prices for consumers.	Comment acknowledged.
1282	8	Dubreuil	Michael	Project Talent Acquisition Group, Inc.	Pipelines are the safest, most reliable, economical and environmentally favorable way to transport oil and petroleum products, as well as other energy liquids, throughout the U.S.	Comment acknowledged.
1282	10	Dubreuil	Michael	Project Talent Acquisition Group, Inc.	This project stands to provide a powerful private sector economic stimulus. During construction, Keystone XL will create more than 13,000 jobs funded with private investment.	Consolidated Response ECO-1 and Section 3.10.2.2 of the EIS address the potential socioeconomic impacts of the proposed Project.
1282	11	Dubreuil	Michael	Project Talent Acquisition Group, Inc.	Local governments will have a steady long term source of income from economic activity associated with construction and from the property taxes the pipeline company will pay.	Comment acknowledged.
1282	12	Dubreuil	Michael	Project Talent Acquisition Group, Inc.	A secure supply of oil into the Houston refining market will ensure the retention of 1,000's of long term high paying jobs, which support much of our local economy.	Comment acknowledged.
1282	13	Dubreuil	Michael	Project Talent Acquisition Group, Inc.	Rejection of the permit or suspension of the review would be a significant sacrifice of the substantial economic benefits the Keystone XL project stands to deliver and force U.S. government and consumers to rely on other sources of crude oil not economically and politically allied with U.S. interests. This would be a mistake. We urge the granting of the permit.	Comment acknowledged.
908	1	Duchene/Ball	Staci		I live in Calgary Alberta, where just recently Syncrude was found guilty of killing over 1600 ducks and other wildlife that landed in their tailing ponds. The tar sands have a detrimental effect upon the environment and ecosystems as a whole, and my position is that I oppose the Keystone XL Pipeline Project. I have seen the devastating effects that these large projects have had upon our landscape here in Alberta, irreversible effects upon watersheds and wildlife, and as a First Nations woman I will not lend my support for any such project.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information on current and future production. As noted in that Consolidated Response, without the proposed Project, oil sands development would continue at or above the current level until at least 2020, with or without the proposed Project. Consolidated Response ENV-4 addresses issues related to oil sands production and migratory birds.
1062	1	Duennerman	Wanda&Lonny		Gentlemen: We want you to know that we have grave concerns regarding a pipeline which transports oil over one of this nation's most precious resource: water. In some areas the distance between the Ogallala Aquifer and this pipeline would be only a matter of a few feet. With oil flowing under higher than typical pressure, it seems as though the danger of an oil spillage into this aquifer could easily occur. Let's not have another catastrophe which could impact states from South Dakota to Texas, and well beyond. PLEASE, give careful consideration to this and other environmental impacts as you	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					decide whether or not to allow this pipeline to cross through the heartland of America	
25	1	Duerksen	Lucius	USACE	I am the project manager in charge of regulating the Keystone Pipeline project through Kansas (in respect to Section 404 of the Clean Water Act). I was not able to attend the El Dorado public meeting, so I was wondering if you could send me a copy of the Public Comments made during that meeting (I couldn't find them posted anywhere on your website - www.keystonepipeline-xl.state.gov). Will these, and written comments, be posted to this website after the public comment period ends on June 16? If this is the case I will just print them off of your website at that time.	All substantive comments and the responses to those comments are in the EIS. Comment letters and transcripts of public comment meetings will be included in the Administrative Record for the Project.
1546	190	Duffield	Willy	Montana Association of Oil, Gas, and Coal Producing Counties	Keystone project will has the added benefit of providing a potential on-ramp for domestic supplies being produced from the Bakken and Dandy Three Forks Formations in Montana and North Dakota. Right now the sellers of this oil are taking \$18 to \$20 differentials in their price because they can't get crude to the market.	Consolidated Response ALT-3 addresses issues related to transportation of crude oil from the Williston Basin.
1546	191	Duffield	Willy	Montana Association of Oil, Gas, and Coal Producing Counties	During construction, the pipeline will create more than 13,000 privately funded jobs.	Consolidated Response ECO-1 and Section 3.10.2.2 of the EIS address the potential socioeconomic impacts of the proposed Project.
1546	192	Duffield	Willy	Montana Association of Oil, Gas, and Coal Producing Counties	Local governments will have a steady source of income from the construction and taxation of the pipeline.	Consolidated Response ECO-1 addresses potential socioeconomic impacts, and Consolidated Response TAX-1 addresses concerns regarding taxes.
1546	193	Duffield	Willy	Montana Association of Oil, Gas, and Coal Producing Counties	Regardless of what opponents say, Philips County has not had one farmer or rancher lose their farm or ranch due to the crossing of a pipeline. In almost all cases, it has actually improved the land above the pipeline.	Comment acknowledged.
1546	194	Duffield	Willy	Montana Association of Oil, Gas, and Coal Producing Counties	Project would be a benefit to electrical co-ops along the route as well, which would lower rates.	Comment acknowledged.
1546	195	Duffield	Willy	Montana Association of Oil, Gas, and Coal Producing Counties	Fallon County, MT is home to one of the largest oil fields in the country, but also has the best mule deer, antelope, and sage grouse hunting in the U.S.	Comment acknowledged.
1552	92	Duffield	Willie	Montana Association of Oil, Gas and Coal Producing Counties	We would like to go on record as supporting the Keystone pipeline project, and we would encourage the Department of State to approve this project.	Comment acknowledged.
1552	93	Duffield	Willie	Montana Association of Oil, Gas and Coal Producing Counties	Keystone has worked very hard with the counties and I think they'll continue to work for them.	Comment acknowledged.

1552	96	Duffield	Willie	Montana Association of Oil, Gas and Coal Producing Counties	This project is going to benefit the entire state of Montana.	Comment acknowledged.
1552	93	Duffield	Willie	Montana Association of Oil, Gas and Coal Producing Counties	Keystone has worked very hard with the counties and I think they'll continue to work for them.	Comment acknowledged.
123	1	Dugan	Linda		I oppose an oil pipeline through the sandhills of Nebraska.	Consolidated Response ALT-1 addresses potential alternative routes, including routes that would avoid much of the Northern High Plains Aquifer system.
123	2	Dugan	Linda		Oil is a dirty and environmentally unsound product that could cause great distress on water resources in our state when any leakage occurs.	Consolidated Response OIL-4 addresses the composition of the Canadian crude oil that would be transported by the proposed Project, including concerns relative to the corrosivity and erosivity of the crude oil. As noted in that Consolidated Response, that crude oil is similar in composition and properties to other heavy crude oils that are currently transported within the U.S. pipeline system and similar in composition and properties to other heavy crude oils that are currently refined in PADD III.
305	2	Dunavan	Susan		What would be the effects of increased soil temperatures with heat input from the pipeline?	Consolidated Response ENV-2 addresses concerns related to pipeline temperature effects.
305	3	Dunavan	Susan		Would all the 20 varieties of grasses and 90 varieties of flowers, herbs, and forbs that we have be able to be reestablished and survive? What is the effect of prairie plants that have root systems going down 10 feet or more going to be with a pipeline buried only 4 feet underground? Would it be possible for these plants to be reestablished? The Draft EIS 3.5.2.1 under Native Grasslands states that "Native grasslands or prairies are among the most threatened native vegetation communities in the United States". There is only a fraction of Native Prairie left in our county. Should not TransCanada try to avoid this threatened native vegetation community?	The EIS was revised to include additional information on Keystone's construction and restoration techniques within the Sand Hills in Section 3.5. Additional information on Keystone's process for development of construction and restoration methods within the Sand Hills and other issues are discussed in Consolidated Responses ENV-1 and ERO-1 and additional construction and reclamation information specifics to the Sand Hills was added to Appendix H of the EIS. Additional discussions of temperature effects on native prairie grasses were incorporated into Section 3.5.5.2 and additional discussions of this issue are included in ENV-2.
305	5	Dunavan	Susan		What impact does the Environmental Impact statement have on a company? Is it just a series of "guidelines"? Is it in any way legally binding? Or are these 1000+ pages only "suggestions"?	The EIS will be used by decision makers to determine whether or not the proposed Project should be approved. If a Presidential Permit is issued and the proposed Project is determined to be in the national interest, The Department of State would prepare a Record of Decision. The ROD would require that the Project be constructed, operated, monitored, and maintained as described in the EIS and in documents incorporated into the EIS by reference, and that Keystone comply with the regulatory requirements described in the EIS.
1533	2	Dunavan	Susan		According to the Draft EIS: 3.5.2.1 Native Grasslands "Native grasslands or prairies are among the most threatened native vegetation communities in the United States. In the past, grasslands such as the tall grass prairies, mixed grass prairies, and short-grass prairies dominated central North America. Across the Project area the influence of fire and	Many commenters had concerns about routing the proposed Project through the Sand Hills of Nebraska. Issues related to the Sand Hills area are addressed in Consolidated Response ERO-1, and Consolidated Response ALT-1 addresses potential alternative routes, including routes that would avoid much of the Northern High Plains Aquifer system and the

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					grazing, especially by large herds of bison, maintained native grasslands in a relatively treeless condition. With suppression of fires, woody vegetation has encroached upon the prairie landscape in some parts of Great Plains. Prairies have been lost to agriculture, urbanization, and mineral exploration and altered by invasions of non native plants, fire suppression, establishment of woodlots and shelterbelts, and water developments." Our grassland is a little oasis in the midst of cropland. Why is the pipeline crossing Native Prairie in York County when there is so little left?	Sand Hills area. In selecting its proposed route, Keystone attempted to avoid and minimize impacts to native prairie remnants where possible. Keystone has made assurances that reclamation of the commenter's property would be completed and provided the landowner with the construction /reclamation plan for the tall grass prairie unit, including provisions for seeding with native tall grass prairie species.
1533	3	Dunavan	Susan		It is also stated that in Draft EIS: 3.5.5.1 General Vegetation Resources "Impacts on pastures, rotated croplands, and open grassland range generally would be short to long term, with vegetation typically reestablishing within 1 to 5 years after construction." In the Executive Summary Draft EIS: ES.6.5 Terrestrial Vegetation "Grassland impacts due to pipeline construction are expected to be minimal, and affected vegetative communities generally are expected to reestablish within 2 years." Why the discrepancy of 1-5 years or 2 years? We have been working for over 30 years to establish our Prairie. How can you reestablish Native Prairie after only 2 years? We have found over 20 varieties of grasses and over 90 varieties of flowers, legumes and forbs in that area of our property. (See Appendix 2 - Plant Listings) Just in the past few days I have photographed 10 varieties of wildflowers on the area the pipeline would be going through. (See Appendix 3- Wildflower Photographs taken May 5-May 9,2010 Along Proposed Keystone XL Pipeline Route)	The Executive Summary has been revised. As stated in Section 3.5.5.2 of the EIS: ". . . construction effects on previously untilled native prairies could be long-term, as destruction of the prairie sod during trenching may require more than a 100 years for recovery."
1533	4	Dunavan	Susan		We were told an assessment of our land was to be made. We have requested copies of when the assessment was made and what was found and have not received any reports back.	Consolidated Response EAS-2 addresses issues related to easement negotiations and eminent domain. DOS has no legal authority in the easement negotiations or in eminent domain proceedings.
1533	5	Dunavan	Susan		The time of the year these assessments were made would change the results of any surveys. In the spring cool season grasses would be seen. If it was surveyed during June or July, the Native Prairie grasses would be flourishing. If surveys were taken immediately after the grassland was grazed, (We use the "Rapid Rotational Grazing Method") they may have found little evidence of what we know is there. Can a company come in and document everything that grows on an area of land in during an entire year in just one hour?	Keystone attempted to avoid and minimize impacts to native prairie remnants where possible. Keystone would coordinate with landowners regarding potential minor reroutes if they can be implemented to avoid areas such as this. All landowner requests for specific actions by Keystone on landowner property should be addressed during easement negotiations. Consolidated Response EAS-2 addresses issues related to easement negotiations. As noted in that response, DOS has no legal authority in the easement negotiation process. .
1533	6	Dunavan	Susan		Keystone gave us the brochure: BIOLOGICAL AND CULTURAL RESOURCE SURVEYS (See Appendix 4) "For most areas, field surveys require tract access for two to three hours; however, depending on the spatial extent and level of detail required to complete data acquisition, field surveys may require numerous hours and possible multiple days." We have yet to hear if they did a survey, the date of the survey was conducted or what they found.	Consolidated Response EAS-2 addresses issues related to easement negotiations. As noted in that response, DOS has no legal authority in the easement negotiation process. .
1533	7	Dunavan	Susan		Another question is brought up in Draft EIS: 3.5.5 Potential Impacts and Mitigation "Alteration in vegetation productivity and phenology due to increased soil temperatures associated with heat input from the pipeline". 3. What would be the effects of increased soil temperatures with heat input from the	Consolidated Response ENV-2 addresses concerns related to pipeline temperature effects.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					pipeline? How would this affect Native Prairie? I have not found this out in any of the Draft EIS.	
1533	8	Dunavan	Susan		Would all these varieties of plants (if they were reestablished) continue to survive? Prairie plants also have roots that go into the soil up to 16 feet. (See Appendix 5-Prairie Root Chart) Would not a pipeline that is only buried 4 feet deep have an effect on the root system of these plants?	Heat dissipation and potential impacts on native vegetation and crops are discussed in Section 3.5.5 of the EIS. The EIS was revised to add discussions of temperature effects on native prairie grasses and crops in Section 3.5.5, and additional discussions of this issue are included in Consolidated Response ENV-2. Appendix L of the EIS illustrates modeled temperature effects of the pipeline from Montana to Texas and reviews effects of increased soil temperature on native prairie grasses and crops.
1533	9	Dunavan	Susan		The question of the effect of increased soil temperatures was brought up in the May 2009 Scoping Summary, but I never saw an answer to this question.	Consolidated Response ENV-2 addresses concerns related to pipeline temperature effects.
1533	10	Dunavan	Susan		The next question I have concerns the reclamation and revegetation process. The following is a quote from the Draft EIS: 3.5.5.1 General Vegetation Resources "To restore disturbed areas to pre-construction use and vegetation cover, Keystone would implement the following reclamation and revegetation measures in its CMR Plan in accordance with applicable permits: -Reseed the reclaimed construction right-of-way following cleanup and topsoil replacement as closely as possible using seed mixes based on input from the local NRCS and specific seeding requirements as requested by the landowner or the land management agency; - Use certified seed mixes to limit the introduction of noxious weeds within 12 months of seed germination testing, and adjust seeding rates based on test results; - Remove and dispose of excess mulch prior to seedbed preparation to prevent seed drills from becoming plugged and to ensure that seed incorporation can operate effectively; - Re-apply and anchor temporary mulch, such as erosion control blankets, on the construction right-of-way following seeding; - Seed at a rate appropriate for the region and for the stability of the reclaimed surface based on pure live seed; - Use seeding methods appropriate for weather conditions, construction right-of-way constraints, site access, and soil types using drill seeding unless the right-of-way is too steep. Temporary cover crop seed shall be broadcast; - Delay seeding until soil is in an appropriate condition for drill seeding; - Use Truax or an equivalent-type drill seeder equipped with a cultipacker that is designed and equipped to apply grass and grass-legume seed mixtures, with mechanisms such as seed box agitators to allow even distribution of all species in each seed mix and with an adjustable metering mechanism to accurately deliver the specified seeding rate and depth; - Operate and calibrate drill seeders so that the specified seeding rate is planted using seed depths consistent with local or regional agricultural practices and row spacing that does not exceed 8 inches; - Use broadcast or hydro-seeding in lieu of drilling at double the recommended seeding rates and use a harrow, cultipacker, or other equipment immediately following broadcasting to incorporate the seed to the specified depth and to firm the seedbed; - Delay broadcast seeding during high wind	These are Keystone's standard restoration plans. Reclamation and revegetation would be enforced through the easement agreement as described in EAS-2. The U.S. Department of State has no legal authority over negotiations of easement agreements and has no legal status to enforce the conditions of an easement agreement. A landowner who considers Keystone to be out of compliance with an easement agreement would need to contact local law enforcement officials, or initiate legal proceedings.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					conditions and when the ground is frozen; - Hand rake all areas that are too steep or otherwise cannot be safely harrowed or cultipacked to incorporate broadcast seed to the specified depth; - Use hydro-seeding on a limited basis, where the slope is too steep or soil conditions do not warrant conventional seeding methods; and - Work with landowners to discourage intense livestock grazing of the construction right-of-way during the first growing season by using temporary fencing, deferred grazing, or increased grazing rotation frequency." My question here is how would this reclamation and revegetation be enforced? Our OPTION AGREEMENT that we were offered only mentions "reseeding" of our Prairie and we were told that WE would have to supply all the labor and monitoring of the planting was NOT AN OPTION! We even asked to insert "successful" before the word "reseeding" in our Option Agreement and were told that using the word "successful" WAS NOT AN OPTION! (See Appendix 6)	
1533	11	Dunavan	Susan		All the preliminary information given to us by Keystone, all their color brochures promise: PROPOSED KEYSTONE XI PIPELINE PROJECT: (See Appendix 7) Our goal is conserve environmental resources and re-establish the essential physical, chemical and biological characteristics of the environment ... reclamation of the soils and vegetation" WHAT LANDOWNERS CAN EXPECT: (See Appendix 8) We will negotiate in good faith for land rights... Will compensate for construction losses and inconvenience and will restore the land impacted by construction and restore the land". We asked for successful reestablishment of the prairie and were denied.	Reclamation and revegetation would be enforced through the easement agreement as described in EAS-2. The U.S. Department of State has no legal authority over negotiations of easement agreements and has no legal status to enforce the conditions of an easement agreement. A landowner who considers Keystone to be out of compliance with an easement agreement would need to contact local law enforcement officials, or initiate legal proceedings.
1533	12	Dunavan	Susan		There are too many discrepancies in what either TransCanada Brochures say or what the Draft EIS says and what we are being offered. The best thing for us would be to have the Proposed Pipeline not go through areas that are considered threatened, including Native Prairie where tremendous plant diversity exists and where no promises are made to truly restore, reestablish or revegetate the land.	Brochures provided to the public by TransCanada and not incorporated into the EIS are not germane to the environmental review. The impact analysis in this EIS is based on the design, construction, operation, monitoring, inspection, and maintenance procedures described in the EIS or referred to in the EIS. If the proposed Project is approved, Keystone would be required implement the restoration and revegetation procedures presented in or referred to in the EIS.
1533	4	Dunavan	Susan		We were told an assessment of our land was to be made. We have requested copies of when the assessment was made and what was found and have not received any reports back.	Consolidated Response EAS-2 addresses issues related to easement negotiations and eminent domain. DOS has no legal authority in the easement negotiations or in eminent domain proceedings.
1533	6	Dunavan	Susan		Keystone gave us the brochure: BIOLOGICAL AND CULTURAL RESOURCE SURVEYS (See Appendix 4) "For most areas, field surveys require tract access for two to three hours: however, depending on the spatial extent and level of detail required to complete data acquisition, field surveys may require numerous hours and possible multiple days." We have yet to hear if they did a survey, the date of the survey was conducted or what they found.	Consolidated Response EAS-2 addresses issues related to easement negotiations and eminent domain. DOS has no legal authority in the easement negotiations or in eminent domain proceedings.
1533	9	Dunavan	Susan		The question of the effect of increased soil temperatures was brought up in the May 2009 Scoping Summary, but I never saw an answer to this question.	Consolidated Response ENV-2 addresses concerns related to pipeline temperature effects
1312	1	Dunbar	Richard	Montana	On behalf of the Montana Association of Oil, Gas and Coal	Comment acknowledged.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
				Association of Oil, Gas and Coal Counties	Counties Inc. we write insupport of TransCanada's Keystone XL crude oil pipeline project and urge theDepartment to grant a permit for the pipeline.Our Association is made up of County Commissioners from 37 oil, gas and coalproducing Counties across the State of Montana. The Keystone XL pipeline will crosssix of these counties and all have hundreds of miles of pipeline already buried underground.	
1312	2	Dunbar	Richard	Montana Association of Oil, Gas and Coal Counties	Pipelines are the safest, most reliable, economical and environmentally favorable way to transport oil and petroleum products, as well as other energy liquids, throughout Montana and the U.S.Montana County Commissioners take their jobs and responsibilities very seriously; we are the local elected officials that work for the citizens of Montana where the rubber meets the road. TransCanada officials and representatives have been very responsiveto all our concerns and have pledged to work closely with county officials throughout this project.	Comment acknowledged.
1312	4	Dunbar	Richard	Montana Association of Oil, Gas and Coal Counties	This project also stands to provide a powerful private sector economic stimulus. During construction, Keystone XL will create more than 13,000 jobs funded with private investment. In addition, local governments will have a steady source of income from economic activity associated with construction	Consolidated Response ECO-1 and Section 3.10.2.2 of the EIS address the potential socioeconomic impacts of the proposed Project.
1312	5	Dunbar	Richard	Montana Association of Oil, Gas and Coal Counties	and from property taxes the pipeline company will pay.	Comment acknowledged.
1555	28	Dunbar	Richard	Phillips County Commissioner	As far as environmental impacts of the pipeline, of the 20-some miles where it crosses through the county, I don't know of any area where there will be any large impact to the land that won't be able to be mitigated with construction, and after construction, you probably won't even know the pipeline is there.	Comment acknowledged.
1555	29	Dunbar	Richard	Phillips County Commissioner	There may be a couple areas of concern to landowners, but I know they are working with them to address concerns.	Comment acknowledged.
1555	30	Dunbar	Richard	Phillips County Commissioner	I think the environmental impacts to Phillips County will be minor. There may be a little bit during construction, but I'm sure that will all be worked through.	Comment acknowledged.
1555	31	Dunbar	Richard	Phillips County Commissioner	This is a good project for the county.	Comment acknowledged.
1555	32	Dunbar	Richard	Phillips County Commissioner	The project will increase the tax base of the county.	Comment acknowledged.
1555	33	Dunbar	Richard	Phillips County Commissioner	The economic benefits to the county will be huge in terms of the dollars it will bring in.	Consolidated Response ECO-1 and Section 3.10.2.2 of the EIS address potential socioeconomic impacts.
1555	34	Dunbar	Richard	Phillips County Commissioner	I think this is a good project and I would like to encourage everyone to support the project and keep moving forward.	Comment acknowledged.
1400	1	Duncan	Bertha		To whom this may concern: I'm a colleague and stakeholder in the Keystone XL Pipeline Project. The only comment I have is that when work begins on my property everything that is torn down be rebuilt, such as fences, barns, sheds, and roads if you cross through my land. I have a spring, I ask or recommend that it not be torn up at all.	Keystone would reclaim all lands affected by construction to pre-construction to the extent practicable and described in Sections 2.3.2.8 and 2.3.2.9 of the EIS and in the Keystone Construction, Mitigation, and Reclamation Plan (presented in Appendix B of the EIS) unless the landowner and Keystone agree to an alternate restoration. Consolidated Response

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
						FRM-1 addresses potential ranch of farmland impacts, including compensation for lost crops. As noted in the EIS, after construction is complete, farming can continue over the pipeline. Keystone would coordinate with landowners regarding issues such as minor realignments to avoid springs, provided the realignment meets all permit requirements of federal, state, and local agencies.
1400	2	Duncan	Bertha		Another comment I have is that it be safe for my neighborhood because of the children of my neighbors and for adults also. Thanks for allowing me the chance to comment. Yours truly	Comment acknowledged.
483	1	Dunn	Jack		Please deny the permit for the proposed tar sands oil pipeline across the Sandhills and Ogallala Aquifer. If we have to choose between oil and water (as seems to be the case), I choose water.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
839	1	Dunn	Michael	Progressive Student Coalition	I think that the pipeline is the last thing that Nebraska needs. Putting it in will endanger our environment. We should be investing in green jobs, not oil. This project is short sighted.	The impacts associated with implementation of the proposed Project are addressed in Section 3.0 of the EIS. As noted in that section, construction and normal operation the proposed Project would not result in significant environmental impacts. Issues related to the Northern Plains High Aquifer system are addressed in Consolidated Response AQF-1, and issues related to the Sand Hills area are addressed in Consolidated Response ERO-1. Section 3.13 of the EIS addresses reliability and safety issues, including calculations of the probability of a spill from the Project and the potential environmental impacts associated with spills. Consolidated Response ALT-2 addresses the use of alternative technologies and alternative energy sources.
585	1	Dunnigan	David	Greater Dallas Planning Council	As executive director of the Greater Dallas Planning Council, and acting only on my own as one who has been involved for many years in planning and in East Texas issues including economic development, I register my encouragement to approve the Keystone XL project.	Comment acknowledged.
585	2	Dunnigan	David	Greater Dallas Planning Council	It is an energy infrastructure project that not only will strengthen long-term energy security for the United States, but also will provide a powerful private sector economic stimulus to the mostly rural communities along the pipeline route during its construction at a time when our economy is struggling. Keystone XL will create more than 13,000 high-wage construction and manufacturing jobs during the project's 2011-2012 construction schedule. TransCanada's study to measure the project's economic impact determined the project will generate \$20.9 billion in total expenditures, \$9.6 billion in output (gross product), personal income of \$6.5 billion and 118,935 person years of employment (jobs). During construction, it will generate \$486.36 million in tax revenue for state governments along the route and \$99.1 million for local taxing entities where the pipeline is located. Expenditures during construction would total \$5.4 billion and generate an economic gross product of nearly \$2.86 billion. Construction also would generate more than \$64.5 million in tax revenue for local government and \$152 million for state government. This is a vital project that will strengthen U.S. energy security and reduce our dependence on unstable foreign sources of oil. Canada is already the largest supplier of energy to the United	Consolidated Response ECO-1 addresses potential socioeconomic impacts, and Consolidated Response TAX-1 addresses concerns regarding taxes.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					States, providing 12 percent of our country's needs. Canada's 175 billion barrels of oil reserves is second only to Saudi Arabia. Oil sands account for more than 97 percent of that vast reserve: 170 billion barrels of oil with the potential for more than 100 years of production. Canada has more than 50 percent of the non-state controlled reserves in the world. Long-term supply is critical in a world where supply risks are growing, whether due to declining production from a once-reliable source, an unstable geo-political climate, or uncertainties in key oil producing regions. Construction of additional pipeline facilities such as the Keystone XL Project, to transport oil sands production to the vitally important Gulf Coast area is critical. These refineries also have excess capacity as a result of reduced production from Mexico, where heavy oil production is in steep decline, and Venezuela, which is moving to other markets. Turning to Canada for a secure oil supply is a logical step. I support the Keystone XL Pipeline Project and encourage the Department of State to confirm the findings of the Draft EIS, which found that the proposed Keystone XL Pipeline would have "limited adverse environmental impact during construction and operation."	
1159	1	Dunnigan	Joy		As a resident of Nebraska I am strongly opposed to the pipeline coming across the Ogallala Aquifer. I am confident there can be a solution to this issue that would not put this vital resource at risk. I think we already know what a tragic injury our environment is currently suffering and we do not need to risk another. It just is not worth it. There is no just reason to risk this aquifer.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
1159	2	Dunnigan	Joy		Please do not allow the pipeline to come across the aquifer.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
1159	3	Dunnigan	Joy		I am confident there can be a solution to this issue that would not put this vital resource at risk.	Consolidated Response ALT-1 addresses potential alternative routes, including routes that would avoid much of the Northern High Plains Aquifer system. Consolidated Response ALT-2 addresses the use of alternative technologies, alternative energy sources, and conservation of energy.
1239	1	Dupre	Kyle	Department of Homeland Security	p. 3.10-57, Public Services Re: Public Services section: What about protection of the pipeline and adequacy of required security and emergency services in the event of accidental or deliberate actions that severely damage sections of the pipeline? This aspect of public services availability and support is not discussed and should be discussed in this section.	Keystone would install security fencing around the aboveground facilities (pump stations and mainline valves). The pipeline would be buried but would not be guarded. The impact of normal operation of the Project on public services is addressed in Section 3.10 of the EIS. If there is a spill from the Project, emergency services may be required in some areas, depending on the volume, location, and timing of the release. The emergency services potentially needed would be listed in the Emergency Response Plan (ERP) and the Spill Prevention, Control, and Countermeasure (SPCC) plans for the Project. Consolidated Response RES-1 addresses issues related to preparation and review of the ERP. SPCC plans are addressed in Sections 2.3 and 3.13.5 of the EIS and in the Construction, Mitigation, and Reclamation Plan presented in Appendix B of the EIS.
1239	2	Dupre	Kyle	Department of Homeland Security	p. 3.13-1, Section 3.13 This section should discuss security risks as well. Oil pipelines are part of the U.S.'s critical infrastructure. Pipelines are linear systems that must operate	The text of Section 3.13.4.5 of the EIS has been revised to provide additional information on the security procedures that would be incorporated into the Project.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					continually; there should be some discussion of how the applicant proposes to protect the pipeline, and the associated tank farm in Steele City, NE.	
1239	3	Dupre	Kyle	Department of Homeland Security	p. 3.13-13, Section 3.13.3.1, Oil Pipeline Incident History in States that would be Traversed by Keystone XL Six threats are discussed in this section. This section should also address the threat to the pipeline, as it is part of the nation's critical infrastructure.	The incident data presented in Section 3.13 are from the incident database of the Pipeline and Hazardous Materials Safety Administration. That database includes only the six threats noted in the text. DOS has revised the text of Section 3.13.4.5 to address security risks to the Project.
1239	4	Dupre	Kyle	Department of Homeland Security	p. 3.13-25, Prevention The bullets after the discussion on 'Threat analysis' should include facility damage from deliberate terrorist activities.	The text referred to by the commenter reports the threat analysis conducted by Keystone for the proposed Project. The text of Section 3.13.5.5 has been revised to address the potential for terrorist activities against the proposed Project.
1239	6	Dupre	Kyle	Department of Homeland Security	3.13.5.8, Socioeconomics What about impacts to the nation's oil supply in cases of catastrophic spill? Please add a discussion in this section regarding impacts to the pipeline as part of the nation's critical infrastructure.	Consolidated Response OIL-2 addresses maximum-sized releases from the Project. To repair a breached pipeline section, typically a section of pipe would be removed and a replacement section would be welded into place. In most cases, the process would require only a few days for the repair and restarting the pipeline. During that time, the crude oil storage capacity at the refineries that would receive crude oil would likely be sufficient to prevent crude oil supply interruption at the refineries. As a result, a pipeline breach and the resulting oil spill from the proposed Project pipeline would have a negligible, short-term impact on the nation's crude oil supply and critical infrastructure and the text of Section 3.13.5.8 has not been revised.
1239	7	Dupre	Kyle	Department of Homeland Security	In general, adverse impacts to critical infrastructure from deliberate actions are not discussed. There should be more discussion in the 'Operations' sections of the document.	Section 2.4 (Operations and Maintenance) describes normal operation of the proposed Project. Section 3.13 addresses abnormal operations, including the impacts of a spill from the proposed Project, whether accidental or deliberate. That section addresses the impacts of a wide variety of spill volumes, from small to the maximum size spill irrespective of cause. In essence that section answers the question "what if" and does not rely on specific causes.
1239	5	Dupri	Kyle	Department of Homeland Security	p. 3.13-48, Sensitive, Threatened and Endangered Species The text states that in the event of a spill large enough to affect habitat or individuals, Keystone would "...return impacted areas to baseline condition." Is it likely that this is possible? Please add more data and provide backup to show that it would be possible to return areas that are subject to spills to their baseline condition.	Section 3.8 of the EIS provides analysis of potential impacts to threatened and endangered species and Appendix T provides the Biological Assessment for the proposed Project.
1553	41	Duval	Candace		Concerned about global warming and deforestation in Canada.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project. Consolidated Response GHG-4 addresses potential loss of boreal forests and peat bogs. Climate change is addressed in Section 3.14.3.14 of the EIS.
1553	42	Duval	Candace		Concern because this is a foreign project. Who profits from this?	As described in Section 1.0 of the EIS and in Consolidated Response RES-2, TransCanada-Keystone Pipeline LP (Keystone) is not a foreign corporation. It is a limited partnership organized under the laws of the state of Delaware. Keystone has the same rights as other pipeline companies in the U.S. to propose projects.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
1559	37	Duvall	Candace		Grave concerns of the toxicity of this dirty oil. Does not want this Presidential permit to be considered.	Consolidated Response OIL-4 addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils.
1559	39	Duvall	Candace		Hold comment meetings in all the counties the pipeline will cross in the U.S.	Consolidated Response CMT-2 addresses issues related to comment meetings on the draft EIS and requests for additional public involvement.
1559	40	Duvall	Candace		Have the DEIS include an assessment of the construction impact on wetlands, including construction camps and access roads outside the 110 foot right of way.	Estimated wetland impacts from construction camps and access roads as well as other temporary and permanent facilities located outside of the 110 foot ROW were added to the EIS in Section 3.4.
1559	42	Duvall	Candace		Need an environmental impact study on the construction method for surface water crossings, especially HGD crossings for the 38 crossings and the areas where the water would infiltrate.	Consolidated Response WAT-1 and Section 3.3.2 addresses stream crossing methods and the associated potential water quality impacts.
1559	43	Duvall	Candace		Need further studies on the impacts to wildlife regarding the vibrations from the higher pressure these pipelines will be operating under, esp. at shallow burial depths.	The top of the pipeline would be at least 4 feet below the ground surface along most of the proposed route and would not produce vibrations sufficient to impact wildlife.
1559	44	Duvall	Candace		Need further studies on the impacts to open ranges and private ranches regarding the vibrations from the higher pressure these pipelines will be operating under, esp. at shallow burial depths.	The top of the pipeline would be at least 4 feet below the ground surface in open ranges and private ranches. The pipeline would not vibrate and there would not generate noise that could be discerned by humans at ground level.
1559	46	Duvall	Candace		Need further study of the effects of potential outcomes for seismic activity, including response time to repair and from the minimal to the extreme effect.	Consolidated Response GEO-2 addresses potential seismic hazards.
1559	47	Duvall	Candace		Need further study of the impact to the environment from the effects of the porosity in the steel, esp. through wetlands and waterways.	It is not clear what the commenter means in referring to "the porosity in the steel." Steel pipe is not porous and there would be no releases of oil from the pipe under normal operating conditions. Section 3.13 of the EIS addresses reliability and safety issues, including calculations of the probability of a spill from the proposed Project and the potential environmental impacts associated with spills, including the impacts of spills in wetlands and waterways.
1559	39	Duvall	Candace		Hold comment meetings in all the counties the pipeline will cross in the U.S.	Consolidated Response CMT-2 addresses issues related to comment meetings on the draft EIS and requests for additional public involvement.
102	1	Dvorak	Ann		I was born and raised in the Sandhills of Nebraska and am against the Keystone XL Pipeline Project as it endangers one of the world's most unique ecosystems. The Sandhills are home to some of the most interesting species of plants and animals that would be adversely affected if this project passes. We must protect the Sandhills because of their uniqueness and because of the resources that they provide millions of people.	Issues related to the Sand Hills area are addressed in Consolidated Response ERO-1.
102	2	Dvorak	Ann		Also sitting below the Sandhills is the Ogallala Aquifer. The aquifer is a clean source of water that would also be affected. One small leak in the pipeline could contaminate this water source and ruin it forever. We must protect the aquifer because of their uniqueness and because of the resources that they provide millions of people.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
232	1	Dyer	Betty		When informed at its meeting Tuesday that the Keystone XL	Issues related to the Northern High Plains Aquifer system are

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					pipeline would go right through the water of the Ogallala Aquifer (not above it I not under it I but actually in it), Lincoln's Heritage League (a General Federated Women's Club) went on record to oppose the plan and to alert other citizens to express their concern also. I write this letter at their direction and hope you will consider it as representing our 75 members. This aquifer is the source of our water supply for drinking and all other purposes, and we feel that although TransCanada considers the risk of contamination through puncture of the pipeline to be low, the possibility of even a low risk cannot be condoned. Public utilities need to have priority over commercial interests.	addressed in Consolidated Responses AQF-1 through AQF-4.
232	2	Dyer	Betty		Environmental groups have made it clear that potential leaks pose a threat to water quality. Since contents of the pipeline would be dirty tar sands on their way to a refinery, it is logical that the population in this part of Nebraska should find the prospect of a leakage into the water to be revolting.	The proposed Project would transport crude oil derived from Canadian oil sands projects, not "dirty tar sands." Consolidated Response OIL-4 addresses the composition of the Canadian crude oils that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils. Issues related to the High Plains Aquifer System are addressed in Consolidated Response AQF-1 through AQF-4. Consolidated Response AQF-3 provides information on hypothetical spills from the Project over two areas of the Northern High Plains Aquifer System.
1552	64	Eaton	Elner	Frank Eaton & Sons, Northern Plains Landowners Group	If there is a spill due to operating at pressures of 80 percent of the pipe failure point, there appears to be no emergency response plan.	Keystone has withdrawn its application for a Special Permit as described in Consolidated Response REG-1. As described in Consolidated Response SAF-1, the Pipeline and Hazardous Materials Safety Administration (PHMSA) has regulatory requirements that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project in a manner that protects the health and safety of the public and the environment. In addition, PHMSA developed 57 Project-specific Special Conditions that Keystone has agreed to implement. Consolidated Response RES-1 addresses issues related to preparation and review of emergency response plans for the proposed Project.
1552	65	Eaton	Elner	Frank Eaton & Sons, Northern Plains Landowners Group	I understand that the pumps are to shut down quickly, but there still could be a major spill.	Consolidated Response OIL-3 addresses the leak detection capabilities of the proposed Project, including the SCADA system, supplementary leak detection methods, physical leak detection methods, and concerns related to smaller leaks from the pipeline that may be under the SCADA detection threshold.
1552	67	Eaton	Elner	Frank Eaton & Sons, Northern Plains Landowners Group	We don't want to have the EIS granted without a complete emergency response plan.	Consolidated Response RES-1 addresses issues related to preparation and review of emergency response plans for the proposed Project.
1552	68	Eaton	Elner	Frank Eaton & Sons, Northern Plains Landowners Group	In section 3.13 through 50 of the Draft EIS, TransCanada maintains our land will be just fine one year after construction, or even a spill. I see no evidence to support this position.	Section 3 of the EIS addresses the impacts of construction and operation of the proposed Project. Section 3.13 of the EIS addresses the risk and environmental impacts of a crude oil spill from the proposed Project.
1552	70	Eaton	Elner	Frank Eaton & Sons, Northern	In Section 3.9.7 under the Compensation clause, TransCanada Keystone requires the landowner to	Consolidated Response EAS-2 addresses issues related to easement negotiations and eminent domain. DOS has no

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
				Plains Landowners Group	demonstrate decreases in land productivity for compensation. Who would we take our complaints to?	legal authority in the easement negotiations or in eminent domain proceedings.
1552	72	Eaton	Elner	Frank Eaton & Sons, Northern Plains Landowners Group	In Section 3 of the EIS, it says that the pipeline workers will close openings in the fence at the end of each day. This is not the standard in ranch country; you leave the gates as you found them. Close it if it was closed. Cattle can go a long way in a 12-hour period.	Consolidated Response EAS-2 addresses issues related to easement negotiations and eminent domain. DOS has no legal authority in the easement negotiations or in eminent domain proceedings.
1552	73	Eaton	Elner	Frank Eaton & Sons, Northern Plains Landowners Group	The Draft EIS says that TransCanada will have established rules for construction and operating on the public lands that the pipeline crosses. This is not the case for the private landowners. They must fend for themselves to get out of the rules for the pipeline to follow on the private property. There needs to be a liaison person to go to for farmers with any problems, someone that has authority and standing with the construction contractor so that these individuals on the pipeline route will not get the run-around, but get satisfaction because of the problem situation. This liaison person could be from the Northern Plains landowners group and be paid for by TransCanada.	Consolidated Response EAS-2 addresses issues related to easement negotiations and eminent domain. DOS has no legal authority in the easement negotiations or in eminent domain proceedings.
1552	75	Eaton	Elner	Frank Eaton & Sons, Northern Plains Landowners Group	If they do have to obtain a new source of power for the electric companies to supply the demand of the pumping stations, then the cost of energy will go up for everyone.	Consolidated Response ELE-1 addresses issues regarding the potential need for additional energy sources to provide electrical power for the pump stations and mainline valves. An analysis of the potential impacts on utility electric rates are outside of the scope of this EIS.
1552	79	Eaton	Elner	Frank Eaton & Sons, Northern Plains Landowners Group	The EIS should address road conditions that must be maintained at no additional cost to the taxpayer.	Consolidated Response RDS-1 addresses concerns about the condition of roadways and roadway structures associated with construction and operation of the proposed Project. As noted in that response, Keystone would be responsible for roadway improvements and restoration if damage occurs due to Project-related activities.
1552	80	Eaton	Elner	Frank Eaton & Sons, Northern Plains Landowners Group	The EIS should address maintaining present environmental and social conditions along the route.	The impacts associated with implementation of the proposed Project are addressed in Section 3.0 of the EIS. As noted in that section, construction and normal operation the proposed Project would not result in significant environmental impacts.
1552	81	Eaton	Elner	Frank Eaton & Sons, Northern Plains Landowners Group	Our rural communities are part of the environment as well.	Consolidated Response RUR-1 addresses issues related to rural environments.
1552	85	Eaton	Elner	Frank Eaton & Sons, Northern Plains Landowners Group	Our family hopes to still be here at the end of those 50 years, and we want to be free of any environmental hazards, any liability.	Responses related to taking the proposed Project out of service at the end of the life of the proposed Project are presented in Consolidated Response DEC-1. Consolidated Response LIA-1 addresses Keystone's liability if there is a spill of hazardous materials or fuel during construction or a spill of crude oil from the proposed Project.
1552	70	Eaton	Einer	Frank Eaton & Sons, Northern Plains Landowners Group	In Section 3.9.7 under the Compensation clause, TransCanada Keystone requires the landowner to demonstrate decreases in land productivity for compensation. Who would we take our complaints to?	Consolidated Response EAS-2 addresses issues related to easement negotiations and eminent domain. DOS has no legal authority in the easement negotiations or in eminent domain proceedings.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
1552	73	Eaton	Einer	Frank Eaton & Sons, Northern Plains Landowners Group	The Draft EIS says that TransCanada will have established rules for construction and operating on the public lands that the pipeline crosses. This is not the case for the private landowners. They must fend for themselves to get out of the rules for the pipeline to follow on the private property. There needs to be a liaison person to go to for farmers with any problems, someone that has authority and standing with the construction contractor so that these individuals on the pipeline route will not get the run-around, but get satisfaction because of the problem situation. This liaison person could be from the Northern Plains landowners group and be paid for by TransCanada.	Consolidated Response EAS-2 addresses issues related to easement negotiations and eminent domain. DOS has no legal authority in the easement negotiations or in eminent domain proceedings.
737	1	Ebright	Matthew		The use of tar sands is incredibly environmentally destructive at this point in time. Maybe these resources can be considered a reserve until a less destructive extraction process can be implemented...Please reference Tar Sands, The Selling of Alberta and Dirty Oil, Petropolis: Aerial Perspectives on the Alberta Tar Sands for further information.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project.
1557	13	Eckel-Dalrymple	Sarah		Wants to know why we continue to feed U.S. oil addiction instead of becoming a producer of alternative energy? Tragedy in Gulf should only reinforce this.	Consolidated Response P&N-1 addresses the need for the Proposed Project. Consolidated Response ALT-2 and Section 4.1 of the EIS address the use of alternative technologies, alternative energy sources, and conservation of energy.
1170	1	Edison	Allen		The proposed pipeline path seems to provide a potential disaster to our ground water resource.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
342	1	Edwards	Sandy		I am all for this project. Going "green" is a hell of a long ways off in time. Local people will need jobs & if we do not get this pipeline, Canada will have these jobs. Our local blowhard politicians only want to look good for the next election with no regards to the future of people in southeast Texas.	Consolidated Response ALT-2 addresses the use of alternative technologies, alternative energy sources, and conservation of energy.
1135	1	Edwards	Belle		I trust your judgment and your vote on this one and know you'll protect our water resources to the best of your ability.	Consolidated Response ENR-1 provides information on the Department of State's environmental review process, the National Interest Determination process, and the need to complete those reviews before approving or denying the Presidential permit for the proposed Project.
1135	2	Edwards	Belle		Many of us don't know enough about the safety precautions that are available. I'm sure you're studying it well.	As described in Consolidated Response SAF-1, the Pipeline and Hazardous Materials Safety Administration (PHMSA) has regulatory requirements that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project in a manner that protects the health and safety of the public and the environment. In addition, PHMSA developed 57 Project-specific Special Conditions that Keystone has agreed to implement. Incorporation of those conditions would result in a Project that would have a degree of safety over any other typically constructed domestic oil pipeline system under current code and a degree of safety along the entire length of the pipeline system similar to that which is required in HCAs as defined in 49 CFR 195.450. It also describes the inspections and reviews of the proposed Project that the Pipeline and Hazardous Materials Safety Administration would conduct to ensure compliance with those regulatory requirements.
1342	1	Eheverria	Amy	Columban Center for	Dear Secretary Clinton: I write to you today to articulate my concern in regards to the proposed Keystone XL Pipeline. As	Comment acknowledged.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
				Advocacy and Outreach	Director of the Columban Center for Advocacy and Outreach, a ministry of the Missionary Society of St. Columban, I hear regularly from our missionaries around the world on issues of natural resource extraction. We are an international society of missionaries who work and serve those living in poverty in 15 countries, as well as communities here in the United States including two states where the proposed pipeline would cross: Nebraska and Texas.	
1342	2	Eheverria	Amy	Columban Center for Advocacy and Outreach	The construction of such a pipeline from Alberta, Canada to Houston, TX would have devastating impacts to the environment and the people in the area. The tar-sands oil under the Boreal Forest in Canada is some of the dirtiest fuel on the planet. Once extracted and burned, tar-sands oil produces high levels of sulfur oxide, nitrogen dioxide, and carbon monoxide. As such the health problems to those in the area are tangible.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project. As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries.
1342	3	Eheverria	Amy	Columban Center for Advocacy and Outreach	Furthermore, the refinery sites of Houston and Port Arthur, TX are already failing the Clean Air Act standards, adding more sulfur, nitrogen oxide, and carbon monoxide to their air will only compound the already existing poor conditions.	As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries. Consolidated Response OIL-4 also addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils.
1342	5	Eheverria	Amy	Columban Center for Advocacy and Outreach	Please look at the current situation in the Gulf Coast if you have any question about the safety of oil extraction and the damaging effects it could have on the environment. Since 2002, there have been roughly 1 billion dollars in damages caused by pipeline spills in the United States, and Canadian pipelines have spilled about 4 million gallons of oil into the environment since the late 1970s.	As described in Consolidated Response GLF-1, the risks associated with the proposed Project are substantially different from those associated with the BP Deepwater Horizon Project. Consolidated Response OIL-1 provides a summary of the range of spill frequency estimates addressed in the EIS. Consolidated Response OIL-2 addresses maximum-sized releases from the Project and addresses concerns about corrosion rate comparisons between the Alberta transmission pipeline system and the U.S. transmission pipeline system.
1342	6	Eheverria	Amy	Columban Center for Advocacy and Outreach	As His Holiness Pope Benedict XVI outlines in Caritas en Veritate "The environment is God's gift to everyone, and in our use of it we have a responsibility towards the poor, towards future generations and towards humanity as a whole." As a people, society, and government we need to respect the intrinsic value of creation, and thus, the environment as well. As such we urge you not to permit TransCanada the opportunity to build the Keystone XL Pipeline and should the project continue anyway, that the safety and security standards for all parts of the project be of the highest standards.	Consolidated Response SAF-1 describes the regulatory requirements and Project-specific Special Conditions that Keystone would comply with to construct, operate, maintain, inspect, and monitor the proposed Project. It also describes the monitoring, inspections, and reviews of the proposed Project that the Pipeline and Hazardous Materials Safety Administration would conduct to ensure compliance with those regulatory requirements.
1387	1	Eissinger	Roger	Eissinger Land & Cattle Co	We write in support of the TransCanada Keystone XL pipeline, some of which may be located in McCone County... Recently a number of advocacy groups sent a letter seeking suspension of the permitting of the Keystone XL pipeline. We encourage you to reject the request and to continue to review the proposed project... We have faith that the permitting processes in place are appropriate and should proceed so that a final determination can be made about the impacts of the	Comment acknowledged.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					project and whether it is in the national interest. We urge you to reject the request to suspend the process and continue with the review.	
1387	2	Eissinger	Roger	Eissinger Land & Cattle Co	Our ranch has been in established here since 1913. Four generations of Eissingers have worked successfully in agriculture, but due to the local economy, the youngest generation is forced to move from the ranch to seek employment elsewhere. This project would be instrumental in assisting in growing our economic base and providing jobs for younger families to move back to our community... At the same time, construction of this project stands to bring significant economic benefits to the areas where it will be built.	Comment acknowledged.
1392	1	Eissinger	Connie	Board of Commissioners, McCone County	The McCone County Commissioners write in support of TransCanada's Keystone XL crude oil pipeline project and urge the department to grant a permit for the pipeline... On behalf of county taxpayers, Circle's main street businesses and McCone County schools, the Board of Commissioners urge the granting of the permit. Thank you for the opportunity to comment.	Comment acknowledged.
1392	3	Eissinger	Connie	Board of Commissioners, McCone County	Considering the economic [and energy security] benefits of these vital resources, we should continue to expand America's access to [safe,] affordable energy to help ensure [improved domestic and global energy security and] stable prices for consumers... Pipelines are the [safest, most reliable,] economical and environmentally favorable way to transport oil and petroleum products, as well as other energy liquids, throughout the U.S... Additional pipeline capacity will help consumers and businesses throughout the United States... This project also stands to provide a powerful private sector economic stimulus. During construction, Keystone XL will create more than 13,000 jobs funded with private investment. In addition, local governments will have a steady source of income from economic activity associated with construction and from property taxes the pipeline company will pay. Rejection of the permit or suspension of the review would sacrifice the significant economic benefits this project stands to deliver and force U.S. consumers to rely on other sources of crude oil not economically and politically allied with U.S. interests. This would be a mistake.	Consolidated Response ECO-1 addresses potential socioeconomic impacts, and Consolidated Response TAX-1 addresses concerns regarding taxes.
1392	6	Eissinger	Connie	Board of Commissioners, McCone County	Pipelines are the safest, most reliable, [economical] and environmentally favorable way to transport oil and petroleum products, as well as other energy liquids, throughout the U.S. America depends on the more than 168,000 miles of liquid pipelines to move energy and raw materials our country relies on...	Comment acknowledged.
1392	7	Eissinger	Connie	Board of Commissioners, McCone County	TransCanada has proved it's concern for the environment and willingness to mitigate and prevent damages throughout their previous projects.	Comment acknowledged.
1545	18	Eissinger	Connie	Board of Commissioners of McCone County	The Board of Commissioners are completely in favor of this pipeline proposed through McCone County. We have been in contact with other commissioners who have had pipelines go through their counties, and are aware of some of the problems that may develop. We're willing to work with them, and we're	Comment acknowledged.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					willing to solve these problems. The pipeline represents an opportunity for infrastructure to be built up and improved; it represents an opportunity for our taxpayers to have improved services. It's just, it's a way of developing our economy in this community. And we would welcome and support this pipeline.	
1555	35	Ekblad	Al	International Union of Operating Engineers	We have Montanas right now working for TransCanada in both Kansas and Oklahoma.	Comment acknowledged.
1555	36	Ekblad	Al	International Union of Operating Engineers	Our guys have been laying pipe for a long time. This is a highly trained workforce that comes and does this work. I want you to understand the time that these people put in to train to do the work. Doing it safely, and doing it to the best possible level that we can is extremely important to us.They're a trained work force that works all over the world right now.	Comment acknowledged.
170	1	Elliott	Paul	TransCanada Corporation	On behalf of the 350,000 members of the United Association, I am writing to request your strong support for the Keystone KXL Pipeline project being developed by TransCanada, Inc	Comment acknowledged.
170	4	Elliott	Paul	TransCanada Corporation	Of equal importance, the Keystone KXL project will serve as a major engine for future job growth and help put Americans back to work. Mr. President, as you know, the alarming fact is that unemployment in the U.S. construction industry is now over 20 percent. Our industry has literally millions of people looking for work and far too many losing their homes and facing other severe hardships. Keystone KXL alone will create some 10,000 critically-needed jobs for building trades workers. It is also estimated this project will generate over 340,000 additional U.S. jobs between 2011 and 2015 in other affected industries, including manufacturing and service industries. Significantly, all of this job-creation will occur without a single dollar of federal stimulus funds. Moreover, many state and local governments stand to benefit since they will collect substantial tax revenues generated by this initiative (over \$100 million in property tax alone, plus sales, fuel and other taxes). Local communities will benefit as well from new business and employment opportunities that emerge as this nearly 2,000-mile pipeline unfolds across the country.	Consolidated Response ECO-1 addresses potential socioeconomic impacts, and Consolidated Response TAX-1 addresses concerns regarding taxes.
170	5	Elliott	Paul	TransCanada Corporation	Keystone KXL is also a well-planned project. TransCanada currently manages more than 35,000 miles of oil and natural gas pipeline in the U.S. and it has done an exemplary job of planning and organizing this project. Long-term transportation contracts are already in place, as are numerous supply contracts with U.S. equipment manufacturers. A great deal of the regulatory work has already been completed as key approvals have been issued from the Canadian government; other approvals have been secured or are expected shortly from state governments in South Dakota and Montana. Additional points regarding the status and positive impact of the Keystone Project are set forth in the attached briefing document.	Comment acknowledged.
170	6	Elliott	Paul	TransCanada Corporation	We understand that substantial progress has been made with respect to each of these actions already and respectfully request the continued support and assistance of your	Comment acknowledged.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					administration to finalize these matters and, if at all possible, expedite them for the reasons set forth above. In sum, please know that the United Association stands firmly behind TransCanada and the Keystone KXL project. We believe this project exemplifies the commitments we share with your Administration of promoting energy independence, putting people back to work, and helping our country get on the road to economic recovery.	
736	1	Ellis	Peter		I am absolutely in favor of the pipeline...	Comment acknowledged.
736	2	Ellis	Peter		...I am not worried about alleged hazards as the Alaskan pipeline has a very long and excellent track record regarding the environment...	Comment acknowledged.
736	3	Ellis	Peter		...[the pipeline] makes oils supplies more readily available to the US thus increasing supplies and decreasing prices. We must continue to explore for and access all available cheap and abundant sources of energy.....The possibility of problems and risks should not outweigh the benefits lower cost energy.	Comment acknowledged.
997	1	Elsener	James		Running oil right through one of the world largest sources of fresh water is wrong headed. This must not happen.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
866	1	Elsner	Gabriel		The Keystone pipeline is the wrong move for the United States of America. Climate change threatens our national security, our economy and our future. As a 23-year old, investing in Tar Sands oil would jeopardize my future, and future generations with catastrophic climate change. It is time to END our addiction to fossil fuels and invest in clean energy sources. Now is NOT the time to approve a major project that will destroy Canadian wilderness and jeopardize our chance at stopping global warming. Say NO to Keystone XL, and say NO to importing dirty Canadian tar sands oil into the United States. It is not the right path for our future.	Consolidated Response GHG-1 addresses the greenhouse gas life-cycle analyses presented in the revised EIS. Climate change is addressed in Section 3.14.3.14. As noted in that Section, implementation of the proposed Project is unlikely to result in a measureable climate change. Consolidated Response GHG-2 addresses the potential causal connection of implementation of the proposed Project and expanded oil sands production in Canada and increases in refining. Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project.
634	1	Embury	Deborah		I am very alarmed that Keystone XL pipeline project is planning to expose the Ogallala Aquifer to possible contamination. Children as young as third grade are taught what an important natural resource this is to our great state of Nebraska and that it is considered one of the great fresh water resources of our world. There are any number of ways the pipeline, especially a buried pipeline, could be damaged. Is there anything more precious than our water supply? As we can see by what has happened in the Gulf of Mexico, once a water source is polluted, all the experts in the world cannot fix it. We can only watch helplessly and wish we had never trusted that oil companies had our best interests at heart. I have never written a letter like this before, but I feel so strongly that if we turn a blind eye to this, we will never be able to face our grandchildren. What in the world is more important than fighting to protect our water supply?	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. As described in Consolidated Response GLF-1, the risks associated with the proposed Project are substantially different from those associated with the BP Deepwater Horizon Project.
1010	1	Enfield	Cheri		I am definitely against any thing that endangers the Aquifer! Have you noticed water is higher priced than gas! People are spending a dollar for 10 oz. of water! Please do everything possible to protect The largest aquifer in the world! Have you noticed all the aquifer in the East that have been polluted. The	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					super fund has not been able to clean any of them! Thank you for this opportunity to let you know my feelings on this matter.	
1102	1	Engelbrecht	Patrice		Thank you for soliciting our opinions about this pipeline, which I hope is not a done deal.	Consolidated Response ENR-1 provides information on the Department of State's environmental review process, the National Interest Determination process, and the need to complete those reviews before approving or denying the Presidential permit for the proposed Project.
1102	2	Engelbrecht	Patrice		... The leaks from the Alaska pipeline seem to not even be taken into account as we take on another risk of the same nature...	Spills from the Trans Alaska Pipeline System are included in the incident database of the Pipeline and Hazardous Materials Safety Administration. That database was used by Keystone in its risk analysis and by DOS in its calculations of spill frequency projections.
1102	3	Engelbrecht	Patrice		It is despicable that we trash the Boreal Forests for this toxic sand, and then produce more pollution in the attempt to extract the oil at the other end of the pipeline...	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project. Consolidated Response GHG-4 addresses concerns regarding the loss of boreal forest and peat bogs. As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries.
1102	4	Engelbrecht	Patrice		To top it off the pipeline's proposed route is through the Ogallala Aquifer, not above, not around or somewhere else, but through. Help! What are we thinking that we will risk the largest valuable resource in many states, not only Nebraska?	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
1154	1	Engelbrecht	Patrice		Please help us to protect the Ogallala Aquifer. Have we humans not made enough of a mess out of our most important resource the sea? Now we may allow a pipeline through another great body of water that supports not only my state of Nebraska, but many other states as well.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
1154	2	Engelbrecht	Patrice		Why would we trash the Boreal Forest only to make another mess at the other end of the pipeline trying to extract oil from this toxic tar sand.	Consolidated Response GHG-4 addresses concerns regarding the loss of boreal forest and peat bogs. Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project. Consolidated Response OIL-4 addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils. As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries.
1154	3	Engelbrecht	Patrice		We have already seen plenty of pipeline leaks in Alaska, let's not risk the Ogalla Aquifer.	Concerns regarding potential risk to Northern High Plains Aquifer system and other aquifer systems are addressed in AQF-1.
1154	4	Engelbrecht	Patrice		How about going [around] above or [just somewhere else rather than directly through the aquifer itself.]	Consolidated Response ALT-1 addresses potential alternative routes, including routes that would avoid much of the Northern

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
						High Plains Aquifer System. Issues related to an aboveground pipeline are addressed in Consolidated Response CST-1. Issues related to the Northern High Plains Aquifer System are addressed in Consolidated Responses AQF-1 and AQF-4, and issues related to the Sand Hills area are addressed in Consolidated Response ERO-1.
1154	6	Engelbrecht	Patrice		Or not at all. What are we thinking? We need an hero to protect all creatures, humans and the environment from our obvious lack of consciousness. I hope you can be this hero. Help!	Consolidated Response ENR-1 provides information on the Department of State's environmental review process, the National Interest Determination process, and the need to complete those reviews before approving or denying the Presidential permit for the proposed Project.
726	1	Engelfried	Nick		I'm writing to strongly urge the State Department not to approve construction of the Keystone XL oil pipeline. Approving the Keystone XL pipeline would be a step backwards at this critical moment. Again, I urge the State Department to reject the Keystone XL pipeline.	Comment acknowledged.
726	4	Engelfried	Nick		...This pipeline would further open the doors of the US market to tar sands oil from Canada - of the dirtiest forms of oil in the world. Tar sands oil has a carbon lifecycle carbon footprint approximately three times greater than that of ordinary crude oil. Burning tar sands oil in our cars on a large scale would negate much of the progress the Obama administration has made so far toward reducing carbon emissions from our vehicles. The whole country is working to make the shift to a clean energy economy, and this is no time to open our doors to new and extremely dirty fuel...	Consolidated Response OIL-4 addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils. Consolidated Response GHG-1 addresses GHG life-cycle analyses. Consolidated Response P&N-1 addresses the need that the Project has been proposed to meet.
812	1	Ephroni	Annette		Please, please stop the Keystone XL pipeline. The short-term gain of jobs oil that the pipeline will provide is absolutely not worth the long-term _known_ costs to the environment, not to mention the _unknown_ costs of potential disasters.	The commenter's opinion is noted.
812	2	Ephroni	Annette		If the BP spill hasn't reminded us of how much devastation a single accident can cause, then we are beyond help. But just to speak of the _known_ costs: tar sands oil is the dirtiest oil produced, producing three times the pollution of conventional oil methods during production--not to mention producing record numbers of other pollutants, like heavy metals. Please, please help us move AWAY from the fossil fuels of the past toward a CLEANER future, not a dirtier one. Please. Not in our backyard, and not anywhere.	Consolidated Response OIL-4 addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils. Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project. Consolidated Response GHG-1 addresses GHG life-cycle analyses.
813	1	Ephroni	Joel		Please do not go forward with the Keystone XL pipeline!	Comment acknowledged.
1559	48	Epps	Randy		Pipeline will take down 1/3 of the woodlands on his property. Pipeline will also disrupt shallow springs. Has 100 year old oaks that are to be taken down that were a very valuable aspect when bought the property. Grove of huckleberries will also be taken down that is very important to landowner.	Consolidated Response FRM-1 addresses potential ranch of farmland impacts and compensation for lost crops.
1559	49	Epps	Randy		Concerned about oil leaks.	Section 3.13 of the EIS addresses reliability and safety issues, including calculations of the probability of a spill from the proposed Project and the potential environmental impacts associated with spills.
1559	84	Epps	Wendy		Bought property because it was heavily wooded. Planned to build a house and retire there, but now not sure. Keystone has rerouted the line for a man down the road but won't do it for	If the pipeline route extends through forested areas, most of the trees on the 110-foot-wide right-of-way would likely be removed. After construction, trees could be replanted over all

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					them and they don't want to lose their trees. Also route will go within 100 ft of her parent's pond.	but the 50-foot-wide permanent right-of-way. Structures could not be built within that permanent right-of-way, but most other current activities could continue after the completion of construction and reclamation. Consolidated Response SAF-1 describes the regulatory requirements that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project in a manner that protects the health and safety of the public and the environment. Those requirements do not include a minimum distance from pipelines to waterbodies.
1559	85	Epps	Wendy		Concerned about the noise affecting humans and wildlife.	Consolidated Response NOI-1 addresses issues related to noise from pump stations. Section 3.6 of the EIS addresses noise impacts to wildlife.
1559	86	Epps	Wendy		Have not been treated kindly by Keystone. They bully and scare people. They don't call, just come out to the property without advance notice.	Consolidated Response EAS-2 addresses issues related to easement negotiations and eminent domain. DOS has no legal authority in the easement negotiations or in eminent domain proceedings.
1559	86	Epps	Wendy		Have not been treated kindly by Keystone. They bully and scare people. They don't call, just come out to the property without advance notice.	Consolidated Response EAS-2 addresses issues related to easement negotiations and eminent domain. DOS has no legal authority in the easement negotiations or in eminent domain proceedings.
1553	37	Escobar	Tony		I really don't think a pipeline is going to be environmentally friendly, no matter what an environmental lawyer says, that is my viewpoint.	Comment acknowledged.
1553	38	Escobar	Tony		We should be looking toward alternative energy sources not new pipelines.	Consolidated Response ALT-2 addresses the use of alternative technologies, alternative energy sources, and conservation of energy.
515	1	Evans	Deirdre		Routing the oil pipeline over the Nebraskan Sandhills above the Ogallala Aquifer must be stopped! You don't have to be a rocket scientist to realize what a bad project this is. Has no one noticed how difficult it is to separate oil and water? How about when it is underground? There has already been a leak in Montana. When one reads about sinkholes caused by 30-year-old sewer pipes, concern only grows. We will still need our water supply in 30 years. Where is the wisdom to understand this needs to be rerouted over safer land? This is our water supply. Someone, please stop this. Now.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. Consolidated Response ALT-1 addresses potential alternative routes, including routes that would avoid much of the Northern High Plains Aquifer system.
801	1	Evans	Paul		This risks are too great to have this pipeline passing through Nebraska! A refinery should receive the oil up near the oil sand source	Consolidated Response P&N-8 addresses issues related to shipping Canadian crude oil to refineries that are closer to the source of oil.
999	1	Ewalt	Hazel		I am very concerned that the pipeline that is going across the Ogallala Aquifer will at some time leak into our water. Water is a priceless necessity and we should do everything to care for it. I urge all of you to stand up to the big oil companies and change plans to the current route.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
1096	1	Ezell	Ed		I am very concerned that the pipeline will be an ongoing potential hazard. Please proceed with great caution and planning to ensure fail-safe operation for 1000 years or don't build it. Thank you for soliciting my input.	As described in Consolidated Response SAF-1, the Pipeline and Hazardous Materials Safety Administration (PHMSA) has regulatory requirements that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project in a manner that protects the health and safety of the public and the environment. In addition, PHMSA

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
						developed 57 Project-specific Special Conditions that Keystone has agreed to implement. Incorporation of those conditions would result in a Project that would have a degree of safety over any other typically constructed domestic oil pipeline system under current code and a degree of safety along the entire length of the pipeline system similar to that which is required in HCAs as defined in 49 CFR 195.450. As discussed in Section 3.13.4, although the likelihood of a spill from the Project is small, it is not possible to guarantee "failsafe" operation of any pipeline system.
1236	1	Fadke	Carol		I am ok with drilling for oil and having a pipe line in Nebraska. But we need to be as careful as possible. Use all safety precautions.	Consolidated Response SAF-1 describes the regulatory requirements that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project in a manner that protects the health and safety of the public and the environment. It also describes the inspections and reviews of the proposed Project that the Pipeline and Hazardous Materials Safety Administration would conduct to ensure compliance with those regulatory requirements.
126	1	Fairchild	Eleanor		Keystone and their land agents UFS are advising landowners that they will not re-plant trees taken out for the temporary work areas for the easement, but the draft EIS requires Keystone to replant trees in the TWA. Who is correct and who is responsible to police this requirement?	Keystone has committed to restoring the temporary right-of-way, which includes temporary work areas, consistent with federal and state regulations as applicable and the easement agreements negotiated between Keystone and individual landowners or land managers, and consistent with its Construction, Mitigation, and Reclamation Plan (see Appendix B of the EIS). DOS is not aware of the requirements of the commenter's easement agreement with Keystone. Consolidated Response EAS-2 addresses issues related to easement negotiations. As noted in that response, DOS has no legal authority in the easement negotiation process. If the easement agreement isn't followed, the commenter would have to seek legal advice regarding corrective action.
126	3	Fairchild	Eleanor		Assuming that the necessary government officials are satisfied with the technical and financial capabilities of Keystone to operate the pipeline and be responsible for any environmental damage that may occur, what procedures are in place to ensure that any proposed assignee or purchaser will have the same or better technical and financial capabilities?	Assurance of the financial stability of any firm that may purchase the proposed Project would be addressed at the time of the purchase. We are not aware of any procedures that are currently in place to govern that process.
790	1	Faires	Alicia		What the hell are you people smoking to think this is a good idea? ...NO! ENOUGH IS ENOUGH! THIS HAS TO STOP! NO PIPELINE THROUGH THE US!	The commenter's opinion is noted.
986	1	Falotico	Michael		It is insane to run a pipeline through the fragile ecosystem of the Sand Hills of Nebraska, literally atop the Ogallala Aquifer. Do you know that there is a trillion gallons of fresh water underneath Nebraska, the world's largest underground water supply? You spring one little, itty-bitty leak in that oil pipeline and it will gush, and gush thereby ruining the water system of the entire region.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
986	3	Falotico	Michael		This pipeline is CRAZY! STOP IT NOW!	Consolidated Response ENR-1 provides information on the Department of State's environmental review process, the National Interest Determination process, and the need to complete those reviews before approving or denying the Presidential permit for the proposed Project.
729	1	Farmer	Robyn		Do not do this...We need to get over the need for everyone's	The commenter's opinion is noted.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					oil.	
729	2	Farmer	Robyn		...There's no complete plan of how to handle a possible leak...	Consolidated Response RES-1 addresses issues related to preparation and review of the Emergency Response Plan for the proposed Project.
251	1	Farrington	J.M.		Intervention requested as a result of the Public Comment Meeting at Livingston TX 77351, 5/19/2010:The maps of the local area and proposed pipeline routes shown by the company representatives were so unclear that they generated considerable confusion among members of the public;(1) They had 2 separate types of maps, one on a handheld computer device that displayed roads and their names but did not show the pipeline route; the others were narrow strip maps made from aerial photography that showed the pipeline route but did not show any road names or buildings, making it impossible for local residents to determine where the route was in relation to their property,(2) When told the route appeared to go through the front yards of some residents, the representatives said they were unaware of any houses there (although they have been there for years).	Consolidated Response EAS-2 addresses issues related to easement negotiations and eminent domain. DOS has no legal authority in the easement negotiations or in eminent domain proceedings.
251	2	Farrington	J.M.		(Cont): (3) I asked the reps to show me exactly where the pipeline route would go along a section of Hwy 146 located 6 to miles south of Livingston, TX, but after 15 minutes searching they gave up the only point they could positively identify was the county line about 12 miles farther south.(4) I asked the pipeline reps to mail me a detailed map of that section and they promised to do so the next days; however, 2 weeks have passed now with no map. Therefore, I ask the Department of State to intervene to force the release of detailed maps and alert local residents.	Consolidated Response EAS-2 addresses issues related to easement negotiations and eminent domain. DOS has no legal authority in the easement negotiations or in eminent domain proceedings. Photoalignment sheets of the entire route are available on the DOS website for the Project at http://www.keystonepipeline-xl.state.gov/clientsite/keystonexl.nsf?Open . Click on "Project Documents" and the maps are accessible under "Supplemental Filing."
251	1	Farrington	J.M. Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
618	1	Favara	Patrick		Please keep any and all oil pipelines away from the Nebraska Sand Hills. Keep the pipelines away from the Ogallala Aquifer.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
1432	1	Feinstein	Jack	Sulzer Pumps Inc	Our 175-year-old company, one of the world's largest manufacturers of industrial machinery and equipment, is a sub supplier for the some 235 pump stations that will help operate KXL. The pumps will be manufactured here in Sulzer's facility in Portland under a contract which will support hundreds of manufacturing jobs here in Oregon.	Comment acknowledged.
1432	2	Feinstein	Jack	Sulzer Pumps Inc	Sulzer is excited to be part of the KXL project because it is a project that will provide a number of benefits to the United States. With the potential to transport roughly 1 million barrels of oil per day, KXL will improve U.S. energy security by importing oil from our friendly northern neighbor and offset imports from unstable or unfriendly regimes.	Comment acknowledged.
1432	3	Feinstein	Jack	Sulzer Pumps Inc	Further, there is an opportunity for KXL to benefit oil production here in the United States, as TransCanada is exploring the possibility of an on-ramp that would allow oil producers in Montana and North Dakota to access the Keystone system.	Consolidated Response ALT-3 addresses issues related to transportation of crude oil from the Williston Basin.
1432	4	Feinstein	Jack	Sulzer Pumps Inc	KXL also provides environmental benefits. If the United States does not import this Canadian oil, it will likely be shipped overseas, which will increase its carbon footprint.	Comment acknowledged.
1432	5	Feinstein	Jack	Sulzer Pumps Inc	And pipelines, as Sulzer knows from experience, are a safe and secure method of transporting oil. The tragedy in the Gulf reminds us of the importance of environmental safety. Sulzer has worked with TransCanada in the past, and know they share Sulzer's commitment to quality design, manufacturing, construction, and operation.	Comment acknowledged.
36	1	Fellows	Ernie		I'm writing because I'm disappointed in your EIS draft. It did not even review the Ogallala Aquifer and Lisa P. Jackson and our President say we need to protect our clean water.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
36	2	Fellows	Ernie		We need more time to read 3000 pages? Why so long? You took a year to draft this. We by civil rights should have at least 180 days for us poor farmers that are REAL busy this time of year, and legal council to read this document and respond. I ask you Mrs. or Ms. Orlando, due I need to file a lawsuit to have time to read this document? Please respond before May 10th.	Consolidated Response CMT-1 addresses issues related to the length of the comment period for the draft EIS and supplemental draft EIS.
143	1	Fellows	Ernie		Trans Canada wants a pipeline through Nebr. against our wills.	Consolidated Response ALT-1 addresses potential alternative routes, including routes that would avoid much of the Northern High Plains Aquifer system.
143	2	Fellows	Ernie		This is heavy crude oil. It sinks into water.	As described in Consolidated Response OIL-4 and Section 3.13.5.1, the crude oil obtained from Canadian oil sands projects has a specific gravity that is less than that of water, which means that it is lighter than water. Therefore, if a spill from the proposed Project reaches surface water or groundwater, it would initially float on the surface of the water.
143	3	Fellows	Ernie		This is heavy crude oil. It sinks in water. It is made up of: tar; bitumen 68%-70%; benzene 10-15% depending on the field; 10% sulfur; and 10 diesel maybe 2% gasoline. All cancer causing agents. The specific gravity is less than water. Water is about 7 heavy crude 3-4 before it is diluted with naphtha. All	Consolidated Response OIL-4 addresses the composition of the Canadian crude oils that would be transported by the proposed Project. As noted in this response, that crude oil is similar in composition to other heavy crude oils. Since the specific gravity is less than that of water, the crude oil would

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					this is explosive and extremely dangerous.	initially float if it reaches water after a spill. As noted in Consolidated Response OIL-5, crude oil pipelines do not explode and it is highly unlikely that there would be an explosion in a pump station.
143	4	Fellows	Ernie		Mercury, arsenic, naphthenic acid, and poly hydrocarbons are also cancer causing agents that come off in tailing ponds of water that poisons wildlife and drinking water sources.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information on current and future production. As noted in that Consolidated Response, without the proposed Project, oil sands development would continue at or above the current level until at least 2020, with or without the proposed Project.
143	7	Fellows	Ernie		Making phone calls along the proposed pipeline no one wants it, especially over the Ogallala Aquifer.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
143	8	Fellows	Ernie		It took Dept of State almost a year to compile a 3000 page, we need and should get more than 3 days to read and reply.	Consolidated Response CMT-1 addresses issues related to the length of the comment period for the draft EIS and supplemental draft EIS.
143	9	Fellows	Ernie		This Trans Canada Co. feels like an invasion by a foreign country we are at war with. Not funny.	The applicant for the proposed Project is TransCanada-Keystone Pipeline LP (Keystone), a limited partnership organized under the laws of the state of Delaware.
143	10	Fellows	Ernie		If this goes through we will have way to much pipe almost 150% to much. This will raise gas prices to maybe \$5.00. Glen Perry has put the Altex pipe on hold for 8 yrs because of the glut of pipe.	Consolidated Response P&N-1 addresses the need that the Project has been proposed to meet.
143	11	Fellows	Ernie		I think this pipe should be put on hold or moved to an alternate until all this is sorted out. We, the people of the affected counties should have the right to vote for this.	Consolidated Responses ENR-1 and REG-2 provide information on the DOS environmental review process, the National Interest Determination process, and the need to complete those reviews before approving or denying the Presidential permit for the proposed Project. This process is accomplished by DOS with the assistance of many other government agencies in accordance with laws and regulatory requirements and is not subject to the voting process.
143	12	Fellows	Ernie		If all of this raises gas prices it will raise a recession again. Pipe tolls will increase also not helping our economy or Canada's.	An analysis of the potential U.S. and Canadian macro-economic impacts of the Project are outside of the scope of this EIS. However, as indicated in Section 1.4.2, the WSCB crude oil would substantially replace dwindling supplies from Mexico and Venezuela. PADD III refineries have a capacity of 8.4 million barrels per day (bpd), with average crude oil input of 7.0 million bpd and a total of 2.6 bbl for 2009. This represents 48.6% of the daily national input of 14.4 million bpd for 2009 and 50.0% of the total national annual input. It is highly likely that the potential economic impacts of the loss of supply from these two countries, and the price for crude oil as a result of increased demand from other sources, would exceed the potential impacts from pipe tolls and retail gas prices.
143	13	Fellows	Ernie		Green house gas will increase because of the type of pollutants from this oil.	Consolidated Response GHG-1 addresses the greenhouse gas life-cycle analyses presented in the revised EIS.
143	14	Fellows	Ernie		If Obama and Lisa P. Jackson are truly green this pipeline will not occur.	Consolidated Response ENR-1 provides information on the Department of State (DOS) environmental review process, the National Interest Determination process, and the need to complete those reviews before approving or denying the Presidential permit for the proposed Project. As noted in that response, DOS is neither a proponent nor an opponent of the

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
						proposed Project.
143	15	Fellows	Ernie		Eminent domain is just a land grab steal thing used by the government and rich people to take from the poor.	As noted in Consolidated Response EAS-2, state laws dictate under what circumstances eminent domain may be used and define the eminent domain process within the state. DOS has no legal authority in the easement negotiations or in eminent domain proceedings.
143	16	Fellows	Ernie		This should never be allowed because I believe this is Chinese crude. This is not for public use.	Consolidated Response P&N-1 addresses the need that the Project has been proposed to meet.
143	17	Fellows	Ernie		Executive order 12630 protects us from this. No one at the EPA or Trans Canada knows how to clean this oil up in case of a spill because this heavy oil sinks down into the earth and water. No one has a plan to clean up.	Executive Order 12630 addresses issues related to potential federal takings. Consolidated Response EAS-2 addresses issues related to easement negotiations and eminent domain, which are state issues. Consolidated Response RES-1 addresses issues related to preparation and review of the Emergency Response plan for the proposed Project. Consolidated Response OIL-4 addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils and its behavior after a spill would be essentially the same as that of other heavy crude oils.
143	18	Fellows	Ernie		Trans Canada has violated our laws a couple times, by not having licensed land agents and saying they did, trespassing in the past.	State or local trespass and access laws are applicable along the entire route and therefore along each easement negotiated by Keystone. DOS has no legal authority over negotiating easement agreements, no legal status to enforce the conditions of an easement agreement, and no legal authority over Keystone representatives who gain access to private property. The commenter has the option to take up the matter with Keystone or local law enforcement officials, or initiate legal consultation.
143	20	Fellows	Ernie		TransCanada has no grass plan that will work. If they do no one at the head offices of UNL or NRCS know anything about it.	The EIS was revised to include additional information on Keystone's construction and restoration techniques within the Sand Hills in Section 3.5. Additional information on Keystone's process for development of construction and restoration methods within the Sand Hills and other issues are discussed in Consolidated Responses ENV-1 and ERO-1 and additional construction and reclamation information specifics to the Sand Hills was added to Appendix H of the EIS.
143	21	Fellows	Ernie		There has been no river or hydrological testing as specified by USGS.	The testing referred to by the commenter is part of the assessment of scour depth that is often conducted to determine the burial depth of a pipeline.
143	22	Fellows	Ernie		This pipe should be at least 1000 feet from our homes and it is not.	Consolidated Response SAF-1 describes the regulatory requirements that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project. It also describes the inspections and reviews of the proposed Project that the Pipeline and Hazardous Materials Safety Administration would conduct to ensure compliance with those regulatory requirements. The regulations and Special Conditions that Keystone would follow do not require that the pipeline be more than 1,000 feet from a home.
143	23	Fellows	Ernie		This pipeline needs fencing as it will take 20 years to resod in some areas and possibly irrigation to get a stand of grass. Trees that are torn out need to be replaced.	The EIS was revised to include additional information on Keystone's construction and restoration techniques within the Sand Hills in Section 3.5. Additional information on Keystone's

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
						process for development of construction and restoration methods within the Sand Hills and other issues are discussed in Consolidated Responses ENV-1 and ERO-1, and additional construction and reclamation information specifics to the Sand Hills was added to Appendix H of the EIS.
143	24	Fellows	Ernie		I know not why Trans Canada feels we live in a low consequence area, we do not. What low consequence areas?	The definition of a high consequence area (HCA) is included in the regulations of the Pipeline and Hazardous Materials Safety Administration (PHMSA) and is based on population levels and environmental sensitivity (see 49 CFR 195.450). Keystone does not define those areas, but provides PHMSA a listing of HCAs along the proposed route as required by PHMSA regulations. As described in Consolidated Response SAF-1, the Pipeline and Hazardous Materials Safety Administration (PHMSA) has regulatory requirements that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project. In addition, PHMSA developed 57 proposed Project-specific Special Conditions that Keystone has agreed to implement. Incorporation of those conditions would result in a proposed Project that would have a degree of safety over any other typically constructed domestic oil pipeline system under current code and a degree of safety along the entire length of the pipeline system similar to that which is required in HCAs as defined in 49 CFR 195.450.
143	25	Fellows	Ernie		The rivers are a high consequence area because of the endangered fish and birds. The red minnow and shiner are two fish.	Sections 3.7 and 3.8 address potential Project-related impacts to general fish species and threatened and endangered species, respectively. Section 3.13 of the EIS has been revised and addresses reliability and safety issues, including calculations of the probability of a spill from the proposed Project and the potential environmental impacts associated with spills.
143	26	Fellows	Ernie		Piper plover and lesser tern nest on the river sand bars and would be endangered by a spill.	Potential Project-related and oil spill effects on the federally protected piping plover and interior least tern are described in Sections 3.8.1.23.13.6.3 of the EIS, and within the Biological Assessment presented in Appendix T of the EIS. Because all rivers with potential piping plover and least tern nesting habitat would be crossed using the horizontal directional drilling (HDD) method, there would be no direct impacts to nesting habitats from construction and operation of the proposed Project.
143	27	Fellows	Ernie		Because tar sands oil sinks there are some leather backed turtles found on the Niobrara below Highway 37 that are endangered.	As discussed in Section 3.7.3.1 of the EIS, the proposed Project would cross the Niobrara River using the HDD method. Use of HDD for proposed crossing would minimize potential Project-related impacts to surface waters and aquatic species during construction, including threatened or endangered species present in this waterbody. There are no federal or state listed threatened or endangered turtles that would occur in the Niobrara River below Highway 37. The specific gravity of crude oils that would be transported by the proposed Project ranges from 0.85 to 0.93, and oil released from the proposed Project that reaches water would initially float on water and would exhibit a behavior essentially the same as that of other heavy crude oils (see Consolidated

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
						Response OIL-4). Section 3.13 addresses oil spill risk and the regulatory safety measures that Keystone would use during construction and operation of the pipeline to minimize spill risk to humans and wildlife. Additional discussions of oil spill risk are presented in Consolidated Response OIL-1 and OIL-2.
143	29	Fellows	Ernie		There is an Executive 13045 that protects and guarantees our children clean water. A pipe laid in this ground will violated this over time by osmosis and a leak will contaminate the greatest natural resource we have, the Ogallala Aquifer where 65% of the state of Nebr. gets its drinking water from wells in the ground in the Aquifer. Can Trans Canada guarantee no contamination? No.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
143	30	Fellows	Ernie		The USGS resurveyed this ground in 2008 and they know where this water is. It is also on top of the High Plains Aquifer. Water is 2 ft to 1500 ft or more in area's deep.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
143	31	Fellows	Ernie		The Clean Water act of 1996 Executive order 13045 signed by Pres Clinton guarantees use clean water. How will the EPA, Dept of State and their partner Trans Canada protect that water? I don't believe it can be done so when it gets contaminated there will be multiple lawsuits filed on behalf of the public. President Obama resigned this executive order 13045 last year, 2009. The Dept of State needs to take more than 30 or 60 days to study this.	As described in Section 1.0 of the EIS and Consolidated Response ENR-1, the Department of State (DOS) is responsible for reviewing Keystone's application for a Presidential permit and is neither a proponent nor an opponent of the proposed Project. Neither DOS nor the U.S. Environmental Protection Agency is a partner of Keystone. DOS initiated its review of the proposed Project in January 2009. The review period the commenter is referring to is the public review period for the draft EIS. Consolidated Response SAF-1 describes the regulatory requirements that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project in a manner that protects the health and safety of the public and the environment. Section 3.13 of the EIS addresses reliability and safety issues, including calculations of the probability of a spill from the proposed Project and the potential environmental impacts associated with spills.
143	32	Fellows	Ernie		There are 2 alternative routes 1 west and 2 over east that should be used because if the pipe crosses the Aquifer every one of us landowners believe it should be triple walled. Moving the pipe east would solve a lot of problems and save our children water supplies to our schools.	Consolidated Response ALT-1 addresses potential alternative routes, including routes that would avoid much of the Northern High Plains Aquifer system. AQF-6 addresses the potential for using double- or triple-walled pipe.
143	33	Fellows	Ernie		I believe all government offices involved have a moral obligation to move the pipe over with the other pipe.	Consolidated Response ALT-1 and Section 4.3 of the EIS address potential alternative routes, including use of the existing Keystone Oil Pipeline System route. The government agencies involved in the review of the proposed Project have the obligation to meet the regulatory requirements for that review as described in Consolidated Response ENR-1 and in Section 1.0 of the EIS.
143	34	Fellows	Ernie		Mount St Helens was one thing but contamination of the Aquifer would be the disaster of the millennium. Clean water bottling companies would lose, people in cities would not be able to use it, cattle could not use it, this is our drinking water.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
143	35	Fellows	Ernie		Surface spillage killed at least 16000 birds and probably more in April 2010 in Canada.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information on current and future production. As noted in that Consolidated Response, without the proposed Project, oil sands development would continue at or above the current

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
						level until at least 2020, with or without the proposed Project.
143	36	Fellows	Ernie		This whole pipeline is a violation of my civil and everyone's civil rights.	The commenter's opinion is noted.
143	37	Fellows	Ernie		This oil is not needed. No National interest. This is somewhat discriminatory. Not for our public use.	Consolidated Response P&N-1 addresses the need that the Project has been proposed to meet. Products refined from the Canadian crude oil would be used by consumers in the U.S.
143	38	Fellows	Ernie		No just compensation for land that has been in families for centuries.	As noted in Consolidated Response EAS-2, state laws dictate under what circumstances eminent domain may be used and define the eminent domain process within the state. DOS has no legal authority in the easement negotiations or in eminent domain proceedings.
143	39	Fellows	Ernie		Violation of artifact grounds.	Consolidated Response CUL-1 and Section 3.11 of the EIS address protection of historic properties and the consultations conducted in compliance with Section 106 of the National Historic Preservation Act, including consultation with Indian tribes.
143	40	Fellows	Ernie		Going through the sand hills will not work quite the way Trans Canada thinks. They will tear up more than 110' wide strip of land, more like 300'.	Keystone would be limited to a 110-foot-wide right-of- way except where temporary additional workspace is needed as described in Section 2.2.7.1 of the EIS. The use of temporary workspace would not result in a 300-foot-wide construction right-of-way width along the entire proposed route through the Sand Hills region. Special construction techniques used in the Sand Hills area are included in the Keystone Construction, Mitigation, and Reclamation Plan presented in Appendix B of the EIS and in Appendix H of the EIS. Issues related to the Sand Hills area are addressed in Consolidated Response ERO-1.
143	41	Fellows	Ernie		This project needs to be put on hold and restudied because the 1st part of the EIS is seriously flawed because of the lack of study not done on the Ogallala, High plains Aquifer and the ground water fluctuation that occurs every year.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. Although seasonal variations in the water table are likely to occur due to use of groundwater for irrigation and/or agricultural purposes, the presence of the proposed Project would not influence, or change aquifer water levels.
143	42	Fellows	Ernie		Trans Canada does not have a complete comprehensive plan to handle a leak. If they do I demand to see here and now.	Consolidated Response RES-1 addresses issues related to preparation and review of the Emergency Response plan for the proposed Project.
143	43	Fellows	Ernie		I'm disappointed in the EIS what I have seen of it. I'll never get it all read in 60 days. Is this to benefit Trans Canada? The short period sounds like it is more for Conoco's benefit than ours.	Consolidated Response CMT-1 addresses issues related to the length of the comment period for the draft EIS and supplemental draft EIS. The applicant for the proposed Project is TransCanada-Keystone Pipeline LP (Keystone), a limited partnership organized under the laws of the state of Delaware.
143	44	Fellows	Ernie		I worked for Conoco at one time. I know how an oil company works. The amount of oil coming out of Canada is just a drop in a bucket compared to what we use, because use is down by at least 10%.	Consolidated Response P&N-1 addresses the need that the Project has been proposed to meet.
143	45	Fellows	Ernie		Why us the Steele City hub being moved and why is it not in the draft, if not for the news media we would not know about it at all.	The commenter is apparently referring to the tank farm Keystone originally proposed at Steele City as described in the draft EIS. After the draft EIS was issued, Keystone revised its Project plan to have the tank farm located in the Cushing Oil

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
						Terminal as described in Sections 2.1 and 2.2.6 of the EIS. The environmental impacts associated with that facility are addressed in the resource sections of Section 3.0; as noted in those sections, construction and normal operation of the tank farm would not result in significant impacts.
143	46	Fellows	Ernie		We need more time to read 3000 page. Why so long? You took a year to draft this. We by civil rights should have at least 180 days for us poor farmers that are REAL busy this time of year, and legal council to read this document and respond.	Consolidated Response CMT-1 addresses issues related to the length of the comment period for the draft EIS and supplemental draft EIS.
347	2	Fellows	Ernie		This letter is to President Obama, J. Steinberg, Hillary R. Clinton, and Elizabeth Orlando. Now TransCanada is threatening us! I'm not happy with you, or your people. Ms. Orlando said there were things she could be better doing than out here "York and Atkinson" during this EIS hearing or whatever you call it. Very unprofessional. Oil use is on it way down not up. TransCanada and Universal Field Services people have lied to me almost every step so far. They have used personal threats. I'll fight back with force if need be. Stop this pipeline or move it off the Ogallala Aquifer before violence occurs. TransCanada does not have enough money to buy an easement. They may have to grind my body, blood and bones into the dirt, and kill me. I'll lay down in front of the Caterpillars before I allow them to ruin my back yard. Oil companies are headed by rich bastards. I also do not feel Entrix was the proper group to sub contract the EIS out to, they are to closely connected to Conoco or Phillips. Elizabeth Orlando is to abrasive to have done the meetings out here in ranch land, she is not believable and she says these EIS meetings are interfering with her other work. TransCanada or their associate Universal Field is acting like the old days, cow thieves! Now I am really pissed off. The state of Nebraska is not a communist country or socialist like Canada run by the Queen of England. TransCanada is trying to make us out to be criminals for not dealing!	Consolidated Response P&N-1 addresses the need that the Project has been proposed to meet, including information on crude oil supply and demand from an analysis specific to the proposed Project. Consolidated Response ALT-1 addresses potential alternative routes, including routes that would avoid much of the Northern High Plains Aquifer system. Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. ENTRIX (now Cardno ENTRIX), the DOS thrid-party contractor for the EIS, does not have busines affiliations with ConocoPhillips. In addition, ConocoPhillips sold its interest in the proposed Project to Keystone and is no longer an applicant for the proposed Project.
347	3	Fellows	Ernie		No national interest, we are not at war.	Consolidated Response P&N-9 and Sections 1.3 and 1.5.1 of the EIS describe the National Interest Determination process. It is not necessary to be at war to require a determination of national interest.
347	4	Fellows	Ernie		Threatening eminent domain; it is not in the USA constitution.	As noted in Consolidated Response EAS-2, state laws dictate under what circumstances eminent domain may be used and define the eminent domain process within the state. DOS has no legal authority in the easement negotiations or in eminent domain proceedings.
347	5	Fellows	Ernie		Nobody wants this pipe across the aquifer. No attention to the aquifer and if the pipe leaks, no plan to prevent benzene and other chemical contamination of the water.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
347	7	Fellows	Ernie		Price of oil is heading down; use across the US is down. TransCanada, almost a year later can't fill the Keystone East. How can they fill this one? This pipeline will bankrupt the tourist trade, \$4.00 gas and people will not travel.	Consolidated Response P&N-1 addresses the need that the Project has been proposed to meet. Consolidated Response ECO-1 addresses potential socioeconomic impacts, and Consolidated Response TAX-1 addresses concerns regarding taxes.
347	8	Fellows	Ernie		This oil will cause EPA emissions to go up, creating more greenhouse gas. Why? Price of gas to rise.	As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
						would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries. Consolidated Response GHG-1 addresses the greenhouse gas life-cycle analyses presented in the revised EIS.
347	9	Fellows	Ernie		There are nesting eagles in Nebraska and nesting falcons in South Dakota along this pipe route, pipeline should be a mile away so their damn chopper doesn't scare the birds away. The EIS ignored endangered birds and fish in and on the Niobrara and Keyallapa Rivers. How come? What other endangered species along this route have been ignored?	One bald eagle and no golden eagle nests were observed during surveys along the proposed route in Nebraska. No falcon nesting habitat was identified and no peregrine falcon nests were identified within 0.5 mile of the proposed route in South Dakota. Buffers recommended to prevent disturbance to eagle nests are set by the U.S. Fish and Wildlife Service, which recommends a 660-foot-wide buffer area from eagle nests or winter roosts for construction activities. Potential occurrence in the Niobrara and Keya Paha rivers and potential Project-related impacts to bald eagles, interior least terns, piping plover, northern redbelly dace, pearl dace, sturgeon chub, black-nosed shiner, finescale dace, long-nose sucker, and plains topminnow are discussed in Section 3.8.
347	11	Fellows	Ernie		This appears to be a very ill conceived EIS. Why the hurry to ignore certain things. Why the hurry to finish?	The environmental review of the proposed Project began in January 2009 and the draft EIS was issued in April 2010. As noted in Consolidated Response ENR-1, the environmental review, including preparation of this EIS, has been conducted consistent with the DOS regulations pertaining to NEPA (22 CFR Part 161) as well as the Council on Environmental Quality (CEQ) regulations for implementing NEPA (40 CFR Part 1500) and includes the preparation of this EIS. As a result, DOS considers the EIS to be in full compliance with the requirements of a NEPA environmental review.
1540	1	Fellows	Ernie		The oil in the pipeline is toxic, full of cancer-causing agents as well as benzene, sulfur, diesel fuel, gasoline, mercury, natha, etc. It is also an explosive element.	Consolidated Response OIL-4 addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils. As noted in Consolidated Response OIL-5, crude oil pipelines do not explode and it is highly unlikely that there would be an explosion in a pump station.
1540	2	Fellows	Ernie		Nobody seems to have a plan to clean up in case of a leak.	Consolidated Response RES-1 addresses issues related to preparation and review of emergency response plans for the proposed Project. Required emergency response plans for the proposed Project are discussed in Consolidated Response RES-1. As discussed in Section 3.13 of the EIS, federal, state, and local agencies would participate in response activities and soil, surface water, and groundwater cleanup consistent with their authorities and duties under applicable regulations and consistent with the requirements of the Emergency Response Plan and the Pipeline Spill Response Plan. A list of applicable regulations relative to remediation of crude oil spill contamination at the federal and state level is provided in Table 3.13.5-10. Required mitigation for crude oil or oil products spill impacts would be determined by these agencies.
1540	3	Fellows	Ernie		Talking to people from the Nebraska/South Dakota border down to Kansas, I can't find anybody along that pipeline that wants this pipe, let alone wants to put it across the aquifer.	Issues related to aquifers along the proposed Project corridor are addressed in Consolidated Responses AQF-1 through AQF-4.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
1540	4	Fellows	Ernie		Everybody thinks it should be moved someplace else so as to not pollute the Ogallala Aquifer.	Consolidated Response ALT-1 addresses potential alternative routes, including routes that would avoid much of the Northern High Plains Aquifer system.
1540	5	Fellows	Ernie		If this pipe is put through, we're going to have about 150 to 160% too much pipe. Glenn Perry thought it didn't make financial sense to build a pipe when there was too much pipeline already out there.	Consolidated Response P&N-1 addresses the need for the proposed Project. As noted in that response, the Project has been proposed to meet the heavy crude oil needs of refineries in the Gulf Coast area, not for the U.S. in general. In addition, the Alberta Clipper and existing Keystone pipeline projects serve other markets and do not meet the demands of the Gulf Coast refineries.
1540	6	Fellows	Ernie		If we have too much pipe, it will drive the price of shipping up, which will drive the price of gasoline up to probably \$4 or \$5 a gallon, negatively impacting the economy	See Consolidated Responses ALT-1 and ECO-1, and revision to Section 3.10.2.2. An analysis of the potential U.S. macro-economic impacts of the pipeline capacities and use are outside of the scope of this EIS.
1540	7	Fellows	Ernie		Eminent domain is simply a way for big business and rich people to take stuff from us poor people that we can't fight, because we don't have enough money. But there is an executive order, 12630, that protects families from this.	Executive Order 12630 addresses issues related to potential federal takings. As noted in Consolidated Response EAS-2, state laws dictate under what circumstances eminent domain may be used and define the eminent domain process within the state. DOS has no legal authority or ability to intervene in the easement negotiations or in eminent domain proceedings.
1540	8	Fellows	Ernie		The pipe goes within about 300 feet of my house, and I think it should be moved at least a thousand feet away.	Consolidated Response SAF-1 describes the regulatory requirements that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project. It also describes the inspections and reviews of the proposed Project that the Pipeline and Hazardous Materials Safety Administration would conduct to ensure compliance with those regulatory requirements. The regulations and Special Conditions that Keystone would follow do not require that the pipeline be more than 300 mile from a home. The commenter can work with Keystone to address potential minor realignments that can be made during final design, assuming the realignment are consistent with the requirements of environmental permits.
1540	10	Fellows	Ernie		One high consequence area is the Niobrara River, another is the Keya Paha River, and any other river in Nebraska. The Niobrara and Keya Paha Rivers are high consequence because the area is habitat to endangered minnows as well as two endangered birds, the Piping Cleaver and the Lesser Tern. This wasn't addressed in the EIS.	Potential occurrence in the Niobrara and Keya Paha rivers and potential Project-related impacts to bald eagles, interior least terns, piping plover, northern redbelly dace, pearl dace, sturgeon chub, black-nosed shiner, finescale dace, long-nose sucker, and plains topminnow were discussed in Section 3.8 of the draft EIS. Piping plover and least tern occurrence and habitat survey information for these locations is presented in the Biological Assessment presented in Appendix T of the EIS.
1540	11	Fellows	Ernie		TransCanada is inexperienced. While they might know a lot about natural gas, they have build only one pipeline for crude oil. This would be their second. This time they've thinned the pipe, which creates thinner welds. Having worked on the Alaska Pipeline myself, and being a certified welder, I think this needs to be addressed, and the pipeline should possibly be double walled across the Ogallala Aquifer.	Keystone has withdrawn its application for a Special Permit as described in Consolidated Response REG-1. As described in Consolidated Response SAF-1, the Pipeline and Hazardous Materials Safety Administration (PHMSA) has regulatory requirements that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project. In addition, PHMSA developed 57 Project-specific Special Conditions that Keystone has agreed to implement. Incorporation of those conditions would result in a Project that would have a degree of safety over any other typically constructed domestic oil pipeline system under current code

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
						and a degree of safety along the entire length of the pipeline system similar to that which is required in HCAs as defined in 49 CFR 195.450. Those regulations do not include a requirement for double-walled pipe. AQF-6 also addresses the potential for using double-walled or triple-walled pipe. Issues related to the Ogallala aquifer are addressed in Consolidated Response AQF-1.
1540	12	Fellows	Ernie		Executive Order 13045 states that we should protect the water our children drink. Everybody, including children, drink water out of the Ogallala Aquifer in this area, and putting the pipe through the aquifer would allow a certain amount of oil to contaminate the water over the years, via osmosis. The same way that an old car engine can leak oil through the side of the block, the pipeline can leak oil into the groundwater. I don't think an electrical charge is going to prevent that. I don't think TransCanada can guarantee that there won't be any contamination. The Clean Water Act, signed by Clinton in 1996 and again by Obama in 2009, should prevent the building of this pipeline across the top of the aquifer.	See Response As described in Consolidated Response GLF-1, the risks associated with the proposed Project are substantially different from those associated with the BP Deepwater Horizon Project. Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. Consolidated Response OIL-1 addresses the likelihood of spills from the Project.
1540	14	Fellows	Ernie		People who bottle and sell water from the Ogallala Aquifer will be out of business because they can't sell bottled water contaminated with bitumen.	Issues related to the High Plains Aquifer System are addressed in Consolidated Response AQF-1 through AQF-4. Consolidated Response AQF-3 provides information on hypothetical spills from the Project over two areas of the Northern High Plains Aquifer System.
347	10	Fellows	Ernie		Why was one of Entrix's employees so deficient about Conoco/Phillips and their role in the EIS? Asking either Conoco/Phillips or TransCanada to secure information for EIS should be in – proper and a conflict of interest and I will remember this when we are in court.	The applicant for the proposed Project is TransCanada-Keystone Pipeline LP (Keystone), a limited partnership organized under the laws of the state of Delaware
937	2	Ferger	Martha		Destruction of the forests has a very negative impact on the native populations of the area.	Consolidated Response CAN-1 and Section 3.14.4 of the EIS address issues related to development of oil sands projects in Canada.
937	4	Ferger	Martha		People who live and work in the areas of extraction are subject to many severe health hazards.	Consolidated Response CAN-1 and Section 3.14.4 of the EIS address issues related to development of oil sands projects in Canada.
463	1	Fette	Daniel		It seems to me that it does not take a large amount of smarts to see the negative effects and chance for an extreme environmental catastrophe. The chance of blowouts after the fragile Sandhill soil is disturbed is very obvious.	Issues related to the Sand Hills area are addressed in Consolidated Response ERO-1.
463	2	Fette	Daniel		If there were to be a leak in the line the largest aquifer in the country would be impacted. I realize big money talks in this world. This would be one time when it could be asked to spend a little more and do what makes sense.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
735	1	Fiddler	Leslie		...The use of its contents (refined oilsands oil) contributes to further warming of our already overheated planet. The oilsands project is the single dirtiest project on the planet.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project. Consolidated Response GHG-1 addresses GHG life-cycle analyses.
735	2	Fiddler	Leslie		Wow sounds like clown school except that it's real life! No to Keystone XL! Yes to a decent life for my children's children...Yes to protecting the Ogallala Aquifer...	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
735	3	Fiddler	Leslie		Keystone XL endangers the Ogallala Aquifer.	Issues related to the Northern High Plains Aquifer system are

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
						addressed in Consolidated Responses AQF-1 through AQF-4.
320	1	Fiechtl	Anya		The DEIS does not contain or evaluate a complete emergency response plan. This poses an unacceptable risk to Montana. The largely volunteer emergency personnel and potentially affected property owners and others who live near the pipeline deserve an opportunity to comment on TransCanada's emergency response plan prior to issuance of permits and approval of the plan. The disaster in the Gulf serves as a warning – if federal officials had paid more attention to the lack of a plan for dealing with a blow-out of BP's rig before the company was allowed to drill, we would have known before it was too late that there was no plan to contain a catastrophic spill.	Consolidated Response RES-1 addresses issues related to preparation and review of emergency response plans for the proposed Project.
320	3	Fiechtl	Anya		The Department of Transportation has said it will issue a separate Environmental Analysis and proposed special permit allowing a waiver for TransCanada to use thinner pipe outside of "High Consequence Areas," but this is too little and too late. The EIS should analyze the real potential risks and impacts of a spill under the waiver-granted scenario.	Keystone has withdrawn its application for a Special Permit as described in Consolidated Response REG-1. As described in Consolidated Response SAF-1, the Pipeline and Hazardous Materials Safety Administration (PHMSA) has regulatory requirements that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project. In addition, PHMSA developed 57 Project-specific Special Conditions that Keystone has agreed to implement. Incorporation of those conditions would result in a Project that would have a degree of safety over any other typically constructed domestic oil pipeline system under current code and a degree of safety along the entire length of the pipeline system similar to that which is required in HCAs as defined in 49 CFR 195.450.
320	5	Fiechtl	Anya		The DEIS doesn't analyze the environmental effects of tar sands oil, which some say is the dirtiest form of energy available.	Consolidated Response OIL-4 addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils. Section 3.13 of the EIS addresses the impacts of a release of crude oil from the proposed Project. As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries.
320	6	Fiechtl	Anya		The DEIS assumes there is a need for the Keystone XL pipeline but without doing a thorough, independent, and detailed analysis of the need for the pipeline. It glosses over the need and fails to analyze reasonable alternatives. If TransCanada is given a permit for this pipeline, the company will have the power to condemn landowners to build it. The company shouldn't get this power unless it is the best alternative to meet U.S. energy needs. The recently completed Alberta Clipper and Keystone I pipelines offer more than enough capacity for the most optimistic projections of tar sands production for many years, if not indefinitely. The DEIS ignores this existing overcapacity. The scoping summary report clearly outlines the questions to be answered, and the DEIS fails to do so.	Consolidated Response P&N-1 describes the need that the Project has been proposed to meet and provides an explanation of the thorough and independent analysis of need that was conducted for the EIS. As also noted in that response, the Project has been proposed to meet the heavy crude oil needs of refineries in the Gulf Coast area, not for the U.S. in general. The Alberta Clipper and existing Keystone pipeline projects serve other markets and do not meet the demands of the Gulf Coast refineries. The EIS addresses all substantive issues raised during the scoping process. Table 1.9.1-1 of the EIS lists the comments received and the sections of the EIS in which they are addressed.
320	8	Fiechtl	Anya		The DEIS severely underestimates the impact that this	DOS takes seriously its responsibilities to thoroughly evaluate

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					pipeline will have on agricultural land, particularly irrigated land. Farmers and ranchers need assurance from this governmental process that they will not be sacrificed in order to make way for this pipeline. These issues of vitally important to the lives every Montanan -- not just rural farmers and ranchers. This effects us all, and with the BP spill now is your opportunity to turn a new leaf. Be thorough, listen to what we have to say and incorporate it in your assessment.	the environmental effects of its Presidential Permit decisions consistent with NEPA and other relevant laws and regulations. In conducting the environmental review of the proposed Project, DOS followed NEPA, CEQ regulations and guidance, and all other applicable laws and regulations. DOS also consulted extensively with other relevant federal agencies that have particular technical expertise and authority relevant to the proposed Project. As a result, DOS considers the EIS to be in full compliance with the requirements of a NEPA environmental review. Consolidated Response FRM-1 addresses potential ranch of farmland impacts, and Consolidated Response FRM-2 addresses potential impacts to irrigated cropland.
991	1	Field	Sharon		Considering the problems in the Gulf, I think we need to think long & hard before we allow an oil pipeline across the Sand Hills.	Issues related to the Sand Hills area are addressed in Consolidated Response ERO-1.
991	2	Field	Sharon		The Ogallala aquifer is very large & provides water for a large section of the U.S. If it is fouled, what will become of the Midwest? This part of the country would surely become the Great American Desert, because no living thing can survive if its roots are contaminated by oil. Also, we would have no water to drink or for any of a number of other uses.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
626	1	Finken	David		Please do not route the Keystone pipeline over any part of the Ogallala Aquifer. There will eventually be a leak from this pipeline. The very valuable and sensitive aquifer will then be fouled with oil and will be ruined. There is no way to clean this freshwater once it is polluted. This underground water is vital to our country for drinking water and agricultural use. It is already endangered from overuse. Hopefully, we will soon realize that we need to conserve it. There is hope that we will wise up to that. There is no hope to reclaim the water once it is polluted with oil. This can be prevented by routing the pipeline around the aquifer. Promises by the pipeline owner, TransCanada, that it will not leak and if it does it will be minimal are not based on anything but the company's desire to maximize profits and build and operate the pipeline as cheaply as possible. We have seen this over and over. Just look to the Gulf of Mexico and the environmental disaster from the oil leak there. The potential for disaster will never be zero; therefore the only logical route for this pipeline is not over the Aquifer. Any other decision reflects either stupidity or someone has been bought by TransCanada.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. Consolidated Response ALT-1 addresses potential alternative routes, including routes that would avoid much of the Northern High Plains Aquifer system.
1099	1	Finken	Randy		It would be helpful if we could see a list of "pros" for the pipeline project, and a list of "cons." Would a new pipeline cause any more risks to our state than the current one? Please take whatever action is necessary to protect our state.	DOS is conducting a NEPA environmental review of the proposed Project. The impacts associated with implementation of the proposed Project, both adverse and beneficial, are addressed in the resource portions of Section 3.0 of the EIS. As noted in those sections, construction and normal operation the proposed Project would not result in significant environmental impacts. Section 3.13 of the EIS addresses reliability and safety issues, including calculations of the probability of a spill from the proposed Project and the potential environmental impacts associated with spills.
588	1	Fischer	Charlotte	Creighton	What happens to our clean water if this pipeline has an oil	As noted in Consolidated Response LIA-1, Keystone would be

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
				University GreenJays	spill? Who pays for clean up? How will it be cleaned up? As we've seen in the Gulf, not very successfully.	responsible for the cost of clean up of oil and restoration of services impacted by the oil. The plans for doing so would be provided in the Emergency Response Plan; Consolidated Response RES-1 addresses issues related to preparation and review of the Emergency Response Plan for the proposed Project. As described in Consolidated Response GLF-1, the risks associated with the proposed Project and the required cleanup methods due to a spill are substantially different from those associated with the BP Deepwater Horizon Project.
924	1	Fitzgerald	Kris		This is a continuation of bad habits, which are destroying our environments, health and communities. Our dependence on oil is shifting and it is imperative that our corporations shift with this change. I strongly disapprove of this project!	Section 3 of the EIS addresses the impacts of construction and operation of the proposed Project. Section 3.13 of the EIS addresses the risk and environmental impacts of a crude oil spill from the proposed Project.
1445	1	Fitzgerald	John	Society for Conservation Biology	We suggest that you reject the proposed permit and that you review and revoke one or more permits previously granted for pipelines entering Wisconsin and elsewhere in the US on the grounds that: 1) they will cause the Secretary and all those relying upon her permits to be operating in violation of the law and subject to remedies at law and equity...	The Department of State is authorized by Executive Order 13337 to grant Presidential Permits for the construction and maintenance of petroleum pipeline facilities at the international border. The President's authority to grant such permits derives from the President's constitutional authority to conduct the foreign affairs of the United States. Additional information regarding this comment is presented in Consolidated Response ENR-1.
1445	3	Fitzgerald	John	Society for Conservation Biology	[lengthy letter with the following conclusions:]...We suggest that you reject the proposed permit and that you review and revoke one or more permits previously granted for pipelines entering Wisconsin and elsewhere in the US on the grounds that: ...3) they will harm large numbers of migratory and nesting birds, damage swaths of wildlife habitat in the boreal forest and boreal plains, contaminate and divert clean water, and pollute the air in violation of the laws and treaties cited; ...	Consolidated Response CAN-1 and Section 3.14.4 of the EIS address issues related to development of oil sands projects in Canada. The impacts associated with implementation of the proposed Project are addressed in Section 3.0 of the EIS. As noted in that section, construction and normal operation the proposed Project would not result in significant environmental impacts.
1445	4	Fitzgerald	John	Society for Conservation Biology	[lengthy letter with the following conclusions:]...We suggest that you reject the proposed permit and that you review and revoke one or more permits previously granted for pipelines entering Wisconsin and elsewhere in the upon the grounds that: ...4) they will likely lead to much intense pollution and GHG emissions as to be the single largest contributor to climate change shifts that many coral reefs, ice bodies, and forests of the planet cannot survive.	Consolidated Response GHG-1 addresses the greenhouse gas life-cycle analyses presented in the revised EIS. Climate change is addressed in Section 3.14.3.14. As noted in that Section, implementation of the proposed Project is unlikely to result in a measureable climate change.
1445	7	Fitzgerald	John	Society for Conservation Biology	Inadequate Basic Compliance with NEPA. D. The DEIS Inadequately Examines Adverse EffectsThe State Department is required to more fully assess the impacts of the action inside and outside the US, when the action will affect natural or ecological resources of global importance. 1. Adverse Effects on Wildlife, Ecosystems and Biodiversitya. Degraded Water Quality and Overconsumption Tailing ponds kill birds, pollute groundwater, and could pollute neighboring waterways if a dike or berm were to break. b. Potential for Serious Air Quality Consequences Oil sands releases of benzene are currently at 100 tons per year, and could grow to 500 to 800 per year by 2015, for example. 2. Natural Gas Consumption and Leakage Extracting a single barrel of bitumen requires 250 cubic feet of natural gas for which there are better uses.	Consolidated Response P&N-1 addresses the need for the proposed Project. As noted in that response, the Project has been proposed to meet the heavy crude oil needs of refineries in the Gulf Coast area, not for the U.S. in general. DOS is conducting a NEPA environmental review of the proposed Project and has assessed alternatives to the proposed Project in Section 4.0 of the EIS. It is beyond the scope of a NEPA environmental review to consider overall energy needs of the U.S.
1445	10	Fitzgerald	John	Society for Conservation	Inadequate Basic Compliance with NEPA. E. Extensive Water Use and Contamination Extracting a single barrel of bitumen	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
				Biology	using surface mining requires two to five 159-liter barrels of fresh water. .	information regarding development of oil sands projects with and without the proposed Project.
1445	11	Fitzgerald	John	Society for Conservation Biology	I. Inadequate Basic Compliance with NEPA...F. DEIS Inadequately Examines Cumulative EffectsThe reach of the pipeline's environmental affects go far beyond its physical bounds.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information on current and future production. As noted in that response, without the proposed Project, oil sands development would continue at or above the current level until at least 2020, with or without the proposed Project. Section 3.13.4 of the EIS has been revised to expand discussions of extraterritorial concerns.
1445	13	Fitzgerald	John	Society for Conservation Biology	The DEIS inadequately examines adverse effects on wildlife and endangered species and may reflect a failure prepare a proper biological assessment in violation of Section 7 of the Endangered Species Act. Each Federal agency shall insure that any action authorized is not likely to jeopardize the existence of any endangered species.... Effects on the Black-Footed Ferret Are Inadequately Examined Destruction of prairie dog habitat could harm the black-footed ferret.	Potential Project-related effects on the black -footed ferret are described in Section 3.8.1.1 and in the Biological Assessment presented in Appendix T of the EIS. These evaluations include potential impacts to black-tailed prairie dog towns and conservation measures to prevent adverse impacts to the black-footed ferret.
1445	14	Fitzgerald	John	Society for Conservation Biology	The DEIS inadequately examines adverse effects on wildlife and endangered species and may reflect a failure to prepare a proper biological assessment in violation of Section 7 of the Endangered Species Act. Each Federal agency shall insure that any action authorized is not likely to jeopardize the existence of any endangered species. Effects on the Whooping Crane are underestimated - Geographic limits are illegal and data insufficient. The pipeline route follows the migratory route of the crane and could potentially affect designated critical habitat in Nebraska. Approval of the proposed Project would be arbitrary and capricious under the Administrative Procedures Act because the proposed Project is likely to be in violation of the Migratory Bird Treaty Act. The MBTA's prohibition states that taking is unlawful "at any time, by any means or in any manner." Approval of the proposed Project would be arbitrary and capricious under the Administrative Procedures Act because the proposed Project is likely to be in violation of the Fish and Wildlife Coordination Act. If an applicable body of water is controlled or 'modified for any purpose whatsoever, the agency must consult with FWS, amongst others, with a view to the conservation of wildlife resources.	The proposed Project would cross the Platte River downstream from designated critical habitat for the whooping crane. The Platte River would be crossed using the horizontal directional drilling (HDD) method and would not result in impacts to instream habitats. Species evaluations and conservation measures presented in the draft EIS were preliminary. Section 3.8of the EIS and the Biological Assessment in Appendix T of the EIS present the findings of the Section 7 consultation process.
1445	15	Fitzgerald	John	Society for Conservation Biology	The DEIS Inadequately Addresses National and Global Climate Change Concerns. Climate change is the greatest single environmental threat of our time. A The DEIS Is Misleading in its Emissions Analysis ~ Grossly Understating Known Emissions Resulting from Such Production and Use CEQ's draft Guidance is a partial example what reasonable analysis might include and this does not come close, rather it seriously misrepresents emissions and ignores the full cost CO2 equivalent per btu in delivered end use energy. The DEIS Lack of Climate Change Considerations Is Contrary to the UN Framework Convention on Climate Change the Parties to the UNFCCC, including the US and Canada, should take precautionary measures to anticipate, prevent or minimize the causes of climate change and mitigate its adverse effects.	Consolidated Response GHG-1 addresses the greenhouse gas life-cycle analyses presented in the revised EIS. Climate change is addressed in Section 3.14.3.14. As noted in that Section, implementation of the proposed Project is unlikely to result in a measureable climate change. Consolidated Response GHG-5 explains that the DOS assessment of GHG emissions was conducted in accordance with CEQ guidance.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					Nothing in the DEIS does this with any rigor.	
1445	18	Fitzgerald	John	Society for Conservation Biology	Each spring more than half of America's birds migrate to the Boreal to nest. A rupture to the pipeline resulting in oil spills would be potentially devastating to countless numbers and 'species of birds and other wildlife using this area.	The Department of State and the cooperating agencies are evaluating a proposed pipeline in the U.S., not in Canada. The Canadian portion of the Keystone XL Project has been approved by the Canadian National Energy Board (see Appendix R of the EIS). Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1. Issues related to migratory birds are addressed in Consolidated Response ENV-4.
1445	20	Fitzgerald	John	Society for Conservation Biology	The mining and drilling that will take place to feed the Keystone pipeline will eventually convert an area the size of Florida, from peat bogs or Boreal forest to grasslands or highly degraded areas	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information on current and future production. As noted in that response, without the proposed Project, oil sands development would continue at or above the current level until at least 2020, with or without the proposed Project. Consolidated Response GHG-2 also addresses the potential causal connection of implementation of the proposed Project and expanded oil sands production in Canada and increases in refining.
1445	22	Fitzgerald	John	Society for Conservation Biology	Inadequate examination of adverse effects in violation of the Endangered Species Act	Species evaluations and conservation measures presented in the draft EIS were preliminary. Section 3.8 of the EIS and the Biological Assessment in Appendix T of the EIS present the findings of the Section 7 consultation process.
1445	23	Fitzgerald	John	Society for Conservation Biology	3. Possible violations of the Migratory Bird Treaty Act	Keystone is coordinating with U.S. Fish and Wildlife Service (USFWS) to minimize potential incidental take of migratory birds. The Migratory Bird Treaty Act has no provision to allow unauthorized take of migratory birds. USFWS recognizes, however, that some birds could be killed during construction and operation of energy infrastructure even if all know reasonable, prudent, and effective measures to protect birds are used. Keystone would work with USFWS to identify and implement effective steps to avoid take of migratory birds and minimize loss, destruction, and degradation of migratory bird habitat. USFWS Office of Law Enforcement focuses its resources on investigating and prosecuting individuals and companies that take migratory birds without identifying and implementing all reasonable, prudent and effective measures to avoid take.
1445	24	Fitzgerald	John	Society for Conservation Biology	4. Possible violations of the Fish and Wildlife Coordination Act.	Keystone is in consultation with the U.S. Army Corps of Engineers, the U.S. Fish and Wildlife Service (USFWS), and state regulatory agencies to identify sensitive fish and wildlife resources and to avoid, minimize, and mitigate impacts to identified resources at water crossings. Supporting documents are filed on the Department of States web site for the proposed Project. Fish and wildlife resources subject to USFWS review and consultation are described in Sections 3.6, 3.7, and 3.8 of the EIS.
1445	25	Fitzgerald	John	Society for Conservation Biology	5. Lack of consideration of national and global climate change concerns	Climate change is addressed in Section 3.14.3.14. As noted in that Section, implementation of the proposed Project is unlikely to result in a measureable climate change.
1445	28	Fitzgerald	John	Society for Conservation Biology	The draft EIS Does Not Adequately Examine the Alternatives to the Project - This Failure to Examine Alternatives Violates NEPA This section is the heart of the environmental impact	The alternatives analysis was initially conducted as a screening process that first identified potential alternatives to the proposed Project then screened out alternatives that were

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					statement. Based on the information and analysis presented in the sections on the Affected Environment (§ 1502.15) and the Environmental Consequences (§ 1502.16), it should present the environmental impacts of the proposal and the alternatives in comparative form, thus sharply defining the issues and providing a clear basis for choice among options by the decision-maker and the public. In this section agencies shall: (a) Rigorously explore and objectively evaluate all reasonable alternatives, and for alternatives which were eliminated from detailed study, briefly discuss the reasons for their having been eliminated. (b) Devote substantial treatment to each alternative considered in detail including the proposed action so that reviewers may evaluate their comparative merits. (c) Include reasonable alternatives not within the jurisdiction of the lead agency. (d) Include the alternative of no action. (e) Identify the agency's preferred alternative or alternatives, if one or more exists, in the draft statement and identify such alternative in the final statement unless another law prohibits the expression of such a preference. (f) Include appropriate mitigation measures not already included in the proposed action or alternatives. 21 Section 1502.14 requires the EIS to examine all reasonable alternatives to the proposal. In determining the scope of alternatives to be considered, the emphasis is on what is "reasonable" rather than on whether the proponent or applicant likes or is itself capable of carrying out a particular alternative. Reasonable alternatives include those that are practical or feasible from the technical and economic standpoint and using common sense, rather than simply desirable from the standpoint of the applicant? What constitutes a reasonable range of alternatives depends on the nature of the proposal and the facts in each case.	not judged to be reasonable. The screening decisions are explained in Section 4.0 of the EIS and in Section I-2.0 of Appendix I of the EIS, as required by 40 CFR 1502.14. As noted in Section 4.0, all major alternatives identified were screened out as not being reasonable and were not further evaluated.
1445	30	Fitzgerald	John	Society for Conservation Biology	The draft EIS inadequately examines the "No Action" alternative to the Project in violation of NEPA. CEQ NEPA regulation §1502.14 states the following: "This section is the heart of the environmental impact statement. Based on the information and analysis presented in the sections on the Affected Environment (§1502.15) and the Environmental Consequences (§1502.16), it should present the environmental impacts of the proposal and the alternatives in comparative form, thus sharply defining the issues and providing a clear basis for choice among options by the decision-maker and the public. In this section agencies shall: (a) Rigorously explore and objectively evaluate all reasonable alternatives, and for alternatives which were eliminated from detailed study, briefly discuss the reasons for their having been eliminated. (b) Devote substantial treatment to each alternative considered in detail including the proposed action so that reviewers may evaluate their comparative merits. (c) Include reasonable alternatives not within the jurisdiction of the lead agency. (d) Include the alternative of no action. (e) Identify the agency's preferred alternative or alternatives, if one or more exists, in the draft statement and identify such alternative in the final statement unless another law prohibits the expression of such a preference. (1) Include appropriate mitigation measures not already included in the proposed	The alternatives analysis was initially conducted as a screening process that first identified potential alternatives to the proposed Project then screened out alternatives that were not judged to be reasonable. The screening decisions are explained in Section 4.0 of the EIS and in Section I-2.0 of Appendix I of the EIS, as required by 40 CFR 1502.14. As noted in Section 4.0, all major alternatives identified were screened out as not being reasonable and were not further evaluated.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					action or alternatives. Section 1502.14 requires the EIS to examine all reasonable alternatives to the proposal. In determining the scope of alternatives to be considered, the emphasis is on what is "reasonable" rather than on whether the proponent or applicant likes or is itself capable of carrying out a particular alternative. Reasonable alternatives include those that are practical or feasible from the technical and economic standpoint and using common sense, rather than simply desirable from the standpoint of the applicant. What constitutes a reasonable range of alternatives depends on the nature of the proposal and the facts in each case.	
1445	31	Fitzgerald	John	Society for Conservation Biology	The existing Keystone and Alberta pipelines have a combined initial capacity of 885,000 bpd, expandable to 1,391,000 bpd ²⁹ and double current export capacity to the U.S. Midwest. ³⁰ Although the DEIS states that the Keystone XL is needed to address a lack of capacity, these facts suggest otherwise: that there is ample existing capacity. In fact, constructing more capacity will in all likelihood spur more mining - and hence more adverse effects, more adverse cumulative effects - in short, more needless environmental damage. In light of this - in fact, since 'lack of capacity' is the only reason given for needing the pipeline - a reasonable alternative would be to not construct it. It makes little "common sense" to spend billions of dollars to build an unnecessary pipeline that will encourage the most environmentally devastating type of mining. Indeed, for all the reasons discussed below, it would not be in "the nation's best interest" to approve this permit. This Administration has made greener alternative energy development a priority, and to approve this pipeline would be, in every sense, contrary to the spirit of current energy policy.	Consolidated Response P&N-1 addresses the need for the proposed Project. As noted in that response, the Project has been proposed to meet the heavy crude oil needs of refineries in the Gulf Coast area, not for the U.S. in general. In addition, the Alberta Clipper and existing Keystone pipeline projects serve other markets and do not meet the demands of the Gulf Coast refineries. Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project. Section 4.1 of the EIS addresses alternatives to the proposed project, including alternative energy sources and energy conservation.
1445	32	Fitzgerald	John	Society for Conservation Biology	D. The DEIS Inadequately Examines Adverse Effects Section 102(c) of NEPA does not have geographically limiting language in its requirement that agencies assess the likely environmental impact of proposed major Federal actions significantly affecting the human environment. Although its sets out procedures for involving states and localities, NEPA also directs all gencies to "recognize the worldwide and long-range character of environmental problems ...," and "lend appropriate support to ... programs designed to maximize international cooperation - in anticipating and preventing a decline in the quality of mankind's world environment.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information on current and future production. As noted in that response, without the proposed Project, oil sands development would continue at or above the current level until at least 2020, with or without the proposed Project. Section 3.13.4 of the EIS has been revised to expand discussions of extraterritorial concerns.
1445	33	Fitzgerald	John	Society for Conservation Biology	NEP A also requires the Department of State to assess any adverse environmental effects that cannot be avoided when the pipeline is built. Because the Department of State's proposed agency action in this case will have environmental impacts in Canada, the Department must also adhere to Executive Order 12114, Environmental Effects Abroad (f Major Federal Actions (January 4, 1979) to the extent that it complies with NEP A33 The Order is designed to "provide information for use by decision makers, to heighten awareness of and interest in environmental concerns and, as appropriate, to facilitate environmental cooperation with foreign nations...," ³⁴ The E.O. sets forth different levels of	The United States conducts its environmental reviews consistent with NEPA and in accordance with Executive Order 12114. All activities associated with the proposed project in Canada are subject to sovereign control of Canada and its provinces. The Canadian National Energy Board conducted an environmental review of the Canadian portion of the Keystone XL pipeline, and approved construction of that portion of the Project. The Province of Alberta has authority over the environmental review, permitting, and regulation of extraction projects in the Western Canadian Sedimentary Basin. As a matter of policy, the Department of State has determined it will include information about environmental

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					documentation for different contexts in order to protect national security interests of the U.S. while furthering the purposes of NEPA, the Deepwater Port Act and the Marine Protection Research and Sanctuaries Act. The E.O. even if it were the only applicable measure of the Secretary's legal duty, would require assessment of the impacts outside of the us because it requires such assessment in Section 2-3 (c): • for Federal actions affecting the environment of a foreign nation which provide to that nation "a product or a physical project producing a principle product or effluent, which is prohibited or strictly regulated by Federal law in the United States because its toxic effects on the environment create a serious public health risk; • for actions which affect natural or ecological resources ... of global importance or protected by international agreement binding on the United States. The oil sands project and process is the epitome of a project producing toxic effluent and products regulated by U.S. law. Further, the migratory birds and endangered and threatened species are protected under more than one international treaty that is binding on the U.S., The Courts ultimately determine that compliance. In Environmental Defense Fund v. Massey, the United States Court of Appeals for the District of Columbia Circuit, the court wrote that the Executive Order by its own terms was sole for the pUt-[ose of establishing internal procedures for Federal agencies and that even according to the E.O. major federal actions affecting other countries may also require environmental analysis under certain circumstances. (986 F. 2d 528 (1993)». The court wrote (at 530-32) that as NEPA affects. Federal agency decisions made largely in the United States the presumption against extraterritorial application of Federal laws expressed in EEOC v. Aramco 113 L. Ed. 2d 274 (1991) in a private employment case did not generally apply to NEPA and that the CEQ is the primary arbiter of NEPA policY, while the E.O. was based on other authorities (E.O. SectionI-I declares as much.). EDF v. Massey was about the incineration of waste at an NSF research station in the Antarctic but its examination of the inapplicability of an extraterritorial presumption to NEPA concerning decisions made in: Washington is compelling.	impacts associated with extraction projects in Alberta, including about regulations and mitigation measures Alberta imposes on those projects. That information is presented in Section 3.14.4 of the EIS.
1445	34	Fitzgerald	John	Society for Conservation Biology	The E.O. did not address the duties of agencies under Section 7 of the ESA which is also without geographic limitation and at the time supported by regulations that expressly covered the full global environment. These were curtailed without statutory authority in 1986 and found to be in violation of the law by the circuit court that reached that question as discussed below. The E.O. refers to designation of reSOllrces by the President and the Secretary of State but conservation duties under these Conventions already cover many of the species affected. including but not limited to the Migratory Bird Treaties with Canada and Mexico and the Convention on Nature Protection in the Western Hemisphere. In these cases, the E.O. notes that different levels of assessment may be produced, according to the 1079 E.O., but the impacts cannot be ignored and must be the subject of reasoned analysis. Having decided to conduct a full EIS, the Secretary should not	The United States conducts its environmental reviews consistent with NEPA and in accordance with Executive Order 12114. All activities associated with the proposed project in Canada are subject to sovereign control of Canada and its provinces. The Canadian National Energy Board conducted an environmental review of the Canadian portion of the Keystone XL pipeline, and approved construction of that portion of the Project. The Province of Alberta has authority over the environmental review, permitting, and regulation of extraction projects in the Western Canadian Sedimentary Basin. As a matter of policy, the Department of State has determined it will include information about environmental impacts associated with extraction projects in Alberta, including about regulations and mitigation measures Alberta imposes on those projects. That information is presented in Section 3.14.4 of the EIS.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					now back out and fail to assess the impacts of her proposed actions in this case and as a cumulative total building upon her earlier permits for oil sands pipelines such as the one ready to deliver oil to Wisconsin in April of 2010. This EIS should describe the affects of such other pipelines, permitted, planned or likely to be planned in the foreseeable future After EDF v. Massey (1993) the CEQ issued a memorandum in 1997 addressing transboundary environmental effects of proposed agency actions The memo states, among other things, the following: "Neither NEPA nor the Council on Environmental Quality's (CEQ) regulations implementing the procedural provisions of NEPA define agencies' obligations to analyze effects of actions by administrative boundaries. Rather, the entire body of NEPA law directs federal agencies to analyze the effects of proposed actions to the extent they are reasonably foreseeable consequences of the proposed action, regardless of where those impacts might occur. Agencies must analyze farther removed in distance, but are still reasonably foreseeable, including growth-inducing effects and related effects on the ecosystem,38 as well as cumulative effects?9 Case law interpreting NEPA has reinforced the need to analyze impacts regardless of geographic boundaries within the United States .."	
1445	36	Fitzgerald	John	Society for Conservation Biology	The final point addressed by the Manitoba court involved Reclamation's argument that it had no duty to take a "hard look" at the consequences of the transfer in Canada because NEPA does "not require assessment of environmental impacts within the territory of a foreign country" and "therefore this type of evaluation is considered outside the scope of the EIS. However the court made clear that "the Council on Environmental Quality 'has determined that agencies must include analysis of reasonably foreseeable transboundary effects of proposed actions in their analysis of proposed actions in the United States. " Although Reclamation countered that the cited guidance is not binding, the court stated, "That the guidance is not binding on agencies or entitled to substantial deference by courts does not sap it of all persuasive authority. The court concluded by stating the following: NEPA requires agencies to consider reasonably foreseeable transboundary effects resulting from a major federal action taken within the United States. Accordingly, when analyzing the consequences of biota transfer [with the water] in the Hudson Bay Basin, Reclamation must include in its analysis the impact in Canada.	The United States conducts its environmental reviews consistent with NEPA and in accordance with Executive Order 12114. All activities associated with the proposed project in Canada are subject to sovereign control of Canada and its provinces. The Canadian National Energy Board conducted an environmental review of the Canadian portion of the Keystone XL pipeline, and approved construction of that portion of the Project. The Province of Alberta has authority over the environmental review, permitting, and regulation of extraction projects in the Western Canadian Sedimentary Basin. As a matter of policy, the Department of State has determined it will include information about environmental impacts associated with extraction projects in Alberta, including about regulations and mitigation measures Alberta imposes on those projects. That information is presented in Section 3.14.4 of the EIS.
1445	37	Fitzgerald	John	Society for Conservation Biology	When the pipeline is built, it will carry crude oil from the oil sands fields of Alberta Canada to the Gulf Coast of Texas and Cushing, Oklahoma. When the pipeline is built, it will enable the export of a potential capacity of 900,000 bpd of crude oil. The pipeline's capacity will in turn enable TransCanada to develop the approximately 140,000 square kilometers of Alberta's northeastern Boreal forest - roughly 21 % of the provinces - where the oil sands are located. The DEIS does not adequately address the adverse pollution effects on wildlife, ecosystems and biodiversity from this expansive level of mining and associated developments. It also does not	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information on current and future production. As noted in that response, without the proposed Project, oil sands development would continue at or above the current level until at least 2020, with or without the proposed Project. Consolidated Response GHG-2 also addresses the potential causal connection of implementation of the proposed Project and expanded oil sands production in Canada and increases in refining. Section 3.13.4 of the EIS has been revised to expand discussions of extraterritorial concerns.

					adequately address consumption impacts of mining and upgrading the oil the pipeline will transport.	
1445	38	Fitzgerald	John	Society for Conservation Biology	Adverse Effects on Wildlife, Ecosystems and Biodiversity: Degraded Water Quality and Overconsumption: Degraded Water Quality and Overconsumption as "a slow motion oil spill ... [which] may be worse than the Exxon Valdez oil Spill."S2 Fish and game animals in the Lake Athabasca area are found covered in tumors and mutations 53 One study established that arsenic levels in moose could be as much as 453 times acceptable levels 54 As stated in The Most Destructive Project on Earth, "A recent report for the Health Authority of ne downstream community - Fort Chipewyan - found serious flaws in the monitoring programs and went on to discover dangerous and rising levels of mercury and arsenic, and raised disturbing questions about polycyclic aromatic hydrocarbons (PAHs)." PAHs are toxic to embryonic fish at concentrations as low as 1 part per billion, and the levels of PAHs in the oil sands areas have been rising up to 1.4 in 2005. In addition to PAHs, a current study by Dr. Timoney comparing toxin levels from the 1970s-1990s to present day produced the following results: Mercury levels (total mercury in sediments) are as much as 98% higher in parts of the Athabasca delta over the historical medians; Dissolved arsenic levels have jumped as much as 466%; Sediment arsenic levels have increased as much as 114%; Alkylated PAH levels in sediments have risen as much as 72% above the historical means in some areas.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information on current and future production. As noted in that Consolidated Response, without the proposed Project, oil sands development would continue at or above the current level until at least 2020, with or without the proposed Project.
1445	39	Fitzgerald	John	Society for Conservation Biology	Second, the real and potential dangers of the tailing ponds cannot be underestimated. As explained in The Most Destructive Project on Earth: These tailings ponds are often built on the banks of the Athabasca River and held in place only by earthen dykes. These mines and tailings ponds are being built in a Boreal forest ecosystem dominated by water. Indeed, more than 50% of the region is water in the form of lakes and creeks, marshlands and fens and of course, groundwater. The toxic chemicals from the processing of the Oil sands are released into this wetland environment. Huge pipes disgorge toxic sludge 24/7 into open air tailings ponds, which then seeps into the rivers and groundwater systems. The toxicants are so concentrated that birds can die by landing at the tailings ponds. Some companies have hired workers to rake the dead birds off the ponds; most sites use propane cannons and scarecrows intended to frighten birds away. These tailings ponds are acutely toxic. Like all tailings ponds, they leak into the river systems. Suncor admitted in 1997 that its Tar Island Pond leaks approximately 1,600 cubic meters of toxic fluid into the Athabasca River every day. 59 The tailings ponds are growing constantly and already cover more than 50 square kilometers 60 the International Commission on Large Dams tracks major failures worldwide and finds that "Unfortunately the number of major incidents [at the oil sands tailing ponds] continues at an average of more than one a year. During the last 6 years the rate has been two per year. Therefore, in addition to these tailing ponds killing birds; polluting groundwater, mutating fish and threatening	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information on current and future production. As noted in that Consolidated Response, without the proposed Project, oil sands development would continue at or above the current level until at least 2020, with or without the proposed Project.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					complex ecosystems, a breach of only one earthen dyke could be devastating for human health, fish, wildlife, air and water quality. The longer term damage these tailing ponds will have on Canada's wildlife and ecosystems should be given a "hard look" before the State department commits to a project that has such potential to both waste and pollute.	
1445	40	Fitzgerald	John	Society for Conservation Biology	b. Potential for Serious Air Quality Consequences Environment Canada estimates that oil sands releases of benzene are now about 100 tons per year, and could grow to 500 to 800 tons per year by 2015. Benzene is a human carcinogen that can cause cancer. As a "non-threshold" 3 carcinogen, meaning any human exposure is unsafe, one can only extrapolate the danger it poses to more-vulnerable wildlife that cannot escape it and must be exposed 24 hours a day seven days a week. The combination of the above effects in the air, in the ground, and in the water could be devastating to the wildlife of the area. It is unclear why the effects to the environment of this mining project, which is the raison d'être for the pipeline, are not addressed in the DEIS.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project.
1445	42	Fitzgerald	John	Society for Conservation Biology	Extensive Water Use and Contamination: Oil sands mining operations divert and use water in many ways. Extracting a single barrel of bitumen using surface mining requires two to five 159-liter barrels of fresh water. However, only 7% of bitumen can be reached by surface mining. 70 Extracting via in situ requires 2.5 to 4 cubic meters of steam to produce 1 cubic meter of bitumen. Water for in situ operations is often taken from groundwater. Since more than four-fifths of the total bitumen reserves in Alberta are accessible only by in situ methods, demand for water will continue to grow. Further, transporting and processing the mined bitumen uses large volumes of water, most of which is sent to tailings ponds to be recycled in processing. 73 Although some water is recycled in the mining operations, tailing ponds already cover an area in excess of 170 square kilometers. 74 Water is also used to upgrade the bitumen into lighter crude synthetic oil. 75 The Pembina Institute of Canada reported the following: In 2004 Alberta produced 63 million m3 of crude bitumen and 35 million m3 of conventional oil. 76 Almost two-thirds of the bitumen production came from mining operations and the rest from in situ operations. Thus the total volume of water required for bitumen recovery is very large. For example, approved oil sands mining companies are licensed to divert 359 million m3/year from the Athabasca River. This is more than twice as much water as is used by the City of Calgary in a year.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information on current and future production. As noted in that Consolidated Response, without the proposed Project, oil sands development would continue at or above the current level until at least 2020, with or without the proposed Project.
1445	43	Fitzgerald	John	Society for Conservation Biology	The Pembina Institute further states, "There are concerns about a number of potential and realized environmental impacts associated with the use of water for in situ bitumen recovery operations, including the removal of fresh water from the watershed; the drawdown of fresh aquifers and changes in groundwater levels; depressurization of geological formations by the removal of water, resulting in decreased aquifer pressure and increased rates of recharge; the removal ("voidage") of bitumen from production zones, which can result in significant changes in the storage and flow of water in and	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information on current and future production. As noted in that Consolidated Response, without the proposed Project, oil sands development would continue at or above the current level until at least 2020, with or without the proposed Project.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					through these zones when the depleted bitumen reservoirs become groundwater aquifers; the availability of saline water; waste disposal in deep saline aquifers; and landfilling [sic] of waste from water treatment processes., The amount of water used, polluted and wasted in order to extract the oil is high. The health of the region's people, wildlife and ecosystems depend on the availability of fresh water. To use twice as much water as Calgary uses in a year would seem to warrant considerable analysis and a determination of how such losses of fresh, potable water could be, at the very least, mitigated and monitored.	
1445	44	Fitzgerald	John	Society for Conservation Biology	E. The DEIS Inadequately Examines Cumulative Effects: An EIS must address cumulative impacts, defined as "the impact on the environment which results from the incremental impact of the action when added to other past, present, and reasonably foreseeable future actions regardless of what agency ... or person undertakes such other actions. Cumulative impacts can result from individually minor but collectively significant actions taking place over a period of time. The DEIS does little in addressing the true cumulative impacts of the proposed pipeline. The only "past, present, and reasonably foreseeable future actions" examined are short-sighted at best. The few actions included were, among others: oil and natural gas wells; a water delivery project and energy development projects. However, this view is far too narrow in scope. As outlined above, the reach of this pipeline's affects go far beyond its physical bounds. For example, although the Boreal forest system is resilient to natural disturbances, disturbances from the pipeline and associated developments are likely to exceed the capacity of the system to recover. The oils sands development will likely be expanded if this large pipeline is built for several reasons and it is only the rate of that expansion that is in question. The extra pipeline capacity will likely lower the charges per unit transmitted and expand the footprint of the stripping away of vegetation. We see now direct removal in some places of standing forests and reclamation of less than 25% of the degraded lands according to the only reports we have been able to find. This alone will cause severe problems for the healthy movement and foraging of wildlife of all kinds in these areas, and the death of near 2000 ducks in tailing ponds is stark testimony to the impact of that end of the process even without the breaking open of such impoundments. Finally these have a very large climate footprint, which is likely to be measurable in microclimatic terms and that means a lot in boreal areas and in other areas where long periods of cold are the norm.	The cumulative impact assessment addresses the cumulative effects of many major linear projects in conjunction with the proposed Project. Table 3.14.1-1 lists more than 30 representative projects that were considered in the analysis. As noted in the footnote to that table, the table provides basic information on representative key projects in the vicinity of the proposed Project that are existing, under construction, proposed, planned, or reasonably foreseeable. It is not intended to provide a listing of all such projects since there are likely hundreds of existing linear and other projects that have contributed to the cumulative impacts within the area in the vicinity of the proposed Project. The cumulative impact assessments in Section 3.14 were conducted following CEQ guidance on cumulative impact analyses. As noted in Consolidated Response ENR-1, the environmental review, including preparation of this EIS, has been conducted consistent with the DOS regulations pertaining to NEPA (22 CFR Part 161) as well as the Council on Environmental Quality (CEQ) regulations for implementing NEPA (40 CFR Part 1500). As a result, DOS considers the EIS, including the assessment of cumulative impacts, to be consistent with the requirements of a NEPA environmental review. Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information on current and future production. As noted in that response, without the proposed Project, oil sands development would continue at or above the current level until at least 2020, with or without the proposed Project. Consolidated Response GHG-2 also addresses the potential causal connection of implementation of the proposed Project and expanded oil sands production in Canada and increases in refining. Section 3.13.4 of the EIS has been revised to expand discussions of extraterritorial concerns.
1445	46	Fitzgerald	John	Society for Conservation Biology	3. How much wildlife habitat can be destroyed before species or significant numbers or populations of declining species are lost?	The thresholds for cumulative habitat loss are largely unknown for most plants and animals. The goal is to minimize impacts to habitats identified as important or critical for the species in question.
1445	47	Fitzgerald	John	Society for Conservation Biology	A second example is the cumulative effects of the extensive tailing ponds, dikes and basins. It is imperative that the DEIS address questions such as: I. What is the long term commitment to the maintenance of the ponds, dikes and	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information on current and future production. As noted in that response, without the proposed Project, oil sands

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					basins;	development would continue at or above the current level until at least 2020, with or without the proposed Project. Consolidated Response GHG-2 also addresses the potential causal connection of implementation of the proposed Project and expanded oil sands production in Canada and increases in refining. Section 3.13.4 of the EIS has been revised to expand discussions of extraterritorial concerns.
1445	48	Fitzgerald	John	Society for Conservation Biology	What is the estimated life span of the ponds, dikes and basins, i.e., how will the inevitable deterioration of these structures be addressed;	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project.
1445	49	Fitzgerald	John	Society for Conservation Biology	What is the estimated cumulative loss of migratory birds to the ponds and basins; a calculation which must include, for example, consideration of the loss of nestlings when breeding pairs are killed.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project. Consolidated Response ENV-4 addresses issues related to oil sands production and migratory birds.
1445	50	Fitzgerald	John	Society for Conservation Biology	What is the estimated cumulative impact of a breach of the dikes, which will, as stated above, kill birds and fish; pollute groundwater, threaten complex ecosystems, and in short be devastating for human health, fish, wildlife, and water quality.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project.
1445	51	Fitzgerald	John	Society for Conservation Biology	A third example is the lack of cumulative impacts analysis at the other end of the pipeline - when the oil reaches its destination. Refineries will pollute in refining the oil; the resulting fuels will be transported over rail and road; and the fuel will combust and create even more GHG emissions. It is imperative that the DEIS address questions such as: I. What will be the cumulative impacts~f the Gulf Coast. refinery upgrades necessary to refine the crude;	Consolidated Response GHG-1 addresses the greenhouse gas life-cycle analyses presented in the EIS. Consolidated Response OIL-4 addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils.As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries. Similarly, use of refined products produced and sold by the Gulf Coast refineries would continue along recent trends assuming the economy is not drastically altered.
1445	52	Fitzgerald	John	Society for Conservation Biology	2. What will be the cumulative impacts of the resultant GHGO emissions produced during the actual refining of the crude;	Consolidated Response GHG-1 addresses the greenhouse gas life-cycle analyses presented in the EIS. Consolidated Response OIL-4 addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils.As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries. Similarly, use of refined products produced and sold by the Gulf Coast refineries would continue along recent trends assuming the economy is not drastically altered.
1445	56	Fitzgerald	John	Society for Conservation Biology	II. The DEIS Inadequately Examines Adverse Effects on Wildlife and Endangered Species And May Reflect a Failure Prepare a Proper Biological Assessment in Violation of Section 7 of the Endangered Species Act: The NEP A duties	Impacts to wildlife and wildlife habitats including loss and alteration are addressed in Sections 3.5, 3.6, 3.7, and 3.8 of the EIS. DOS and USFWS conducted consultations as required by Section 7 Endangered Species Act as described in

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					and the Section 7 duties of the action agencies are often considered together in a combined environmental and biological assessment. The ESA requires that action agencies consult with the wildlife agencies, in this case FWS, to determine how the action agencies can use their authorities to further the conservation of listed species (7(a)(1)) as well as to avoid jeopardizing their existence (a)(2). Section 7(a)(2) of the ESA requires the following: Each Federal agency shall, in consultation with and with the assistance of the Secretary [of the Interior], insure that any action authorized, funded, or carried out by such agency ... is not likely to jeopardize the continued existence of any endangered species or threatened species or result in the destruction or adverse modification of habitat of such species which is determined by the Secretary, after consultation as appropriate with affected States, to be critical. Emphasis added. The failure to prepare a more thorough analysis of the impact on listed species as described below in regard to just two of those affected indicates a failure to prepare a Biological Assessment worthy of the name. That is a violation of the ESA per se even if the USFWS has not insisted upon a better one.	Section 3.8. DOS considers the EIS, including assessments of potential impacts to wildlife, to be consistent with the requirements of a NEPA environmental review.
1445	57	Fitzgerald	John	Society for Conservation Biology	Effects on the Black-Footed Ferret Are Inadequately Examined. The DEIS states the following: The proposed Project would cross two counties in Montana and four counties in South Dakota with black-tail prairie dog colonies that may contain potential or remnant black-footed ferret habitat. If black-footed ferrets were present in prairie dog colonies along the Proposed Project route, direct impacts would include increased habitat loss and fragmentation from the disturbance of prairie dog colonies or complexes. Construction and operation activities from the proposed Project could cause direct mortalities resulting from collisions with construction equipment and vehicles. Other indirect impacts could include increased habitat alteration due to fragmentation, dust deposition, and spread of noxious and invasive plants; and increased disturbance due to noise and human presence. Indirect effects could also include a reduction of prairie dog colonies due to the spread of infectious diseases such as distemper and plague.	Section 3.8 of the EIS addresses potential impacts to threatened and endangered species. See also Appendix T to the EIS.
1445	58	Fitzgerald	John	Society for Conservation Biology	First, it is unclear how the DEIS drafters arrived at the conclusion that increase habitat loss and fragmentation from the prairie dog colonies - the ferrets main source of food and burrows - is not a concern. If this is the conclusion that was presented to FWS during State's mandatory consultation process and FWS did not see fit to discuss incidental take permits, then either State or FWS have fallen short of its duty to protect this endangered species.	The evaluation and preliminary determination were based on the conservation measures that would be implemented and the lack of potential occurrence of wild populations within the proposed Project area. During consultation, the U.S. Fish and Wildlife Service did not suggest that incidental take permits would be required for this species during consultation.
1445	59	Fitzgerald	John	Society for Conservation Biology	Although the maps supplied in the DEIS are somewhat misleading, it can be shown that the pipeline route will be uncomfortably close to a ferret reintroduction area in South Dakota. There is little to no discussion about this important geographic area.	The evaluation of potential Project-related impacts to the black-footed ferret is presented in Section 3.8.1.1 and in the Biological Assessment presented in Appendix T of the EIS. Proximity to reintroduced populations is also addressed in the Biological Assessment. The reintroductions in South Dakota are outside of the proposed Project right-of-way.
1445	60	Fitzgerald	John	Society for	Effects on the Whooping Crane Are Underestimated -	Neither Section 7 of the Endangered Species Act (ESA), nor

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
				Conservation Biology	Geographic Limits Are Illegal and Data Insufficient. The Whooping Crane is in danger of extinction throughout all or a significant portion of its range. The ESA statutory language requires that the action agency must consult with and comply with the Opinion of the Secretary of the Interior on fulfilling its (7)(a)(1) and(2) duties. Thus the environmental and biological assessments should include information on the impact on the Canadian and US habitats of the crane not only to fulfill the statutory scope of NEPA but of the ESA as well. Neither statute is limited in this instance, regulations or guidance to the contrary notwithstanding The Society in 2008 urged the Obama transition team for the Interior Department to restore the full geographic scope of the Section 7 regulations.	the Section 7 consultation and analysis process under the ESA's implementing regulations addresses species outside the borders of the United States. Nothing in the plain language of Section 7 indicates that it applies to transboundary effects. Section 3.14.4 of the EIS was revised to add information on endangered species and migratory bird resources shared with Canada.
1445	61	Fitzgerald	John	Society for Conservation Biology	First, the DEIS neglects to address the fact that the complete expanse of the action is within the Whooping Crane's migration route, Maps 1-2, Appendix I, pp 29-30. The Aransas Wildlife Bird Preserve population of Whooping Cranes migrates to Alberta in a northwesterly direction. According to a recent survey, there are only 263 cranes in this flock ⁹⁹ They migrate through Texas, Oklahoma, Kansas, Nebraska, South Dakota, North Dakota, eastern Montana, and eastern Manitoba before reaching Alberta. 100 The pipeline route follows this same path, and skirts designated critical habitat in Nebraska along the Platte River. However, the DEIS gives scant attention to this highly endangered crane. In fact, the DEIS states, 'The Proposed Project may affect, but is not likely to adversely affect whooping cranes. This determination is based on the rarity of the species, its status as a migrant through the Proposed Project area, and Keystone's commitment to follow recommended USFWS conservation measures.' To cite the "rarity of a species" as a reason that the Proposed Project will not affect the cranes is dubious and illogical thinking.	The evaluation for the whooping crane presented in the draft EIS was based on implementation of the conservation measures developed during the early states of consultation with the U.S. Fish and Wildlife Service. As a the consultation progresses, the assessment, conservation measures and basis for determination were revised.
1445	62	Fitzgerald	John	Society for Conservation Biology	Second, the draft Biological Assessment notes that specific location information included in the field survey reports, are not available because "specific location information is confidential. "This is unacceptable and insufficient when it comes to analyses of threatened and endangered species and the effects the proposed action might have on habitat. There are ways to protect such species and demonstrate that thorough assessments and evaluations have been done.	Specific location information for protected animals and plants was included in the survey reports submitted to U.S. Fish and Wildlife Service (USFWS) for evaluation within the Biological Assessment. These reports were withheld as confidential to protect the listed species. Public release of this information is at the discretion of the USFWS.
1445	63	Fitzgerald	John	Society for Conservation Biology	Finally, limiting the analysis of affects on the Whooping Crane to the United States is inadequate as discussed above. The extent of the oil sands mining - its destruction of wetlands, the length of time of mining; and. the poisonous tailing ponds, are but a few of issues that will greatly adversely affect the Whooping Crane in its northern Canadian habitat. Without such analysis the Department cannot have a true and complete picture of the threats to the Whooping Crane.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information on current and future production. As noted in that response, without the proposed Project, oil sands development would continue at or above the current level until at least 2020, with or without the proposed Project. Section 3.14.4 of the EIS was revised to add information on the environmental effects of oil sands development. Neither Section 7 of the Endangered Species Act (ESA), nor the Section 7 consultation and analysis process under the ESA's implementing regulations addresses species outside the borders of the United States. Nothing in the plain language of Section 7 of the ESA indicates that it applies to transboundary

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
						effects. Section 3.14.4 of the EIS was revised to add information on endangered species and migratory bird resources shared with Canada.
1445	64	Fitzgerald	John	Society for Conservation Biology	III. Approval of the Project Would Be Arbitrary and Capricious Under the Administrative Procedures Act Because the Project Is Likely to Be In Violation of the Migratory Bird Treaty Act: The APA governs judicial review of agency action. A court shall "hold unlawful and set aside agency action, findings, and conclusions found to be arbitrary, capricious, an abuse of discretion, or otherwise not in accordance with law." Said another way, an agency action will be set aside if it breaks the law. An agency action that breaks the law, such as the Migratory Bird Treaty Act ("MBT A"), is vulnerable to citizen suit seeking to enforce the no-take requirement of the MBTA using the citizen suit provisions of the APA. As stated in Fund for Animals v. Norton: Although "the MBTA provides no private cause of action against the United States government to enforce its provisions, ... the law on his Circuit is clear: a plaintiff may sue a federal agency under the APA for violations of the MBTA." Center for Biological Diversity v. Pirie, 191 F.Supp.2d at 175; see also Hill v. Norton, 275 F.3d at 103;104 Humane Society of the United States v. Glickman, 217 F.3d 882 (D.C.Cir.2000) (holding that federal agency action in violation of MBTA violates the "otherwise not in accordance with law" provision of the APA). The APA requires courts to set aside agency action for judicial review, the Secretary's disputed failure to include the mute swan on the List of Migratory Birds can only be challenged by Hill under the APA." that is "arbitrary, capricious, an abuse of discretion, or otherwise not in accordance with the law." 5 U.S.C. § 706 (2003). The MBTA prohibits the "take" of migratory birds, their nests or eggs, except as permitted by regulation. 106 The statute's prohibition states that taking is unlawful "at any time, by any means or in any manner. As the DEIS itself states, "Destruction or disturbance of a migratory bird nest that results in the loss of eggs or young is a violation of the MBTA.	Keystone is coordinating with USFWS to minimize potential incidental take of migratory birds. The Migratory Bird Treaty Act (MBTA) has no provision to allow unauthorized take of migratory birds. USFWS recognizes, however, that some birds could be killed during construction and operation of energy infrastructure even if all know reasonable, prudent, and effective measures to protect birds are used. Keystone would work with USFWS to identify and implement effective steps to avoid take of migratory birds and minimize loss, destruction, and degradation of migratory bird habitat. USFWS Office of Law Enforcement focuses its resources on investigating and prosecuting individuals and companies that take migratory birds without identifying and implementing all reasonable, prudent and effective measures to avoid take.
399	6	Fix	Mark		The proposal to change pressures in rural areas only causes more problems. To change pressures this will require additional compressor stations, which are very noisy and can cause disturbance in these rural quiet areas.	The proposed Project is a crude oil pipeline that includes pump stations, not compressor stations. Keystone has withdrawn its application for a Special Permit as described in Consolidated Response REG-1. Consolidated Response RUR-1 addresses concerns regarding potential changes to rural lifestyles. Consolidated Response NOI-1 addresses issues related to noise from pump stations.
399	7	Fix	Mark		They [the compressor stations] may also affect the wildlife. Sage Hens are close to being listed and building a compressor station near their strutting areas or removing sagebrush for the station could affect their numbers. The pipeline itself could remove sagebrush that is critical to the survival of the Sage Grouse. The DEIS did not adequately estimate the amount of sage grouse habit that this pipeline will cross nor the potential effects.	The proposed Project is a crude oil pipeline that includes pump stations, not compressor stations. Consolidated Response NOI-1 addresses issues related to noise from pump stations. Additional surveys and habitat assessments were completed after the draft EIS was issued and that information is included in the final EIS. Sections 3.6 and 3.8 address issues regarding wildlife, and threatened, endangered and sensitive species that have the potential to occur along the proposed Project route.
399	8	Fix	Mark		The compressor, or "pumping" stations will require coal fired	The proposed Project is a crude oil pipeline that includes

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					electricity, natural gas or diesel to run them. How will the fuel be supplied? Will this require additional pipelines or transmission lines? Will there be roads required to haul diesel to the compressor stations? The DEIS glosses over the additional infrastructure which will be needed, and completely omits as far as I can tell the additional energy demand that pumping will require.	pump stations, not compressor stations. Consolidated Response ELE-1 addresses issues regarding the potential need for additional energy sources to provide electrical power for the pump stations and mainline valves. During operation, the pump stations would consume at least as much electrical power as other customers currently use in the area. That could result in long-term stability of the usage rates of electricity and increased profits to local electric co-ops. Consolidated Response RDS-1 addresses concerns about the condition of roadways and roadway structures associated with construction and operation of the proposed Project as well as traffic safety measures that would be incorporated into the Project.
399	9	Fix	Mark		The energy required to pump the tar sands crude is an environmental issue too large to be ignored and should be analyzed within this DEIS.	Consolidated Response ELE-1 addresses issues regarding the potential need for additional energy sources to provide electrical power for the pump stations and mainline valves. During operation, the pump stations would consume at least as much electrical power as other customers currently use in the area. That could result in long-term stability of the usage rates of electricity and increased profits to local electric co-ops.
399	10	Fix	Mark		The Emergency Response Plan is incomplete. How will the pipeline be monitored? Will the line be flown daily to monitor for leaks? How quickly will leaks be stopped? Is there a cleanup crew stationed nearby so that cleanup can take place quickly? How will the landowners be compensated for future damages from spills?	Consolidated Response RES-1 addresses issues related to preparation and review of emergency response plans for the proposed Project. Information on leak detection and pipeline monitoring and inspection is presented in Sections 2.4 and 3.13.5.5 of the EIS. Compensation associated with a spill from the proposed Project is addressed in Consolidated Response LIA-1.
399	12	Fix	Mark		Citizens deserve the ability to comment on a more fully developed Emergency Response Plan	Consolidated Response RES-1 addresses issues related to preparation and review of emergency response plans for the proposed Project.
399	14	Fix	Mark		Will the pipeline have a public fiber-optic lines installed in the easement? The landowners must be paid for each additional easement. If power lines are required to run monitoring equipment or provide power for compressor stations, the landowner must also be paid for those easements. Will eminent domain be used to obtain easements for this pipeline? A proof of need should be in place before eminent domain is enacted, but the DEIS glosses over need and just declares that there is need.	Public fiber optic lines are not a part of the proposed Project and we are not aware of any plans to place them in the easement. As noted in Consolidated Response EAS-2, state laws dictate under what circumstances eminent domain may be used and define the eminent domain process within the state. DOS has no legal authority in the easement negotiations or in eminent domain proceedings. We disagree with the commentor's suggestion that the EIS simply states that there is a need for the Project. Consolidated Response P&N-1 addresses the need that the Project has been proposed to meet, including information on the thorough and independent analysis of need that was conducted.
399	15	Fix	Mark		There needs to be an actual economic analysis of demand for this type of fuel versus domestic oil and renewable energy alternatives such as wind farms to meet demand. Also existing pipeline capacity should be analyzed, as Keystone 1 still is not full. Why is this pipeline required? Are there no refinery facilities available in Canada? Wouldn't it make sense to refine the tar sands in Canada and then pump refined products through the pipeline instead of the crude product? Are there regulations in Canada that don't allow them to refine this	Consolidated Response P&N-1 addresses the need that the Project has been proposed to meet. Consolidated Response ALT-2 addresses the use of alternative technologies and alternative energy sources. Consolidated Response P&N-8 addresses issues related to shipping Canadian crude oil to refineries that are closer to the source of oil. Consolidated Response P&N-3 addresses issues related to emissions and discharges from refineries.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					product? What will be done with the refinery byproducts that cannot be used in the United States? Will they be pumped back to Canada for disposal? Are Canadian regulations stricter than United States regulations regarding refining of this product? It seems that Canada may be shifting the environmental problems associated with refining the tar sands to the United States.	
399	16	Fix	Mark		This alternative, that of no-pipeline, was not fully analyzed in the draft EIS and needs to be.	Section 4.1 of the EIS has been revised to include updated information. DOS considers the analysis presented of the No Action Alternative in Section 4.1 to be in compliance with the requirements of the NEPA environmental review process.
399	17	Fix	Mark		Will United States subsidies be used to build this pipeline? What is the economic viability of TransCanada considering a downturn in the world economy? I understand that there may be an on ramp for oil produced in the United States to transport oil to Texas.	TransCanada Keystone Pipeline, LP is a limited partnership under Delaware law. Keystone would finance the entire costs of the Project and would not receive governmental subsidies. See Consolidated Response P&N-1 regarding U.S. demand for the Alberta crude oil. Consolidated Response ALT-3 addresses issues related to a potential pipeline connection to the proposed Project in Montana.
399	18	Fix	Mark		Since United States products are also proposed in this pipeline, the pipeline must be built to United States standards, not Canadian standards. Will the construction of the pipeline be done to United States specifications? Will all welds be certified by United States inspectors?	The portion of the proposed Project within the U.S. would be under the jurisdiction of U.S. federal and state agencies, and Keystone would be required to comply with U.S. pipeline regulatory requirements. Consolidated Response SAF-1 describes the regulatory requirements of the Pipeline and Hazardous Materials Safety Administration (PHMSA) that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project. As noted in Section 2.3.2.4, all welds would be accomplished and inspected in accordance with PHMSA requirements in 49 CFR 195.214 through 195.234 and with the welding requirements in Special Conditions 4, 5, 6, 10, 12, 18, and 20.
399	19	Fix	Mark		Will river crossings be built to United States specifications? Will additional refineries be built along this pipeline? Again, the total life cycle needs to be addressed. What are the limitations of this pipeline? Can natural gas be transported in it? Will it be used to transport carbon dioxide? Will flow be utilized both directions? Will water be transported in this pipeline? The EIS needs to consider many more issues before it is complete.	As described in Section 3.3 and in Consolidated Response WAT-1, most streams would be crossed using the open-cut method. Less than 40 rivers would be crossed using the horizontal directional drilling method. As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries. Consolidated Response GHG-1 addresses the greenhouse gas life-cycle analyses presented in the EIS.
399	20	Fix	Mark		The EIS must protect the rural farmers and ranchers as well as the cities.	Consolidated Responses FRM-1 addresses potential impacts to ranch and farmland, Consolidated Response FRM-2 addresses potential impacts to irrigated cropland, and Consolidated Response LIA-1 addresses Keystone's liability if there is a spill of hazardous materials or fuel during construction and from a spill of crude oil from the Project. .
399	6	Fix	Mark		The proposal to change pressures in rural areas only causes more problems. To change pressures this will require additional compressor stations, which are very noisy and can cause disturbance in these rural quiet areas.	Keystone has withdrawn its application for a Special Permit as described in Consolidated Response REG-1. Consolidated Response RUR-1 addresses concerns regarding potential changes to rural lifestyles.
399	8	Fix	Mark		The compressor, or "pumping" stations will require coal fired	Consolidated Response ELE-1 addresses issues regarding

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					electricity, natural gas or diesel to run them. How will the fuel be supplied? Will this require additional pipelines or transmission lines? Will there be roads required to haul diesel to the compressor stations? The DEIS glosses over the additional infrastructure which will be needed, and completely omits as far as I can tell the additional energy demand that pumping will require.	the potential need for additional energy sources to provide electrical power for the pump stations and mainline valves. During operation, the pump stations would consume at least as much electrical power as other customers currently use in the area. That could result in long-term stability of the usage rates of electricity and increased profits to local electric co-ops. Consolidated Response RDS-1 addresses concerns about the condition of roadways and roadway structures associated with construction and operation of the proposed Project as well as traffic safety measures that would be incorporated into the Project.
399	9	Fix	Mark		The energy required to pump the tar sands crude is an environmental issue too large to be ignored and should be analyzed within this DEIS.	Consolidated Response ELE-1 addresses issues regarding the potential need for additional energy sources to provide electrical power for the pump stations and mainline valves. During operation, the pump stations would consume at least as much electrical power as other customers currently use in the area. That could result in long-term stability of the usage rates of electricity and increased profits to local electric co-ops.
399	19	Fix	Mark		Will river crossings be built to United States specifications? Will additional refineries be built along this pipeline? Again, the total life cycle needs to be addressed. What are the limitations of this pipeline? Can natural gas be transported in it? Will it be used to transport carbon dioxide? Will flow be utilized both directions? Will water be transported in this pipeline? The EIS needs to consider many more issues before it is complete.	Consolidated Response WAT-1 addresses concerns related to river crossings. Consolidated Response P&N-1 addresses the purpose and need of the proposed Project. Consolidated Response GHG-1 addresses the greenhouse gas life-cycle analyses presented in the EIS. As noted in Consolidated Response ENR-1, the environmental review, including preparation of this EIS, has been conducted consistent with the DOS regulations pertaining to NEPA (22 CFR Part 161) as well as the Council on Environmental Quality (CEQ) regulations for implementing NEPA (40 CFR Part 1500). As a result, DOS considers the EIS to be consistent with the requirements of a NEPA environmental review.
1104	1	Fletcher	Peggy		I am writing to express my opposition to the proposed Keystone XL Pipeline route through Nebraska and the other states [that have the Ogallala Aquifer.]	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. Consolidated Response ALT-1 addresses potential alternative routes, including routes that would avoid much of the Northern High Plains Aquifer system.
1104	3	Fletcher	Peggy		We have to much to loose if an accident would happen ... We must remember the impact beyond our generation but think of the future...Thank you for considering my opinion.	The commenter's opinion is noted.
1553	26	Flippen	Kenneth	Sierra Club	in all of this area that is out of attainment, by adding so much oil to the system that's already being refined, and adding a very much a dirtier form of oil, the amount of pollutants that are going to be released to produce the same barrel of oil versus conventional oil -we all know here in Texas, because we've done a lot of that - it's going to create so much more of it.	As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries. Consolidated Response OIL-4 also addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils.
1553	28	Flippen	Kenneth	Sierra Club	why we would bring this very dirty oil down here to refine it in a place that we have the least ability to absorb that impact in our air.	Consolidated Response P&N-1 addresses the need that the Project has been proposed to meet. As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
						not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries. Consolidated Response OIL-4 also addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils.
1553	29	Flippen	Kenneth	Sierra Club	There's a lot of lakes and rivers in East Texas. And this pipeline is going to cross 32 of them. It's running over so much water, if it does break the chances of it breaking in an aquifer, in a river, a lake.	Section 3.13 of the EIS addresses reliability and safety issues, including calculations of the probability of a spill from the proposed Project and the potential environmental impacts associated with spills.
1553	30	Flippen	Kenneth	Sierra Club	There are so many areas along this corridor in Texas, whether it's recreational or commercial fishing, or it's just a recreational area that tons of people go to. There are a lot of these places in here. The chance that those economies could be affected by this pipeline [breaking], such a negative impact, that I think that, that should also be a balancing factor.	Section 3.13 of the EIS addresses reliability and safety issues, including calculations of the probability of a spill from the proposed Project and the potential environmental impacts associated with spills.
1553	31	Flippen	Kenneth	Sierra Club	the larger implications of how we are consuming and producing energy in this country. And again, to build a pipeline is a big process in and of itself. But there are good alternatives, and to build a pipeline that is really only being built because the lack of ability or will to build a refinery somewhere closer to where this is being produced, to do that, and to spend all of those resources, those billions of dollars, those resources could be used to develop and to strengthen the alternative energy sources that are already starting to show life and to show opportunity. And so I think it's just a missed priority to build a pipeline and to spend all that expense when in the long run not only could this be environmentally damaging, but from what I understand because it's such a difficult process, and of course having to build a big pipeline, the more difficult process of refining, the amount of water that has to be used to clean this stuff. All of those things means that the cost is higher. And if we are able to turn that curve on the cost of energy, ultimately it may not be economically competitive. And then we are going to have a pipeline there at some point that will be abandoned, because it won't be an economically viable option compared to like local production of oil and things like that.	Consolidated Response P&N-8 addresses issues related to shipping Canadian crude oil to refineries that are closer to the source of oil. Consolidated Response P&N-5 addresses issues related to investments in other technologies. As noted Consolidated Response P&N-1, the project has been proposed to meet a need for heavy crude oil in the Gulf Coast area and will replace declining supplies of heavy crude oil from Mexico and Venezuela. That need cannot be met by existing sources of oil in the U.S.
1559	15	Flippin	Ken		No meeting in Houston but Houston is one of the points where the pipeline ends up. Air quality in Houston is a big issue.	As noted in Consolidated Response CMT-4, a public comment meeting on the draft EIS was held in Channelview, Texas, which is adjacent to Houston. As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries. Consolidated Response OIL-4 also addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils.
1559	16	Flippin	Ken		Need a hearing in Houston.	Consolidated Response CMT-2 addresses issues related to comment meetings on the draft EIS and requests for additional public involvement.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
1559	19	Flippin	Ken		Concerned that TransCanada requested for an exemption for a safe requirement to notify affected landowners about spills less than 5 barrels. Request was denied, but gives concern that TransCanada is trying to avoid accountability to the landowners if there is a spill.	TransCanada is required to report spills of 5 gallons or more to the National Response Center and the Pipeline and Hazardous Materials Safety Administration.
1559	20	Flippin	Ken		Concerned that DEIS states that "in Texas, the project area contains several geological faults. Project in Northeast Texas crosses a zone where minor seismic risk exists."	Consolidated Response GEO-2 addresses potential seismic hazards.
1559	21	Flippin	Ken		According to DEIS, at peak the pipeline will only produce 5-6 thousand jobs and 4500-5100 will be nonlocal. Is the risk of the pipeline worth the 5-600 jobs that it will create for the local economy?	Consolidated Response ECO-1 addresses potential socioeconomic impacts associated with construction and normal operation of the proposed Project.
1559	16	Flippin	Ken		Need a hearing in Houston.	Consolidated Response CMT-4 addresses requests for DEIS comment meetings Near Houston, Texas and in Washington, D.C.
435	1	Flittner	Earl		However, a spill from a pipe line which crosses the Ogallala Aquifer in Nebraska would be truly catastrophic disaster. The aquifer is beneath the Sandhills of Nebraska. The soil there is so porous that any oil leakage would rapidly reach the fresh water below. This soil is so thin that most of it has never been cultivated. It is held in place by prairie grasses. If the pipe line must be constructed, please route it away from this fragile area. The aquifer is one of the great natural resources of the nation, and must be protected.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. Consolidated Response ALT-1 addresses potential alternative routes, including routes that would avoid much of the Northern High Plains Aquifer system. Issues related to the Sand Hills area are addressed in Consolidated Response ERO-1.
435	2	Flittner	Earl		There seems to be the idea that an oil spill on land would be simple to clean up as opposed to the current disaster in the Gulf of Mexico. This may be true in most cases.	As described in Consolidated Response GLF-1, the risks associated with the proposed Project are substantially different from those associated with the BP Deepwater Horizon Project.
435	3	Flittner	Earl		The aquifer is beneath the Sandhills of Nebraska. The soil there is so porous that any oil leakage would rapidly reach the fresh water below. This soil is so thin that most of it has never been cultivated. It is held in place by prairie grasses. If the pipe line must be constructed, please route it away from this fragile area. The aquifer is one of the great natural resources of the nation, and must be protected.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. Issues related to the Sand Hills area are addressed in Consolidated Response ERO-1. Consolidated Response AQF-3 provides information on hypothetical spills from the Project over two areas of the Northern High Plains Aquifer System and also addresses response actions. Consolidated Response ALT-1 addresses potential alternative routes, including routes that would avoid much of the Northern High Plains Aquifer system.
810	1	Floyd	Lindsay		I am opposed to the suggestion. More research must be done to determine health, social, economic, and environmental impacts prior to ratification!	The impacts associated with implementation of the proposed Project are addressed in Section 3.0 of the EIS. As noted in that section, construction and normal operation the proposed Project would not result in significant environmental impacts. As noted in Consolidated Response ENR-1, the environmental review, including preparation of this EIS, has been conducted consistent with the DOS regulations pertaining to NEPA (22 CFR Part 161) as well as the Council on Environmental Quality (CEQ) regulations for implementing NEPA (40 CFR Part 1500). As a result, DOS considers the EIS to be in full compliance with the requirements of a NEPA environmental review.
1544	209	Flukinger	Scott		The fact of the matter is, BP, TransCanada, thousands and thousands of second and third and fourth tier suppliers, the multinational corporations, enable us to live the way of life.	The commenter's opinion is noted.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
1544	210	Flukinger	Scott		Praises the draft EIS process for allowing people to vent their opinions, urges better representation in Channelview.	Comment acknowledged.
1544	211	Flukinger	Scott		Canada is the most faithful military ally and biggest trading partner of the United States. Shares our values and laws, have a similar environmental regulatory policy.	Comment acknowledged.
1544	212	Flukinger	Scott		Until we can come up with renewal (sic) solutions to these problems, folks, that car that we're all going to be driving tomorrow is going to have to run on fossil energy. And for us to continue our lives and make that transition to a renewable future we're going to have a secure supply of fossil energy.	Consolidated Response ALT-2 addresses the use of alternative technologies, alternative energy sources, and conservation of energy.
1544	213	Flukinger	Scott		That's a gigantic health impact, the loss of Americans protecting unsafe oil. I'll take Canadian oil any day.	Comment acknowledged.
697	1	Fornall	Cris	Northern Plains Pipeline Group	I live on the proposed Keystone XL Pipeline route. I have a few points to make about the draft environmental impact statement that I hope will be seriously addressed in the final EIS. First, according to the EIS, paved roads are not likely to require improvement or maintenance prior to or during the construction, and gravel roads and dirt roads may require maintenance. Which is stated in the EIS reference 3.9-33 & appendix T pages 2-16. Clearly no research was done as to the road situation during and after construction of Keystone because had this research been done, the DOS would have learned road damage horror stories. The EIS needs to accurately place responsibility for all of the likely damage in the hands of Trans Canada. Otherwise the counties and taxpayers will be left with ruined roads and the bill to fix them. Secondly, I transport my two young children 25 miles on these gravel roads the construction crew of the pipeline will also be traveling every day to and from school. I fear for the safety of my family and their lives. The road measures 30 feet. On average 24 feet with very soft shoulders. I measured some heavy machinery that measured 16 feet wide. My pick up measures 7 feet. This only leaves 1-7 feet clearance between moving vehicles. There are also blind corners on the road I will be transporting my children. The crew of Trans Canada will also be traveling along these same narrow curves with the heavy machinery and there is not enough clearance for the on coming traffic especially with the wide turns they will need to take to get around the corners. I think you would fear for the safety of your family if they were living on these gravel roads as well. Slow moving flaggers are a MUST to be driving ahead of the loaded semi trucks at all times. It is scary passing regular vehicles that are not loaded and are unfamiliar with these blind spots known as the Cashman Hills and the Fornall Hills. These are very dangerous hills. This road is essentially a one vehicle road. Also because of all the extra traffic on the roads, the roads will become very rough. This in return will be causing extra wear and tear on our vehicles due to the construction of the pipeline if Trans Canada does not keep these roads well maintained during and after the construction of this pipeline.	Consolidated Response RDS-1 addresses concerns about the condition of roadways and roadway structures associated with construction and operation of the proposed Project as well as traffic safety measures that would be incorporated into the Project.
1552	1	Fornall	Scott		According to the EIS, the main roads are not likely to require improvement or maintenance prior to or during construction. Gravel and dirt roads may require maintenance, as stated in	Consolidated Response RDS-1 addresses concerns about the condition of roadways and roadway structures associated with construction and operation of the proposed Project as well as

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					the EIS under Appendix T, page 2.3-16. Clearly the research was not done considering the road situation during and after the construction of Keystone I, because there are road damage horror stories.	traffic safety measures that would be incorporated into the Project.
1552	2	Fornall	Scott		The EIS needs to accurately place responsibility for all likely road damage in the hands of TransCanada. Otherwise, the taxpayers will be left to fix the roads.	Consolidated Response RDS-1 addresses concerns about the condition of roadways and roadway structures associated with construction and operation of the proposed Project. As noted in that response, Keystone would be responsible for roadway improvements and restoration if damage occurs due to Project-related activities.
1552	3	Fornall	Scott		I fear for the safety of my family, as my wife and I transport my two young children to and from school on the gravel roads the construction and pipeline crew will be using. The road measures on average 24 feet with very soft shoulders. Heavy construction machinery can measure 16 feet wide and our pickup measures up to 7 feet wide; this only leaves 1 to 7 feet of clearance between moving vehicles.	Consolidated Response RDS-1 addresses concerns about the condition of roadways and roadway structures associated with construction and operation of the proposed Project as well as traffic safety measures that would be incorporated into the Project.
1552	4	Fornall	Scott		There are a lot of blind spots on Road 229. Slow moving flaggers driving ahead of these loaded semis are a must.	Consolidated Response RDS-1 addresses traffic safety measures that would be incorporated into the proposed Project.
1552	5	Fornall	Scott		It is very scary passing regular, non-loaded vehicles that are unfamiliar with these blind spots in the Cashman Hills and also the Fornall Hills. These are very dangerous roads as they are even narrower than the regular roads. The Cashman Road is only 21 feet in places. Through the Fornall Hills it's only 18 feet. These are essentially one-vehicle roads.	Consolidated Response RDS-1 addresses concerns about the condition of roadways and roadway structures associated with construction and operation of the proposed Project as well as traffic safety measures that would be incorporated into the Project.
1552	6	Fornall	Scott		All the extra traffic on these roads will cause them to become very rough. This will cause extra wear and tear on our vehicles if TransCanada does not keep these roads well maintained during and after the construction of the pipeline.	Consolidated Response RDS-1 addresses concerns about the condition of roadways and roadway structures associated with construction and operation of the proposed Project. As noted in that response, Keystone would be responsible for roadway improvements and restoration if damage occurs due to Project-related activities.
1153	1	Forsman	Wilt&Eileen		Please find another way for the pipeline. Do not go across the sandhills.	Alternative routes are addressed in Section 4.3 of the EIS. Issues related to the Sand Hills area are addressed in Consolidated Response ERO-1.
1443	1	Fortenberry	Jeff	US Congress	As you know, the proposed pipeline would traverse Nebraska. Recently, I have heard from many of my constituents who have raised concerns about this project and its potential impact on the Sandhills area in Nebraska and the Ogallala Aquifer. These constituents are troubled about several aspects of the project, including the proposal to use thinner pipes carrying oil at higher pressures than usual. They are also concerned about the danger posed to the aquifer in the event of a pipeline leak. The Sandhills and the Ogallala Aquifer are unique resources that deserve a high level of protection, I am requesting that you take into account the comments of those who expressed an interest in protecting these special areas.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. Keystone has withdrawn its application for a Special Permit as described in Consolidated Response REG-1.
179	1	Foster	Eric		I am writing to express my opposition to the route TransCanada has chosen for its Keystone XL Pipeline. As a Nebraska resident, I am dismayed that anyone would think it's safe to route the pipeline directly over the Ogallala Aquifer,	Consolidated Response ALT-1 addresses potential alternative routes, including routes that would avoid much of the Northern High Plains Aquifer system.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					where the state gets a large share of its drinking and irrigation water.	
179	2	Foster	Eric		As if the Gulf oil spill weren't enough evidence of the catastrophic nature of oil spills, now we have a situation in which an underground Chevron pipeline in Salt Lake City leaked up to 33,000 gallons of oil into a local creek. It fouled the creek and a pond and coated birds and wildlife with oil. Emergency crews narrowly stopped it from reaching the Great Salt Lake. At the time of this writing, the Associated Press is reporting that the hole in the pipe was only the size of a quarter and caused by a fence pole puncturing through it. "We think of this as a one-in-a-million event," the manager of the refinery is quoted as saying. And so when I hear TransCanada's assurances that all will be well with the Keystone XL Pipeline positioned immediately over the Ogallala Aquifer in Nebraska, that's what I think - they are failing to take into account the "one-in-a-million" freak accidents that could potentially happen. An accident similar to the one in Utah would ruin the state's greatest natural resource in an very short period of time.	Consolidated Responses OIL-1 and OIL-2 address the likelihood of large spills from the Project. The low likelihood but high volume release of oil for whatever reason is discussed in Section 3.13.4.2 of the EIS. Section 3.13 of the EIS was revised to update spill incident statistics and projections, provide additional information on composition of the crude oil that would be transported by the proposed Project, additional information on potential impacts to the Northern High Plains Aquifer system, and other key information. This section addresses reliability and safety issues, including calculations of the probability of a spill from the proposed Project and the potential environmental impacts associated with spills. Issues related to the Northern High Plains Aquifer System are addressed in Consolidated Responses AQF-1 through AQF-4. Consolidated Response AQF-3 provides information on hypothetical spills from the Project over two areas of the Northern High Plains Aquifer System.
179	3	Foster	Eric		In the unfortunate event of a breach in the Keystone XL Pipeline - even a quarter-sized one - the results would be disastrous not only for Nebraska, but for the entire Midwestern region. Nor do I buy the argument that rerouting the pipeline to a safer area would be cost prohibitive for TransCanada. Oil companies make billions of dollars a year in profits. Going out of their way to protect the aquifer would be like a penny in an ocean of money for them.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. Consolidated Response ALT-1 addresses potential alternative routes, including routes that would avoid much of the Northern High Plains Aquifer system. Consolidated Response OIL-1 addresses the likelihood of spills from the Project.
473	1	Foster-Rodriguez	Starr		The longer the Gulf Oil Crisis continues, the less trusting I am of any pipeline. The Keystone XL Pipeline is too close to the Ogallala Aquifer. Please do not let it go near the Ogallala Aquifer. I don't know the other viable solutions but this is not one we can afford to risk!	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. Consolidated Response ALT-1 addresses potential alternative routes, including routes that would avoid much of the Northern High Plains Aquifer system. As described in Consolidated Response GLF-1, the risks associated with the proposed Project are substantially different from those associated with the BP Deepwater Horizon Project.
1126	2	Fousse	Linda		now Nebraskans are being told the proposed pipeline through our aquifer will be "safe" too.	As described in Consolidated Response SAF-1, the Pipeline and Hazardous Materials Safety Administration (PHMSA) has regulatory requirements that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project in a manner that protects the health and safety of the public and the environment. In addition, PHMSA developed 57 Project-specific Special Conditions that Keystone has agreed to implement. Incorporation of those conditions would result in a Project that would have a degree of safety over any other typically constructed domestic oil pipeline system under current code and a degree of safety along the entire length of the pipeline system similar to that which is required in HCAs as defined in 49 CFR 195.450. Section 3.13 of the EIS addresses reliability and safety issues, including calculations of the probability of a spill from the Project.
1126	4	Fousse	Linda		In the event of even a small leak, the likelihood of it being	Issues related to the Northern High Plains Aquifer System are

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					discovered before doing irreversible damage is very, very small. Nebraska CANNOT risk its aquifer for oil not now, NOT EVER!!!! Nebraska will literally die if it's aquifer is spoiled!!!	addressed in Consolidated Responses AQF-1 through AQF-4. Consolidated Response AQF-3 provides information on hypothetical spills from the Project over two areas of the Northern High Plains Aquifer System. Consolidated Response OIL-3 addresses the detection of small leaks. As noted in those responses, Nebraska would not be devastated if a spill from the Project entered the aquifer.
1148	1	Francke	Eleanor		The Ogallala Aquifer should not be placed in risk by a foreign government application.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
1148	2	Francke	Eleanor		Do not permit it.	Comment acknowledged.
1148	3	Francke	Eleanor		Especially do not approve the special permit/waiver of the standard regulations as the aquifer needs all the protection these regulations provide.	Keystone has withdrawn its application for a Special Permit as described in Consolidated Response REG-1. As described in Consolidated Response SAF-1, the Pipeline and Hazardous Materials Safety Administration (PHMSA) has regulatory requirements that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project. In addition, PHMSA developed 57 Project-specific Special Conditions that Keystone has agreed to implement. Incorporation of those conditions would result in a Project that would have a degree of safety over any other typically constructed domestic oil pipeline system under current code and a degree of safety along the entire length of the pipeline system similar to that which is required in HCAs as defined in 49 CFR 195.450.
1290	1	Franssen	Lonny		XL doesn't want to assume responsibility for any damages or any pipeline leaks.	Consolidated Response EAS-2 addresses issues related to easement negotiations, which typically include clauses regarding damages. Consolidated Response LIA-1 addresses Keystone's liability if there is a spill of hazardous materials or fuel during construction or a spill of crude oil from the proposed Project.
1290	3	Franssen	Lonny		They have asked about land to use for parking equipment and supplies. That would ruin use of that ground for an undetermined length of time from sod destruction and compaction. The damage to local roads would be extensive, costing counties huge amounts to repair or rebuild.	Soil compaction and the methods Keystone would use to restore compacted areas are addressed in Section 3.2.2.1 of the EIS. Consolidated Response RDS-1 addresses concerns about the condition of roadways and roadway structures associated with construction and operation of the proposed Project as well as traffic safety measures that would be incorporated into the Project. As noted in that response, Keystone would be responsible for roadway improvements and restoration if damage occurs due to Project-related activities.
1290	4	Franssen	Lonny		XL doesn't want to be responsible for road damage either.	Consolidated Response RDS-1 addresses concerns about the condition of roadways and roadway structures associated with construction and operation of the proposed Project. As noted in that response, Keystone would be responsible for roadway improvements and restoration if damage occurs due to Project-related activities.
1290	5	Franssen	Lonny		The Nebraska citizens are concerned about the aquifer we have. XL is trying to tap into our water and when leaks occur in pipeline the contamination occurring.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
1290	6	Franssen	Lonny		XL is not wanting to pay what we should have for loss of use and damages.	Consolidated Response EAS-2 addresses issues related to easement negotiations. As noted in that response, DOS has no legal authority in the easement negotiation process.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
1290	7	Franssen	Lonny		I haven't been able to get them to move pipeline to create less damage and loss of use on my property as of yet.	Consolidated Response PVT-2 addresses concerns regarding the proximity of the proposed project to existing structures and facilities and routing concerns across private property.
1291	2	Franssen	Mershon		Also pipeline going through hills that are sandy. Blowouts will form. Take 20-30 years minimum to develop sod in hills.	Identification of sensitive environments crossed by the proposed Project is discussed in Consolidated Response ENV-1 and ENV-3. Issues related to the Sand Hills area are addressed in Consolidated Response ERO-1.
1291	3	Franssen	Mershon		Concerned about damage to local roads with heavy machinery and trucks. Cost to county to repair and replace them.	Consolidated Response RDS-1 addresses concerns about the condition of roadways and roadway structures associated with construction and operation of the proposed Project. As noted in that response, Keystone would be responsible for roadway improvements and restoration if damage occurs due to Project-related activities.
1291	4	Franssen	Mershon		Keystone is not wanting to be liable for pipeline leaks. Pipeline is going across the country's valuable aquifer, the leaks would contaminate our water supply.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
1291	5	Franssen	Mershon		Since we have a high water table across much of Nebraska, the pipeline will have to be weighted to hold it down, as it will be forced up when water table rises.	The proposed Project would be buried by a minimum of 4 feet of soil. A shallow or fluctuating water table would not affect the burial of the proposed Project. As noted in Section 2.3.3, at some locations the proposed pipeline would be installed with a concrete coating or with set-on weights to provide negative buoyancy.
1291	6	Franssen	Mershon		Also heaving takes place in winter. Even some of our highways are adversely affected in the spring.	Consolidated Response RDS-1 addresses concerns about the condition of roadways and roadway structures associated with construction and operation of the proposed Project.
2e	2	Franssen	Lonny		They are dividing small pastures and going up through Sandy Hills. It takes up to 30+ years to re-establish sod in sand. We would lose that many years of use at least.	Identification of sensitive environments crossed by the proposed Project is discussed in Consolidated Response ENV-1 and ENV-3. Issues related to the Sand Hills area are addressed in Consolidated Response ERO-1.
67	1	Freeman	Donna		Allowing the Keystone Pipeline to be built is a terrible idea from the carbon emission to mining of huge tracts of forest. While this may be happening in Canada it will impact the US. The environmental dangers of transporting this tar sand oil is immense. This pipeline should be stopped.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project. Consolidated Response GHG-1 addresses GHG life-cycle analyses. Section 3.13 of the EIS addresses reliability and safety issues, including calculations of the probability of a spill from the proposed Project and the potential environmental impacts associated with spills.
67	2	Freeman	Donna		If the company is allowed to build the line it must be held to the strictest safety and environmental standards. This would include requiring thick-walled pipe and not being allowed to pump at pressures that exceed the normal allowable limits. Hoping that an environmental disaster will not happen is not working.	Keystone has withdrawn its application for a Special Permit as described in Consolidated Response REG-1. As described in Consolidated Response SAF-1, the Pipeline and Hazardous Materials Safety Administration (PHMSA) has regulatory requirements that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project in a manner that protects the health and safety of the public and the environment. In addition, PHMSA developed 57 Project-specific Special Conditions that Keystone has agreed to implement. Incorporation of those conditions would result in a Project that would have a degree of safety over any other typically constructed domestic oil pipeline system under current code and a degree of safety along the entire length of the pipeline system similar to that which is required in HCAs

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
						as defined in 49 CFR 195.450.
468	1	Freeman	Paul		Its not about money. Money is replaceable. The Aquifer is not replaceable. The Gulf disaster is waving at us vigorously. The same voices come out "We know what we're doing". I ask you, do you really think the oil industry has a clue what they're doing in the gulf? Do you think the gulf will ever be the same? There is no reset button on this one. There seems to be a lot of people unaware of the pipeline and its impact. I ask you to make sure your windshield is clear.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. Consolidated Response SAF-1 describes the regulatory requirements that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project. It also describes the inspections and reviews of the proposed Project that the Pipeline and Hazardous Materials Safety Administration would conduct to ensure compliance with those regulatory requirements.
468	2	Freeman	Paul		The aquifer is not replaceable.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
534	1	Freilich	Candace		As an engineering student, I have learned the importance of energy sources. However, the importance of clean water is greater. The Ogallala Aquifer has been a concern for the citizens of Nebraska and some of the surrounding states due to greater use than replenishment. Any infiltration of oil could endanger not only the livelihood of America's farmers, but also the supply of drinking water of the Americans living on the Great Plains. The risk posed to the aquifer by cutting through that area of land is significantly greater than the benefit of a shorter route. If constructed, the pipeline should skirt the aquifer at a safe distance. Water, not oil, is the most important resource for civilization and should be treated as such.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. Consolidated Response ALT-1 addresses potential alternative routes, including routes that would avoid much of the Northern High Plains Aquifer system.
83	1	French	T.J.		I strongly oppose the construction of this pipeline and the power of Eminent Domain being accorded a foreign company.	As described in Section 1.0 of the EIS and in Consolidated Response RES-2, TransCanada-Keystone Pipeline LP (Keystone) is not a foreign corporation. It is a limited partnership organized under the laws of the state of Delaware. Keystone has the same rights as other pipeline companies in the U.S. to propose projects. If easement negotiations with landowners are not successful, Keystone would initiate eminent domain proceedings. Consolidated Response EAS-2 also addresses issues related to easement negotiations and eminent domain.
83	2	French	T.J.		This pipeline in assuming ownership of large swaths of farm and ranch land will create erosion.	Issues related to the potential for erosion adjacent to streambanks and private land area are addressed in Consolidated Response ERO-2.
83	3	French	T.J.		This pipeline in assuming ownership of large swaths of farm and ranch land will create transgression.	Consolidated Response EAS-2 addresses issues related to easement negotiations and eminent domain. DOS has no legal authority in the easement negotiations or in eminent domain proceedings.
83	4	French	T.J.		This pipeline in assuming ownership of large swaths of farm and ranch land will create job loss.	Consolidated Response EAS-2 addresses issues related to easement negotiations and eminent domain. DOS has no legal authority in the easement negotiations or in eminent domain proceedings. Consolidated Response FRM-1 addresses potential ranch or farmland impacts, and Consolidated Response FRM-2 addresses potential impacts to irrigated cropland.
83	5	French	T.J.		This pipeline in assuming ownership of large swaths of farm and ranch land will create the destruction of antiquities of our Indian forbearers.	Consolidated Response CUL-1 and Section 3.11 of the EIS address protection of historic properties and the consultations conducted in compliance with Section 106 of the National Historic Preservation Act, including consultation with Indian

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
						tribes.
83	6	French	T.J.		It will not benefit any state from Montana to Texas with the possible exception of Texas where the product will be loaded on ships bound for foreign countries.	Consolidated Response P&N-1 addresses the need that the Project has been proposed to meet. Consolidated Response P&N-2 provides information on the export of refined product from Gulf Coast refineries.
489	1	French	Aaron		I would encourage the State Department to revoke the extension to the Keystone Pipeline. This pipeline would not only increase the US's greenhouse gas emissions but would also affect the states in which the pipeline is proposed drastically.	Consolidated Response GHG-1 addresses the greenhouse gas life-cycle analyses presented in the revised EIS. The impacts associated with implementation of the proposed Project are addressed in Section 3.0 of the EIS. As noted in that section, construction and normal operation the proposed Project would not result in significant environmental impacts.
489	2	French	Aaron		I'm from Nebraska and the threat that this pipeline poses to the Ogallala Aquifer seems too dangerous to even continue to think about this project. The aquifer is one of the largest underwater tables in the world and if anything were to happen with this pipeline (due to thin piping and increased oil pumping pressure) it would be just as catastrophic as what is happening in the Gulf of Mexico for Midwestern farming and tribal communities. Thus, I demand that you revoke this extension of the dirty Keystone XL pipeline and instead take action to wean America off fossil fuels and direct us toward a clean energy future!	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. Keystone has withdrawn its application for a Special Permit as described in Consolidated Response REG-1. As described in Consolidated Response GLF-1, the risks associated with the proposed Project are substantially different from those associated with the BP Deepwater Horizon Project.
936	1	Frerichs	AnneMarie		Please say no to the Pipeline Project! Please keep this away from our land and water.	The commenter's opinion is noted.
1192	1	Frerking	Vicki		Please continue to fight for [the safety of our water resources and] stronger safety measures for the proposed pipeline in Nebraska.	As described in Consolidated Response SAF-1, the Pipeline and Hazardous Materials Safety Administration (PHMSA) has regulatory requirements that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project in a manner that protects the health and safety of the public and the environment. In addition, PHMSA developed 57 Project-specific Special Conditions that Keystone has agreed to implement. Incorporation of those conditions would result in a Project that would have a degree of safety over any other typically constructed domestic oil pipeline system under current code and a degree of safety along the entire length of the pipeline system similar to that which is required in HCAs as defined in 49 CFR 195.450. Consolidated Responses AQF-1 through AQF-4 address issues related to the Northern High Plains Aquifer system, which includes the Ogallala aquifer.
1192	3	Frerking	Vicki		The Ogallala Aquifer is too valuable to put at risk.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
687	1	Friedman	David	National Petrochemical and Refiners Association	NPRA, the National Petrochemical and Refiners Association, appreciates the opportunity to provide comments on the Keystone XL pipeline project. NPRA supports the Keystone XL pipeline project, because it would strengthen our country's national and economic security, and because it's good for our environment. Everyone agrees that the United States – and the rest of the world – will rely on many forms of energy in the future. Nuclear, natural gas, solar, wind and wave energy will all play a growing part in our energy mix. But petroleum and coal will continue to have vital roles for years. Our economy	Comment acknowledged.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					would plunge into another Great Depression if we were suddenly unable to obtain products manufactured from oil – such as gasoline, diesel fuel, jet fuel, home heating oil and petrochemicals. All the planes, tanks, many ships and other equipment used by our armed forces to defend America would be useless. So the question our nation faces is not whether or not to consume oil. The question is: Where do we get the petroleum we need, even as we work to produce more energy from other sources? A pipeline to bring Canadian oil to the United States makes sense for several reasons. First, Canada has been a close friend for many generations. At a time when people worry about our reliance on unstable regions of the world for imported oil, we can count on Canada to continue its history as a stable and democratic ally. Canadian oil strengthens our national security. Second, sending Canadian oil to America to be manufactured into finished products at refineries and petrochemical plants has the potential to pump billions of dollars into our economy and support thousands of jobs for American workers. Finally, failure to build this pipeline won't halt the development of the oil sands. Canada recognizes that this oil is a valuable export. If America doesn't want the Canadian oil, China and other nations across the Pacific will be more than happy to buy it. That would require shipping Canadian oil across the ocean, and would force the United States to ship in more oil from elsewhere. This trans-oceanic traffic would use a lot more energy and would increase the carbon footprint of transporting the oil. For all these reasons, getting more oil from Canada makes sense. If we turn our back on this important source of energy, we'll be imposing economic sanctions on ourselves.	
1295	1	Friedman	David	National Petrochemical and Refiners Association	I'm senior director of regulatory affairs for NPRA, the National Petrochemical & Refiners Association. More than 450 companies, including virtually all U.S. refiners and petrochemical manufacturers, are members of NPRA. We support the Keystone XL pipeline project, because it would strengthen our country's national and economic security, and because it's good for our environment.	Comment acknowledged.
1295	5	Friedman	David	National Petrochemical and Refiners Association	Sending Canadian oil to America to be manufactured into finished products at refineries and petrochemical plants has the potential to pump billions of dollars into our economy and support thousands of jobs for American workers.	Consolidated Response ECO-1 and Section 3.10.2.2 address potential socioeconomic impacts.
1295	6	Friedman	David	National Petrochemical and Refiners Association	Failure to build this pipeline won't halt the development of the oil sands. Canada recognizes that this oil is a valuable export. If America doesn't want the Canadian oil, China and other nations across the Pacific will be more than happy to buy it. That would require shipping Canadian oil across the ocean, and would force the United States to ship in more oil from elsewhere. This trans-oceanic traffic would use a lot more energy and would increase the carbon footprint of transporting the oil. For all these reasons, getting more oil from Canada makes sense.	Comment acknowledged.
1295	7	Friedman	David	National Petrochemical and Refiners	If we turn our back on this important source of energy, we'll be imposing economic sanctions on ourselves.	Comment acknowledged.

				Association		
1546	168	Friedman	David	NPRA	We support the Keystone XL Pipeline Project, because it would strengthen our country's nation and economic security, and because it's good for our environment.	Comment acknowledged.
1546	169	Friedman	David	NPRA	The question is not whether or not to consume oil, but where we will get it. The Canadian pipeline makes the most sense.	Comment acknowledged.
1546	171	Friedman	David	NPRA	Refining Canadian oil in America has the potential to pump billions of dollars into our economy, and create thousands of jobs.	Consolidated Response ECO-1 and Section 3.10.2.2 of the EIS address potential socioeconomic impacts. As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed production in Gulf Coast refineries. Consolidated Response ECO-1 and Section 3.10.2.2 of the EIS address the potential socioeconomic impacts of the proposed Project.
1546	173	Friedman	David	NPRA	If we turn our back on this important source of energy, we'll be imposing economic sanctions on ourselves.	The commenter's opinion is noted.
8	1	Frigon	Harvey		The project is ok.	Comment acknowledged.
1004	1	Fritz	Marv		We need to have the development. Make it safe but make it happen. If we don't develop things there will be no one to protect.	Consolidated Response SAF-1 describes the regulatory requirements and Project-specific Special Conditions that Keystone would comply with to construct, operate, maintain, inspect, and monitor the proposed Project. It also describes the monitoring, inspections, and reviews of the proposed Project that the Pipeline and Hazardous Materials Safety Administration would conduct to ensure compliance with those regulatory requirements.
142	1	Froelich	James		I am very much opposed to the Keystone Pipeline Project.	Comment acknowledged.
142	2	Froelich	James		The tar sands are considered an environmental disaster of epic proportions by many - including most Canadians.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information on current and future production. As noted in that Consolidated Response, without the proposed Project, oil sands development would continue at or above the current level until at least 2020, with or without the proposed Project.
142	3	Froelich	James		An area of deforestation the size of Greece! We believe the U.S. should not be a partner in this deforestation.	Consolidated Response GHG-4 addresses concerns regarding the loss of boreal forest and peat bogs
142	4	Froelich	James		Disturbance to Sage Grouse and other wildlife in McCone County where we live and elsewhere along the route.	Potential Project-related impacts to greater sage-grouse are addressed in Section 3.8.1.2, with additional information for Montana wildlife presented in Appendix I
142	8	Froelich	James		Construction - air pollution	The potential impacts of construction on air quality are presented in Section 3.12.1.3
142	11	Froelich	James		Oil, coal, gas comes at an extremely high price. It is not a matter of 'if' but 'when' and 'how often' a tragedy will occur.	Consolidated Response OIL-1 addresses the likelihood of spills from the Project.
142	12	Froelich	James		We live 0.5 mile from a gas pipeline and about 5 miles from a compressor station of that pipeline. There is a potential for fires, explosions, and air pollution.	As noted in Consolidated Response OIL-5, crude oil pipelines do not explode and it is highly unlikely that there would be an explosion in a pump station.
142	14	Froelich	James		Energy sprawl degrades quality of life for those living near it - bottom line.	Consolidated Response PVT-2 addresses concerns regarding the proximity of the proposed project to existing structures and facilities and routing concerns across private property.
29	1	Frost	Doris		I am writing to express a set of concerns related to the	Consolidated Response FRM-1 addresses potential ranch of

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					<p>placement and construction of the proposed Keystone XL Pipeline. I own land near the Yellowstone River which was farmed by my late husband for decades and is now leased to a young man in the area who raises beets, corn, beans, and/or grain. My primary concern is that the pipeline will make useless my best irrigated field if it crosses it as I understand it to be planned. The pipeline appears to be routed diagonally across this field (ML-MT-DA-00403.000). The pipe and dirt on top of the pipe will certainly settle and become a trench, diverting the water that is ditch irrigated on the Northwest end of the field along Old US Highway 10. Irrigated land is much riskier to deal with than dry farm or range land. For example, in my experience, if a truck went up and down the same row too many times during harvest, the soil got packed down and made it difficult to grow next year. The massive amounts of equipment involved in the construction of this pipeline will cause the same problem but on a bigger scale, whether or not the company uses mats underneath their equipment. There is also the risk that the construction will break the hard pan, which will make the water disappear. I seek your assistance on ensuring that the pipeline company be required to route the pipeline in such a way as to not ruin this prime irrigated field. If it is moved East perhaps 750 feet it would miss the field and go through grass instead. Or, not ideal but still better than diagonally cutting across the field, I would ask that at the very least the pipeline be required to parallel the rows to lessen the impacts of diverting water flow on the field. Please call or write me with any questions, I am happy to clarify any of these issues. I hope that the Department is able to take these concerns of mine into consideration. I will appreciate a response to know if and to what level you will be able to deal with my situation. I am enclosing a map diagram of the field that I am writing about.</p>	<p>farmland impacts, and Consolidated Response FRM-2 addresses potential impacts to irrigated cropland. In addition, Section 2.3.2.9 of the EIS and the Keystone Construction, Mitigation, and Reclamation (CMR) Plan (Appendix B of the EIS) describe the procedures that Keystone would incorporate into the Project to avoid or minimize impacts to irrigated farm land as well as procedures to avoid or minimize soil compaction and to minimize settling. After completion of construction, restoration, and reclamation, farming can continue on the right-of-way above the pipeline. Section 3.2 of the EIS addresses potential impacts to soil due to implementation of the Project.</p> <p>Pipeline routing in Montana is addressed in Consolidated Response EAS-1. In addition, the commenter can work with Keystone to address potential minor realignments that can be made during final design, assuming the realignment are consistent with the requirements of environmental permits.</p>
1449	1	Frost	Doris		<p>Impacts to irrigated farming are extremely underestimated in this draft Environmental Impact Statement. It states that "irrigation systems such as ditches, flood, pivots, wheels, or other types may be impacted by construction of the project. If pipeline construction crosses active irrigation ditches, they would not be stopped or obstructed except during the typical one day or less time period needed to install the pipeline beneath the ditch." (EIS reference: page 3.9-20) To think that the effects of construction would only last a day on irrigated agricultural land is completely ridiculous. Just driving a normal truck on irrigated agricultural land a few times will cause a depression of the land, which then trenches and causes the water to re-route. This project will have equipment many times the weight and size of what's normally handled by irrigated fields. The pipeline right of way will likely settle and could need treatment for many, many years. Fixing ditches, releveling, and other irrigated agricultural practices need to be done by highly skillful workers and are expensive endeavors for landowners. The EIS says that "Keystone would repair or restore drain tiles, repair fences ... and restore farm terraces" - this is only a start as to what the company should be required to do, as far as reclaiming irrigated land goes.</p>	<p>Consolidated Response FRM-2 addresses potential impacts to irrigated cropland. The "one day" in the quoted text refers to the time of construction across an irrigation ditch, not the recovery time after construction through an irrigated field. Section 4.0 of the Keystone Construction, Mitigation, and Reclamation Plan (presented in Appendix B of the EIS) lists the procedures that would be followed for construction through irrigated fields, including coordination with the landowner and compensation for lost production.</p>

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
1449	2	Frost	Doris		My primary concern is that the pipeline will make useless my best irrigated field if it crosses it as I understand it to be planned. The pipeline appears to be routed diagonally across this field (MLMT-DA-00403.000). The pipe and dirt on top of the pipe will certainly settle and become a trench, diverting the water that is ditch-irrigated on the Northwest end of the field along Old US Highway 10. Irrigated land is much riskier to deal with than dry farm or range land. For example, in my experience, if a truck went up and down the same row too many times during harvest, the soil got packed down and made it difficult to grow next year. The massive amounts of equipment involved in the construction of this pipeline will cause the same problem but on a bigger scale, whether or not the company uses mats underneath their equipment. There is also the risk that the construction will break the hard pan, which will make the water disappear.	Consolidated Response FRM-2 addresses potential impacts to irrigated cropland. Special Condition 19 of the Pipeline and Hazardous Materials Safety Administration (see Appendix U of the EIS) states that "Keystone shall maintain a depth of cover of 48 inches in cultivated areas . . .". Therefore, if settling occurs, Keystone would be required to correct the situation. Section 4.0 of the Keystone Construction, Mitigation, and Reclamation Plan (presented in Appendix B of the EIS) lists the procedures that would be followed for construction through irrigated fields, including coordination with the landowner and compensation for lost production.
569	1	Fryer	Heather		It is with the greatest sense of urgency that I write to voice my opposition to the Tar Sands project, which would allow TransCanada to run pipeline through the Ogallala Aquifer in western Nebraska. Not only does the aquifer provide 85% of Nebraska's drinking water, it supplies nearly one-third of the water that irrigates the nation's crops. Given what we have seen of the BP oil spill in the Gulf of Mexico, running highly toxic petroleum through the Ogallala Aquifer is unthinkable.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. As described in Consolidated Response GLF-1, the risks associated with the proposed Project are substantially different from those associated with the BP Deepwater Horizon Project.
569	2	Fryer	Heather		The project already threatens clear-cutting of sections of the Boreal Forest and the generation of enormous quantities of toxic waste, but an accident of any sort would be ruinous to the environment and economy of much of the state of Nebraska, where I live.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information on current and future production. As noted in that response, without the proposed Project, oil sands development would continue at or above the current level until at least 2020, with or without the proposed Project. Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. Consolidated Response AQF-3 provides information on hypothetical spills from the Project over two areas of the Northern High Plains Aquifer System and also addresses response actions.
569	3	Fryer	Heather		Clearly, spills cannot be reversed or repaired and the human and environmental cost is wholly unacceptable.	Although spills cannot be reversed, they can be stopped as described in Section 3.13.5 and the oil cleaned up as described in the Emergency Response Plan. RES-1 addresses issues related to preparation and review of the Emergency Response Plan for the proposed Project. The impacts can be alleviated and mitigated through restoration actions required by federal, state and/or native American natural resource trustees under the current Natural Resource Damage Assessment program provided for in the Oil Pollution Act of 1990. Consolidated Response AQF-3 provides information on hypothetical spills from the Project over two areas of the Northern High Plains Aquifer System.
569	4	Fryer	Heather		Indeed, allowing construction of the pipelines would represent the clearest demonstration of the prioritization profits over human and environmental health that the American people have seen to date.	Section 3 of the EIS addresses the impacts of construction and operation of the proposed Project. Section 3.13 of the EIS addresses the risk and environmental impacts of a crude oil spill from the proposed Project.
569	5	Fryer	Heather		It also places the local economy at risk, as there is no clear compensation structure for Nebraskans whose livelihoods	The impacts associated with implementation of the proposed Project are addressed in Section 3.0 of the EIS. As noted in

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					would be lost as a result of negative environmental impacts.	that section, construction and normal operation the proposed Project would not result in significant environmental impacts. Section 3.13 of the EIS addresses reliability and safety issues, including calculations of the probability of a spill from the proposed Project and the potential environmental impacts associated with spills. Issues related to the High Plains Aquifer System are addressed in Consolidated Response AQF-1 through AQF-4. Consolidated Response AQF-3 provides information on hypothetical spills from the Project over two areas of the Northern High Plains Aquifer System.
386	1	Fuchs	Robert	Audubon Society of Omaha	As Conservation Chair of the Audubon Society of Omaha, Nebraska, I want to express opposition to the proposed Keystone pipeline route through Nebraska.	Comment acknowledged.
386	2	Fuchs	Robert	Audubon Society of Omaha	We should not encourage tar sands development, since it is an extremely dirty way to get petroleum.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project. Consolidated Response GHG-1 addresses GHG life-cycle analyses. Consolidated Response GHG-2 addresses the potential causal connection of implementation of the proposed Project and expanded oil sands production in Alberta and increases in refining.
386	4	Fuchs	Robert	Audubon Society of Omaha	Contamination of the Oglala Aquifer from a spill or leak would be catastrophic to the environment and economy of Nebraska.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
610	1	Fuller	Amanda		I am opposed to the construction of a pipeline to transport tar sands from Canada to Texas. We have seen how disastrous our oil-based technologies can be an we need to KICK the HABIT. Spend the money on wind turbines instead and protect our natural lands.	Consolidated Response P&N-5 addresses issues related to investments in other technologies.
471	1	Funk	Christine		I strenuously oppose the Keystone XL Pipeline Project because of the potential for contamination of our precious groundwater in the Ogallala Aquifer. According groundwater expert Susan Seacreast, this aquifer contains two-thirds of the volume of the High Plains system and is considered one of the great fresh water resources of the world. It underpins the largest sand dune area in North America and the entire system is responsible for recharging lakes, streams and wetlands in the region. The pipeline is to be built with thinner than usual pipe and pump slurry at higher than normal pressure, which increase the risk of leaks. In a Lincoln Journal Star editorial of 6-24-10 Seacrest explains that because of the porosity and transmissivity of the Sandhills/aquifer system any leak would cause instant and widespread damage to the groundwater. It is insane to build such a pipeline! If it must be built, it must be built above ground. I beg you to not allow this pipeline to be built underground.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. Keystone has withdrawn its application for a Special Permit as described in Consolidated Response REG-1. Issues related to an aboveground pipeline are addressed in Consolidated Response CST-1.
1548	21	Galemore	Julie	Domestic Oil Producers of Kansas	This pipeline is bringing in heavy tar sands oil from Canada -- which is destroying Canada,	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project.
1548	22	Galemore	Julie	Domestic Oil Producers of Kansas	last year the State of Kansas lost over -- no the year 2008, sorry -- the State of Kansas lost over \$400 million because the domestic oil producer, the tar sands oil are coming in to	Consolidated Response P&N-1 addresses the need that the Project has been proposed to meet. In addition, the proposed Cushing Marketlink Project described in Section 2.5.4 of the

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					Cushing, and they're docking the domestic oil producer anywhere from 10 to 20 dollars a barrel on our oil, yet they're paying Canada for bad oil 2 dollars under NYMEX. So it's really going to affect this area, and we're not going to have domestic oil production because of this Canadian tar sands oil. It's going to eliminate a lot of producers around here, and I don't know if anybody realizes that, but we have a bill on the floor right now as we speak to try to make the refineries pay us NYMEX price, which is what we got before Canadian tar sands oil came in the picture.	EIS would provide the opportunity for crude oil produced in Kansas to be shipped to Gulf Coast refineries on the proposed Project.
1548	37	Galemore	Judy		I would like to see a way to keep the domestic producer selling their oil to Cushing without Cushing saying they're full...I don't believe there's enough outflow for the Cushing market to get rid of all the oil that Canada wants to bring down.	Consolidated Response P&N-1 addresses the need for heavy crude oil in the Gulf Coast refineries that the Project has been proposed to meet. At the present time there is not sufficient pipeline capacity to ship heavy crude oil from the Cushing area to the Gulf Coast refineries. The proposed Cushing Marketlink Project described in Section 2.5.4 of the EIS would provide an opportunity for producers in the general area of Cushing to ship crude oil to Gulf Coast refineries via the proposed Project.
1548	38	Galemore	Matt		Concern that local producers will not be able to sell their oil to refineries because the refineries will be full of the "sour crude" from Canada.	Consolidated Response P&N-1 addresses the need for heavy crude oil in the Gulf Coast refineries that the Project has been proposed to meet. At the present time there is not sufficient pipeline capacity to ship heavy crude oil from the Cushing area to the Gulf Coast refineries. The proposed Cushing Marketlink Project described in Section 2.5.4 of the EIS would provide an opportunity for producers in the general area of Cushing to ship crude oil to Gulf Coast refineries via the proposed Project.
199	1	Galt	Dave	Montana Petroleum Association	The KXL project will provide vital transportation infrastructure to Montana, the Region and the Nation....the development of infrastructure to import petroleum products from Canada, a safe and friendly trading partner, is vital to the American economy and would be in America's best interest.	Consolidated Response ALT-3 addresses issues related to a potential pipeline connection to the Keystone XL Project in Montana that would transport oil produced in Montana and North Dakota.
199	2	Galt	Dave	Montana Petroleum Association	MPA also supports the efforts that TransCanada has put forth with Montana and North Dakota petroleum producers in an effort to allow an injection point for Williston Basin crude oil. Adequate pipeline capacity in the Williston Basin has been a problem in recent years. According to data on the North Dakota Pipeline Authority's website, crude production will soon out pace current capacity. The KXL line will provide much needed additional transportation infrastructure.	Consolidated Response ALT-3 addresses issues related to a potential pipeline connection to the Keystone XL Project in Montana that would transport oil produced in Montana and North Dakota.
199	3	Galt	Dave	Montana Petroleum Association	KXL will provide much needed good paying jobs to a region of the country that has experienced severe economic hardship. For years the region has worked on a variety of economic development ideas only to see the availability of jobs dwindle and the livelihood of many eastern Montana towns become questionable. KXL estimates that the project will create nearly 800 construction jobs and a dozen permanent positions. The construction jobs will provide an immediate benefit to struggling communities across eastern Montana. Currently, the Montana Department of Labors shows that there are 396 pipeline transportation Jobs in Montana with an average wage of \$64,105. The Keystone project is estimated to add at least another 10 positions at this average wage level. Keep in mind	Consolidated Response ECO-1 and Section 3.10.2.2 of the EIS address the potential socioeconomic impacts of the proposed Project.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					that Montana's average wage is among the lowest in the nation at \$33,000. These 10 long term jobs are extremely important in a part of the state where wage levels bring the extremely low current statewide average even lower.	
199	4	Galt	Dave	Montana Petroleum Association	At this time just about every state and local government in America is experiencing budget revenue shortfalls. In some places this short fall is at a crisis level. Keystone XL will provide \$62 million dollars in annual tax revenue in several of the least populated and poorest counties in Montana. Let me put that into perspective, the pipeline will more than double the tax base of one of the counties it will pass through.	Consolidated Response ECO-1 addresses potential socioeconomic impacts, and Consolidated Response TAX-1 addresses concerns regarding taxes.
1105	1	Gamble	Craig		Please do not build this stupid horrible thing! It will only further the destruction of the planet!	The commenter's opinion is noted.
1545	11	Garoutte	Darrell	Landowner	The EIS does not contain a complete and viable emergency response plan, risk of tanker spills and other construction accidents need to be assessed and response plan published. Consequences of pipeline rupture in regard to landowner and public safety need to be addressed, and a detailed response plan needs to be available for public comment. It seems unconscionable that the risk of potential impacts from the use of thinner wall pipe have not been discussed, or an explanation made as to why landowners in Montana are considered of low consequence.	Consolidated Response RES-1 addresses issues related to preparation and review of the emergency response plan for the proposed Project. Construction spills from the Project and the impacts of those incidents are addressed in Section 3.13 of the EIS. Keystone has withdrawn its application for a Special Permit as described in Consolidated Response REG-1. As described in Consolidated Response SAF-1, the Pipeline and Hazardous Materials Safety Administration (PHMSA) has regulatory requirements that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project in a manner that protects the health and safety of the public and the environment. In addition, PHMSA developed 57 Project-specific Special Conditions that Keystone has agreed to implement. Incorporation of those conditions would result in a Project that would have a degree of safety over any other typically constructed domestic oil pipeline system under current code and a degree of safety along the entire length of the pipeline system similar to that which is required in HCAs as defined in 49 CFR 195.450.
1545	12	Garoutte	Darrell	Landowner	Impacts to agricultural lands and the production thereof will certainly last more than one year; five to ten years would certainly be a better estimate.	Consolidated Response FRM-1 describes potential impacts to farmland and ranches and Keystone's responsibilities to compensate for damage to these crops. The EIS was revised to reflect that the potential impacts to agricultural land from construction and from an oil spill and subsequent response actions may last for one to a few years, depending upon the amount of oil, area impacted, and the type of cleanup actions taken by Keystone. In general, oil on and/or in the soils is weathered through biodegradation by micro-organisms, photodegradation by sunlight, and physical-chemical degradation. These basic processes generally reduce or eliminate the lighter fractions of oil that may be harmful to plants and/or animals and do so in a few months to a year or two. The heavier fractions of the oil (commonly called tar or asphalt) may persist for longer periods of time but are not toxic to organisms. The response actions may disturb the soils and provide habitat for weeds, reduce or remove the native or agricultural vegetation, and otherwise have impacts that may persist for a year or more.
717	1	Garra	Kathryn		Make Texas follow the clean air act.	The U.S. Environmental Protection Agency, not the Department of State, is responsible for delegating the authority

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
						to states to issue and monitor permits under the Clean Air Act (CAA) and to ensure that the actions of the states are in compliance with the requirements of the CAA.
444	1	Garrison	Jeanette		Please reconsider this potentially disastrous plan.	Consolidated Response ENR-1 provides information on the Department of State's environmental review process, the National Interest Determination process, and the need to complete those reviews before approving or denying the Presidential permit for the proposed Project.
444	2	Garrison	Jeanette		I cannot fathom running this kind of risk through an aquifer. The oil destroying the gulf and residents lives should be enough to redraw this project. If you don't learn from experience, you don't learn.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. As described in Consolidated Response GLF-1, the risks associated with the proposed Project are substantially different from those associated with the BP Deepwater Horizon Project.
1058	1	Gartner	Robert		I wish to make comment on the proposed Keystone XL Pipeline project. It is my wish that it not be built and that Canadian tar sands oil not be brought to Texas for refining either by pipeline or by any other means.	As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries.
1058	2	Gartner	Robert		I am concerned that no meeting was offered or held in Harris County or Houston where a major portion of populace resides and who would be most directly affected by he processing and burning of this oil.	Consolidated Responses CMT-2 and CMT-4 address the issue of public comment meetings in the Houston area. Consolidated Response P&N-3 addresses iddues related to refinery emissions.
1058	3	Gartner	Robert		I am concerned that many streams would be crossed	Section 3.3 addresses the potential impacts from stream crossings.
1058	5	Gartner	Robert		I am concerned about the projected effects of a spill or rupture of the pipeline. Who can say that it could not happen. We have recently seen that accidents do happen- e.g., BP catastrophe in the gulf of Mexico. BP had said a accident was unlikely as well and furthermore they had no plan as to what to do when it did. Please enter my comments into the record.	Section 3.13 of the EIS addresses reliability and safety issues, including calculations of the probability of a spill from the Project and the potential environmental impacts associated with spills.
326	1	Garvey	Lydia		Nix tars sands pipeline! So destructive & polluting & water wasteful.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information on current and future production. As noted in that Consolidated Response, without the proposed Project, oil sands development would continue at or above the current level until at least 2020, with or without the proposed Project. Consolidated Response OIL-4 addresses the composition of the Canadian crude oil that would be transported by the proposed Project, including concerns relative to the corrosivity and erosivity of the crude oil. As noted in that Consolidated Response, that crude oil is similar in composition and properties to other heavy crude oils that are currently transported within the U.S. pipeline system and similar in composition and properties to other heavy crude oils that are currently refined in PADD III.
326	2	Garvey	Lydia		Get us OFF oil! Do your job- Protect Our lands, waters, wildlife & health! You work for citizens -Not industry! Your attention to this most urgent matter would be much appreciated by all present & future generations of all species.	Consolidated Response ENR-1 provides information on the Department of State's environmental review process, the National Interest Determination process, and the need to complete those reviews before approving or denying the Presidential permit for the proposed Project.
146	1	Garwood	Ron	Valley County Conservation	This proposed pipeline will pass within 300 yards of my property where I graze my cows and I irrigate my crops from a	Consolidated Response PVT-2 addresses concerns related to the proximity of the proposed Project to existing structures and

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
				District	raised ditch from the Missouri River. I have concerns from damage that can occur during and after the construction of the pipeline as it crosses the Missouri river near where I get my irrigation water at the Edgar Garwood and Martha Anderson pump site.	facilities.
146	2	Garwood	Ron	Valley County Conservation District	There is a dirt trail that is my easement to the county for access to cross to go to a neighbor's property. I would like to be compensated for damage to this road for May of 08 when up to 4 outfits at a time would go across my easement to check out the surface property where the proposed pipeline would go. I was not contacted of this activity until after it had started in the spring of 2008. We had 7 inches of rain in May 08 so this traffic tore up our service road pretty bad when we don't us it under these conditions. I do not want nor does the valley county road dept. want this road improved from the condition before the XL pipestone activity. These are some the concerns that I have with the project.	State or local trespass and access laws are applicable along the entire route and therefore along each easement negotiated by Keystone. DOS has no legal authority over negotiating easement agreements, no legal status to enforce the conditions of an easement agreement, and no legal authority over Keystone representatives who gain access to private property. The commenter has the option to take up the matter with Keystone or local law enforcement officials, or initiate legal consultation.
146	3	Garwood	Ron	Valley County Conservation District	The irrigation ditches and the drain ditches should be considered the same as creek crossings and should be bored under if possible.	As described in Section 3.3 and in Consolidated Response WAT-1, most streams would be crossed using the open-cut method. Less than 40 rivers would be crossed using the horizontal directional drilling method.
146	4	Garwood	Ron	Valley County Conservation District	This river bottom has very shallow top soil and river sand is about 30 inches or less under the top of the surface. All topsoil should be saved and be put back on the soil surface and on the ditches where they are trenched.	See Consolidated Response SOI-2 and Section 3.2.2.1 of the EIS for a discussion of topsoil handling and restoration concerns.
146	5	Garwood	Ron	Valley County Conservation District	Damages should be paid to landowners and landowners who own land under the easements that have been let out to utilities or county governments for public roads when damage has been done.	As noted in Consolidated Response EAS-2, state laws dictate under what circumstances eminent domain may be used and define the eminent domain process within the state. DOS has no legal authority in the easement negotiations or in eminent domain proceedings.
146	6	Garwood	Ron	Valley County Conservation District	If a pump station is located nearby there should be damages paid for noise pollution if the noise levels are excessive. We live in a very quiet and pristine environment and we should be compensated if this is compromised.	Consolidated Response NOI-1 and Section 3.12.2 of the EIS address issues related to noise from pump stations.
146	7	Garwood	Ron	Valley County Conservation District	If a new substation is located nearby the neighboring property owners should be compensated for possible dangers of the future liabilities.	Electrical substations do not pose a significant risk to nearby landowners. Substations needed as a part of the connected actions described in Section 2.5 would be owned and operated by public utility companies that would be responsible for considering compensation for damages.
146	8	Garwood	Ron	Valley County Conservation District	Where the pipeline crosses the river there should be stops on the pipeline on either side of the river and there should be one or more stops up the adobe hills to the south to the top to protect the clear cold river at this location from the potential of oil spills in the future.	Consolidated Response SAF-1 describes the regulatory requirements and Project-specific Special Conditions that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project. Portions of those regulations and Special Condition 32 include requirements for the placement of valves. Section 3.13 of the EIS addresses reliability and safety issues, including calculations of the probability of a spill from the proposed Project and the potential environmental impacts associated with spills.
146	9	Garwood	Ron	Valley County Conservation District	Damages should be paid to the landowners from damages caused by the construction of the pipeline and to the landowners that would lose the crops because of inability to water crops in a timely matter because of the construction and	Compensation to landowners for damage and crop loss are addressed in Consolidated Response FRM-1 and in Section 2.5 of the Keystone Construction, Mitigation, and Reclamation Plan in Appendix B of the EIS.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					after if they can not water, spray for weeds, cultivate, harvest or care for their crops. The damages should be paid for the three crop years and for years after if the property isn't returned to the fields as they were before construction was started.	
146	10	Garwood	Ron	Valley County Conservation District	When the first people that came around to propose the pipeline to the landowners that all damages would be paid to them for three years after construction of the pipeline. They really impressed on the landowners the importance of the oil to the country. Most of the landowners were under the impression that damages would be paid when done to roads and property. They found out later they would be paid damages only after the construction and this has led many to not trust the pipeline people as much.	Consolidated Response RDS-1 addresses concerns about the condition of roadways and roadway structures associated with construction and operation of the proposed Project as well as traffic safety measures that would be incorporated into the Project. After construction, Keystone would either reclaim the construction-reated areas to pre-construction conditions to the extent practicable or compensate landowners for damages as specified in the Keystone Construction, Mitigation, and Reclamation Plan (see Appendix B of the EIS).
146	11	Garwood	Ron	Valley County Conservation District	I believe the control of weeds and mostly noxious weeds should be controlled in the newly disturbed earth. This area should not be sterilized but controlled by spraying or seeded to grass as soon as possible in pasture or uncultivated areas on as needed to control erosion or weed infestation.	The focus of Keystone's Construction, Mitigation, and Reclamation (CMR) Plan is to follow construction promptly with revegetation in order to prevent noxious and invasive weeds from becoming established. The CMR Plan is incorporated as Appendix B of the EIS. Weed management plans would be developed in consultation with state and local weed management boards.
1385	1	Garwood	Edgar		I am writing to you about my concerns on the DEIS for the Keystone XL pipeline. The following comments are in regards to how the proposed pipeline will cross my land. When we irrigate on my land, there's a lot of water standing in the middle of the road and the proposed pipeline is planned to cross right in the middle of the water. Please move south about a couple hundred feet. Cross the road at a 90 degree angle, straight across it. Right now they're crossing at 45 degrees. Given that the pipeline is proposed to cross 3 ditches and 18-20 dykes on my land, the last contract offer of \$6000 isn't quite enough to cover the impacts. I'm leaving this land to my grandkids and I don't like thinking about leaving them with that problem.	Pipeline routing in Montana is addressed in Consolidated Response EAS-1. Consolidated Response PVT-2 addresses concerns regarding the proximity of the proposed project to existing structures and facilities and routing concerns across private property.
1536	1	Garwood	Ronald		We need the thicker pipe. There should be more stops going up to signal hill coming up out of the Missouri River Valley.	Keystone has withdrawn its application for a Special Permit as described in Consolidated Response REG-1. Consolidated Response SAF-1 describes the regulatory requirements that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed proposed Project. Those regulations include requirements for the placement of valves. In addition, the Pipeline and Hazardous Materials Safety Administration (PHMSA) has regulatory requirements that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project. In addition, PHMSA developed 57 Project-specific Special Conditions that Keystone has agreed to implement. Incorporation of those conditions would result in a Project that would have a degree of safety over any other typically constructed domestic oil pipeline system under current code and a degree of safety along the entire length of the pipeline system similar to that which is required in HCAs as defined in 49 CFR 195.450. Keystone would site Special Condition 32 addresses the locations of valves.
1536	2	Garwood	Ronald		Irrigation ditches should be considered the same as creeks	As described in Section 3.3 and in Consolidated Response

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					and should be bored in the sandy soils on Missouri in the past the surveyors tore up the unimproved roads to get to the pipeline route.	WAT-1, most streams would be crossed using the open-cut method. Less than 40 rivers would be crossed using the horizontal directional drilling method. DOS has no legal authority over negotiating easement agreements, no legal status to enforce the conditions of an easement agreement, and no legal authority over Keystone representatives who gain access to private property. The commenter has the option to take up the matter with Keystone or local law enforcement officials, or initiate legal consultation.
1551	15	Garwood	Ron	Missouri River Districts Council	As the pipeline route kitty-corners right through my dad's irrigated land, we have a lot of concerns about it, in terms of ditches and dikes.	Consolidated Response PVT-2 addresses concerns related to the proximity of the proposed Project to existing structures and facilities.
1551	16	Garwood	Ron	Missouri River Districts Council	A lot of our irrigation ditches should be considered about the same as crick crossings, that they should be bored under rather than dug through, because we know we're going to have problems with settling, and it will be hard to keep those irrigation ditches open.	As described in Section 3.3 and in Consolidated Response WAT-1, most streams would be crossed using the open-cut method. Less than 40 rivers would be crossed using the horizontal directional drilling method. Special Condition 19 developed by the Pipeline and Hazardous Materials Safety administration requires that Keystone maintain a cover of at least 48 inches over installed pipe in cultivated areas and a minimum depth of 42 inches in all other areas.
1551	18	Garwood	Ron	Missouri River Districts Council	When the pipeline crosses the Missouri River, it goes up Signal Hill about 700 feet, I feel that we should have at least two stops there, in case there is a break, to stop oil from flowing down into the Missouri River Bottom.	Consolidated Response SAF-1 describes the regulatory requirements that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project. Those regulations include requirements for the placement of valves. In addition, as noted in Section 3.13.1, Keystone has agreed to incorporate 57 Project-specific Special Conditions (see Appendix U of the EIS) into the proposed Project as requested by PHMSA. Special Condition 22 addresses valve placement.
1551	19	Garwood	Ron	Missouri River Districts Council	We do have concerns about the pipeline.	Comment acknowledged.
61	2	Garza	Luis		Tar sands oil emits three times more greenhouse gases during production than conventional gasoline. It requires clear-cutting ancient forests and will also suck up water supplies and leave behind massive toxic lakes.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project. Consolidated Response GHG-1 addresses GHG life-cycle analyses.
864	1	Gaston	MariaTeresa	Creighton Center for Service and Justice	I am opposed to the Keystone XL Pipeline Project and urge you to stop the expansion of this from the Canadian Tar Sands through the U.S. I am very concerned about the climate effects from the energy extraction process ...	Consolidated Response GHG-2 addresses the potential causal connection of implementation of the proposed Project and expanded oil sands production in Canada and increases in refining. Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project.
864	2	Gaston	MariaTeresa	Creighton Center for Service and Justice	I am very concerned about the dangers of this passing over our Ogallala Aquifer.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
1558	57	Gaub	Carleen		My concern is in relation to the emergency response procedures as done in chapter 2.4.2.2 of the DEIS. It states that an ERP had already been proposed for the Keystone No. 1 pipeline, and that parts were being incorporated into the proposed Keystone XL pipeline. I would like to know how that	Consolidated Response RES-1 addresses issues related to preparation and review of emergency response plans for the proposed Project.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					is going to be applicable to us specifically on this pipeline; whether or not we as the public will have access to it, where we can access it, and what kind of things we're going to have to do to entail us access. How will this affect our local disaster preparedness, our EMS system?	
1558	58	Gaub	Carleen		Not only is it just a spill that we're worried about. Digging these big trenches, etc., you're always concerned that there are going to be people hurt, an explosion could happen during construction, etc. We need to be aware of that. It affects us a great deal.	The public would be excluded from the construction right-of-way and the construction staging yards and pipeyards. Therefore, in general the public would not be susceptible to injuries during construction. In addition, Keystone would provide notice of construction to landowners prior to entering the property as described in Section 2.4 of the Keystone Construction, Mitigation, and Reclamation Plan in Appendix B of the EIS. Landowners would be aware of the work being performed and would have contact information for key Keystone construction personnel.
1558	60	Gaub	Carleen		The emergency response preparedness affects a great deal of our rights as Montana citizens.	Consolidated Response RES-1 addresses issues related to preparation and review of emergency response plans for the proposed Project.
486	1	Gaura	Robin	Diamond Mountain University	To Whom it may concern, I would like to voice my hearty disapproval of this pipeline. The tar sands project is an environmental disaster unfolding in slow motion. It will destroy a large percentage of the fresh water sources in north America. All public policy in the energy arena should be to support and mandate conservation and frugality on the consumption side. No housing should be built that is not passive solar. The dangers of transporting such a toxic load over such large distances lies in that spills will happen. Areas will be devastated. This risk should be unacceptable to every town and county along the proposed pipeline trajectory. The only winners in this proposed scenario would be stockholders in the companies who want to build it. The mess and liability for future disasters will lie with the government. Its a bad deal all around. Lets learn to live simply, elegantly and lightly on the earth, and leave it a habitable place for those who follow.	Consolidated Response OIL-4 addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils. Section 3.13 of the EIS addresses reliability and safety issues, including calculations of the probability of a spill from the proposed Project and the potential environmental impacts associated with spills.
1056	1	Geary	B.A.		I am writing to comment on the DEIS for the Keystone XL pipeline. Even if the oil business were working smoothly and according to best plans as far as extraction, transporting and refining, I would object to the Keystone XL pipeline, and to the whole tar sands oil cycle from strip-mining through refining. With the huge environmental disaster in the Gulf caused by Big Oil, we can easily realize that destructive effects of a large-scale project are truly beyond knowing. And it is obvious that Big Oil lets its greed takes priority over the health of humans and the environment we depend on. The stakes are shown now to be too high for the oil industry to continue its domination of our economy and its pollution of our air, water and land. The Keystone XL project carries Big Oil bullying to new extremes. This makes tar sands oil, the dirtiest oil, and the Keystone XL pipeline not just undesirable but truly unthinkable. Oklahoma does not want the Keystone XL to threaten our water and our agriculture. Oklahoma tribes do not want the Keystone XL trespassing on their lands. The draft EIS for the pipeline does not tell the whole truth about the degradation the pipeline would cause; the draft EIS is a	Consolidated Response OIL-4 addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils. As noted in Consolidated Response ENR-1, the environmental review, including preparation of this EIS, has been conducted consistent with the DOS regulations pertaining to NEPA (22 CFR Part 161) as well as the Council on Environmental Quality (CEQ) regulations for implementing NEPA (40 CFR Part 1500). As a result, DOS considers the EIS to be in full compliance with the requirements of a NEPA environmental review. Keystone has withdrawn its application for a Special Permit as described in Consolidated Response REG-1. Consolidated Response SAF-1 describes the regulatory requirements that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project in a manner that protects the health and safety of the public and the environment.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					cosmetic 1600-page attempted disguise. Long before the appearance of the Keystone XL draft EIS, TransCanada was threatening landowners in Oklahoma. What gall! Once the Keystone XL was built, would TransCanada suddenly become a good and grateful visitor? Ha! TransCanada has been behaving fraudulently with landowners. Their pushy arrogance would only increase once they were installed on the property they covet. TransCanada has refused to set up a cleanup fund that would be available in case something went2wrong with the pipeline. Such insolence! The plan to use extra-thin walls and extra-high pumping pressure for the pipeline is brazen and presumptuous. As though a spill here and there would be of no import!	
1056	3	Geary	B.A.		The fact that the US would have no control over construction company testing while construction proceeds is a very smelly factor in the whole Keystone XL plan. There should be independent testing (at TransCanada expense) at every step of construction.	There would be federal control over the proposed Project during construction. Keystone would be under the regulatory jurisdiction of the Pipeline and Hazardous Materials Safety Administration (PHMSA), which is an agency of the U.S. Department of Transportation. As noted in Consolidated Response SAF-1, Keystone must comply with PHMSA's regulatory requirements for design and construction, and PHMSA would conduct on-site inspections during construction. There would also be on-site Environmental Inspector during construction as described in Section 2.3.5.2 of the EIS.
1056	4	Geary	B.A.		At a time when the world is aware that we need to reduce the human carbon footprint, the KeystoneXL project and tar sands oil extraction promise a huge carbon footprint. This is downplayed in the draft EIS. Extraction of Tar Sands oil causes triple emissions of carbon by comparison with conventional oil extraction. How can the US State Department be an accessory to this cocky, ruinous plan?	As noted in Section 1.0 of the EIS, the Department of State (DOS) is reviewing Keystone's application a Presidential Permit for the proposed Project to determine whether or not to issue a permit. DOS is also conducting a determination of national interest as described in Section 1.4 of the EIS and in Consolidated Response P&N-9. Consolidated Response GHG-1 addresses GHG life cycle analyses.
1056	5	Geary	B.A.		When it comes to basic human needs, clean air, clean water, and non-toxic agricultural land trump any so-called "need" for unlimited oil.	Consolidated Response ENV-2 addresses concerns related to pipeline temperature effects. Consolidated Response NOX-1 addresses issues related to invasive species.
1056	6	Geary	B.A.		The Keystone XL will heat up land and disrupt insect cycles and farming.	Section 3.5.5.1 of the EIS addresses potential impacts to vegetation due to increased temperature in the soil in the vicinity of the proposed pipeline.
1056	8	Geary	B.A.		TransCanada (and apparently the US State Department) have obviously no conception of the value of land unless it is generating mega profits for a mega corporation.	Consolidated Response EAS-2 addresses issues related to easement negotiations and eminent domain. DOS has no legal authority in the easement negotiations or in eminent domain proceedings.
1056	9	Geary	B.A.		The Keystone XL is the antithesis of a sustainable enterprise. Extraction of tar sands oil is a huge assault on sustainability for our PLANET. How can anyone even THINK of destroying any part of the Canadian Boreal forest, much less an area the size of Florida? What an idiotic plan!	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project.
1056	10	Geary	B.A.		The draft EIS for the Keystone XL, which I referred to above as a disguise, is an abominable waste of paper supporting one more invasion by Big Oil. The public comment period should be extended to atleast a year so that, in spite of inadequate publicity (why no paid notices in the mainstream media?),every affected American will have an opportunity to	Consolidated Response CMT-1 addresses issues related to the public comment period on the draft EIS. As noted in Consolidated Response ENR-1, the environmental review, including preparation of this EIS, has been conducted consistent with the DOS regulations pertaining to NEPA (22 CFR Part 161) as well as the Council on Environmental

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					realize the possible and probable terrible consequences of this pipeline and register opposition.	Quality (CEQ) regulations for implementing NEPA (40 CFR Part 1500) and includes the preparation of this EIS. As a result, DOS considers the EIS to be in full compliance with the requirements of a NEPA environmental review. The impacts associated with implementation of the proposed Project are addressed in Section 3.0 of the EIS. As noted in that section, construction and normal operation the proposed Project would not result in significant environmental impacts.
1056	11	Geary	B.A.		Where tar sands pipelines are under construction, landowners find removal of trees causes erosion beside streams	Issues related to the potential for erosion adjacent to streambanks and private land area are addressed in Consolidated Response ERO-2.
1056	12	Geary	B.A.		and tribes find their sustainability and cultural traditions disrupted. The US government is certainly not helping these victims.	Consolidated Response CUL-1 and Section 3.11 of the EIS address protection of historic properties and the consultations conducted in compliance with Section 106 of the National Historic Preservation Act, including consultation with Indian tribes. Consolidated Response JUS-1 addresses environmental justice issues.
1056	13	Geary	B.A.		Rather than a transparent, honest statement of the risks and threats posed by the pipeline the draft EIS glosses over a takeover not just by Big Oil, but by a foreign corporation. Redress for damages caused by the pipeline is not seriously addressed in the draft EIS nor is it assured where tar sands pipeline damages have already occurred.	As described in Section 1.0 of the EIS and in Consolidated Response RES-2, TransCanada-Keystone Pipeline LP (Keystone) is not a foreign corporation. It is a limited partnership organized under the laws of the state of Delaware. Keystone has the same rights as other pipeline companies in the U.S. to propose projects. Section 3.13 of the EIS addresses reliability and safety issues, including calculations of the probability of a spill from the proposed Project and the potential environmental impacts associated with spills. Consolidated Response LIA-1 addresses Keystone's liability if there is a spill of hazardous materials or fuel during construction or a spill of crude oil from the proposed Project. Section 2.5 of the Keystone Construction, Mitigation, and Reclamation Plan in Appendix B of the EIS addresses damage to private property during construction.
1056	14	Geary	B.A.		Would the Keystone XL be considered subject to NAFTA regulations? If so, we have only begun to experience the nightmare of injustice. The Keystone XL project is imperious in conception and it is troubling to see the US State Department allying itself with interests inimical to US citizens' health, to tribal rights, and to a whole range of freedoms which our government is supposed to protect. I believe in international cooperation, but not in imperialism by foreign corporations. I hasten to add that allowing a US corporation to build the Keystone XL would be equally unacceptable from virtually every viewpoint save the NAFTA legal entanglements.	As described in Section 1.0 of the EIS and in Consolidated Response RES-2, TransCanada-Keystone Pipeline LP (Keystone) is not a foreign corporation. It is a limited partnership organized under the laws of the state of Delaware. As described in Section 1.0 of the EIS and Consolidated Response ENR-1, the Department of State (DOS) is responsible for reviewing Keystone's application for a Presidential permit and is neither a proponent nor an opponent of the proposed Project. As a result of NAFTA, the Canadian crude oil transported by the proposed Project would not be subject to import tax in the U.S. The tariffs for the oil would be regulated by the U.S. Federal Energy Regulatory Commission.
1056	15	Geary	B.A.		Tar sands leaks in Wisconsin have already gone into aquifers. The Ogallala Aquifer is threatened by the Keystone XL. It is undeniable to any sane person that water is more valuable than oil or gold. Yet the U.S. State Department seems to be in collusion with this project's devaluation of water—in other words, in collusion with Big Oil's insane focus on short-term profits rather than on sustaining life.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
1056	16	Geary	B.A.		Supposedly the Keystone XL would be a contribution to US	Consolidated Responses ENR-1 and P&N-9 provide

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					energy “needs” --or should I say US overconsumptionand waste of energy? Yet the tar sands pipeline being constructed in Kansas isexpected to be that state’s largest user of electricity! This is prize non-thinking and it is preposterousfor the US State government (State Department) to have any hand in promoting the pipeline.	information on the Department of State (DOS) environmental review process, the National Interest Determination process, and the need to complete those reviews before approving or denying the Presidential permit for the proposed Project. As noted in that response, DOS is neither a proponent nor an opponent of the proposed Project.
1056	17	Geary	B.A.		What contemptuous disregard for human life and health is shown by the waste and pollution of water that tar sands oil extraction causes! Don't the soaring cancer rates, the high rates of renal failure, lupus, hperthyroidism among indigenous people downstream of the toxic tailing ponds say clearly that using tar sands oil (and encouraging that use by building the Keystone XL pipeline) is simply notacceptable? Any support for tar sands and the Keystone XL is not acceptable, non-negotiable! What contemptuous disregard for the fragile eco-system of the Canadian Boreal forest! The forest is significant for wildlife as well as human survival. Millions of migratory birds are expected to perish because of the projected destruction of the forest.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project. Consolidated Response GHG-4 addresses concerns regarding the loss of boreal forest and peat bogs.
1344	1	Geary	Edmond		Dear Elizabeth Orlando, Your pipeline displeases me. Please cease.	Keystone is proposing the Keystone XL Project, not the Department of State (DOS). Consolidated Response ENR-1 provides information on the DOS environmental review process, the National Interest Determination process, and the need to complete those reviews before approving or denying the Presidential permit for the proposed Project.
1344	2	Geary	Edmond		The threat to farmers is unacceptable	Comment acknowledged.
1344	3	Geary	Edmond		Carbon emissions are far too high.	Consolidated Response GHG-1 addresses the greenhouse gas life-cycle analyses presented in the revised EIS.
1557	17	Geary	B.		Appalled that there wasn't more public notice about this meeting.	Consolidated Response CMT-2 addresses issues related to comment meetings on the draft EIS and requests for additional public involvement.
1557	18	Geary	B.		Cannot understand why the Obama administration is even considering the approval of this pipeline due to its environmental factors.	As described in Section 1.0 of the EIS, Keystone has applied for a Presidential permit and the Department of State has the responsibility of considering whether or not to issue that permit. Consolidated Response ENR-1 addresses the environmental review process.
1557	19	Geary	B.		Concerned about greenhouse gasses. Tar sands produce three times as much carbon dioxide than conventional oil and the Obama administration wants to reduce greenhouse gas emissions.	Consolidated Response GHG-1 addresses the greenhouse gas life-cycle analyses presented in the revised EIS.
1557	20	Geary	B.		Concerned about the destruction of Canada's boreal forest, one of the few large intact ecosystems left in the world.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project.
1557	21	Geary	B.		Concerned about waste water from the tar sands oil production. Toxic sludge from the waste water from producing the oil from tar sands has found its way into neighboring clean water supplies.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1.
1557	24	Geary	B.		Concerned about the effects of the refining process in Texas on our air. Refineries will have much higher sulfur dioxide and nitrous oxide than conventional oil has in its emissions.	As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
						changed refinery emissions in Gulf Coast refineries. Consolidated Response OIL-4 also addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils.
1557	17	Geary	B.		Appalled that there wasn't more public notice about this meeting.	Consolidated Response INT-1 addresses concerns related to the Notice of Intent (NOI) to prepare an EIS for the proposed Project. Consolidated Response CMT-3 addresses the level of information provided to the public regarding the proposed Project and the draft EIS scoping meeting locations and schedules.
987	1	Getz	John		It would seem logical to assume that a pipeline that reaches such a vast distance would certainly experience great environmental impacts. Adequate maintenance can not be expected, so what is the allowable level of failure to protect the environment?	Impacts associated with construction and normal operation of the proposed Project are presented in the resources sections of Section 3.0 of the EIS. As described in those sections, construction and normal operation of the proposed Project would not result in significant impacts. As described in Consolidated Response SAF-1, the Pipeline and Hazardous Materials Safety Administration (PHMSA) has regulatory requirements that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project in a manner that protects the health and safety of the public and the environment. In addition, PHMSA developed 57 Project-specific Special Conditions that Keystone has agreed to implement. Incorporation of those conditions would result in a Project that would have a degree of safety over any other typically constructed domestic oil pipeline system under current code and a degree of safety along the entire length of the pipeline system similar to that which is required in HCAs as defined in 49 CFR 195.450.. There is not an "allowable level of failure" for the Project, rather Keystone would have to be in compliance with PHMSA regulations that protects the health and safety of the public and the environment.
987	2	Getz	John		The likelihood of a potential disaster from a long list of negative factors ie; earthquakes, forest fires, sabotage, floods, slides, volcanic events, and even the long term subtle shifts in the geological landscape, etc., combined with such a great distance, would definitely insure the highest probability of failure to remain within whatever you decide is "allowable environmental impact".	The PHMSA design requirements take into account many of the types of events mentioned by the commenter, and most are addressed in Section 3.0 of the EIS. Section 3.13 of the EIS addresses reliability and safety issues, including calculations of the probability of a spill from the proposed Project and the potential environmental impacts associated with spills. Wildfires would not affect the buried pipeline. However, if a major wildfire were to occur in the vicinity of valve sites or pump stations, it is anticipated that the system would be shut down for safety. Sabotage is addressed in Consolidated Response TER-1.
1534	1	Getz	Dennis		Upon initial review of the draft environmental impact statement, I believe there are 2 issues that need to be improved. One is that the Emergency Response Plan is in a barebones state, and all first responders, police departments, hospitals, and landowners near the route deserve the security of a well developed plan.	Consolidated Response RES-1 addresses issues related to preparation and review of emergency response plans for the proposed Project.
1534	3	Getz	Dennis		As a state representative in this area, I am interested in making sure that the burdens of any unforeseen accidents do not fall on the local or state governments or taxpayers.	Consolidated Response LIA-1 addresses Keystone's liability if there is a spill of hazardous materials or fuel during construction or a spill of crude oil from the proposed Project.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
853	1	Gibb	Connie		As a major water source for the state of Nebraska, the Ogallala aquifer should never be jeopardized by any means. As a result, the pipeline should not go over this aquifer! No one can say that a leak could not occur.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
853	2	Gibb	Connie		Also, the Sandhills of Nebraska are a natural wonder and should be left alone. Regardless of their research there is no way to rejuvenate the grasses on the Sandhills to keep them from moving.	Identification of sensitive environments crossed by the proposed Project is discussed in Consolidated Response ENV-1 and ENV-3. Issues related to the Sand Hills area are addressed in Consolidated Response ERO-1.
853	3	Gibb	Connie		Why is a FOREIGN pipeline even being discussed to run across the USA so that poor crude oil can be refined to be shipped to other countries? I am very much against any pipeline going through the Sandhills and over the Ogallala aquifer of Nebraska. Find some other means to transport this crude oil or build a refinery to take care of it in Canada!!!	Consolidated Response P&N-8 addresses issues related to shipping Canadian crude oil to refineries that are closer to the source of oil. As noted in Consolidated Response EAS-2 and Section 1.0 of the EIS, Keystone is a U.S. corporation.
124	1	Gibbons	Jeannie		PLEASE do not permit either drilling for oil in the tar sands of Canada or the pipeline expansion associated therewith.	Consolidated Response ENR-1 provides information on the Department of State's environmental review process, the National Interest Determination process, and the need to complete those reviews before approving or denying the Presidential permit for the proposed Project.
124	2	Gibbons	Jeannie		Tar-sands oil emits three times more greenhouse gas during production than conventional gasoline. It requires clear-cutting of ancient forests, sucks up water supplies, and leave behind massive toxic lakes.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project. Consolidated Response GHG-1 addresses GHG life-cycle analyses.
1278	1	Giblin	Vincent	International Union of Operating Engineers	On behalf of the International Union of Operating Engineers, I am writing in support of TransCanada Corporation's proposed Keystone KXL Pipeline project.	Comment acknowledged.
1278	3	Giblin	Vincent	International Union of Operating Engineers	The Operating Engineers represent over 400,000 skilled construction workers and stationary engineers, including many heavy equipment operators who specialize in large scale pipeline projects such as the proposed Keystone KXL project. As you know, the construction industry is suffering unemployment nearing twenty percent in certain market areas. A project the size and scope of the Keystone KXL pipeline will employ thousands of Operating Engineers and other construction crafts in good paying jobs.	Consolidated Response ECO-1 and Section 3.10.2.2 of the EIS address the potential socioeconomic impacts of the proposed Project.
1278	4	Giblin	Vincent	International Union of Operating Engineers	It will generate millions of dollars in tax revenue for state and local governments and significant expenditures, thereby benefitting those areas and residents facing challenges as a result of the economic climate.	Consolidated Response ECO-1 addresses potential socioeconomic impacts, and Consolidated Response TAX-1 addresses concerns regarding taxes.
1278	7	Giblin	Vincent	International Union of Operating Engineers	In terms of environmental impact, we in the Operating Engineers are very experienced in ensuring that the appropriate construction techniques and other mitigation factors are carried out at the construction site along the pipeline right-of-way.	Comment acknowledged.
1278	8	Giblin	Vincent	International Union of Operating Engineers	The Draft Environmental Impact Statement finds that the proposed Keystone KXL project will have "limited adverse environmental impact during construction and operation" and I note that TransCanada has committed to taking all steps in the design, construction, and operation of its pipelines to avoid adverse environmental impact.	Comment acknowledged.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
1278	9	Giblin	Vincent	International Union of Operating Engineers	In light of the many economic and security benefits of moving forward with this project, the International Union of Operating Engineers requests the Department of State to adopt the Draft Environmental Impact Statement and approve the Keystone KXL Pipeline Project.	Comment acknowledged.
306	1	Gibson	Donna		WE CANNOT AFFORD TO THIS IRRESPONSIBLE INVASION OF TEXAS (OR ANYWHERE!) ENVIRONMENTS! THIS MUST BE CURTAILED, STOPPED IN ITS TRACKS!!! DO SOMETHING ELSE!!! THANK YOU!	Consolidated Response ENR-1 provides information on the Department of State's environmental review process, the National Interest Determination process, and the need to complete those reviews before approving or denying the Presidential permit for the proposed Project.
1559	52	Gilbert	Hank		If oil companies have so many safeguards, why is there such a problem in the Gulf?	As described in Consolidated Response GLF-1, the risks associated with the proposed Project are substantially different from those associated with the BP Deepwater Horizon Project. Section 3.13 of the EIS addresses reliability and safety issues, including calculations of the probability of an accidental spill from the Project.
1559	53	Gilbert	Hank		Even if you have shut off valves, some stretches go 40 miles between valves and that is a lot of oil to spill. It would contaminate several acres of land for perpetuity.	The Pipeline and Hazardous Materials Safety Administration (PHMSA) developed 57 Speical Conditions (see Appendix U of the EIS). Special Condition 22 addresses the placement of valves and states that the minimum distance between valves must be 20 miles. As a result, Keystone redesigned the pipeline to meet the requirements of that condition. Consolidated Response OIL-2 describes the maximum volume of a spill which is estimated at about 2.8 million gallons which could cover a few acres of land depending upon topography and vegetation type. However, the impact will not be in perpetuity since most of the contaminate soil would be removed and replaced, and the majority of any remaining oil would be degraded in one to a few years through biological, photooxidation, and other physical/chemical processes to the basic components of carbon, hydrogen, and nitrogen.
1559	54	Gilbert	Hank		Pipeline goes through the richest agricultural land in Texas. Investment value will go down next to a pipeline.	Consolidated Response VAL-1 addresses concerns regarding property values.
1559	55	Gilbert	Hank		Agricultural property value is worthless if have an oil leak.	The effect of an oil spill on property values is addressed in Section 3.13.6.7.
1559	56	Gilbert	Hank		Why refine the oil here where have some of the worst air quality in the country already?	Consolidated Response P&N-1 addresses the need that the Project has been proposed to meet. As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries. Consolidated Response OIL-4 also addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils.
1559	57	Gilbert	Hank		Where are they going to get the water to refine this oil? Lake Columbia.	As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions, discharges, or water use in Gulf Coast refineries.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
1523	1	Giles	Cynthia	EPA	Dear Mr. Fernandez and Ms. Jones: The Environmental Protection Agency (EPA) has reviewed the Draft Environmental Impact Statement (Draft EIS) for the Keystone XL project pursuant to our authorities under the National Environmental Policy Act (NEPA), Council on Environmental Quality (CEQ) NEPA regulations (40 CFR Parts 1500-1508), and Section 309 of the Clean Air Act. We appreciate the substantial efforts by the State Department to solicit broad expert and public input to analyze the potential environmental impacts of the Keystone XL project, and believe the Draft EIS provides useful information and analysis. However, we think that the Draft EIS does not provide the scope or detail of analysis necessary to fully inform decision makers and the public, and recommend that additional information and analysis be provided. The topics on which we believe additional information and analysis are necessary include the purpose and need for the project, potential greenhouse gas (GHG) emissions associated with the project, air pollutant emissions at the receiving refineries, pipeline safety/spill response, potential impacts to environmental justice communities, wetlands and migratory birds.	The EIS provides additional information and analysis on the purpose and need for the project, potential greenhouse gas (GHG) emissions associated with the project, air pollutant emissions at the receiving refineries, pipeline safety/spill response, potential impacts to environmental justice communities, wetlands and migratory birds.
1523	2	Giles	Cynthia	EPA	Project Purpose and Need/Alternatives We are concerned that the Draft EIS uses an unduly narrow purpose and need statement, which leads to consideration of a narrow range of alternatives. The Draft EIS considers issuance of a cross-border permit for the proposed project and to a limited extent, the no-action alternative(i.e., denying the permit). By using a narrow purpose and need statement, the Draft EIS rejects other potential alternatives as not meeting the stated project purpose. While we recognize that an objective of the applicant's proposal is to construct a pipeline to transport oil sands from Canada to Gulf Coast refineries in the United States, we believe the purpose and need to which the State Department is responding is broader. Accordingly, EPA recommends that the State Department frame the purpose and need statement more broadly to allow for a robust analysis of options for meeting national energy and climate policy objectives.	Consolidated Response P&N-7 addresses concerns about the stated purpose of the proposed Project. Consolidated Response P&N-1 addresses the need for the proposed Project.
1523	3	Giles	Cynthia	EPA	In evaluating the need for the project and its alternatives, we also recommend that the discussion include consideration of different oil demand scenarios over the fifty-year project life. This would help ensure that the need for the project is clearly demonstrated. The Draft EIS uses one demand scenario that indicates that with permit denial, the demand for crude oil would continue at a rate such that U.S. refineries "would continue to acquire crude oil primarily from sources other than Canada to fulfill this demand and/or find alternative methods of delivery of Canadian oil sands." We recommend that this discussion be expanded to include consideration of proposed and potential future changes to fuel economy standards and the potential for more widespread use of fuel-efficient technologies, advanced biofuels and electric vehicles as well as how they may affect demand for crude oil.	Consolidated Response P&N-1 addresses the need that the Project has been proposed to meet, including information on crude oil supply and demand from an analysis specific to the proposed Project. DOS consulted extensively with DOE as part of this environmental analysis. The analysis addressed the 20-25-year demand projections which are the longest timeframes typically assessed by EIA, IEA, and other credible expert entities that routinely conduct analyses of energy demand. Energy demand projections extending beyond 20-25 years are highly speculative and as such provide few reliable insights to decision makers. Further, CEQ guidance requires that an agency make "a good faith effort to explain the effects that are not known but are reasonably foreseeable" (40 CFR 1508.8[b]) in the environmental review. The agency is not required to engage in speculation beyond what is reasonably foreseeable.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
1523	5	Giles	Cynthia	EPA	The Draft EIS estimates GHG emissions associated with construction and operation of the pipeline itself and the refining process, although not the GHG emissions associated with upstream oil sands extraction intended for this pipeline or downstream end use. In order to fully disclose the reasonably foreseeable environmental impacts on the U.S. of the Keystone XL project, we recommend that the discussion of GHG emissions be expanded to include, in particular, an estimate of the extraction-related GHG emissions associated with long-term importation of large quantities of oil sands crude from a dedicated source. This would be consistent with the approach contemplated by CEQ's recent Draft NEPA Guidance on Consideration of the Effects of Climate Change and Greenhouse Gas Emissions (February 18, 2010).	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information on current and future production. As noted in that Consolidated Response, without the proposed Project, oil sands development would continue at or above the current level until at least 2020, with or without the proposed Project. Consolidated Response GHG-1 addresses the greenhouse gas life-cycle analyses presented in the EIS. Consolidated Response GHG-5 explains that the DOS assessment of GHG emissions was conducted in accordance with CEQ guidance.
1523	6	Giles	Cynthia	EPA	Extraction and refining of Canadian oil sands crude are GHG-intensive relative to other types of crude oil. Our calculations indicate that on an annual basis, and assuming the maximum volume of 900,000 barrels per day (bpd) of pipeline capacity, annual well-to-tank emissions from the project would be 27 million metric tons carbon dioxide equivalent (MMTCO ₂ e) greater than emissions from U.S. "average" crude. ¹ [900,000 bpd * (181 kgCO ₂ e/bbl - 99 kgCO ₂ e/bbl) * 365 ~ 27 MMTCO ₂ e/yr. Based on average 2005 crude oil lifecycle GHG emissions estimates in EPA's Renewable Fuel Standard (RFS2) final rule (75 FR 14669); also see DOE/NETL. 2009. Petroleum-Based Fuels Life Cycle Greenhouse Gas Analysis - 2005 Baseline Model] Accordingly, we estimate that GHG emissions from Canadian oil sands crude would be approximately 82% greater than the average crude refined in the U.S., on a well-to-tank basis. To provide some perspective on the potential scale of emissions, 27 million metric tons is roughly equivalent to annual CO ₂ emissions of seven coal fired power plants. ² [See, http://www.epa.gov/c1eanenergy/energy-resources/calculator.html (translating 27 MMTCO ₂ e to annual coal plant CO ₂ emissions).]	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information on current and future production. As noted in that Consolidated Response, without the proposed Project, oil sands development would continue at or above the current level until at least 2020, with or without the proposed Project. Consolidated Response GHG-1 addresses GHG life-cycle analyses. Since the time of the draft EIS, DOS has conducted an extensive analysis of potential incremental carbon emissions associated with extraction, transportation, refining and combustion of crude oil that would be transported by the proposed Project. As stated in Section 3.14.3 of the EIS, the full range of incremental GHG emissions estimated across the reference crudes and sub-set of studies is 3 to 17 MMTCO ₂ e annually at the near term initial throughput (of 700,000bpd) or 4 to 21 MMTCO ₂ e annually at the potential throughput (of 830,000 bpd). This overall range of 3 to 21 MMTCO ₂ e is equivalent to annual GHG emissions from the combustion of fuels in approximately 588,000 to 4,061,000 passenger vehicles or the CO ₂ emissions from combusting fuels used to provide the energy consumed by approximately 255,000 to 1,796,000 homes for one year. The differentials presented here are based on life-cycle emission estimates for current or near-term conditions in the world oil market, as can be seen from the reference years used in each report. Over time, however, the GHG emission estimates for fuels derived from both WCSB oil sands crude oils and the reference crude oils are likely to change.
1523	7	Giles	Cynthia	EPA	Based on our review, there is a reasonably close causal relationship between issuing a cross-border permit for the Keystone XL project and increased extraction of oil sands crude in Canada intended to supply that pipeline. Not only will this pipeline transport large volumes of oil sands crude for at least fifty years from a known, dedicated source in Canada to refineries in the Gulf Coast, there are no significant current export markets for this crude oil other than the U.S. Accordingly, it is reasonable to conclude that extraction will likely increase if the pipeline is constructed. While we recognize that other pipeline projects are currently being planned that might bring additional pipeline capacity for oil transport should the Keystone XL project not be constructed,	As discussed in Consolidated Responses CAN-1, EnSys (2010) projections indicate that approval or denial of the proposed Project would have little if any effect on the rate of development in the Canadian oil sands between now and 2030, and further indicates that the rate of oil sands resource development would only be affected if no additional transportation infrastructure is constructed either now or in the future to allow access to WCSB oil sands resources in PADD III or elsewhere. Potential markets for WCSB crude oil are addressed in Sections 1.4 and 4.1 of the EIS.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					these other proposed pipelines appear to still be in the planning stages, and whether and when they will be approved or constructed appears uncertain.	
1523	8	Giles	Cynthia	EPA	We also note that the Draft EIS discusses end use GHG emissions from combustion of refined oil, indicating they would not differ from those of conventional crude. Because they are easily calculated and are of interest to the public in obtaining a complete picture of the GHG emissions associated with the proposed project, it might be helpful to provide a quantitative estimate of these emissions.	Consolidated Response GHG-1 addresses the greenhouse gas life-cycle analyses presented in the revised EIS.
1523	10	Giles	Cynthia	EPA	We appreciate the efforts to predict pollutant emissions from refineries processing crude oil from the proposed project, and recognize that it is likely that some of the oil sands crude from the project would replace declining feedstock at existing refineries, and that some of the oil sands crude would supply newly upgraded or expanded facilities. We also agree with the Draft EIS's conclusion that there may be increases in air emissions from refineries in the area, and we recommend that additional information and analyses be presented to substantiate the conclusion that these increases "would not likely be major (Draft EIS, pp. 3.14-36)." Further, we recommend that additional information be provided concerning potential impacts from emissions associated with events such as start up, shut down, and malfunctions, which are not addressed by existing permits and which may have substantial adverse impacts.	As described in Consolidated Responses P&N-1 and P&N-3, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III. Consolidated Response OIL-4 addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that Consolidated Response, that crude oil is similar in composition and properties to other heavy crude oils that are currently transported within the U.S. pipeline system and similar in composition and properties to other heavy crude oils that are currently refined in PADD III.
1523	11	Giles	Cynthia	EPA	We believe that additional efforts to evaluate potential adverse impacts to surface and ground waters from pipeline leaks or spills, including potential adverse impacts to public water supplies and source water protection/wellhead protection areas, are necessary.	Section 3.13 of the EIS assesses impacts to surface and ground waters from pipeline leaks and spills. It also provides updated spill incident statistics and projections, additional information on composition of the crude oil that would be transported by the proposed Project, and additional information on potential impacts to the Northern High Plains Aquifer system, and other key information. This section addresses reliability and safety issues, including calculations of the probability of a spill from the proposed Project and the potential environmental impacts associated with spills. In addition, to further substantiate conclusions in that section, DOS has developed additional information on spills that reach groundwater in Consolidated Response AQF-3. That response provides information on hypothetical spills from the Project over two areas of the Northern High Plains Aquifer System and also addresses response actions.
1523	12	Giles	Cynthia	EPA	First, we note that in order for the bitumen to be transported by the pipeline, it will be either "diluted with cutter stock (the specific composition of which is proprietary information to each shipper) or an upgrading technology is applied to convert the bitumen to synthetic crude oil." (Draft EIS, pp. 3.13-18). Without more information on the chemical characteristics of the diluents or the synthetic crude, it is difficult to determine the fate and transport of any spilled oil in the aquatic environment. For example, the chemical nature of the diluents may have significant implications for response as it may negatively impact the efficacy of traditional floating oil spill response equipment or response strategies.	Consolidated Response OIL-4 addresses the composition of the Canadian crude oil that would be transported by the proposed Project, including concerns relative to the corrosivity and erosivity of the crude oil. As noted in that Consolidated Response, that crude oil is similar in composition and properties to other heavy crude oils that are currently transported within the U.S. pipeline system and similar in composition and properties to other heavy crude oils that are currently refined in PADD III. Consolidated Response RES-1 addresses issues related to preparation and review of the required emergency response plans for the proposed Project.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
1523	13	Giles	Cynthia	EPA	In addition, the Draft EIS addresses oil in general and as explained earlier, it may not be appropriate to assume this bitumen oil/synthetic crude shares the same characteristics as other oils. This is especially of concern in light of the Draft EIS's statement that "Some characteristics could not be described or distilled from assay data for the example oils for this EIS, including viscosity profiles, proportion of volatile and semi-volatiles compounds, the amount or proportion of PAHs, and toxicity to aquatic organisms based on bioassays." (Draft EIS, pp. 3.13-19)	Consolidated Response OIL-4 addresses the composition of the Canadian crude oil that would be transported by the proposed Project, including concerns relative to the corrosivity and erosivity of the crude oil. As noted in that Consolidated Response, that crude oil is similar in composition and properties to other heavy crude oils that are currently transported within the U.S. pipeline system and similar in composition and properties to other heavy crude oils that are currently refined in PADD III.
1523	14	Giles	Cynthia	EPA	We recommend that a more complete chemical/physical profile of the oil and details describing the processing activities be provided in order to accurately predict the potential impacts to aquatic environment from a spill event. We are also concerned that while the Draft EIS discusses the impacts of oil in general on dissolved oxygen in waters in the event of a spill, it does not emphasize the primary effect of an oil spill, i.e., acute toxicity to the aquatic environment or address the chronic impacts of the undefined poly nuclear aromatic hydrocarbons(PAR). We recommend further information be provided regarding both acute and chronic impacts.	Consolidated Response OIL-4 addresses the composition of the Canadian crude oil that would be transported by the proposed Project, including concerns relative to the corrosivity and erosivity of the crude oil. As noted in that Consolidated Response, that crude oil is similar in composition and properties to other heavy crude oils that are currently transported within the U.S. pipeline system and similar in composition and properties to other heavy crude oils that are currently refined in PADD III. Sections 3.13.5.6 and 3.13.6 provide additional information on the potential impacts of a spill.
1523	15	Giles	Cynthia	EPA	We are concerned that the Draft EIS only uses what the Department of Transportation's Office of Pipeline Safety (OPS) considers a "serious or significant" spill to assess risks, and did not estimate the number of spills that may have caused harm to the waters of the U.S. under the Oil Pollution Act. EPA recommends also using historical data regarding oil spills that caused harm using EPA's regulations (40 CFR 110) and that were required to be reported to the National Response Center. The risk assessment should also address spills from pipeline-related pump stations, breakout tanks and construction activities. In order to better assess the risks of spills, we also recommend that additional information be provided concerning the frequency of pipeline inspections and the methods for inspection by the OPS and Keystone.	Consolidated Response OIL-1 provides a summary of the range of spill frequency estimates addressed in the EIS including estimates derived from the National Response Center (NRC) database. Consolidated Response OIL-2 addresses maximum-sized releases from the Project. Consolidated Response RES-1 addresses issues related to preparation and review of the required emergency response plans for the proposed Project. Consolidated Response SAF-1 describes the regulatory requirements and Project-specific Special Conditions that Keystone would comply with to construct, operate, maintain, inspect, and monitor the proposed Project. It also describes the monitoring, inspections, and reviews of the proposed Project that the Pipeline and Hazardous Materials Safety Administration would conduct to ensure compliance with those regulatory requirements.
1523	16	Giles	Cynthia	EPA	We recommend that additional information be provided to describe the means by which small pipeline leaks would be detected (including those leaks that will not be detected by the proposed Supervisory and Control Data Acquisition System) and the time frames over which a small leak may occur prior to detection and control, as well as the potential volume of oil that would be released before shut-off could occur. We also recommend that information be provided to describe what methods would be employed to patrol the pipeline in search of a possible leak, especially at times of severe weather.	Consolidated Response OIL-3 addresses the leak detection capabilities of the proposed Project, including the SCADA system, supplementary leak detection methods, physical leak detection methods, and concerns related to smaller leaks from the pipeline that may be under the SCADA detection threshold. Consolidated Response SAF-1 describes the regulatory requirements and Project-specific Special Conditions that Keystone would comply with to construct, operate, maintain, inspect, and monitor the proposed Project. It also describes the monitoring, inspections, and reviews of the proposed Project that the Pipeline and Hazardous Materials Safety Administration would conduct to ensure compliance with those regulatory requirements. Information on monitoring and inspection is presented in Sections 2.4 and 3.13.4.5 of the EIS.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
1523	17	Giles	Cynthia	EPA	We are concerned that the Draft EIS only provides a summary of the procedures likely to be included in yet to be developed Emergency Response Plan, and does not provide information about potential Facility Response Plans. We recommend that detailed information regarding these plans, including draft versions of the plans, be provided. More specifically, we also recommend that the draft plans (including the draft Spill Prevention Control and Countermeasure (SPCC) plans, include strategies for responding to bitumen that is mixed with a diluent, which may affect its behavior in water, as described above.	<p>Consolidated Response RES-1 addresses issues related to preparation and review of emergency response plans for the proposed Project. It appears unlikely that the proposed Project would be required to prepare a Facility Response Plan (FRP) under 40 CFR 112.20 for equipment and activities at the pump stations or the Cushing tank farm. Those facilities would not house any non-transportation-related equipment or activities subject to the requirement to prepare and submit an FRP. Further, 40 CFR 112.20 requires an FRP if a facility could reasonably be expected to cause substantial harm to the environment by discharging oil into or on navigable waters or adjoining shorelines; due to the locations of the facilities, they are not expected to do so. However, if EPA makes the determination that any or all of those facilities meet the criteria for an FRP within 40 CFR 112.20, Keystone would be required to prepare and submit an FRP to EPA.</p> <p>As noted in Consolidated Response OIL-4, the Canadian crude oil that would be transported by the proposed Project would be similar to other heavy crude oil transported by pipeline in the U.S. As discussed in Section 3.13.5.1 of the EIS, if a spill occurs, the behavior of the released Canadian crude oil would be the same as that of other heavy crude oils. Therefore, the recovery process and the equipment needed would be the same as those applicable to other heavy crude oils.</p>
1523	18	Giles	Cynthia	EPA	We recommend that more information be provided on proposed measures to reduce the risk of spills in "high consequence areas (HCA)" (49 CFR 195.450) (i.e., populated areas, designated zones around public drinking water intakes, and unusually sensitive ecologically resource areas). In particular, we recommend that the State Department and OPS work with Keystone to ensure that the Integrity Management Plans for these HCAs would be completed before the pipeline would begin operation.	As described in Consolidated Response SAF-1, the Pipeline and Hazardous Materials Safety Administration (PHMSA) has regulatory requirements that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project. In addition, PHMSA developed 57 project-specific Special Conditions (see Appendix U of the EIS) that Keystone has agreed to implement. DOS, in consultation with PHMSA, has determined that incorporation of those conditions would result in a Project that would have a degree of safety over any other typically constructed domestic oil pipeline system under current code and a degree of safety along the entire length of the pipeline system similar to that which is required in high consequence areas (HCAs) as defined in 49 CFR 195.450. 49 CFR 195.452 dictates the schedule for submittal of an integrity management plan by a pipeline operator.
1523	19	Giles	Cynthia	EPA	In order to further reduce the risks of damage to water resources, we recommend including an analysis of the feasibility of increasing the number of mainline valves, which can shut down the pipeline in the event of an emergency, particularly where the pipeline would cross perennial streams or drinking water source aquifers.	Consolidated Response SAF-1 describes the regulatory requirements that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project. Those regulations include requirements for the placement of valves at 49 CFR 195.260. In addition, as noted in Section 3.13.1, Keystone has agreed to incorporate 57 Special Conditions into the proposed Project as requested by PHMSA, including special requirements for valve placement at Special Condition 32 (see Appendix U).
1523	20	Giles	Cynthia	EPA	We also recommend that a description be provided of Keystone's financial assurances for potential liability in the event of a spill, including potential bond amounts that would	Required emergency response plans for the proposed Project are discussed in Consolidated Response RES-1. As discussed in Section 3.13 of the EIS, federal, state, and local

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					be necessary to protect both human health and the environment.	agencies would participate in response activities and soil, surface water, and groundwater cleanup consistent with their authorities and duties under applicable regulations and consistent with the requirements of the Emergency Response Plan and the Pipeline Spill Response Plan. A list of applicable regulations relative to remediation of crude oil spill contamination at the federal and state level is provided in Table 3.13.5-10. Required mitigation for crude oil or oil products spill impacts would be determined by these agencies.
1523	22	Giles	Cynthia	EPA	Environmental Justice We are concerned that the Draft EIS does not fully identify and address the potential for disproportionately high and adverse human health and environmental effects on minority, low income and Tribal populations. Foremost, we believe the methodology for defining minority, low-income and Tribal populations may have underestimated the extent of these vulnerable populations in the project area. When examining the presence of minority and low-income populations that are potentially affected by the proposed project, the Draft EIS compared the percentage of minority and low-income residents in the counties along the proposed pipeline route with State-level percentages. First, we suggest that in addition to using county-level data, census tract data be used to determine the presence of minority, low income and Tribal populations in the project area that may be potentially impacted Second, we recommend comparing this community level data to national U.S. population data in order to ensure that the minority and low-income populations are properly identified. EPA believes that this approach will ensure that the presence of minority and low-income populations are not artificially "diluted" (as discussed in EPA Guidance for Consideration of Environmental Justice in Clear Air Act Section 3.009 Reviews (1999): pp. 12-13) and that the characteristics of the potentially affected communities are identified in order to evaluate potential impacts from the proposed action. We also note that the Draft EIS does not evaluate the environmental justice issues associated with potential impacts to communities in Port Arthur, Texas, where numerous industrial facilities, including chemical plants and a hazardous waste incinerator, are contributing to the residents' overall exposure to contaminants.	As suggested by EPA, the EIS uses census tract data in addition to county data to determine the presence of minority and low income population in the proposed Project 4 mile wide analysis corridor. Also, the EIS considers a 'meaningfully greater' criterion of 120 percent compared to state-wide reference populations. DOS considers comparisons to statewide population levels more appropriate than comparisons to nationwide population levels for linear energy facility projects. As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries. Also see Consolidated Response JUS-1 which addresses potential impacts to minority and low-income populations.
1523	23	Giles	Cynthia	EPA	In addition, we believe that the potential human health impacts associated with both air emissions from refineries and the potential contamination of drinking water supplies from an oil spill have not been fully evaluated. We recommend that the State Department prepare a health risk assessment to specifically address these issues as they relate to low income, minority and Tribal populations.	As discussed in the EnSys 2010 report, the quantity of crude oil refined in PADD III is driven by market conditions and is independent of the existence of the proposed Project. The proposed Project would provide access to WCSB crude oil in PADD III refineries that would supplant supplies from other sources, including Venezuela and Mexico. As discussed in Section 3.13.5.1 of the EIS and Consolidated Response OIL-4, the composition of WCSB crude oils that could be transported by the proposed Project is not dissimilar from other heavy crude oils currently refined in PADD III. There is therefore no credible evidence that implementation of the proposed Project would lead to disproportionate adverse impacts on minority and low income populations near PADD III refineries. Section 3.13.6.7 addresses the potential impacts of an oil spill on minority, low-income, and tribal populations.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
1523	24	Giles	Cynthia	EPA	The Draft EIS identifies 746 acres of aquatic resources that would be affected by pipeline construction and operations, but does not identify impacts associated with ancillary facilities and connected actions, including staging areas, work camps and storage locations. We recommend that additional information be developed to ensure that a complete estimate of potential impacts is provided. In addition, we recommend that the potential impacts of converting forested and scrub-shrub wetlands to herbaceous wetlands be evaluated, as well as appropriate mitigation measures to address these impacts. In general, the EIS should identify how wetland impacts would be avoided and minimized, to the maximum extent practicable, and how unavoidable wetland impacts would be compensated for through wetland restoration, creation, or enhancement.	<p>Section 3.4 of the EIS has been revised to include an updated discussion of the ongoing USACE wetland review process under Section 404 of the Clean Water Act. Each USACE district would be consulted to determine the kind of compensatory mitigation would be required for losses of aquatic resources, including the permanent conversion of forested wetland to herbaceous wetland. Pre-construction notification packages would include the mitigation plans agreed upon with the USACE. Preliminary mitigation discussions with the USACE districts have identified the following mitigation options for the project:</p> <ul style="list-style-type: none"> USACE Omaha District (Montana, South Dakota, and Nebraska) - Compensatory mitigation for permanent wetland impacts would follow state-specific protocol established by field offices in Montana, South Dakota, and Nebraska. USACE Tulsa District (Oklahoma) - Compensatory mitigation for permanent wetland impacts to forested and other wetlands could include combinations of any of several different mitigation strategies. Refer to Tulsa District Mitigation and Monitoring Guidelines at: http://www.swt.usace.army.mil/permits/Documents%20-%20Mitigation/M&MG.pdf. Mitigation banking is not available in the Tulsa District in the vicinity of the proposed Project. <p>USACE Fort Worth and Galveston Districts (Texas) - Compensatory mitigation for permanent wetland impacts would be based on the results of functional wetland assessments completed for all anticipated impacts to forested wetlands which would be used to determine an appropriate number of wetland credits to be purchased from USACE-approved wetland mitigation banks in proximity to the proposed Project.</p>
1523	25	Giles	Cynthia	EPA	EPA also recommends that the State Department assess the potential impacts to migratory bird populations in the U.S. from oil sands extraction activities associated with the proposed project. An estimated 30% of North America's land birds breed in the boreal forests of Canada and Alaska (Saving Our Shared Birds: Partners in Flight Tri-National Vision for Landbird Conservation. Cornell Lab of Ornithology: Ithaca, NY: 2010). As recognized by this recently released study, sponsored in part by the U.S. Fish and Wildlife Service, effects on bird populations in the boreal forest can be felt throughout the birds' migratory range, including wintering grounds in the United States. While we appreciate that the Keystone has agreed to develop a "Migratory Bird Mitigation Plan" in consultation with U.S. Fish and Wildlife Service, it appears that this plan would only address potential impacts from construction activities in the U.S.	Section 3.14.4 of the EIS was revised in response to this comment to add a discussion of Canada's regulation of migratory bird impacts. The provincial government of Alberta and the Canadian government address potential impacts due to construction of the Project in Canada. Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project. Consolidated Response ENV-4 addresses issues related to oil sands production and migratory birds.
1523	28	Giles	Cynthia	EPA	We appreciate the inclusion of estimates of GHG emissions from the pipeline construction and operation. With regard to GHG emissions from refining, we recognize that incremental GHG emissions will depend on the feedstock being replaced, and we appreciate the efforts to provide an estimate in the Draft EIS. Given the potential large volumes of emissions, we	Since the time of the draft EIS, DOS has conducted an extensive analysis of potential incremental carbon emissions associated with extraction, transportation, refining and combustion of crude oil that would be transported by the proposed Project. As stated in Section 3.14.3 of the EIS, the full range of incremental GHG emissions estimated across the

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					recommend that the State Department explain in more detail the reasons for the very large range (i.e., 1.3 to 17.2 million tons of CO2) of the estimate, and provide complete citations for the data and analyses used (i.e., the BP Whiting data, the Natural Resources Defense Council analysis, and the University of Toronto study). In addition, we recommend that the State Department provide information that would allow decision makers to understand the total, as well as incremental, GHG emissions expected from refining the oil sands.	reference crudes and sub-set of studies is 3 to 17 MMTCO2e annually at the near term initial throughput (of 700,000bpd) or 4 to 21 MMTCO2e annually at the potential throughput (of 830,000 bpd). This overall range of 3 to 21 MMTCO2e is equivalent to annual GHG emissions from the combustion of fuels in approximately 588,000 to 4,061,000 passenger vehicles or the CO2 emissions from combusting fuels used to provide the energy consumed by approximately 255,000 to 1,796,000 homes for one year. The differentials presented here are based on life-cycle emission estimates for current or near-term conditions in the world oil market, as can be seen from the reference years used in each report. Over time, however, the GHG emission estimates for fuels derived from both WCSB oil sands crude oils and the reference crude oils are likely to change.
1523	29	Giles	Cynthia	EPA	EPA recommends that the revised Draft EIS provide additional information and analysis regarding potential emissions of pollutants at the receiving refineries and other associated facilities. EPA is prepared to assist the State Department in this analysis; as a first step, we recommend compiling the following information: 1) Describe the expected composition (crude slate) of the oil sands crude that will be transported through the pipeline, including sulfur and nitrogen content. 2) Describe whether the oil sands crude is pre-processed in Canada before shipment, and if so, describe the expected pre-processing and the expected characteristics of the crude before and after the pre-processing.	Consolidated Response OIL-4 addresses the composition of the Canadian crude oil that would be transported by the proposed Project, including concerns relative to the corrosivity and erosivity of the crude oil. As noted in that Consolidated Response, that crude oil is similar in composition and properties to other heavy crude oils that are currently transported within the U.S. pipeline system and similar in composition and properties to other heavy crude oils that are currently refined in PADD III. As described in Consolidated Responses P&N-1 and P&N-3 construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries.
1523	30	Giles	Cynthia	EPA	3) Indicate which of the following refineries are anticipated to have direct access to the proposed project, have contracted to receive the oil sands crude and in what quantities. ConocoPhillips, Ponca City, OK Sinclair/Holly, Tulsa, OK Sunoco/Holly, Tulsa, OK Valero, Ardmore, OK Wynnewood Refining, Wynnewood, OK Motiva, Port Arthur, TX Total, Port Arthur, TX Valero, Port Arthur, TX ExxonMobil, Beaumont, TX Pasadena Refining, Pasadena, TX Houston Refining, Houston, TX Valero, Houston, TX Deer Park Refining, Deer Park, TX ExxonMobil, Baytown, TXBP, Texas City, TX Marathon Oil, Texas City, TX Valero, Texas City, TX Calcasieu, Lake Charles, LACITGO Lake Charles, LA ConocoPhillips, Lake Charles, LA 4) Indicate which of the refineries listed above are expected to receive oil sands crude from the proposed project but do not currently appear to have agreements in place.	Section 3,14,3 of the EIS includes information regarding the locations of refineries in PADD II and PADD III that could receive WCSB crude oil transported by the proposed Project.
1523	31	Giles	Cynthia	EPA	5) Indicate whether the refineries that receive the oil sands crude from the project are expected to use it to replace existing supplies; if so, provide available information on the current crude slate utilized at these refineries, including sulfur and nitrogen content.	Section 3,.14.3 includes the relevant analysis of existing crude slate quality related to potential emissions associated with the crude slate quality in the event the proposed Project were implemented. As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
1523	32	Giles	Cynthia	EPA	6) Indicate how many U.S. refineries already receive oil sands crude and whether they have been required to apply for new or modified permits; if so, indicate what type of refinery upgrades have been required and how have emissions been affected after they began processing the oil sands crude oil	Section 3.,14.3 includes the relevant analysis of existing crude slate quality related to potential emissions associated with the crude slate quality in the event the proposed Project were implemented. As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries.
1523	33	Giles	Cynthia	EPA	We also recommend that the revised Draft EIS provide information as to whether any new storage capacity would be required in Port Arthur or at the Moore Junction in Harris County, and whether any additional air permits for processing the crude oil would be required in Beaumont/Port Arthur, Texas and in Harris County, Texas. We recommend that the potential for air quality impacts associated with increased emissions from storage and processing be addressed in the revised Draft EIS.	The proposed Project does not include additional storage capacity in the Port Arthur area or at Moore Junction. The only storage facilities associated with the proposed Project are at the Cushing tanks farm as discussed in the EIS. As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries. Consolidated Response OIL-4 also addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils.
1523	34	Giles	Cynthia	EPA	With regard to air quality impacts from construction activities, while these emissions maybe temporary, we do not believe it is appropriate to conclude that the construction activities would not significantly affect local or regional air quality without a full analysis. We appreciate the inclusion of an emission inventory for construction and operation of the proposed project; however, since the Draft EIS does not present an air quality impact analysis of these potential emissions, the potential for localized impacts or impairment on Class I areas is not clear. We note that the cumulative 3-year construction emissions depicted in Table 3.12.1-9 are significant (e.g., 1,142 tons NOx), but since these figures are presented at project-wide scale, the potential impacts to the individual Class I and Sensitive Class II areas are not apparent. We recommend that the revised Draft EIS provide emissions information on a more useful scale, such as per spread (the Draft EIS states that the project will be built in 17 spreads) and make clear what distance and time the emissions are spread over. EPA recommends that the revised Draft EIS include a detailed emissions control plan to address concerns related to the potential impacts of particulate matter emissions, as well as diesel emissions. The existing fugitive dust control plan presented in the Draft EIS contains some reasonable types of emission controls, such as water trucks; however, the level of detail currently provided may not ensure protection of air quality. We also recommend that the emissions control plan identify when mitigation measures would take effect, the duration of mitigation measures, and how compliance with the plan would be ensured.	As discussed in Section 3.12.1.2, if a new source or major modification to an existing source is subject to the PSD program requirements and is within 62 miles (100 kilometers) of a Class I area, the facility is required to notify the appropriate federal officials and assess the impacts of the proposed project on the Class I area. There are Class I areas within 62 miles of the Project right-of-way in North Dakota, South Dakota, and Montana. However, the proposed Project does not include construction or operation of significant stationary sources of air pollutants subject to the PSD program requirements. Based on these distances, it is not expected that the Project would affect haze at any Class I or Sensitive Class II areas. The Keystone Construction, Mitigation, and Reclamation Plan presented in Appendix B to the EIS provides further details on dust control mitigation measures.
1523	35	Giles	Cynthia	EPA	We recommend that the revised Draft EIS clarify the time period used to quantify the estimated emissions associated with the electrical pumps that will be used at the pump stations	There would be no direct emissions from the pumps as they are electric. The emissions listed for CO2-e are related to the use of vehicles by maintenance personnel traveling to and

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					-see Table 3.12.1-10 (Estimated Direct Emissions for the Project).	from the pump stations periodically. The EIS has been revised to provide a footnote to the table to clarify the CO2-e emissions information. The VOC emissions listed are in tons per year for all 30 pump stations as noted in footnote c to Table 3.12.1-10.
1523	36	Giles	Cynthia	EPA	Pipeline Safety/Spill Response It is critical that surface and ground water protection, particularly protection of public water supplies and source water protection/wellhead protection areas, receive high priority in the NEPA analysis and decision making. In many areas of potential project routing, the shallow alluvial ground water systems may be the only sources of potable water for public and rural domestic use. All appropriate precautions and actions to reduce the probability of a spill or leak occurring, to reduce the magnitude of a spill or leak, and to otherwise mitigate the adverse consequences of such an event, should be taken.	Consolidated Response SAF-1 describes the regulatory requirements and Project-specific Special Conditions that Keystone would comply with to construct, operate, maintain, inspect, and monitor the proposed Project. It also describes the monitoring, inspections, and reviews of the proposed Project that the Pipeline and Hazardous Materials Safety Administration would conduct to ensure compliance with those regulatory requirements. Issues related to aquifers along the proposed Project corridor are addressed in Consolidated Responses AQF-1 through AQF-4. Consolidated Response RES-1 addresses issues related to preparation and review of the required emergency response plans for the proposed Project. Required emergency response plans for the proposed Project are discussed in Consolidated Response RES-1. As discussed in Section 3.13 of the EIS, federal, state, and local agencies would participate in response activities and soil, surface water, and groundwater cleanup consistent with their authorities and duties under applicable regulations and consistent with the requirements of the Emergency Response Plan and the Pipeline Spill Response Plan. A list of applicable regulations relative to remediation of crude oil spill contamination at the federal and state level is provided in Table 3.13.5-10. Required mitigation for crude oil or oil products spill impacts would be determined by these agencies.
1523	38	Giles	Cynthia	EPA	Additionally, oil products may be present in any water used to hydrostatically test the pipeline prior to being placed in service. We recommend that the revised Draft EIS provide information on the potential impacts, if any, from discharges of hydrostatic testing water, which may be used to pressurize the pipeline.	Section 3.0 of the EIS addresses impacts related hydrostatic testing. As noted in the EIS, the discharge of hydrostatic test water would be accomplished in compliance with water quality regulations in each of the states traversed by the proposed route.
1523	39	Giles	Cynthia	EPA	The revised Draft EIS should include the applicable standards from the list presented in 49 CFR 195.3 that are specific to breakout tanks.	The concern that any non-transportation related breakout tanks relates to the potential requirement of the submission and, in some cases approval, of a Facility Response Plan (FRP) as required under 40 CFR 112.20. However, it appears unlikely that the proposed Project would be required to submit an FRP under 40 CFR 112.20 for equipment and activities at the pump stations, the Cushing tank farm, or the surge relief tanks at the Nederland delivery point. Those facilities would not house any non-transportation-related equipment or activities subject to the requirement to prepare and submit an FRP. Further, 40 CFR 112.20 requires an FRP if a facility could reasonably be expected to cause substantive harm to the environment by discharging oil into or on the navigable waters or adjoining shorelines. However, if EPA makes the determination that any or all of those facilities meet the criteria for an FRP within 40 CFR 112.20, Keystone would be required to prepare and submit an FRP to EPA for review.
1523	40	Giles	Cynthia	EPA	To properly characterize the operating history with respect to	It is likely that all of the enforcement cases/actions referred to

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					environmental impacts (and specifically to waters of the U.S.), we recommend that there be a discussion of enforcement cases/actions related to pipeline oil discharges (or pipeline related pump stations or construction activities) which caused harm, as defined by 40 CFR 110, and were required to be reported to the National Response Center. We recommend that the revised Draft EIS presents oil spills (discharges) in the context of both Department of Transportation (DOT) and EPA enforcement of oil spill cases.	<p>by the commenter were reported to the Pipeline and Hazardous Materials Safety Administration (PHMSA) as required in 49 CFR 195. As a result, those incidents are presumed to be in the PHMSA incident database and have already been considered in the risk analysis and spill frequency analyses presented in Section 3.13 of the EIS.</p> <p>The impacts of those cases are addressed by the summaries of potential impacts presented in Sections 3.13.5.5 and 3.13.6 of the EIS and the assessment of impacts from a spill of crude oil from the Project is based on the findings of impacts due to other oil spills, including the results of natural resource damage assessments. This also includes information from spills that caused injury and were reported to the National Response Center (NRC). The assessment of potential impacts presents a summary of those findings and covers a wide range of potential release sizes. An estimate of the number of spills that may have caused harm to the waters of the U.S. under the Oil Pollution Act would have, at most, limited bearing on either the likelihood of a spill from the proposed Project or the assessment of impacts due to a release from the Project and that information is not included in the EIS. However, the spill frequency discussion in Section 3.13.1.2 of the EIS has been updated to include data from the EPA NRC database.</p>
1523	41	Giles	Cynthia	EPA	We recommend that the revised Draft EIS clarify that there are a significant number of requirements in 40 CFR 112 in addition to the requirement for containment at SPCC regulated facilities. In addition, we recommend that the revised Draft EIS clarify that the construction operations may require the development of SPCC plans per 40 CFR112, and that a discussion of the reporting procedures for oil discharges under 40 CFR110 for these construction activities be provided. Finally, please use 40 CFR 112 as the correct citation for EPA's regulation that applies for spill prevention.	Section 3.13.1.2 of the EIS has been updated with relevant information on construction and operations spill reporting requirements and procedures. Additionally, Consolidated Response RES-1 addresses issues related to preparation and review of the required emergency response plans for the proposed Project.
1523	42	Giles	Cynthia	EPA	We recommend that analysis of the potential of impacts of oil spill discharges be revised to reflect information available in Natural Resource Damage Assessments(NRDAs) conducted by Federal Trustees in response to major pipeline incidents. The current discussion in the Draft EIS is limited with regard to actual documented impacts, and we suggest these NRDAs, several of which have been generated in response to major oil spills from pipelines, be reviewed and used as a source for information regarding the environmental impacts from pipeline oil spills.	NRDA Damage and Restoration Plans (DARPs) are general sources that were used for the overall analysis. The third-party contractor to the Department of State has been involved in the majority of oil spill incidents for which a DARP was prepared. However, most DARPs do not contain detailed data and other relevant information that quantitatively or specifically document the impacts. Further, the information on the NOAA or U.S. Fish and Wildlife Service (and some states such as California) web sites usually does not contain many of the basic injury assessment reports that form the basis of the DARP.
1523	43	Giles	Cynthia	EPA	We recommend that the revised Draft EIS clarify that the SPCC plans only apply to the non-transportation related equipment and activities at pump stations and breakout tank farms and to pipeline construction activities. The SPCC plan employs measures to prevent spills and mitigate spills on the facility grounds in order to prevent oil discharges to waters of the US. The pipeline itself is regulated by DOT and response preparedness is addressed by the plans required by DOT	DOS has revised the EIS to provide the requested information regarding the SPCC plan.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					under 49 CFR 194. It should be noted however, these plans should be shared with EPA response personnel (On Scene Coordinators) in the EPA Regions because EPA is typically the federal responder to inland pipeline spills and responsible for inland area planning required in the National Contingency Plan, 40 CFR 300.	
1523	44	Giles	Cynthia	EPA	Finally, non-transportation related equipment and activities at pump stations breakout tank farms may require the submission and some cases, approval, of a Facility Response Plan (FRP) as required under 40 CFR 112.20. In addition, the spill reporting procedures in the Draft SPCC plan should be expanded to include procedures to report to federal and local responders, in addition to the NRC and state responders.	It appears unlikely that the proposed Project would be required to prepare a Facility Response Plan (FRP) under 40 CFR 112.20 for equipment and activities at the pump stations or the Cushing tank farm. Those facilities would not house any non-transportation-related equipment or activities subject to the requirement to prepare and submit an FRP. Further, 40 CFR 112.20 requires an FRP if a facility could reasonably be expected to cause substantial harm to the environment by discharging oil into or on navigable waters or adjoining shorelines; due to the locations of the facilities, they are not expected to do so. However, if EPA makes the determination that any or all of those facilities meet the criteria for an FRP within 40 CFR 112.20, Keystone would be required to prepare and submit an FRP to EPA. Keystone has revised its draft SPCC Plan to include the requested text.
1523	45	Giles	Cynthia	EPA	Spill Response Equipment As mentioned earlier, without the actual data explaining the oil's chemical and physical characteristics, the efficacy of traditional "floating oil" spill response equipment is in question. Again, this reflects the importance of obtaining all relevant information related to the bitumen oil/synthetic crude's chemical and physical characteristics.	As discussed in Consolidated Response OIL-4 and in Section 3.13.4 of the EIS, the Canadian crude oil that would be transported by the proposed Project would be similar to other heavy crude oil transported by pipeline in the U.S. Therefore, if a spill occurs, the behavior of the released Canadian crude oil would be similar to that of other heavy crude oils.
1523	46	Giles	Cynthia	EPA	Because the exact composition of the P AH content of the oil is not documented, it is difficult to determine any long-term risks from a spill to the aquatic environment. In addition, there is no analysis of impacts to downstream water intakes (both industrial and municipal), nor recognition that oil spills reaching these intakes may impact fire-fighting capabilities at the facility or municipality.	Sections 3.13.5 and 3.13.6 of the EIS have been revised to include additional information on the composition of WCSB crude oils that could be transported by the proposed Project.
1523	48	Giles	Cynthia	EPA	EPA recommends that the revised Draft EIS analyze whether minority, low income and Tribal populations, may be exposed to greater risks from air emissions from the project, with a specific focus on emissions from refineries receiving oil sands. We recommend that the revised Draft EIS include a health risk assessment to address these issues.	As discussed in the EnSys (2010) report, the quantity of crude oil refined in PADD III is driven by market conditions and is independent of the existence of the proposed Project. The proposed Project would provide access to WCSB crude oil in PADD III refineries that would supplant supplies from other sources, including Venezuela and Mexico. As discussed in Section 3.13.5.1 of the EIS and Consolidated Response OIL-4, the composition of WCSB crude oils that could be transported by the proposed Project is not dissimilar from other heavy crude oils currently refined in PADD III. There is therefore no credible evidence that implementation of the proposed Project would lead to disproportionate adverse impacts on minority, low-income, and tribal populations near PADD III refineries.
1523	49	Giles	Cynthia	EPA	We recommend additional analysis of whether minority, low income and Tribal populations may be especially vulnerable to drinking water contamination from oil spills because they often	Section 3.13.6.7 has been revised to address the potential impacts of an oil spill on minority and low-income populations.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					obtain their drinking water from private wells or small public water supply systems for which monitoring and treatment of contaminants may be limited or nonexistent. In performing this analysis, we recommend that the same "region of influence" be used to evaluate potential impacts for both public and private water supplies.	
1523	50	Giles	Cynthia	EPA	We recommend that information and data produced for Local Emergency Response Planning Committees, created pursuant to the Emergency Response Planning and Community Right to Know Act, be evaluated to determine available response capacity of those counties that have meaningfully greater minority, low income and Tribal populations.	Sections 3.10.1.1 and 3.10.1.2 of the EIS have been revised to provide information on Local Emergency Planning Committees (LEPCs).
1523	51	Giles	Cynthia	EPA	EPA is concerned that access to medical facilities' for minority, low-income and Tribal populations may not have been fully evaluated; these populations may be especially vulnerable to human health impacts of oil spills due to their lack of access to medical care, combined with potential health disparities. EPA recommends that the revised Draft EIS evaluate these potential impacts and means to minimize or mitigate the impacts in those counties that are designated as medically underserved areas.	Section 3.10 of the EIS has been expanded to include information on potential impacts on minority and low-income populations in areas that could be underserved by health professionals, available medical facilities, or other health services. The minority and low-income populations identified in this analysis were compared to locations along the proposed Project corridor that are listed on the Health and Human Services (HHS) Health Resource Services Administration (HRSA) website. Areas designated as Health Professional Shortage Areas (HPSA) and Medically Underserved Areas/Populations (MUA/P) in counties that contain census block groups with one or more minority and/or low-income population identified in this assessment are presented in Table 3.10.1-18 and Figures 3.10.1-7 through 3.10-1-13 of the EIS.
1523	52	Giles	Cynthia	EPA	We recommend that as the State Department continues the NEPA process it ensure that efforts are taken to provide meaningful opportunities for public involvement, including measures to address populations that are linguistically or culturally isolated, and ensuring full accessibility of NEPA documents to minority, low income and Tribal populations. Translation of selected documents may be important for public involvement and also for developing mitigation measures in those areas where a significant percentage of the households speak a language other than English at home. We also recommend that the revised Draft EIS provide a summary of the efforts taken to inform and involve low income, minority and Tribal populations. In addition, we recommend that an Enhanced Public Participation Plan be developed that would provide up-to-date information to communities during project construction and operation.	Section 3.10 of the EIS has been revised to provide information on outreach to minority and low income populations. Section 3.13 of the EIS has also been revised to include concerns relative to emergency response planning for minority and low income populations.
1523	53	Giles	Cynthia	EPA	EPA recommends that the State Department provide additional information regarding its efforts to consult with Tribal governments, along with measures to address issues raised by non-federally recognized Tribes. We also recommend that impacts to Tribal populations and communities that are associated with their conditions of poverty be further evaluated, including potential impacts due to subsistence consumption of fish, wildlife and vegetation that may be contaminated by oil spills, potential endangerment of drinking water sources, and language/cultural barriers which may impede capacity for public involvement in developing	Consolidated Response CUL-1 and Section 3.11.4.3 of the EIS address the consultation process between DOS and Indian tribes. As noted in Consolidated Response CUL-1, a Programmatic Agreement (PA) has been developed for the Project under Section 106 of the National Historic Preservation Act. The PA includes mitigation measures for known adverse effects and provides a process for ongoing surveys to be conducted in areas where access was not granted during the EIS process. The Traditional Cultural Property (TCP) reports (noted in Section 3.11.4-3 of the EIS) may not be disclosed due to concerns regarding confidentiality. Potential impacts to

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					mitigation measures.	cultural resources are addressed in Section 3.11.3.1 of the EIS. DOS considers this assessment to be in compliance with NEPA environmental review requirements.
1523	54	Giles	Cynthia	EPA	The Draft EIS discussion of impacts to Tribes is limited to an identification and count of the number of counties with a higher percentage of Native Americans than the state percentage, and a section on archaeological resources, historic resources (buildings, structures, objects, and districts), and properties of religious and cultural significance, including Traditional Cultural Properties (TCPs). The Draft EIS does not address potential impacts to Tribal members and communities along the pipeline, or to Tribal culture and traditional practices. We recommend a more rigorous analysis of potential for impact to Tribes be included in a revised Draft EIS. For example, in some areas, impacts may be compounded by the presence of poverty and the high percentage of Native Americans. Coal, Hughes, Okfuskee, Seminole, and Pontotoc Counties in Oklahoma have both high percentages of Native American residents (in contrast with the state's percentage) and high poverty levels. Nacogdoches County in Texas also has a high percent of Native Americans compared with the State, as well as a relatively high poverty level. In these areas, a large portion of the population may rely on hunting, fishing, gathering and other means of subsistence due to both tradition and necessity. They may be disproportionately impacted by spills that reach waters and impact fisheries, or affect areas where food is traditionally obtained.	Consolidated Response CUL-1 and Section 3.11.4.3 of the EIS address the consultation process between DOS and Indian tribes. As noted in Consolidated Response CUL-1, a Programmatic Agreement (PA) has been developed for the Project under Section 106 of the National Historic Preservation Act. The PA includes mitigation measures for known adverse effects and provides a process for ongoing surveys to be conducted in areas where access was not granted during the EIS process. The Traditional Cultural Property (TCP) reports (noted in Section 3.11.4-3 of the EIS) may not be disclosed due to concerns regarding confidentiality. Potential impacts to cultural resources are addressed in Section 3.11.3.1 of the EIS. DOS considers this assessment to be in compliance with NEPA environmental review requirements.
1523	55	Giles	Cynthia	EPA	We recommend that the revised Draft EIS clarify the extent of Indian country lands potentially impacted by the proposed project, including Tribal trust and allotted Tribal member land. We also recommend that the revised Draft EIS address the potential impacts to areas where Tribes may have unadjudicated claims to water bodies that could be affected by spills from the proposed pipeline (e.g., Clear Boggy and its tributaries in Coal County, Oklahoma).	No Indian tribal trust lands, allotments, or Indian reservations would be crossed by the proposed Project. Consolidated Response CUL-1 and Section 3.11 of the EIS address protection of historic properties and the consultations conducted in compliance with Section 106 of the National Historic Preservation Act, including consultation with Indian tribes. Potential impacts to cultural resources and water resources due to a spill are addressed in Sections 3.13.6.3 and 3.13.6.6 of the EIS.
1523	56	Giles	Cynthia	EPA	Finally, we recommend that additional information be provided regarding potential impacts to the Arbuckle Simpson aquifer in Oklahoma, which is located east of the proposed pipeline route. In particular, we recommend including specific information regarding the distance of the pipeline to the aquifer, the direction of groundwater flow in the area, and the potential for a plume from an underground leak to reach the aquifer.	From the center line of the proposed Project, the eastern extent of the Arbuckle-Simpson aquifer is approximately 12 miles to the west. Based on studies and hypothetical spill scenarios evaluated by the applicant, the Arbuckle-Simpson aquifer is not at risk due to potential spills. Issues related to aquifers along the proposed Project corridor are addressed in Consolidated Responses AQF-1 through AQF-4.
1523	57	Giles	Cynthia	EPA	Wetlands Pursuant to 33 CFR 332.4 and 40 CFR 230.94, Compensatory Mitigation for Losses of Aquatic Resources (Mitigation Rule), a compensatory mitigation plan must be submitted and approved by U.S. Army Corps of Engineers (USACE) before issuance of an individual CW A Section 404 permit. EPA recommends that the USACE/EP A regulations that address compensatory mitigation for losses of aquatic resources be reviewed, and that compensatory mitigation consistent with these regulations (73 Fed. Reg. 19594, April 10, 2008,	Section 3.4 of the EIS has been revised to include an updated discussion of the ongoing USACE wetland review process under Section 404 of the Clean Water Act. Each USACE district would be consulted to determine the kind of compensatory mitigation would be required for losses of aquatic resources, including the permanent conversion of forested wetland to herbaceous wetland. Pre-construction notification packages would include the mitigation plans agreed upon with the USACE. Preliminary mitigation discussions with the USACE districts have identified the

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					http://www.usace.army.mil/CECWIPages/final_cmr.aspx be developed that will adequately compensate for potential losses of wetland functions and services from pipeline construction and operation along the entire route be included in the revised Draft EIS. Additionally, we recommend that the revised Draft EIS include a conceptual wetland monitoring plan that would, throughout a period of time (normally five years), direct field evaluations of those wetlands crossed by the pipeline to assure wetland functions and values are recovering. The monitoring plan should also include the wetland mitigation sites. EPA prefers wetland mitigation take place in areas as close to the project site as practicable (i.e., in close proximity and, to the extent possible, the same watershed) in order to replace lost functions and services.	<p>following mitigation options for the project:</p> <ul style="list-style-type: none"> USACE Omaha District (Montana, South Dakota, and Nebraska) - Compensatory mitigation for permanent wetland impacts would follow state-specific protocol established by field offices in Montana, South Dakota, and Nebraska. USACE Tulsa District (Oklahoma) - Compensatory mitigation for permanent wetland impacts to forested and other wetlands could include combinations of any of several different mitigation strategies. Refer to Tulsa District Mitigation and Monitoring Guidelines at: http://www.swt.usace.army.mil/permits/Documents%20-%20Mitigation/M&MG.pdf. Mitigation banking is not available in the Tulsa District in the vicinity of the proposed Project. <p>USACE Fort Worth and Galveston Districts (Texas) - Compensatory mitigation for permanent wetland impacts would be based on the results of functional wetland assessments completed for all anticipated impacts to forested wetlands which would be used to determine an appropriate number of wetland credits to be purchased from USACE-approved wetland mitigation banks in proximity to the proposed Project.</p>
1523	58	Giles	Cynthia	EPA	The Draft EIS states "Implementation of measures in Keystone's Construction, Mitigation and Reclamation (CMR) Plan (Appendix B) would avoid or minimize most impacts on wetlands associated with construction and operation activities: and would ensure that potential effects would be primarily minor and short term." Impacts to forested wetlands are long-term and would be considered permanent. We recommend that Keystone work with each EPA Region and USACE district to determine what kind of compensation would be required for the permanent conversion of forested wetland to herbaceous wetland, and Keystone continue to work with the EPA Regions and the USACE Districts to develop a Wetland Mitigation Plan for review and consideration in the revised Draft EIS.	Permanent wetland impacts and requirements for compensatory mitigation will be determined during permitting under the U.S. Army Corps of Engineer Section 404 permits. See additional discussion of this issue in general Consolidated Response WAT-2.
1523	59	Giles	Cynthia	EPA	We recommend that the revised Draft EIS provide additional information on the proposed widths of construction zones and right-of-ways for all wetland crossings, along with a clearer explanation of which wetland areas will be re-vegetated and which will not allow reestablishment of scrub-shrub and forested wetlands.	Wetland summaries presented in the EIS reflect proposed widths for construction zones and ROW. All wetlands will be allowed to revegetate. Those areas that would be maintained in a herbaceous state reflecting conversion of wetlands from scrub-shrub of forested wetlands are quantified as "Wetland Area Affected by Operations" in Section 3.4.
1523	60	Giles	Cynthia	EPA	In addition, we recommend including a clearer explanation of which wetlands are considered "of special concern and value" and which are considered "standard," as well as the management implications of those designations. Of particular importance are impacts to prairie pothole wetlands and bottomland hardwood forested wetlands, as these resources are of generally high ecological importance and difficult to replace on the landscape. Whenever practicable, potential impacts to prairie pothole wetlands should be avoided using horizontal directional drilling (HDD) techniques, rather than trenching.	Wetlands of special concern or value are described in Section 3.4.2. Additional descriptions are provided in Section 3.5.2.1 under Native Grasslands. Wetlands of special concern or value are those identified by federal or state agencies during scoping and review of the EIS. Potential Proposed Project impacts to wetlands of special concern or value are listed in Table 3.4.2-1. No wetlands were specifically identified during the environmental review process for crossing using Horizontal directional drilling; although most HDD crossings of rivers and streams are designed to cross under and avoid riparian forests and riverine wetlands.
1523	61	Giles	Cynthia	EPA	We recommend that the revised Draft EIS provide additional	The EIS was revised to reflect the current status of permanent

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					information on the status of the efforts to avoid locating specific mainline valves in wetland areas.	facilities within wetland areas. See Section 3.4 of the EIS for further information on wetland impacts and mitigation.
1523	62	Giles	Cynthia	EPA	The Draft EIS indicates that there are nine forested wetland crossings in Oklahoma and 78 in Texas, and a total of 261 acres of forested wetlands will be affected during construction and 137 acres will be affected by pipeline operation. However, these estimates do not include the number of acres disturbed by associated access roads or construction camps; we recommend that these estimates be revised to include all potential impacts.	Estimated impacts from ancillary facilities outside of the 110-foot ROW were added to the wetland analysis. Most ancillary facilities are sited outside of wetlands and away from streams and total impacts to wetlands from these facilities are estimated at less than 30 acres or temporary impact during construction and about 11 acres of permanent impact during operations (see added Tables 3.4.3-3 and 3.4.3-4.) Keystone is currently consulting with the State of Nebraska concerning permanent wetland impacts at Pump Station 22. Most wetlands would be restored after pipeline construction. Mitigation for wetland losses are negotiated during the permitting process as discussed in general Consolidated Response WAT-2.
1523	63	Giles	Cynthia	EPA	We also recommend that the revised Draft EIS address compliance with E.O. 11990 (Protection of Wetlands), including the requirement to ensure mitigation of unavoidable impacts to all wetlands and waters of the U.S. on Federal lands and facilities.	<p>Section 3.4 of the EIS has been revised to include an updated discussion of the ongoing USACE wetland review process under Section 404 of the Clean Water Act. All wetlands will receive construction mitigations as described in Keystone's Construction, Mitigation, and Reclamation Plan (Appendix B of the DEIS) and any other applicable guidance from the U.S. Army Corps of Engineers. Keystone has committed to follow the same construction, mitigation, and reclamation plan for all wetland crossings regardless of whether the wetland qualifies as jurisdictional under the U.S. Army Corps of Engineer Section 404 permits. The only difference would be the requirement for compensatory mitigation for permanent wetland losses. Most wetlands would be restored after pipeline construction. Permanent wetland impacts and requirements for compensatory mitigation will be determined during permitting under the U.S. Army Corps of Engineer Section 404 permits.</p> <p>Each USACE district would be consulted to determine the kind of compensatory mitigation that would be required for losses of aquatic resources, including the permanent conversion of forested wetland to herbaceous wetland. Pre-construction notification packages would include the mitigation plans agreed upon with the USACE. Preliminary mitigation discussions with the USACE districts have identified the following mitigation options for the project:</p> <ul style="list-style-type: none"> • USACE Omaha District (Montana, South Dakota, and Nebraska) - Compensatory mitigation for permanent wetland impacts would follow state-specific protocol established by field offices in Montana, South Dakota, and Nebraska. • USACE Tulsa District (Oklahoma) - Compensatory mitigation for permanent wetland impacts to forested and other wetlands could include combinations of any of several different mitigation strategies. Refer to Tulsa District Mitigation and Monitoring Guidelines at: http://www.swt.usace.army.mil/permits/Documents%20-%20Mitigation/M&MG.pdf. Mitigation banking is not available in the Tulsa District in the vicinity of the proposed Project.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
						USACE Fort Worth and Galveston Districts (Texas) - Compensatory mitigation for permanent wetland impacts would be based on the results of functional wetland assessments completed for all anticipated impacts to forested wetlands which would be used to determine an appropriate number of wetland credits to be purchased from USACE-approved wetland mitigation banks in proximity to the proposed Project.
1523	65	Giles	Cynthia	EPA	EPA agrees with the suggestions provided on page 3.4-12 of the Draft EIS, and recommends that these suggestions be applied to all wetlands, including both non jurisdictional and jurisdictional. These additional measures include a request that pre- and post construction monitoring plans be developed for depressional wetlands of the prairie pothole region, and that wetlands that no longer pond water after the pipeline is installed should receive additional compaction, replacement, or at the landowner's or managing agency's discretion, compensatory payments should be made for drainage of these wetlands. Recommendations are also included that Keystone should develop a plan to compensate for permanent wetland losses in areas of concern to the National Park Service and Texas Parks and Wildlife.	<p>As discussed in Section 3.4, no prairie pothole wetlands would be impacted by the proposed Project. Each USACE district would be consulted to determine the kind of compensatory mitigation that would be required for losses of aquatic resources, including the permanent conversion of forested wetland to herbaceous wetland. Pre-construction notification packages would include the mitigation plans agreed upon with the USACE. Preliminary mitigation discussions with the USACE districts have identified the following mitigation options for the project:</p> <ul style="list-style-type: none"> • USACE Omaha District (Montana, South Dakota, and Nebraska) - Compensatory mitigation for permanent wetland impacts would follow state-specific protocol established by field offices in Montana, South Dakota, and Nebraska. • USACE Tulsa District (Oklahoma) - Compensatory mitigation for permanent wetland impacts to forested and other wetlands could include combinations of any of several different mitigation strategies. Refer to Tulsa District Mitigation and Monitoring Guidelines at: http://www.swt.usace.army.mil/permits/Documents%20-%20Mitigation/M&MG.pdf. Mitigation banking is not available in the Tulsa District in the vicinity of the proposed Project. <p>USACE Fort Worth and Galveston Districts (Texas) - Compensatory mitigation for permanent wetland impacts would be based on the results of functional wetland assessments completed for all anticipated impacts to forested wetlands which would be used to determine an appropriate number of wetland credits to be purchased from USACE-approved wetland mitigation banks in proximity to the proposed Project.</p>
1523	66	Giles	Cynthia	EPA	We recommend that further commitments to protect sensitive water bodies be provided. The Draft EIS states that 341 perennial water bodies would be crossed during the construction of the proposed project, and that four techniques would be used to cross perennial water bodies: the open-cut wet method, the dry flume method, the dry dam-and-pump method, or, horizontal directional drilling (HDD). For each perennial water body crossing, a site specific engineering and geomorphologic analysis would determine the best method to use to avoid and reduce aquatic impacts. Based on available information, we understand that the open-cut wet method has the greatest potential for water quality impacts. Open-cut wet trench methods with a flowing river often require a wide ditch since the side walls of the ditch are likely to be unstable in alluvial material, and this often results in discharge of	Consolidated Response ENV-5 addresses requests for the use of the horizontal direction drilling method for all wetlands and waterbodies. Consolidated Response WAT-1 and Sections 3.2, 3.3 and 3.7 of the EIS address stream crossing methods and the associated potential impacts to water quality and fisheries resources. Issues related to the potential for erosion adjacent to stream banks and private land is addressed in Consolidated Response ERO-2.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					substantial quantities of sediment into the river. Such methods generally result in increased sediment production and transport, and increased risks of adverse effects to water quality and aquatic life. Directional drilling beneath waterbodies or constructing waterbody crossings using coffer dams and pumping to keep the construction work area dry are considered less damaging techniques than wet trench crossings. EPA recommends the revised Draft EIS evaluate potential impacts to water quality, aquatic species, riparian and wetland habitat from the various water crossing methods to determine which method would be both practicable and environmentally preferable.	
1523	67	Giles	Cynthia	EPA	To ensure protection of drinking water supplies, we recommend that private water wells within 1 mile of the pipeline be identified, rather than within 100 feet, as currently described in the Draft EIS. We recommend that Keystone be required to notify state source water protection officials and private well owners before construction would begin in a Source Water Protection Area (SWPA) or wellhead protection area.	Section 3.3.1 of the EIS has been revised to provide information on the likely occurrence of potable groundwater in water wells within 1 mile of the proposed pipeline centerline using publicly available and searchable databases maintained by water resource agencies within each state that would be crossed by the proposed Project. The databases were searched for domestic, irrigation, and public water supply well data. Data accessed included well locations, well total depth, and depth to first water (if available) or static water level.
1523	68	Giles	Cynthia	EPA	Pipeline routing alternatives that avoid Sole Source Aquifers, SWPAs, and wellhead protection zones are preferred; if the pipeline route is unable to avoid these areas, EPA recommends that specific mitigation measures be developed, including installation of double lining, corrosion protection, cathodic protection, water quality monitoring, and state-of-the-art leak detection methods.	The proposed pipeline route does not cross any sole-source aquifers as designated by EPA along the proposed Project route. One PWS well (associated with the Colome SWPA) is identified within 1 mile of the centerline of the pipeline in Tripp County, SD. In Nebraska, eight PWS wells are present within 1 mile of the centerline of the proposed route in Hamilton, York, Fillmore, Saline, and Jefferson counties. The proposed route would not however pass through any identified PWS wellhead protection areas. SWPAs within 1 mile of the proposed Project include those for the towns of Ericson, Hordville, McCool Junction, Exeter, Steele City and the Rock Creek State Park. Additional SWPAs within 1 mile of the proposed Project include those mapped in Hamilton County near Milepost (MP) 772 and York County near MP 781 and 783. A total of 29 private water wells are located within approximately 100 feet of the proposed pipeline route within Greeley, Merrick, Hamilton, York, Fillmore, and Jefferson counties, NE. In Texas, Within 1 mile of the proposed Gulf Coast Segment pipeline route in Lamar, Wood, Smith, Rusk, Nacogdoches, Angelina, Polk, and Liberty counties, 53 PWS wells are present. Within 1 mile of the proposed Houston Lateral pipeline route, 145 PWS wells are present in Liberty and Harris counties. The proposed Project would pass within 1 mile of 36 SWPAs in Texas. A total of three private water wells are located within approximately 100 feet of the proposed pipeline route within Smith and Chambers counties, TX. Issues related to aquifers along the proposed Project corridor are addressed in Consolidated Responses AQF-1 through AQF-4. Consolidated Response OIL-3 addresses the leak detection capabilities of the proposed Project, including the SCADA system, supplementary leak detection methods, physical leak detection methods, and concerns related to smaller leaks from the pipeline that may be under the SCADA detection threshold. Consolidated Response SAF-1 describes

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
						the regulatory requirements and Project-specific Special Conditions that Keystone would comply with to construct, operate, maintain, inspect, and monitor the proposed Project. It also describes the monitoring, inspections, and reviews of the proposed Project that the Pipeline and Hazardous Materials Safety Administration would conduct to ensure compliance with those regulatory requirements.
1523	69	Giles	Cynthia	EPA	If public or private wells would be located within 100 feet of the proposed pipeline route, we recommend that Keystone be required to sample the wells for appropriate petroleum indicator compounds as part of baseline monitoring, and additional monitoring, as appropriate. We also recommend that water quality monitoring would need to be made available for well and/or spring owners, upon request.	DOS has followed the typical Federal Energy Regulatory Commission (FERC) approach to documenting private water wells that could potentially be impacted by proposed Project construction and operation. As explained in Consolidated Responses SAF-1 and AQF-3, there is minimal risk to private water wells distant from the pipeline centerline due to the high level of safety imposed on the proposed Project and due to the low likelihood of long-distance crude oil migration in the unlikely event of a major oil spill. In addition, well testing is not required around every petroleum storage tank or gasoline storage tank. Such testing is conducted only after a leak occurs. If there is a spill from the proposed Project state, federal agencies will require sampling as appropriate.
1523	71	Giles	Cynthia	EPA	EPA also notes that the Ogallala Aquifer is a critical resource that may be affected by the proposed project, as it is the drinking water source for almost 80% of Nebraska's residents, as well as a multi-state agricultural industry. We recommend that the revised Draft EIS provide additional information as to the potential for adverse impacts to this resource.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
1523	72	Giles	Cynthia	EPA	We are pleased that Keystone proposes to use the horizontal directional drilling method (HDD) for crossing the Niobrara River in Nebraska. However, we recommend that the revised Draft EIS include a discussion of the Niobrara River's status as a National Scenic River (http://www.nps.gov/niob/index.htm) and how the proposed crossing would not conflict with its status as a National Scenic River.	The proposed crossing of the Niobrara River is not located within the designated National Scenic River reach and the crossing would have no conflict with the Scenic designation.
1523	73	Giles	Cynthia	EPA	We appreciate the information provided in Appendix E-4 ("Waterbodies within 10 Miles Downstream of Proposed Water Crossings"). Based on our review of this appendix, we note that there are numerous proposed water crossings that are located upstream of water supply reservoirs. We recommend that the revised Draft EIS include an analysis of potential impacts to these reservoirs in the event of a spill. There are also many points where the potential alignment of the pipeline will cross stream or river segments which are not attaining the state Water Quality Standards and thus a Total Maximum Daily Load (TMDL) has been prepared; special considerations should be applied to prevent contributing to pollutant loads when crossing these sensitive resources.	Section 3.13 of the EIS addresses reliability and safety issues, including calculations of the probability of a spill from the proposed Project and the potential environmental impacts to waterbodies associated with spills. Appendix J lists the impaired waterbodies that would be crossed by the proposed route.
1523	74	Giles	Cynthia	EPA	The Draft EIS states (p. 3.3-29) that the Lower Brule to Witten 230-kV transmission line would have "negligible effects on water resources" - we recommend that additional information be provided to support this conclusion.	The assessment of potential impacts due to construction and operation of the Big Bend to Witten (formerly the Lower Brule to Witten) 230-kV transmission in the EIS is based on the information for the proposed project that was available at the time the EIS was prepared. Additionally, as a result of a request for financing from Basin Electric Power Cooperative to the Rural Utilities Service (RUS) of the U.S. Department of

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
						Agriculture for the transmission line compliance with NEPA, Section 106 of the NHPA, and other environmental review requirements will be the responsibility of the RUS as the lead federal agency.
1523	76	Giles	Cynthia	EPA	Additionally, the Draft EIS does not clearly describe where the right of way (ROW) would be reduced to protect "certain sensitive areas, which may include wetlands, cultural sites, shelterbelts, residential areas, or commercial/industrial areas" (Draft EIS, p. 2-3). EPA recommends that the revised Draft EIS clearly define, using maps and/or a table with milepost numbers, where the reduced ROW would be implemented. This information should be summarized in each of the resource chapters of Chapter 3 Environmental Analysis to enable the reader to easily understand when extra protection would be provided to sensitive resources.	The areas where the right-of-way would be reduced are being negotiated with the agencies that have jurisdiction over the resources and would be addressed during the permitting process conducted by each of those agencies if Keystone is granted a Presidential Permit.
1554	33	Gilkey	Allie		No one said anything about the farmers. Because the pipelines here send surveyors out, they cut down farmer's fences, they ignore the property owners, never replace when cows get out, dam up the ponds, creeks, our wildlife, and that cuts out on our farming and our growing our crops. And where these pipelines that are located here in Polk County, already we are having quite a bit of problems. We have quite a bit of farmland	State or local trespass and access laws are applicable along the entire route and therefore along each easement negotiated by Keystone. DOS has no legal authority over negotiating easement agreements, no legal status to enforce the conditions of an easement agreement, and no legal authority over Keystone representatives who gain access to private property. The commenter has the option to take up the matter with Keystone or local law enforcement officials, or initiate legal consultation.
633	1	Gillen	Ann		Please do NOT allow any company to run an oil pipeline through the Nebraska sandhills. Some may think it is just empty barren land, but it is beautiful. I live in Nebraska and just traveled through the sandhills for the first time last summer. It is a beautiful and unique land that deserves preservation.	Consolidated Response ALT-1 addresses potential alternative routes, including routes that would avoid much of the Northern High Plains Aquifer system and the Sand Hills area.
633	2	Gillen	Ann		With the aquifer(s) beneath the ground, even a small accident could have devastating effects on our groundwater. Please do not allow the pipeline in the Sandhills.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
584	1	Girard	Margaret		Please do not continue with this pipeline project. The Nebraska Sand Hills are a source of water for the entire Middle West, an area of the country which provides food for the world. Any leak or spill would damage the aquifer irreparably.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
1371	1	Gittlen	William		I am writing to encourage you, as our representative in the Department of State in this matter, to insist that the State Department say no to the Keystone XL pipeline. DO NOT ISSUE A PERMIT... Do not issue a permit to import the dirty fuel that comes from the tar sands of Canada.	Comment acknowledged.
1371	2	Gittlen	William		Now is the time to change the old paradigm of growth based on "cheap" energy. The only path to an improved US economy and a better future for the nation and the world is by decreasing the amount of fossil fuel consumed. Rather, we must build a sustainable economy, [based on renewable energy and conservation.]	Comment acknowledged.
1371	4	Gittlen	William		Global warming is occurring now. [Do not issue a permit to import the dirty fuel that comes from the tar sands of Canada.] It would undermine other efforts to decrease the causes of	Consolidated Response OIL-4 also addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					global warming and would be a giant step backwards.	similar in composition to other heavy crude oils being processed in Gulf Coast refineries. Consolidated Response GHG-1 addresses the greenhouse gas life-cycle analyses presented in the revised EIS.
622	1	Given	David		I do not support building this pipeline through the Nebraska Sandhills. If it is to be constructed, it is worth the extra cost to route it away from the Ogallala Aquifer.	Consolidated Response ALT-1 addresses potential alternative routes, including routes that would avoid much of the Northern High Plains Aquifer system.
281	1	Glaser	Caroline		I own sandhill pasture land that the pipeline is going through. My concern is protecting the environment and returning the sand to grass after the pipeline is installed. It takes years to establish grass in the sand where the ground has been disturbed.	The EIS was revised to include additional information on Keystone's construction and restoration techniques within the Sand Hills in Section 3.5. Additional information on Keystone's process for development of construction and restoration methods within the Sand Hills and other issues are discussed in Consolidated Responses ENV-1 and ERO-1 and additional construction and reclamation information specifics to the Sand Hills was added to Appendix H of the EIS.
281	3	Glaser	Caroline		The landowner should be protected against any liability and given a yearly payment for the use of our land.	Consolidated Response LIA-1 addresses Keystone's liability if there is a spill of hazardous materials or fuel during construction or a spill of crude oil from the proposed Project. Consolidated Response EAS-2 addresses issues related to easement negotiations. As noted in that response, DOS has no legal authority in the easement negotiation process.
1023	1	Glenn	Lori		Thank you for taking time to study this issue. The aquifer is very important.	Issues related to aquifers along the proposed Project corridor are addressed in Consolidated Responses AQF-1 through AQF-4.
696	1	Goetzinger	Kurt		I oppose this pipeline due to the risks to our environment.	Comment acknowledged.
856	1	Golden	Connie		I oppose TransCanada using our water line in Nebraska. Reports just keep coming out how unsafe this would be.	Consolidated Response SAF-1 describes the regulatory requirements and Project-specific Special Conditions that Keystone would comply with to construct, operate, maintain, inspect, and monitor the proposed Project. It also describes the monitoring, inspections, and reviews of the proposed Project that the Pipeline and Hazardous Materials Safety Administration would conduct to ensure compliance with those regulatory requirements.
404	1	GoodmanHealy	Gretchen		This pipeline is expensive and dangerous. We should know by now that we cannot trust oil companies with the safety of our air, water, land, natural resources, and ecosystems. The proposed pipeline's walls are thinner, and the pressures higher, than has been approved in the past. It is a situation ripe for another disaster.	Keystone has withdrawn its application for a Special Permit as described in Consolidated Response REG-1. As described in Consolidated Response SAF-1, the Pipeline and Hazardous Materials Safety Administration (PHMSA) has regulatory requirements that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project in a manner that protects the health and safety of the public and the environment. In addition, PHMSA developed 57 Project-specific Special Conditions that Keystone has agreed to implement. Incorporation of those conditions would result in a Project that would have a degree of safety over any other typically constructed domestic oil pipeline system under current code and a degree of safety along the entire length of the pipeline system similar to that which is required in HCAs as defined in 49 CFR 195.450.
404	2	GoodmanHealy	Gretchen		Nebraska sits atop one of the largest fresh water aquifers in the nation. Once contaminated, it is difficult, if not impossible, to clean up.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
404	3	GoodmanHealy	Gretchen		The pipeline is mapped to go through some of the most fragile	Identification of sensitive environments crossed by the

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					grasslands in the world--the Sandhills. Once damaged, it takes decades to repair. Even building the pipeline will cause extensive damage to this delicate ecosystem, let alone what might happen if there is a spill. We cannot take the chance.	proposed Project is discussed in Consolidated Response ENV-1 and ENV-3. Issues related to the Sand Hills area are addressed in Consolidated Response ERO-1. Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. Section 3.13 of the EIS addresses reliability and safety issues, including calculations of the probability of a spill from the proposed Project and the potential environmental impacts associated with spills.
404	4	GoodmanHealy	Gretchen		The exploitation of tar sands is extremely dirty, expensive, and polluting. We should not encourage this by providing transportation to markets.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project.
1541	17	Gookin	Sharon		We are concerned by the use of a thinner pipe at higher pressure with thick, heavy crude oil that is more polluting than normal.	Keystone has withdrawn its application for a Special Permit as described in Consolidated Response REG-1. As described in Consolidated Response SAF-1, the Pipeline and Hazardous Materials Safety Administration (PHMSA) has regulatory requirements that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project in a manner that protects the health and safety of the public and the environment. In addition, PHMSA developed 57 Project-specific Special Conditions that Keystone has agreed to implement. Incorporation of those conditions would result in a Project that would have a degree of safety over any other typically constructed domestic oil pipeline system under current code and a degree of safety along the entire length of the pipeline system similar to that which is required in HCAs as defined in 49 CFR 195.450.
1541	18	Gookin	Sharon		I don't understand why the thinner pipe is to be used in rural areas. I don't know why land in rural areas that we make our living off of should be of less consequence than more populated areas.	As described in Consolidated Response SAF-1, the Pipeline and Hazardous Materials Safety Administration (PHMSA) has regulatory requirements that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project in a manner that protects the health and safety of the public and the environment. In addition those regulations, PHMSA developed 57 Project-specific Special Conditions that Keystone has agreed to implement. Incorporation of those conditions would result in a Project that would have a degree of safety over any other typically constructed domestic oil pipeline system under current code and a degree of safety along the entire length of the pipeline system similar to that which is required in high consequence areas as defined in 49 CFR 195.450.
454	1	Goomis	Virginia		Please say no to the proposed Keystone XL pipeline which will run underground through the Ogallala Aquifer. The BP oil catastrophe has clearly demonstrated our inability to fully assess the risk of such a venture and to mitigate damages if/when a disaster occurs. The importance of preserving the Ogallala Aquifer clearly outweighs the potential economic benefits of the pipeline, when the possibility of destruction of the Aquifer is taken into account.	Consolidated Response AQF-3 provides information on hypothetical spills from the Project over two areas of the Northern High Plains Aquifer System and also addresses response actions. As described in Consolidated Response GLF-1, the risks associated with the proposed Project are substantially different from those associated with the BP Deepwater Horizon Project.
906	1	Gorman	Charles		I grew up in the Sandhills of Nebraska always amazed at the Ogallala aquifer and its amazing size and the importance to the Sandhills and their beautiful grasslands. I would hate to see this ruined and the devastating results of any type of	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. Consolidated Response P&N-8 addresses issues related to shipping Canadian crude oil to refineries that are closer to the

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					accident, no matter the size. Build a refinery in Canada; please do not spend the money on this pipeline which could ruin our wonderful country and the aquifer so needed for water in the area. Please vote no on this pipeline in Nebraska.	source of oil.
1478	1	Gosala	Stephen		I am a Canadian that currently lives in MN, I am writing you to ask not to give permits for pipelines to import the world's dirtiest fuel, oil!	Consolidated Response OIL-4 addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils.
1478	2	Gosala	Stephen		Tar Sands will increase our transportation emissions, counteract existing efforts to fight global warming and undermine US energy independence by continuing our dependence on foreign oil. The pipeline will increase air pollution @ American refineries and has caused severe water and air contamination in Canada.	Consolidated Response GHG-2 addresses the potential causal connection of implementation of the proposed Project and expanded oil sands production in Canada and increases in refining. Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project. Consolidated Response OIL-4 also addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils being processed in Gulf Coast refineries. As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries. The transportation fuel (i.e., gasoline, diesel fuel, and jet fuel) obtained from processing the crude oil that would be transported by the proposed Project would be the same as transportation fuel currently produced and sold by the Gulf Coast refineries. As a result, combustion emissions from the use of the fuel refined from the crude oil that would be transported by the proposed Project would not be different from the combustion emissions of fuels currently derived from heavy crude oil processed in those refineries.
1478	3	Gosala	Stephen		I also strongly feel that an adequate assessment of the environmental impacts of this project, and the fuel it will deliver, cannot be fully undertaken until a comprehensive life-cycle greenhouse gas assessment for tar sands oil has been completed. Please, I am asking you to protect our country and say no to tar!	Consolidated Response GHG-1 addresses GHG life-cycle analyses.
87	1	Gotschall	Benjamin		This project should be aborted due to its endangerment of the Ogallala Aquifer, also known as the High Plains aquifer, arguably one of the most valuable water systems in the world. According to the information on the website: http://co.water.usgs.gov/nawqa/hpgw/factsheets/DENNEHYF_S1.html This aquifer provides "about 30 percent of the Nation's ground water used for irrigation. In addition, the aquifer system provides drinking water to 82 percent of the people who live within the aquifer boundary." This 82 percent comes to a total of "almost 2 million people [who] rely on the High Plains aquifer for their drinking water."	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
87	2	Gotschall	Benjamin		The scale of disaster in the event of a leak or spill is unfathomable. This pipeline will carry 900,000 barrels of tar sand oil per day. Compare that to the 5,000 barrels of oil per day leaking from the 2010 BP spill in the Gulf of Mexico, only	Consolidated Response OIL-2 addresses regarding the maximum size of a spill, and Consolidated Response OIL-1 addresses the likelihood of various sizes of releases. As described in Consolidated Response GLF-1, the risks

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					this would be underground, in highly permeable sandy soil, above the valuable Ogallala Aquifer, one of the last sources of fresh groundwater anywhere in the world.	associated with the proposed Project are substantially different from those associated with the BP Deepwater Horizon Project. Issues related to the Northern High Plains Aquifer System are addressed in Consolidated Responses AQF-1 through AQF-4.
87	3	Gotschall	Benjamin		This project is one of the greatest environmental threats we are currently facing and needs to be stopped.	The commenter's opinion is noted.
101	1	Gotschall	Christopher		Keystone aka "Sandhill Suicide" is not something I can support. My family owns a ranch in the Sandhills and I want desperately to protect it from this.	Issues related to the Sand Hills area are addressed in Consolidated Response ERO-1.
264	1	Gotschall	Jerry		How could Keystone seriously say that a spill would only leak "three barrels or less" from a pipeline that is transporting 900,000 barrels daily? That's 37,500 barrels per hour, 625 barrels per minute, and 10 barrels per second. So, the leak would be detected, located and contained in less than 1/3 of a second? Bullshit!!	The complete text of the statement is as follows: "Keystone's Pipeline Risk Assessment projects that 50 percent of releases would be three barrels or less and that less than 0.5 percent of releases would be 10,000 barrels or greater." That statement does not mean that any spills would be 3 barrels or less. Consolidated Response OIL-1 addresses the likelihood of spills from the Project. Consolidated Response OIL-2 addresses maximum-sized releases from the Project. Consolidated Response OIL-3 addresses small releases from the Project. Section 3.13 of the EIS was revised to update spill incident statistics and projections, provide additional information on composition of the crude oil that would be transported by the proposed Project, additional information on potential impacts to the Northern High Plains Aquifer system, and other key information. This section addresses reliability and safety issues, including calculations of the probability of a spill from the proposed Project and the potential environmental impacts associated with spills.
264	2	Gotschall	Jerry		Save the Ogallala Aquifer!	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
264	4	Gotschall	Jerry		Keep the pipeline out of the Ogallala Aquifer!	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. Consolidated Response ALT-1 addresses potential alternative routes, including routes that would avoid much of the Northern High Plains Aquifer system.
419	1	Gotschall	Christopher		Please halt the Keystone Pipeline Project. Running an oil pipeline across one of the world's largest aquifers and the most active fault line in the Midwest is a recipe for disaster. And it would be different if the oil being transferred was even going to be used in the US, but it's not even high enough grade for our use—it's just being shipped to China! NOT WORTH IT. Please halt the Keystone Pipeline Project!	Consolidated Response ENR-1 provides information on the Department of State's environmental review process, the National Interest Determination process, and the need to complete those reviews before approving or denying the Presidential permit for the proposed Project. Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. Consolidated Response OIL-4 addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils. Consolidated Response P&N-1 addresses the need that the Project has been proposed to meet.
419	2	Gotschall	Christopher		And it would be different if the oil being transferred was even going to be used in the US, but it's not even high enough grade for our use—it's just being shipped to China! NOT WORTH IT. Please halt the Keystone Pipeline Project!	Consolidated Response OIL-4 addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils. Consolidated Response P&N-2 provides information on the export of WCSB crude oil from the Gulf Coast.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
419	3	Gotschall	Christopher		Running an oil pipeline across one of the world's largest aquifers and the most active fault line in the Midwest is a recipe for disaster. And it would be different if the oil being transferred was even going to be used in the US, but it's not even high enough grade for our use--it's just being shipped to China! Not worth it!. Please halt the Keystone Pipeline Project!	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. Consolidated Response GEO-2 addresses potential seismic hazards. Consolidated Response OIL-4 addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils. Consolidated Response P&N-2 provides information on the export of refined product from Gulf Coast refineries as well as exporting WCSB crude oil from the Gulf Coast.
1560	48	Gotschall	Ben		Worried about losing organic certification for farm if pipeline has a leak, or just by having a pipeline underground on property. And whether Keystone will compensate them for income and time lost for losing organic certification.	Consolidated Response FRM-1 addresses potential ranch of farmland impacts, including compensation for lost crops. As noted in the EIS, after construction is complete, farming can continue over the pipeline. It is not likely that the presence of a pipeline on a farm would influence organic certification since during normal operation the pipeline would not have an effect on crop quality. The commenter would have to consult with legal counsel to determine what influence an oil spill that ranches organic certified land would have on the certification. Consolidated Response LIA-1 addresses Keystone's liability if there is a spill of hazardous materials or fuel during construction and from a spill of crude oil from the Project.
1560	49	Gotschall	Ben		Worried about the environment, even if Keystone is second to none on safety.	The impacts associated with implementation of the proposed Project are addressed in Section 3.0 of the EIS. As noted in that section, the proposed Project would not result in significant environmental impacts. Section 3.13 of the EIS addresses reliability and safety issues, including calculations of the probability of a spill from the Project and the potential environmental impacts associated with spills.
947	1	Gould	Donna		I am very concerned about the pipeline running over the aquifer. The water there is an extremely important resource to the state. As we have seen with the Gulf oil spill, accidents can and do occur. And while I'm sure the state will try to oversee the project and make sure it is safe, the potential for harm is still there. The risk, in this case, is too great. If the aquifer became polluted, it would mean many people would no longer have safe drinking water.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
437	2	Gourlay	Joseph		I urge you not to move forward with this project. At the very least, the pipeline of oil from the dirty tar sands of Canada must not be allowed to pollute the massive Ogallala Aquifer.	Consolidated Response OIL-4 addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils. Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. Consolidated Response AQF-3 provides information on hypothetical spills from the Project over two areas of the Northern High Plains Aquifer System and also addresses response actions.
437	5	Gourlay	Joseph		Stop Big Oil from destroying the Sandhills and the Ogallala Aquifer.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
573	1	Goyette	Roland	Ching Farm Animal Rescue & Sanctuary	NO devastating tar sands refineries or mining in the U.S. period	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information on current and future production. As noted in that

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
						Consolidated Response, without the proposed Project, oil sands development would continue at or above the current level until at least 2020, with or without the proposed Project.
685	1	Graham	Robert		I have read how oil is extracted from oil sand areas. It is a method highly damaging to the environment by destroying ecosystems and polluting the immediate area while releasing CO2 in prodigious amounts into the atmosphere.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project. Consolidated Response GHG-1 addresses GHG life-cycle analyses.
685	3	Graham	Robert		Apparently, there is no plan in case of a disaster which would destroy agricultural and water resources.	Response to a spill from the proposed Project would be accomplished in accordance with Keystone's Emergency Response Plan (ERP) and its Spill Prevention, Control, and Countermeasure (SPCC) plans. Consolidated Response RES-1 addresses issues related to preparation and review of the ERP for the proposed Project. SPCC plans are addressed in Sections 2.3 and 3.13.5 of the EIS and in the Construction, Mitigation, and Reclamation Plan presented in Appendix B of the EIS. Sections 3.13.5.6 and 3.13.6 of the EIS address the potential impacts of spills from the proposed Project. As noted in those sections, although pipeline spills would have an adverse effect on the environment, the resources affected would be expected to recover over time.
713	1	Graham	Janice		I would like to voice my objection to the XL Pipeline project on a number of counts, with these three being my top priorities: ...All told, it appears to be a generally bad idea.	The commenter's opinion is noted.
713	2	Graham	Janice		The oil sands extraction process used is dirtier, [creating more greenhouse gases than other processes used in the US...]	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project. Consolidated Response GHG-1 addresses GHG life-cycle analyses.
713	3	Graham	Janice		[...1. The oil sands extraction process used is dirtier, creating] more greenhouse gases than other processes used in the US...	Consolidated Response GHG-1 addresses the greenhouse gas life-cycle analyses presented in the revised EIS.
713	5	Graham	Janice		...3. We'd be piping oil for processing into a state (TX) that refuses to abide by accepted Clean Air rules...	As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries. Consolidated Response OIL-4 also addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils.
1165	1	Graham	Ginger		Please do all you can to prevent a pipeline from crossing the Ogallala Aquifer!	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
1165	2	Graham	Ginger		[...a pipeline from crossing the Ogalala Aquifer!] No matter how well it is done it is a danger we can not afford!	Issues related to aquifers along the proposed Project corridor are addressed in Consolidated Responses AQF-1 through AQF-4.
822	1	Greenwood	James		Stop the Keystone XL pipeline!	Consolidated Response ENR-1 provides information on the Department of State's environmental review process, the National Interest Determination process, and the need to complete those reviews before approving or denying the

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
						Presidential permit for the proposed Project.
759	1	Gregerson	Rosalie		...Pipeline companies do not seem to understand how to keep these leaks from happening.	Consolidated Response SAF-1 describes the regulatory requirements and Project-specific Special Conditions that Keystone would comply with to construct, operate, maintain, inspect, and monitor the proposed Project. It also describes the monitoring, inspections, and reviews of the proposed Project that the Pipeline and Hazardous Materials Safety Administration would conduct to ensure compliance with those regulatory requirements.
759	2	Gregerson	Rosalie		Please do not allow this pipeline to cross over the Ogallala Aquifer...	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
759	3	Gregerson	Rosalie		...If a leak would happen, damage would be done to a water source for a large area...	Section 3.13 of the EIS addresses reliability and safety issues, including calculations of the probability of a spill from the proposed Project and the potential environmental impacts associated with spills, including impacts to surface water and groundwater. Issues related to the Northern High Plains Aquifer System are addressed in Consolidated Responses AQF-1 through AQF-4. Consolidated Response AQF-3 provides information on hypothetical spills from the Project over two areas of the Northern High Plains Aquifer System and also addresses response actions.
983	1	Gregory	Joan		Tar sands are the dirtiest fuel we use, creating 3 times the greenhouse gases as conventional oil.	Consolidated Response GHG-1 addresses the greenhouse gas life-cycle analyses presented in the revised EIS. Consolidated Response OIL-4 also addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils being processed in Gulf Coast refineries.
983	2	Gregory	Joan		Tar sands are the dirtiest fuel we use, contaminating entire rivers and watersheds from leaking toxic tailings lakes and devastating an area of Canada the size of Florida.	As noted in Consolidated Response OIL-4, crude oil produced from Canadian oil sands projects is similar in composition to heavy crude oil currently used in U.S. refineries. Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1.
983	3	Gregory	Joan		The pipeline poses a danger to landowners and communities along the pipeline route.	Section 3.13 of the EIS addresses reliability and safety issues, including calculations of the probability of a spill from the proposed Project and the potential environmental impacts associated with spills.
983	4	Gregory	Joan		I am totally opposed to the Keystone XL pipeline	Comment acknowledged.
983	5	Gregory	Joan		This pipeline is NOT in the public interest, not in the interest of the planet, and not in the interest of a livable future.	Comment acknowledged.
1522	2	Grell	Carey	Nebraska Game and Parks Commission	As we understand, the proposed pipeline is currently routed to avoid impacting properties owned or managed by the Nebraska Game and Parks Commission. We could not find a map with adequate detail within the Draft EIS to confirm this, and we want to ensure that this is indeed still a current statement. If changes are proposed for the route that would result in impacts to NGPC properties, we recommend that you notify us immediately.	Detailed maps of the proposed route are available on the DOS website for the proposed Project at the following url: http://www.keystonepipeline-xl.state.gov/clientsite/keystonexl.nsf?Open . At that site, click on "Project Documents," then click on "Supplemental Filings" for July 6, 2009 and May 19, 2010.
1522	3	Grell	Carey	Nebraska Game and Parks Commission	Page 3.8-23 of the Draft EIS discusses electrical distribution lines associated with the pipeline and that they are a potential collision hazard to migrant whooping cranes, which is a state-listed endangered species in Nebraska. The document also	Section 3.8 of the EIS was revised in response to this comment by removing the statement about undocumented prior use of habitats by whooping cranes and revised habitat use during migration to include wetland habitats.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					states that an analysis of suitable migration stop-over habitat in relation to proposed transmission lines found 74 locations within the primary migration corridor for the whooping crane where transmission lines could potentially increase collision hazard to migrating whooping cranes, and it goes on to say that there is no indication that any of these locations have been used by whooping cranes. A lack of documented occurrences in a particular area within the migration corridor for this species does not mean that these locations are not used by whooping cranes. We want to ensure that this analysis included not only those lines near riverine roosting habitats, but also those near wetland habitats within the migration corridor that may be used for roosting and/or feeding by whooping cranes. Whooping cranes can also be adversely impacted by transmission lines while flying between roost sites and nearby feeding sites. We would recommend that the document provide additional information on the identified locations of concern, and on the specific types of measures that would be implemented to reduce the potential for collisions of whooping cranes with electrical distribution lines.	
1522	4	Grell	Carey	Nebraska Game and Parks Commission	Page 3.8-31 states that critical habitat for the Topeka shiner in Nebraska includes 6 miles of the Elkhorn river in Madison County. This should be corrected to read that critical habitat for the Topeka shiner in Nebraska includes 6 miles of Taylor Creek,	The EIS was revised in response to this comment.
1522	5	Grell	Carey	Nebraska Game and Parks Commission	Page 3.8-32 begins discussion regarding the American burying beetle, which is a state-listed endangered species in Nebraska. The document references presence/absence surveys that were completed for this species in Nebraska in 2009, for which no American burying beetles were captured. However, since construction of the proposed Project will not begin until 2011 at the earliest, presence/absence surveys in Nebraska would need to be conducted again in areas identified as suitable habitat prior to construction, as survey results are only considered valid for a year from the date of survey. Please contact us if clarification is needed on survey protocol. Further, the document states that it is likely that all direct impacts to the American burying beetle may not be avoided by construction of the proposed Project. We would also be available for further discussions regarding the development of conservation measures to avoid and minimize adverse impacts to this species, and compensatory mitigation to offset the habitat losses in Nebraska.	Presence/absence surveys were completed along the entire route through Nebraska in 2010 and Keystone is continuing to work with both the U.S. Fish and Wildlife Service and the Nebraska Game and Parks Commission on formal Section 7 Endangered Species Act consultation to avoid, minimize, and calculate compensatory mitigation for the incidental take of American burying beetles and for habitat loss and alteration due to construction and operation of the proposed Project.
1522	6	Grell	Carey	Nebraska Game and Parks Commission	Page 3.8-37 discusses the Western Prairie Fringed orchid, which is a state-listed threatened species in Nebraska. The document identifies that surveys conducted in 2009 observed this species along the proposed pipeline right-of-way at mile post 662 in Holt County, Nebraska. What options are being considered for ways to avoid impacting the known population along the right-of-way? The document should provide more detail regarding whether re-routing of the pipeline was considered as a way to avoid impacts to the Western prairie fringed orchid at milepost 662, or if other specific methods will be considered at this location.	This known population is outside of the proposed construction right-of-way within a wetland area that is completely outside of the proposed construction right-of-way. The proposed Project is not likely to adversely affect the known occurrence of the western prairie fringed orchid. Conservation measures have been revised for the portions of the proposed Project route with potentially suitable habitat that could not be surveyed because of a lack of landowner permission to include pre-construction surveys and/or contribution to a conservation easement for the potential to affect unknown occurrences of the western prairie fringed orchid.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
1522	7	Grell	Carey	Nebraska Game and Parks Commission	Table 3.8.3-2 lists state protected animals and plants potentially occurring along the pipeline route. The information contained in the "proposed conservation measures" column for the fine scale dace (a state-listed threatened species) in Nebraska states that no specific measures are needed for this species. This is incorrect, as we do have concern for potential impacts to the fine scale dace in Nebraska. The "proposed conservation measures" identified in the Table for the northern redbelly dace are also applicable to the fine scale dace and the Table should be updated to reflect the appropriate conservation measures for fine scale dace in Nebraska. We recommend surveys for these species in tributaries of the Niobrara river and South Fork of the Elkhorn river, as well as in all small streams that would be crossed by the proposed Project in Rock County.	Keystone completed surveys documenting finescale dace occurrence and habitat in the fall of 2009. No potential suitable habitat was identified in Nebraska. The appropriate finescale dace-specific discussions in Section 3.8, including Table 3.8.3-2, have been updated to include field survey results.
1522	8	Grell	Carey	Nebraska Game and Parks Commission	The Table [3.8.3-2] also includes conservation measures for the pearl dace in Nebraska, however, we have no requirements for pearl dace as it is no longer a state-listed species. The notation in the Table to surveys for pearl dace in Nebraska should be re	Section 3.8 of the EIS has been revised to update all relevant information, including information on the pearl dace.
1522	9	Grell	Carey	Nebraska Game and Parks Commission	Page 3.8-74 discusses Conservation Measures for the Massasauga, which is a state-listed threatened species in Nebraska. The first conservation measure should be elaborated to state that suitable habitat surveys will not only clear areas where massasauga would not be of concern, but they will also identify areas of concern for the species that will need additional monitoring during construction to ensure that impacts are avoided.	Section 3.8 has been updated to clarify that pre-construction surveys would also identify areas potentially containing massasauga.
1211	1	Grenier	Todd		Why do we have to pipe it clear down south to refine it? then it has to be shipped back up north, after refining. who is getting rich off this one? sounds like we should be refining in the dakotas....then gas would be 50 cents cheaper...	Consolidated Response P&N-8 addresses issues related to shipping Canadian crude oil to refineries that are closer to the source of oil. Consolidated Response P&N-1 addresses the need that the Project has been proposed to meet; transporting Canadian crude oil in the Keystone XL Project to refineries outside of the Gulf Coast region would not meet the current and near-term crude oil needs of those refineries.
227	1	Griffin	Brian	Golder Associates	Golder Associates has 1,300 employees working in the US and we are a key supplier of engineering and environmental services to TransCanada. This project has a direct impact on the business we do with TransCanada. The project has the potential to deliver significant energy security benefits to the United States, increasing access to significant land-based sources of oil from a trading partner with whom we are closely allied. At the same time, construction of this project stands to bring significant economic benefits to the areas where it will be built. Provided it has limited impact on the environment, this project could be an important part of the solution to our energy supplies. The permitting processes in place are appropriate and should proceed so that a final determination can be made about the impacts of the project and whether it is in the national interest.	Comment acknowledged.
227	2	Griffin	Brian	Golder Associates	I write in support of TransCanada's Keystone XL crude oil pipeline project and urge the department to grant a permit for the pipeline. Golder Associates is a key supplier of	Comment acknowledged.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					engineering and environmental services to TransCanada for many of their pipeline assets across North America. Our work for TransCanada has provided significant benefits for our firm including our 1,300 employees working in the US.	
227	3	Griffin	Brian	Golder Associates	We also understand that the Keystone XL pipeline project is a vital link to secure energy supplies for the United States. According to the U.S. Energy Information Administration, oil and natural gas will continue to supply over 50 percent of U.S. energy needs in 2030. Canada is a valued trading partner and our most reliable supplier of foreign based crude oil. The Keystone project will have the added benefit of potential links to growing domestic supplies of crude oil in Montana and North and South Dakota.	Comment acknowledged.
227	4	Griffin	Brian	Golder Associates	The environmental benefits of Keystone XL should not be overlooked. The current tragedy in the Gulf underscores the importance of a diverse portfolio of energy supplies. Within the spectrum of viable options, it is appropriate to seek a growing role for oil resources that are: Land-based; North American; and, Transported by pipeline. This project meets each of these criteria.	As described in Consolidated Response GLF-1, the risks associated with the proposed Project are substantially different from those associated with the BP Deepwater Horizon Project.
227	5	Griffin	Brian	Golder Associates	Securing stable and affordable energy from our North American allies through projects such as the Keystone pipeline is in the national interest. Considering the economic and energy security benefits of these vital resources, we should continue to expand America's access to safe, affordable energy to help ensure improved domestic and global energy security and stable prices for consumers.	Comment acknowledged.
227	6	Griffin	Brian	Golder Associates	Pipelines are the safest, most reliable, economical and environmentally favorable way to transport oil and petroleum products, as well as other energy liquids, throughout the U.S. America depends on the more than 168,000 miles of liquid pipelines to move energy and raw materials our country relies on. Additional pipeline capacity will help consumers and businesses throughout the United States.	Comment acknowledged.
227	7	Griffin	Brian	Golder Associates	This project also stands to provide a powerful private sector economic stimulus. During construction, Keystone XL will create more than 13,000 jobs funded with private investment. In addition, local governments will have a steady source of income from economic activity associated with construction and from property taxes the pipeline company will pay.	Consolidated Response ECO-1 addresses potential socioeconomic impacts, and Consolidated Response TAX-1 addresses concerns regarding taxes.
234	1	Griffin	John	Associated Petroleum Industries of Michigan	I write in support of TransCanada's Keystone XL crude oil pipeline project and urge the department to grant a permit for the pipeline to cross the US/Canadian border. This project is a vital link to secure energy supplies for the United States. According to EIA, oil and natural gas will continue to supply over 50 percent of U.S. energy needs in 2030. Canada is a valued trading partner and our most reliable supplier of foreign based crude oil. The Keystone project will have the added benefit of potential links to growing domestic supplies of crude oil in Montana and North Dakota.	Comment acknowledged.
234	2	Griffin	John	Associated Petroleum Industries of	When our leaders talk of shovel ready jobs this fits the bill. Over 13,000 jobs funded with private investment will result. Local governments will have a steady source of income from	Consolidated Response ECO-1 addresses potential socioeconomic impacts, and Consolidated Response TAX-1 addresses concerns regarding taxes.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
				Michigan	the property taxes the pipeline company will pay.	
1547	17	Griffin	Tracey		...the wall of my house is 206 feet away from where this pipeline is going to be. I have not received any copy of that. My concern is that that can show a little of the distrust that I might have in whoever is running this; because you tell me that I should have received it. You send it out for me to look at, and yet I haven't gotten it...	Consolidated Response PVT-2 addresses concerns regarding the proximity of the proposed project to existing structures and facilities and routing concerns across private property.
1547	18	Griffin	Tracey		I have concerns about, when the ground is opened up and the machines are brought in to open the ground, the structure of my home either being damaged or being compromised....I'm concerned about the change in the soil there and the depth of the pipeline. It may shift some ground there.	It is not clear how far the commenter's home is from the centerline of the pipeline. However, Section 2.3 of the EIS describes the construction methods that would be used, including the depth of burial, topsoil segregation procedures, and methods used if residences are within 25 feet of the centerline of the pipe. In addition, special construction procedures that would avoid or minimize impacts in residential areas are described in the Keystone Construction, Mitigation, and Reclamation (CMR) Plan presented in Appendix B to the EIS. The CMR Plan also states that "Keystone shall reasonably compensate landowners for any construction-related damages caused by Keystone which occur on or off of the established pipeline construction right-of-way." If a residence is more than 25 feet from the pipeline, excavation of the trench would not damage or compromise the structure or the foundation of the structure.
1547	19	Griffin	Tracey		Concern about noise heard at her property during construction. Pipeline will be about 65 feet from her yard.	Consolidated Response NOI-1 and Section 3.12.2 of the EIS address issues related to noise impacts.
1547	21	Griffin	Tracey		Concern about trees that she left as buffers near the edge of her property line dying because of the pipeline. Pipeline will be about 65 feet from her yard.	As noted in Consolidated Response PVT-2, Keystone would work with landowners to identify the most suitable location for the crossing and will avoid key features to the extent practicable. The pipeline should not have any effects on trees after installation and roots should not extend out to the trench line if the pipeline is 65 feet from the property line. .
1547	22	Griffin	Tracey		Concern about whether cattle will be able to graze and whether he will be able to walk over the pipeline.	If the proposed Project is approved and constructed, after construction most existing land use in the right-of-way could continue, including grazing. Structure could not be installed within the 50-foot wide permanent right-of-way, and trees would not be allowed to grow within that area.
1547	23	Griffin	Tracey		Does not like feeling bullied out of his property.	As noted in Consolidated Response EAS-2, state laws dictate under what circumstances eminent domain may be used and define the eminent domain process within the state. DOS has no legal authority in the easement negotiations or in eminent domain proceedings.
1547	24	Griffin	Tracey		Concern about safety during operation. What if the worst case scenario happens 206 feet from his house?	Section 3.13 of the EIS addresses the impacts of spills from the proposed Project, including maximum spill volume scenarios. However, as noted in that section, due to the large number of variables associated with a single spill, it is not possible to predict the effect of a major release on each residence near a release site.
1547	27	Griffin	Tracey		If this people comes through and at some point it is proven to be a hazard somewhere along the way, will it be rerouted or taken out, any at all?	If approved, the Project would be constructed along the proposed route. As described in Consolidated Response SAF-1, the Pipeline and Hazardous Materials Safety Administration (PHMSA) has regulatory requirements that Keystone must comply with to construct, operate, maintain,

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
						inspect, and monitor the proposed Project in a manner that protects the health and safety of the public and the environment. In addition, PHMSA developed 57 Project-specific Special Conditions that Keystone has agreed to implement. Incorporation of those conditions would result in a Project that would have a degree of safety over any other typically constructed domestic oil pipeline system under current code and a degree of safety along the entire length of the pipeline system similar to that which is required in HCAs as defined in 49 CFR 195.450. It also describes the inspections and reviews of the proposed Project that PHMSA would conduct to ensure compliance with those regulatory requirements. If the Keystone monitoring and inspection program identifies a section of pipe that is sufficiently damaged to increase the risk of a release to an unacceptable level as defined by PHMSA, that section of pipe would be replaced.
1547	17	Griffin	Tracey		The disk that we were talking about, the draft, I live -- the wall of my house is 206 feet away from where this pipeline is going to be. I have not received any copy of that. My concern is that that can show a little of the distrust that I might have in whoever is running this; because you tell me that I should have received it. You send it out for me to look at, and yet I haven't gotten it....	Consolidated Response PVT-2 addresses concerns regarding the proximity of the proposed project to existing structures and facilities and routing concerns across private property.
69	1	Grish	Michael		It is irresponsible to spend billions of taxpayer dollars developing a source of energy that could not be worse for a warming planet. Tar sands oil emits three times more greenhouse gases than other fossil fuels, with no current way to mitigate that release. Moreover, the extraction site is an environmental disaster in the heart of one of the last great boreal forests of the planet.	The proposed Project is a private venture that would be paid for by Keystone if approved. Financing for the Project would not come from government agencies or taxpayers. Consolidated Response GHG-1 addresses the greenhouse gas life-cycle analyses presented in the revised EIS. Consolidated Response GHG-4 addresses potential loss of boreal forests and peat bogs.
69	2	Grish	Michael		This money would be better spent on clean, renewable energy such as wind, solar, and geothermal. The US gov't. has acknowledged the threat posed by global warming, and this pipeline project flies in the face of the urgent need to reduce greenhouse gas emissions to avoid the worst consequences of global climate change.	The proposed Project is a private venture that would be paid for by Keystone if approved. Consolidated Response P&N-5 addresses issues related to investments in other technologies. Consolidated Response GHG-1 addresses the greenhouse gas life-cycle analyses presented in the revised EIS. Consolidated Response GHG-3 addresses the decreased rate of greenhouse gas emissions from oil sands production in Canada.
1458	1	Groh	Keith		Make sure in the easement 1 pipeline and 1 only.	Consolidated Response EAS-2 addresses issues related to easement negotiations. As noted in that response, DOS has no legal authority in the easement negotiation process.
1458	2	Groh	Keith		We'd like to have the pipeline moved further from our house, since now it's within a 1/4 of a mile.	Consolidated Response SAF-1 describes the regulatory requirements that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project. It also describes the inspections and reviews of the proposed Project that the Pipeline and Hazardous Materials Safety Administration would conduct to ensure compliance with those regulatory requirements. The regulations and Special Conditions that Keystone would follow do not require that the pipeline be more than 0.25 mile from a home. The commenter can work with Keystone to address potential minor realignments that can be made during final design, assuming the realignment are consistent with the requirements of

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
						environmental permits. The commenter can also work with Keystone to address potential minor realignments that can be made during final design, assuming the realignment are consistent with the requirements of environmental permits. Pipeline routing in Montana is addressed in Consolidated Response EAS-1.
1458	3	Groh	Keith		We want to be compensated for inconvenience of road travel, construction, fences, gates, in a diligent fashion.	Consolidated Response EAS-2 addresses issues related to easement negotiations. As noted in that response, DOS has no legal authority in the easement negotiation process. Consolidated Response RDS-1 addresses concerns about the condition of roadways and roadway structures associated with construction and operation of the proposed Project as well as traffic safety measures that would be incorporated into the Project.
1458	4	Groh	Keith		4) We see a division of our property useage.	Consolidated Response EAS-2 addresses issues related to easement negotiations and eminent domain. DOS has no legal authority in the easement negotiations or in eminent domain proceedings.
1458	5	Groh	Keith		We want to be compensated for our damages personally rather than the government agencies being first in line.	<p>It is not clear what the commenter is referring to regarding a government agency receiving compensation and receiving that compensation before landowners. Compensation for damages that occur during construction or maintenance is typically addressed in easement agreements between landowners and the pipeline company (see Consolidated Response EAS-2).</p> <p>As noted in Consolidated Response LIA-1, Keystone would be liable for costs associated with a spill from the proposed Project. Although those costs would include reimbursing government agencies for work accomplished associated with a spill, landowners would be compensated as well.</p>
1458	6	Groh	Keith		In case of any kind of damage to our property we want to be confident that it can be restored to its original condition at Keystone's expense with no losses to us personally. The burden of damages if there are any should not be our responsibility at all but Keystone's.	The concern of the commenter is addressed in Section 2.5 of the Keystone Construction, Mitigation, and Reclamation Plan presented in Appendix B of the EIS: "Keystone shall reasonably compensate landowners for any construction-related damages caused by Keystone which occur on or off of the established pipeline construction right-of-way. Keystone shall reasonably compensate landowners for damages to private property caused by Keystone beyond the initial construction and reclamation of the pipeline, to include those damages caused by Keystone during future construction, operation, maintenance, and repairs relating to the pipeline."
1458	7	Groh	Keith		What recourse do we have if our water sources are damaged.	It is not likely that wells used for domestic purposes, irrigation, and livestock would be affected during construction and normal operation of the proposed Project. However, if there is damage, Compensation to landowners is addressed in Consolidated Response FRM-1 and in Section 2.5 of the Keystone Construction, Mitigation, and Reclamation Plan in Appendix B of the EIS. If there is a spill from the proposed Project, Keystone or the incident response team would inform all landowners in the vicinity of the spill that the release had occurred and advise the landowners of the appropriate precautions. Keystone would be liable for all costs associated with cleanup and restoration as well as other compensations,

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
						as noted in Consolidated Response LIA-1. If a stock pond or a well used as a source of domestic or irrigation water is affected, Keystone would provide water until the affected water is proven to be acceptable for use.
1458	8	Groh	Keith		How soon of a response will we get if we recognize a problem.	Consolidated Response RES-1 addresses issues related to preparation and review of emergency response plans for the proposed Project.
1458	10	Groh	Keith		10) We would like to know the protocol for us to cross the pipeline, example water lines, fence lines and roads.	The top of the pipeline would be at least 4 feet below the ground surface in most places and many currently conducted activities can be conducted on the permanent right-of-way after construction and reclamation are complete. Prohibited uses would likely be listed in the easement agreement between Keystone and the landowner. Questions on specific uses not listed in the easement agreement should be directed to Keystone.
1458	12	Groh	Keith		We would like a yearly payment that is indexed or adjustable based on changes in the economy.	Payment for use of the right-of-way would be addressed in an easement agreement between the landowner and Keystone. Consolidated Response EAS-2 addresses issues related to easement negotiations. As noted in that response, the Department of State has no authority to intervene in those negotiations.
1458	13	Groh	Keith		Who would be liable if there is a mishap involving the trench.	Keystone would be liable for accidents associated with the trench during construction.
1458	14	Groh	Keith		14) will our taxes and land value be increased or decreased by this pipeline? We would welcome the economic boost the pipeline project could possibly provide for our local economy, but we also want to be sure that we don't sustain problems or losses because of the project.	Consolidated Response TAX-1 and revisions to Section 3.10.2.4 of the EIS address concerns regarding taxes associated with implementation of the proposed Project. Consolidated Response VAL-1 addresses concerns regarding property values. Consolidated Response ECO-1 and Section 3.10.2.2 of the EIS address the potential socioeconomic impacts of the proposed Project.
1458	15	Groh	Keith		The first issue I'd like to address is safety. The DEIS does not contain or evaluate a complete emergency response plan, which the Department of Transportation must approve prior to pipeline operations. The largely volunteer emergency personnel and potentially affected property owners and others who live near the pipeline deserve an opportunity to comment on TransCanada's emergency response plan prior to issuance of permits and approval of the plan. The disaster in the Gulf serves as a warning - if federal officials had paid more attention to the lack of a plan for dealing with a blow-out of BP's rig before the company was allowed to drill, we would have known before it was too late that there was no plan to contain a catastrophic spill. The Emergency Response Plan in fact is so incomplete at this time, it was not even to the point that the public could give proper review and feedback through this process. Therefore, we strongly suggest that once there is a complete draft Emergency Response Plan, you conduct another comment period so that we may address it. At this point it is hardly more than an outline and therefore essentially uncommentable. Safety is of utmost importance and our local communities need to know there is a good plan in place.	Consolidated Response RES-1 addresses issues related to preparation and review of the emergency response plan for the proposed Project.
1458	17	Groh	Keith		As the project is proposed, TransCanada may have Right of Eminent Domain, meaning the courts may force us into an	As noted in Consolidated Response EAS-2, state laws dictate under what circumstances eminent domain may be used and

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					agreement on their terms with minimal compensation. The easement can be sold to any other company under the present contracts offered.	define the eminent domain process within the state. DOS has no legal authority in the easement negotiations or in eminent domain proceedings.
1458	18	Groh	Keith		If contamination of our land occurs, especially in later years and the responsible party cannot or will not pay the cost, government environmental agencies could clean it up and force the landowner to pay for the cleanup. This has happened to landowners when a crystal meth lab was put on their remote property without their knowledge. Oil spill cleanup could potentially cost much more than the value of the property.	Consolidated Response LIA-1 addresses Keystone's liability if there is a spill of hazardous materials or fuel during construction or a spill of crude oil from the proposed Project. As noted in Consolidated Response LIA-2, the Department of State reviewed Keystone's financial stability and found it satisfactory to meet its proposed Project-related commitments. However, we do not have regulatory authority to require that Keystone provide a letter of credit or a bond to pay for damage or cleanup of a spill of oil.
1458	19	Groh	Keith		Because of this overhanging liability, I believe our land values will be drastically reduced. Any potential buyer would be forced to assume any liability you might later incur without receiving any compensation. If offered two properties, one with these overhanging issues and one without, which would you choose?	Consolidated Response VAL-1 addresses concerns regarding property values. Consolidated Response LIA-1 addresses Keystone's liability if there is a spill of hazardous materials or fuel during construction and from a spill of crude oil from the Project.
619	1	Gruba	Kathy		The Ogallala Aquifer is a national treasure, supplying water to the bread basket of the U.S. I can't believe powers that be are considering running a pipeline across it. The sandy soil would channel any spills directly to the water underneath. There are plenty of messes made by oil that may never be cleaned up. They cannot possibly guarantee no spills. How can we in good conscience risk the Ogallala Aquifer? I know we are probably considered "the little people" in this part of the country, but the Aquifer is far from "little;" and the number of crops grown and people fed are far from "little" as well. Please don't do this.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
1544	193	Guerrero	Rosalia	Citizen of Channelview	Opposes pipeline.	Comment acknowledged.
1544	194	Guerrero	Rosalia	Citizen of Channelview	Denial of this permit would be a sign that the federal government is willing and able to protect the people of the U.S. over the corporations of other countries.	Consolidated Response ENR-1 provides information on the Department of State's environmental review process, the National Interest Determination process, and the need to complete those reviews before approving or denying the Presidential permit for the proposed Project.
1544	195	Guerrero	Rosalia	Citizen of Channelview	Those who would speak on behalf of this project have economic interests in seeing this permit go through. Although I don't think they are insincere when they say TransCanada is environmentally responsible, I would like to remind everyone and yourselves that the same was said of BP.	As described in Consolidated Response GLF-1, the risks associated with the proposed Project are substantially different from those associated with the BP Deepwater Horizon Project.
1544	196	Guerrero	Rosalia	Citizen of Channelview	And now, for those that would hold the pipeline faultless, as to air quality, that is like me coming to you and dumping my garbage on your front lawn and then patting myself for not dropping any along the way.	Section 3.12.1.2 includes a discussion of all regulations that the Project is required to comply with in order to minimize impacts to air quality, including health effects. Consolidated Response CAN-1 addresses development of Canadian oil sands. As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries. Consolidated Response OIL-4 also addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
						heavy crude oils.
1553	39	Guerrero	Rosalia	Air Alliance Houston	We also did not hear about this meeting last year or anything that was going on. We are not fly-by-night, we've been around for over 25 years, and usually we get all kinds of letters per day asking us for our comments. So I was really shocked when we just learned about this.	Consolidated Response CMT-2 addresses issues related to comment meetings on the draft EIS and requests for additional public involvement.
1553	40	Guerrero	Rosalia	Air Alliance Houston	Concerned about environmental justice issues for people in Port Arthur, TX.	As discussed in the EnSys 2010 report, the quantity of crude oil refined in PADD III is driven by market conditions and is independent of the existence of the proposed Project. The proposed Project would provide access to WCSB crude oil in PADD III refineries that would supplant supplies from other sources, including Venezuela and Mexico. As discussed in Section 3.13.5.1 of the EIS and Consolidated Response OIL-4, the composition of WCSB crude oils that could be transported by the proposed Project is not dissimilar from other heavy crude oils currently refined in PADD III. There is therefore no credible evidence that implementation of the proposed Project would lead to disproportionate adverse impacts on minority and low income populations near PADD III refineries.
1546	200	Guith	Christopher	U.S. Chamber of Commerce	Net gain of 350,000 jobs associated with the project, and \$42 billion added to GDP. This would add \$600 million annually in state or local tax base.	Consolidated Response ECO-1 addresses potential socioeconomic impacts, and Consolidated Response TAX-1 addresses concerns regarding taxes.
1334	1	Gulick	Ed	Northern Plains Resource Council	Thank you for considering the following points as you make improvements, additions, and changes to the Keystone XL pipeline Environmental Impact Statement. We are concerned that although many of these issues were raised during scoping, and most were captured in the Department's "Scoping Summary," they were still inadequately addressed or completely omitted from the draft EIS.	The EIS addresses all substantive issues that relate to the NEPA environmental review process that were raised during the scoping process. Table 1.7.1-1 of the EIS lists the comments received and the sections of the EIS in which they area addressed.
1334	2	Gulick	Ed	Northern Plains Resource Council	The DEIS does not contain or evaluate a complete emergency response plan. This poses an unacceptable risk to Montana. The largely volunteer emergency personnel and potentially affected property owners and others who live near the pipeline deserve an opportunity to comment on TransCanada's emergency response plan prior to issuance of permits and approval of the plan. The disaster in the Gulf serves as a warning... if federal officials had paid more attention to the lack of a plan for dealing with a blow-out of BP's rig before the company was allowed to drill, we would have known before it was too late that there was no plan to contain a catastrophic spill. The plan is so incomplete at this point it is impossible to fully comment on. Thus, there should be another comment period on this aspect before a final EIS and permit is released.	Consolidated Response RES-1 addresses issues related to preparation and review of emergency response plans for the proposed Project.
1334	4	Gulick	Ed	Northern Plains Resource Council	Integrity management plan• TransCanada has yet to submit an Integrity Management Plan for high consequence areas .. What will be the process for public comment on the IMP?	Keystone would submit its Integrity Management Plan to the Pipeline and Hazardous Materials Safety Administration (PHMSA) as required by PHMSA regulations. There is not a public review process for that plan.
1334	5	Gulick	Ed	Northern Plains Resource Council	Oversight ...The Office of Pipeline Safety, according to the EIS would "conduct periodic inspections" of the proposed pipeline during operation. (EIS reference: page 3.13-14). What defines "periodic"? Also, what government agency will be doing oversight during the construction phase?	As noted in Consolidated Response SAF-1, Keystone must comply with PHMSA's regulatory requirements for design and construction, and PHMSA would conduct on-site inspections during construction. The requirements for and frequency of inline pipeline inspections and other monitoring activities are in

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
						the Special Conditions presented in Appendix U of the EIS.
1334	7	Gulick	Ed	Northern Plains Resource Council	• The DEIS doesn't analyze the environmental effects of tar sands oil, which some say is the 'dirtiest form' of energy available.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project. Consolidated Response OIL-4 addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils. As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries.
1334	8	Gulick	Ed	Northern Plains Resource Council	• The DEIS does not analyze the full climate impacts of tar sands to be transported on the pipeline. The State Department says it does not have to do so, since production will occur in Canada. The Department should follow new guidelines from the Council on Environmental Quality on analyzing climate impacts of major federal actions, and it should ask the EPA to conduct a full lifecycle analysis of tar sands.	Consolidated Response GHG-1 addresses the greenhouse gas life-cycle analyses presented in the revised EIS.
1334	9	Gulick	Ed	Northern Plains Resource Council	The DEIS assumes there is a need for the Keystone XL pipeline but without doing a thorough, independent, and detailed analysis of the need for the pipeline. It glosses over the need and fails to analyze reasonable alternatives.	Consolidated Response P&N-1 describes the need that the Project has been proposed to meet and provides an explanation of the thorough and independent analysis of need that was conducted for the EIS. Section 4.0 provides an assessment of potential alternatives to the proposed Project.
1334	10	Gulick	Ed	Northern Plains Resource Council	If TransCanada is given a permit for this pipeline, the company will have the power to condemn landowners to build it. The company shouldn't get this power unless it is the best alternative to meet U.S. energy needs.	As noted in Consolidated Response EAS-2, state laws dictate under what circumstances eminent domain may be used and define the eminent domain process within the state. DOS has no legal authority in the easement negotiations or in eminent domain proceedings.
1334	11	Gulick	Ed	Northern Plains Resource Council	The recently completed Alberta Clipper and Keystone I pipelines offer more than enough capacity for the most optimistic projections of tar sands production for many years; if not indefinitely. The DEIS ignores this existing over-capacity. The scoping summary report clearly outlines the questions to be answered, and the DEIS fails to do so.	Consolidated Response P&N-1 addresses the need that the Project has been proposed to meet. As noted in that response, the Project has been proposed to meet the heavy crude oil needs of refineries in the Gulf Coast area, not for the U.S. in general. In addition, the Alberta Clipper and existing Keystone pipeline projects serve other markets and do not meet the demands of the Gulf Coast refineries. The EIS addresses all substantive issues raised during the scoping process. Table 1.9.1-1 of the EIS lists the comments received and the sections of the EIS in which they are addressed.
1334	13	Gulick	Ed	Northern Plains Resource Council	Agriculture• The DEIS severely underestimates the impact that this pipeline will have on agricultural land, particularly irrigated land. Farmers and ranchers need assurance from this governmental process that they will not be sacrificed in order to make way for this pipeline. The DEIS states that agricultural land will recover in 1 year (EIS reference: 3.13-50, 3.14-26). Farmers know that it takes many seasons to recover from soil damage, weed introduction, settling, and everything else that will be associated with a massive construction project with	Consolidated Response FRM-1 describes potential impacts to farmland and ranches and Keystone's responsibilities to compensate for damage to these crops. The EIS was revised to reflect that the potential impacts to agricultural land from construction and from an oil spill and subsequent response actions may last for one to a few years, depending upon the amount of oil, area impacted, and the type of cleanup actions taken by Keystone. In general, oil on and/or in the soils is weathered through biodegradation by micro-organisms,

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					huge heavy machinery. Also, the idea that crops will grow back after nature fixes the problem of any spills within one year is absolutely inaccurate and verging on offensive.	photodegradation by sunlight, and physical-chemical degradation. These basic processes generally reduce or eliminate the lighter fractions of oil that may be harmful to plants and/or animals and do so in a few months to a year or two. The heavier fractions of the oil (commonly called tar or asphalt) may persist for longer periods of time but are not toxic to organisms. The response actions may disturb the soils and provide habitat for weeds, reduce or remove the native or agricultural vegetation, and otherwise have impacts that may persist for a year or more.
1334	14	Gulick	Ed	Northern Plains Resource Council	The EIS affords government land some protections but leaves agricultural reclamation up to landowner easements (EIS reference 3.2-12). Private landowners should be afforded the same protections as the government.	Page 3.2-12 of the draft EIS does not state that reclamation would be the responsibility of the landowner. Page 3.2-12 includes the following statement: "Keystone would be required to restore the productivity of the ROW and/or compensate landowners for demonstrated losses associated with decreased productivity resulting from pipeline operation." Keystone would return the construction right-of-way to approximately the same conditions that the land was in prior to construction as described in Sections 2.3.2.8 and 2.3.2.9 and in the Keystone Construction, Mitigation, and Reclamation Plan (presented in Appendix B of the EIS).
1334	15	Gulick	Ed	Northern Plains Resource Council	The Seriousness of noxious weeds to farmers and ranchers is clearly not understood because this EIS allows TransCanada a major loophole stating in 3.5-27 that it is ok if "benefits" outweigh the harm. How are "benefits" defined and who decides?	The language cited by the Commentor concerning "benefits" refers to language within Executive Order 13112 which directs federal agencies to prevent the introduction of invasive species. In this case "benefits" would refer to the benefits to the United States provided by the Keystone XL proposed Project as described in Section 1.2. This Executive Order also specifies that feasible and prudent measures to minimize risk have been taken. The proposed mitigation measure for preventing the spread of noxious weeds are described in the Construction, Mitigation, and Reclamation Plan, presented in Appendix B of the EIS. Mitigation measures to prevent the spread of noxious weeds are described in Section 3.5.5.4 of the EIS.
1334	16	Gulick	Ed	Northern Plains Resource Council	The EIS states that an oil spill would be no problem to mammals (EIS reference:3.13-45)	Sections 3.13.5.6 and 3.13.6.4 of the EIS acknowledge that there may be direct and/or indirect impacts to mammals, with the magnitude and duration of impacts largely determined by the season, areal coverage, amount of oil, effectiveness of the response actions, and the habitats and species present in the oil-impacted area.
1334	19	Gulick	Ed	Northern Plains Resource Council	According to Appendix B of the EIS, Keystone commits to monitoring, repair and reclamation for several years. What defines "several" and shouldn't Keystone be required to monitor, repair and reclaim for as long as there is a problem?	Required monitoring in appropriate ABB habitat areas is determined by USFWS in consultation with DOS and will be defined at the time of publication of the Biological Opinion. See Appendix T of the EIS for the Biological Assessment.
1334	23	Gulick	Ed	Northern Plains Resource Council	Roads. According to the EIS, paved roads are not likely to require improvement or maintenance prior to or during construction, and gravel roads and dirt roads may require maintenance (EIS reference: 3.9.3.3 & Appendix T, p. 2-16). Clearly no research was done as to the road situation during and after construction of Keystone1 because had this research been done, the DOS would have learned road damage horror stories. The EIS needs to accurately place responsibility for all of the likely damage in the hands of TransCanada. Otherwise, the counties and taxpayers will be	Consolidated Response RDS-1 addresses concerns about the condition of roadways and roadway structures associated with construction and operation of the proposed Project. As noted in that response, Keystone would be responsible for roadway improvements and restoration if damage occurs due to Project-related activities.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					left with ruined roads and the bill to fix them.	
254	2	Gumm	Jay	Senate OK District 6	As we understand it, Keystone XL will create more than 13,000 high-wage construction and manufacturing jobs during the project's 2011~2012 construction schedule. Many of those jobs will be created in rural and in my districts, where too many of our residents continue to find it difficult to find good jobs. With Keystone XL, they will have an opportunity to work on the project or for businesses that provide supplies, goods and services for its construction and operation.	Consolidated Response ECO-1 and Section 3.10.2.2 of the EIS address the potential socioeconomic impacts of the proposed Project.
254	3	Gumm	Jay	Senate OK District 6	In addition to the jobs Keystone XL will create, the project will generate substantial economic benefits for the United States and in states and communities along the proposed route. Like our counties, in many cases these are areas where economic performance has stagnated or is shrinking. It is my understanding that TransCanada commissioned a study to measure the projects economic stimulus to the U.S. and the states along the route. The study found that in the U.S. Keystone XL would generate \$20.9 billion in total expenditures, \$9.6 billion in output (gross product), personal income of \$6.5 billion and 118,935 person years of employment (jobs).	Consolidated Response ECO-1 addresses potential socioeconomic impacts, and Consolidated Response TAX-1 addresses concerns regarding taxes.
254	4	Gumm	Jay	Senate OK District 6	In addition, the report concluded that during construction, Keystone XL would generate \$486.36 million in tax revenue for state governments along the route and \$99.1 million for local taxing entities where the pipeline is located. In Oklahoma, the study found Keystone XL expenditures during construction would total \$1.2 billion and generate an economic gross product of nearly \$1.1 billion. Keystone 'XL construction also would generate more than \$7.7 million in tax revenue for local government and \$31.4 million for state government.	Consolidated Responses TAX-1 and ECO-1 address the estimated increases in the tax base and the jobs generated by the proposed Project. Also see the revisions to Sections 3.10.2.3 and 3.10.2.4 of the EIS.
254	8	Gumm	Jay	Senate OK District 6	We enthusiastically support the Keystone XL Pipeline Project and encourage the Department of State to confirm the findings of the Draft Environmental Impact Statement, which found that the proposed Keystone XL Pipeline would have "limited adverse environmental impact during construction and operation."	Comment acknowledged.
1546	107	Guysaind-Jaques		Canadian Embassy	Strong support, project should be considered in the context of the Canada and U.S. relationship which has spanned two centuries and is underpinned by the world's largest and most robust trading relationship.	Comment acknowledged.
1546	109	Guysaind-Jaques		Canadian Embassy	U.S. money spent on Canadian energy are recycled back into the American economy, through Canadian purchases of U.S. goods and services.	Comment acknowledged.
1546	112	Guysaind-Jaques		Canadian Embassy	Canadian oil sands are not as large as Saudi Arabia's, but significantly larger than Iran or Russia.	Comment acknowledged.
1546	114	Guysaind-Jaques		Canadian Embassy	A network of cross-border energy infrastructure already exists.	Comment acknowledged.
1546	116	Guysaind-Jaques		Canadian Embassy	Construction will create over 13,000 construction jobs from 2011-2012. 90% of the equipment used will be sourced within North America.	Consolidated Response ECO-1 and Section 3.10.2.2 of the EIS address the potential socioeconomic impacts of the proposed Project.
1546	117	Guysaind-Jaques		Canadian Embassy	Canada investing heavily at the federal and provincial level to strongly regulate and sustainably develop the oil sands.	Comment acknowledged.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
1144	1	Gwin	Carlyle		I'm concerned about the oil spill as well as a whole lot of other issues where the federal government has overstepped its constitutional authority. In the end, I believe that the outcome for all of us depends more on the integrity of the individuals running the operation than whether they are from the government or the private sector. We don't need more expensive control; we need integrity in the oil fields, banks, & halls of Congress.	The commenter's opinion is noted.
361	1	Gyns	Lyndi	US Pipeline	Building the pipeline brings economic growth to the region.	Comment acknowledged.
361	2	Gyns	Lyndi	US Pipeline	Pipelines are the safest way to transport liquids in respect to the environment. We are strictly inspected to make sure we protect all biological resources. All impacted wetlands are restored back to their original state and construction is limited to the times of the year so that all wildlife is not impacted by construction. We construct to the most stringent environmental rules and are monitored by government agencies while we do so.	Comment acknowledged.
361	3	Gyns	Lyndi	US Pipeline	We at US pipeline support the Keystone Project.	Comment acknowledged.
62	1	Haesly	Jack		I am against strip mining of oil sands in the State of Texas for the extraction of oil from said sands. This is a terribly dirty and destructive process and restoration of lands after mining never leaves the subject land in a fully restored and acceptable condition. The pollution from such a process is on a plain with off-shore drilling and is totally unacceptable. Isn't it enough that off-shore drilling may have killed most of the flora and fauna in the Texas Gulf Coast? Do we have to destroy the Texas lands as well? Do not strip mine the Texas oil sands.	As noted in Section 1.1 of the EIS, the source of crude oil for the proposed Project would be oil sands in Canada. There will be no extraction of oil for the proposed Project in Texas.
93	1	Hageman	Glenn	Glasgow K-12 Schools	The Board of Trustees of the Glasgow School District support the construction of this pipeline. This will be a positive source of revenue for our school district and will supplement the education of our children in Valley County. Glenn Hageman Superintendent of the Glasgow Schools	Consolidated Response ECO-1 addresses potential socioeconomic impacts, and Consolidated Response TAX-1 addresses concerns regarding taxes.
978	1	Hager	Allen		I would really appreciate if you would consider having TransCanada move this pipeline east towards Omaha. This pipeline should not be underground especially through the largest freshbody aquifer anywhere in the world. If its decided that it should be allowed to come through this part of Nebraska, then you should make them build it above ground.	Consolidated Response ALT-1 and Section 4.3 address potential alternative routes, including routes that would avoid much of the Northern High Plains Aquifer System. Issues related to an aboveground pipeline are addressed in Consolidated Response CST-1.
1530	1	Hahn	Gordon	Saco School District 12A&B	This is a letter of support for the Keystone Pipeline and any agency that will be supporting the project, such as Big Flat Electric Cooperative.	Comment acknowledged.
1530	2	Hahn	Gordon	Saco School District 12A&B	Projects of this nature provide an economic opportunity to an area which can boost employment and assist schools with funding and possibly students.	Comment acknowledged.
1530	3	Hahn	Gordon	Saco School District 12A&B	The Board of Trustees for the Saco School District supports the Keystone Pipeline project and the connection that Big Flat Electric has with it.	Comment acknowledged.
1325	1	Hale	William		I write in support of TransCanada's Keystone XL crude oil pipeline project and urge the department to grant a permit for the pipeline.	Comment acknowledged.
1325	3	Hale	William		The environmental benefits of Keystone XL should not be	Comment acknowledged.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					overlooked. The current tragedy in the Gulf underscores the importance of a diverse portfolio of energy supplies. Within the spectrum of viable options, it is appropriate to seek a growing role for oil resources that are: • Land-based; • North American; and, • Transported by pipeline. This project meets each of these criteria. Securing stable and affordable energy from our North American allies through projects such as the Keystone pipeline is in the national interest. Considering the economic and energy security benefits of these vital resources, we should continue to expand America's access to safe, affordable energy to help ensure improved domestic and global energy security and stable prices for consumers.	
1325	4	Hale	William		Pipelines are the safest, most reliable, economical and environmentally favorable way to transport oil and petroleum products, as well as other energy liquids, throughout the U.S. America depends on the more than 168,000 miles of liquid pipelines to move energy and raw materials our country relies on.	Comment acknowledged.
1325	5	Hale	William		Additional pipeline capacity will help consumers and businesses throughout the United States. This project also stands to provide a powerful private sector economic stimulus. During construction, Keystone XL will create more than 13,000 jobs funded with private investment. In addition, local governments will have a steady source of income from economic activity associated with construction	Consolidated Response ECO-1 and Section 3.10.2.2 of the EIS address the potential socioeconomic impacts of the proposed Project.
1325	6	Hale	William		and from property taxes the pipeline company will pay.	Comment acknowledged.
1325	7	Hale	William		Rejection of the permit or suspension of the review would sacrifice the significant economic benefits this project stands to deliver and force U.S. consumers to rely on other sources of crude oil not economically and politically allied with U.S. interests. This would be a mistake. I urge the granting of the permit. Thank you for the opportunity to comment.	Comment acknowledged.
1353	1	Haley	MariaLuisa	Arkansas Economic Development Commission	I am writing this letter to encourage the U.S. Department of State to consider a permit for TransCanada's Keystone XL crude oil pipeline project. I believe this project is instrumental in improving economic conditions in Arkansas - and the rest of the country. Hundreds of Arkansans depend on projects such as Keystone XL to keep manufacturing facilities running. Once approved, this project will put people to work immediately making pipe and other materials for the project - jobs that are desperately needed in Arkansas. These jobs will help provide taxes and strengthen consumer spending from manufacturing, construction and operation of the pipeline and related projects. Each day the project is delayed, we experience a loss of economic potential. It has been estimated that the Keystone XL project will create more than 13,000 private sector jobs and generate some \$60 million in direct payrolls, not to mention millions of additional dollars as a result of indirect jobs.	Consolidated Response ECO-1 and Section 3.10.2.2 of the EIS address the potential socioeconomic impacts of the proposed Project.
212	1	Hall	Doris		It seems that the states involved in this pipeline have no laws in place to protect their landowners and the environment. We are depending on the US Government for protection and fair treatment by the foreign companies (China and Canada) coming in and using our land and possibly contaminating our	Consolidated Response P&N-1 addresses the need that the Project has been proposed to meet. As described in Section 1.0 of the EIS and in Consolidated Response RES-2, TransCanada-Keystone Pipeline LP (Keystone) is not a foreign corporation. It is a limited partnership organized under

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					land and water resources for years to come with no liability on their part just to line the pockets of the big oil companies. They have one big pipeline in place – why the need for another? Is there an endless supply of tar sands oil? What becomes of this line when the oil runs out? Why this pipeline at all and why no refine tar sands oil in Canada? It seems the process of mining and refining this oil causes more damage and use of resources than the value of the oil. Who is going to restore the damaged forests and where is all the contaminated water to go? Has our country learned anything yet from the gulf of oil spill?	the laws of the state of Delaware. Keystone has the same rights as other pipeline companies in the U.S. to propose projects. Consolidated Response LIA-1 addresses Keystone's liability if there is a spill of hazardous materials or fuel during construction and from a spill of crude oil from the Project. Issues related to the life of the Project and taking the Project out of service are presented in Consolidated Response DEC-1. Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1.
213	1	Hall	Doris		Who is financing this pipeline? Where is this "superior" pipe being manufactured and who stands to profit? I read that China is financing this project with Wal-Mart dollars – also the pipe being used is made in India. How can foreign countries come here – take our land – use possibly inferior materials – yet assume no liability in case of leaks and even pay no royalties? Does not our government stand behind its citizens?	The proposed Project would be financed by the applicant, Keystone and there is no involvement by Chinese investors, other than those who may own stock in the parent company of Keystone (TransCanada). As described in Section 1.0 of the EIS and in Consolidated Response RES-2, TransCanada-Keystone Pipeline LP (Keystone) is not a foreign corporation. It is a limited partnership organized under the laws of the state of Delaware. Keystone has the same rights as other pipeline companies in the U.S. to propose projects. Consolidated Response PIP-1 addresses the issue of purchasing pipe for the Project. There are no royalties involved in transporting oil by pipeline. Consolidated Response LIA-1 addresses Keystone's liability if there is a spill of hazardous materials or fuel during construction and from a spill of crude oil from the Project.
1494	1	Hallsten	Greg	Montana DEQ	Under the No Action Alternative, if it is likely that other projects would be proposed to meet the increased demand, how can you justify saying that" ... the U.S. would not receive a reliable and cost efficient source of crude oil from the WSCB region and would remain dependent upon unstable foreign oil supplies from the Mideast, Africa, Mexico, and South America ... "?	The text referred to by the commenter has been revised to indicate that the U.S. would not receive a reliable and cost-efficient source of crude oil from the WSCB region in the near term.
1494	2	Hallsten	Greg	Montana DEQ	ES.5.2.1 ES-5 Section "...Pegasus is considering an expansion of up to 30,000 bpd to PADD III as early as 2009." Since that is in the past, did Exxon upgrade the Pegasus line or not? On page 4-5, section 4.2.1, says this upgrade has occurred, need to update this sentence in the Executive Summary.	The Executive Summary has been revised substantially. Section 4.2.1 has been revised to include the most recent information on the Pegasus Pipeline.
1494	3	Hallsten	Greg	Montana DEQ	ES.S.S ES-7 Section Before the project is approved MDEQ must make the following findings:(a) the basis of the need for the facility;(b) the nature of the probable environmental impact;(c) that the facility minimizes adverse environmental impact, considering the state of available technology and the nature and economics of the various alternatives;(d) in the case of an electric, gas, or liquid transmission line or aqueduct: (i) what part, if any, of the line or aqueduct will be located underground; (ii) that the facility is consistent with regional plans for expansion of the appropriate grid of the utility systems serving the state and interconnected utility systems; and (iii) that the facility will serve the interests of utility system economy and reliability; (e) that the location of the facility as proposed conforms to applicable state and local laws and regulations, except that the department may refuse	The text of the EIS has been revised to provide additional information on the Montana Department of Environmental Quality review of the Keystone application for a certificate of compliance under the Montana Major Facility Siting Act.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					to apply any local law or regulation if it finds that, as applied to the proposed facility, the law or regulation is unreasonably restrictive in view of the existing technology, of factors of cost or economics, or of the needs of consumers, whether located inside or outside the directly affected government subdivisions;(f) that the facility will serve the public interest, convenience, and necessity;(g) that the department or board has issued any necessary air or water quality decision, opinion, order, certification, or permit as required by 75-20-216(3); and(h) that the use of public lands for location of the facility was evaluated and public lands were selected whenever their use is as economically practicable as the use of private lands.If these findings cannot be made then DEQ must delay certification of the project.	
1494	4	Hallsten	Greg	Montana DEQ	ES.6.1.2 ES-8 Line7 Insert: "On all lands in Montana, MDEQ would require additional mitigation measures for paleontological materials in its Environmental Specifications to be complied with by Keystone."	The Executive Summary has been substantially revised.
1494	5	Hallsten	Greg	Montana DEQ	ES.6.1.2 ES-8 Line 8 MDEQ is not a land management agency. Further the MOU is to be applied to ALL lands in Montana, not just federal or state. Suggest using the following: "There is currently an effort among agencies in Montana such as BLM, DOS, MDNRC and MDEQ and other agencies to develop a Memorandum of Understanding (MOU) for the identification, evaluation and protection of paleontological resources in the state of Montana;"	The Executive Summary has been substantially revised.
1494	6	Hallsten	Greg	Montana DEQ	ES.6.1.4 ES-9 Section Note: In Montana the pipeline would cross the Weldon-Brockton-Froid fault zone where seismic activity has been reported in the last 200 years.	The Executive Summary has been revised. Consolidated Response GEO-2 addresses potential seismic hazards.
1494	7	Hallsten	Greg	Montana DEQ	ES.6.2 ES-9 Section In addition to the impacts mentioned, settling of poorly compacted soils over the trench is expected following construction in small areas. This may be exacerbated if construction is unexpectedly delayed and extends into the winter season and the trench backfilled with frozen soils.	The Executive Summary has been revised. Trenches will not be backfilled using frozen soils. Section 3.2.2.3 of the EIS discusses temperature impacts on soil.
1494	8	Hallsten	Greg	Montana DEQ	ES.6.3.1 ES-9 & ES- Section A few areas contain perched aquifers where groundwater is present at shallow depths in gravelly or 10 sandy aquifers underlain by shale or other confining layer. The backfilled trench in isolated areas may be more permeable and porous than the surrounding aquifers and groundwater may tend to collect and flow down the trench. Installation of trench breakers can reduce the flow of water along the trench but may not eliminate this flow. In a few cases additional water flowing along the backfilled trench could raise the water table in cultivated fields, reducing productivity in those fields. One such area described by a landowner to DEQ after leaving the Glasgow hearings, is located between the Milk and Missouri Rivers. Contact DEQ for more details. Add the following sentence to the end of this section: "The chance of a leak is considered low, at any point along the pipeline, but in the unlikely event that a leak occurred, groundwater quality and water supplies could be	The EIS has been revised in response to this comment.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					adversely affected."	
1494	9	Hallsten	Greg	Montana DEQ	ES.6.3.2 ES-10 Section Add to this section: "The chances of a pipeline spill affecting a single lake, pond or wetland stream are considered low, but if a spill were to occur, water quality, and aquatic life would be adversely affected. Water supplies also could be affected."	The EIS includes a revised Executive Summary that generally addresses this comment.
1494	10	Hallsten	Greg	Montana DEQ	ES.6.3.3 ES-10 2 Line 4 "The pipeline would be constructed under streams and rivers with potential for vertical scour and lateral movement."	The Executive Summary of the EIS has been revised.
1494	11	Hallsten	Greg	Montana DEQ	ES.6.4 ES-II 3 How would lost functions and values during the period between construction and the time when wetlands are re-vegetated be mitigated or compensated? Paragraph 3, line 6 add: "and would help ensure that potential effects would be...."	Compensatory mitigation is only required for permanent wetland losses. Most wetlands would be restored to their previous function. During construction sediment barriers, trench plugs, temporary slope breakers, temporary mulching and tackifiers would be used to replace vegetation's function of mediating water infiltration into the soil and limiting sediment flow into streams and wetlands.
1494	12	Hallsten	Greg	Montana DEQ	ES.6.5 ES-11 1 In the northern great plains, re-vegetation of the pipeline may only be achieved in two years in exceptional conditions. Drought and livestock grazing could prolong the time it takes to fully revegetate grasslands the right-of-way to more than five years.	The Executive Summary of the EIS has been revised. Section 3.5 of the EIS describes re-vegetation of grasslands within 1 to 5 years, but requiring 5 to 8 years in northern arid regions when combined with possible drought and livestock grazing. Section 3.5 of the EIS was revised from stating "Grassland impacts due to pipeline construction are expected to be minimal, and affected vegetative communities generally are expected to reestablish within 2 years." to stating "Grassland impacts due to pipeline construction are expected to be moderate, and affected vegetative communities generally are expected to reestablish within 1 to 5 years, but may require 5 to 8 years in northern arid regions with combined with drought and livestock grazing."
1494	13	Hallsten	Greg	Montana DEQ	ES.6.6 ES-12 Section Electrocution of birds by transmission lines with six feet or more of separation between conductors is uncommon. Please read the APLIC document cited. Also, note that the 115kV transmission line that would serve pump station 09 is routed near a wetland and this routing is expected to create a waterfowl collision hazard.	The Executive Summary of the EIS has been revised. Section 3.6.4.1 was revised to reflect the waterfowl collision hazard: "The power distribution lines to Pump Stations 9 and 10 would cross the Milk River and associated oxbows and wetlands in Phillips County, Montana and are expected to present a collision hazard for waterfowl." Additional information on the crossings of Important Bird Areas was also added to this discussion.
1494	14	Hallsten	Greg	Montana DEQ	ES.6.7 ES-13 Line 2 Change: "We impacted are expected " to "Few impacts are expected "	The Executive Summary has been substantially revised.
1494	15	Hallsten	Greg	Montana DEQ	ES.6.7 ES-13 Section If a relatively large amount of water is withdrawn from a small stream, it may not result in a short-term impact. Also, although the chances of an unintended spill reaching a major river or stream are small, the consequences of a spill on fisheries resources, especially rare or ESA listed species could be severe.	The EIS includes a revised Executive Summary that generally addresses this comment.
1494	17	Hallsten	Greg	Montana DEQ	ES.6.13.2 ES-19 Last For a large spill in an aquatic environment, the size of the spill, composition of the spill, and the time paragraph between the spill and recovery of spilled oil would more directly relate to impacts to surface and groundwater and fisheries resources. Perhaps, the most difficult and time consuming spills would be those that occur in	The EIS includes a revised Executive Summary that generally addresses this comment.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					winter when flowing ice is present in rivers or when streams or rivers are in flood stage when there is moving debris in the water.	
1494	18	Hallsten	Greg	Montana DEQ	1.8 1-21 Tb11.8-1 Under Montana DNRC Note that the Department of Natural Resources has the authority to grant land use licenses but the State Land Board must approve permanent easements across state land.	The EIS has been revised in response to this comment.
1494	19	Hallsten	Greg	Montana DEQ	2.2.7.5 2-16 1 "However, the road infrastructure would be inspected prior to construction to ensure that the roads, bridges and cattle guards would be able to withstand oversized vehicle use during construction." The way this sentence is currently written, it is unclear if this is part of Keystone's proposal or this is a regulatory agency requiring this requirement. I would suggest identifying what agency is requiring this or if this is Keystone's proposal.	Section 2.2.7.5 of the EIS has been revised.
1494	22	Hallsten	Greg	Montana DEQ	3.1.1.1 3.1-1 1 The Black Hills Mountain Range was in South Dakota the last time we visited Mount Rushmore National Monument.	The EIS was revised in response to this comment.*
1494	23	Hallsten	Greg	Montana DEQ	3.1.2.1 3.1-13 All Should there not be a discussion of significant (if there were any?) paleontological finds during the initial field surveys?	Significant paleontological finds will be identified to the appropriate state and federal agencies. However, to protect the material found, that information will not be included in the EIS. NEED AUTHOR TO VERIFY THAT THIS IS CORRECT.
1494	24	Hallsten	Greg	Montana DEQ	3.1.2.2 3.1-15 1 Line 4 to end: Delete "the document entitled Conditional Requirements for the Treatment of • Inadvertently Discovered Significant Paleontological Resources for the Keystone XL Pipeline" and replace with "MDEQ's Environmental Specificatio	The EIS was revised in response to this comment.
1494	26	Hallsten	Greg	Montana DEQ	3.2.2.1 3.2-9 2 Regardless of rock size, would the percent coverage of rocks be maintained so that it is equivalent to that found in adjacent undisturbed areas? Many small rocks could also reduce productivity.	Consolidated Response SOI-2 addresses concerns regarding topsoil, backfill, and restoration.
1494	27	Hallsten	Greg	Montana DEQ	3.2.2.2 3.2-11 5 It can take several years before differential settling manifests itself. One year of on the ground monitoring is unlikely to be sufficient.	Consolidated Response SOI-2 addresses concerns regarding topsoil, backfill, and restoration. As noted in PHMSA Special Condition 19 (see Appendix U of the EIS): Keystone shall maintain a depth of cover of 48 inches in cultivated areas and a depth of 42 inches in all other areas. In cultivated areas where conditions prevent the maintenance of forty-eight (48) inches of cover, Keystone must employ additional protective measures to alert the public and excavators to the presence of the pipeline." Those conditions are specified in Special Condition 19.
1494	28	Hallsten	Greg	Montana DEQ	3.2.2.2 3.2-12 1 The EIS cites a study by Keystone and notes that Keystone does not anticipate any significant negative impacts to vegetation or crops from soil temperature increases. Has the Department of State as lead agency done any independent verification of the information related to soil temperature increases predicted by Keystone? Has anyone checked to see if soil temperature increases are occurring over the recently constructed Keystone Pipeline in North Dakota or similar pipelines to determine whether the model used is reasonably accurate in its predictive capabilities?	Section 3.5.5.1 of the EIS addresses potential impacts to vegetation due to increased temperature in the soil in the vicinity of the proposed pipeline. The temperature study referred to by the commenter and included in Appendix L in the EIS was prepared by a contractor to Keystone. The contractor was selected due to his expertise in soil temperature assessments. Previous studies of pipeline temperature effects specific to agricultural crops have failed to show significant negative effects, with the exception of potential soil drying and related water availability.
1494	31	Hallsten	Greg	Montana DEQ	3.3.1.1 3.3-2 & 3.3-3 Tbl3.3.1-1 & 3.3.1-2	The EIS was revised in response to this comment.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					Hells Creek' should be Hell Creek after the name of the formation at least in Montana and probably South Dakota as well.	
1494	32	Hallsten	Greg	Montana DEQ	3.3.1.2 3.3-11 2 Note that while Keystone has proposed three horizontal directional drill crossings in Montana, the type of crossing that would be used at other perennial streams or streams that contain sensitive fish species would be determined after an on-site inspection by DEQ and Keystone with invitations being extended to the landowner, representatives of the local conservation district, and MFWP. After this inspection the crossing method, calculated scour depth, burial below scour depth, width of deep burial considering the potential for lateral stream movement, and stream bank reclamation methods would be determined by DEQ.	Section 3 of the EIS provides the final list of HDD crossings proposed.
1494	33	Hallsten	Greg	Montana DEQ	3.3.1.2 3.3-11 3.3-12 Section All streams in Montana are subject to state water use classifications but the lengthy list of streams does not differentiate between the classifications. The classifications are determined by administrative rule. Review and describe the water use classifications for the affected streams in the Yellowstone, Missouri, and Little Missouri river drainages as listed in ARM 17.30.610,611, and 612 and ditches and lakes in 615. Water quality standards for each of these uses are listed in ARM 17.30.620 through 638. See more detail at http://deq.mt.gov/dir/legalChapters/Ch30-toc.mcp .	Section 3 of the EIS provides the final list of HDD crossings proposed.
1494	34	Hallsten	Greg	Montana DEQ	3.3.2 3.3-25 1 Why would infiltration to groundwater be reduced by vegetative clearing? Without a vegetative cover transpiration would be reduced resulting in more water available for infiltration to ground water.	Stormwater runoff could potentially increase as a result of vegetation clearing. As stormwater runoff increases overland as surface water, less water would infiltrate into the groundwater table. Further discussion of groundwater is found in Section 3.3.1.1 of the EIS.
1494	35	Hallsten	Greg	Montana DEQ	3.3.2 3.3-25 2 Explain further how blasting could affect groundwater by collapsing the strata?	As described in Section 2.3.3 of the EIS, blasting is no longer planned as part of installation activities for the proposed Project. In areas of shallow bedrock and cemented, dense soil, ripping would be employed.
1494	36	Hallsten	Greg	Montana DEQ	[In subsection] 3.3.2 [page] 3.3-27 How does one seed with mulch or erosion control fabric? The sentence needs editing.	The EIS has been revised in response to this comment.
1494	37	Hallsten	Greg	Montana DEQ	3.3.2 3.3-28 2 Explain further how blasting could affect surface water resources. Increase suspended sediment, splash water out of stream, add nutrients? Be more specific.	As described in Section 2.3.3 of the EIS, blasting is no longer planned as part of installation activities for the proposed Project. In areas of shallow bedrock and cemented, dense soil, ripping would be employed.
1494	38	Hallsten	Greg	Montana DEQ	3.3.2 3.3-28 3 Rather than having to rebury or riprap stream banks, why not just do it right the first time and adequately bury the pipeline well below the scour depth during construction and carry this burial depth laterally far enough that the pipeline would not be exposed over its lifetime?	All stream crossing depths would meet the regulatory requirements of the Pipeline and Hazardous Materials Safety Administration (PHMSA) as described in Consolidated Response SAF-1, and the PHMSA Special Conditions presented in Appendix U of the EIS.
1494	39	Hallsten	Greg	Montana DEQ	3.4.2 3.4-3 1 Why wouldn't the same mitigation apply to wetlands that are not covered by USFWS easements? Unless a private landowner makes an alternate request, wetland functions and values should be restored or otherwise mitigated after pipeline construction.	No U.S. Fish and Wildlife Service wetland easements are crossed by the proposed Project. The mitigation was removed. Methods for pre and post-construction reclamation monitoring of wetlands will be determined by the applicable U.S. Army Corps of Engineers District Office.
1494	40	Hallsten	Greg	Montana DEQ	[In subsection] 3.4.4 [page] 3.4-11 Section Excess sediment	Comment acknowledged.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					control fabric should be cut away after and disposed of after disturbed areas are vegetated. Metal staples should not be used where livestock will be grazing after reclamation.	
1494	42	Hallsten	Greg	Montana DEQ	3.5 3.5-1 Tbl 3.5-1 For the northwestern Great Plains native vegetation may be replaced by winter wheat as well as spring wheat in Montana.	Table 3.5-1 of the EIS was revised to add "winter and" before "spring wheat."
1494	43	Hallsten	Greg	Montana DEQ	3.5.1 3.5-15 Tbl 3.5.1-1 Under "Deciduous Forest" note that the project is unlikely to cross areas in Montana with quaking aspen, bur oak, post oak, blackjack oak, American, hickory, or common hackberry. Note that you may have an extra comma between the words American and hickory.	Previous comments and information from Keystone have indicated that deciduous forests are present along the proposed Project route. While no aspens are likely to occur, green ash and other deciduous trees may occur.
1494	44	Hallsten	Greg	Montana DEQ	3.5.1 3.5-15 Tbl 3.5.1-1 Under "Mixed Forest" note that the project is unlikely to cross areas in Montana with quaking aspen, bur oak, shortleaf pine, blackgum, or winged elm. Note that you may have an extra comma between the words water and blackgum.	Previous comments have indicated that areas of mixed forest habitat with juniper would be crossed by the proposed route in Montana. The tree species list includes general examples of mixed forest trees for the entire proposed right-of-way. Note in Table 3.5.5-1 that 0.6 mile of upland forest is crossed by the proposed Project in Montana.
1494	45	Hallsten	Greg	Montana DEQ	3.5.1 3.5-16 Tbl 3.5.1-1 Under "Riparian or Floodplain Woodland" note that the project is unlikely to cross areas in Montana with burr oak or American elm. Several cottonwood species may occur in the area as do several willow species (especially along Frenchman Creek).	The tree species list includes general examples of riparian and floodplain woodland trees for the entire pipeline right-of-way from Montana to Texas. Not all tree species would occur within any single forest patch. As presented in Appendix I of the EIS, riparian and floodplain woodlands occur within and are crossed by the proposed alignment in Montana. The tree list includes cottonwoods and willow.
1494	46	Hallsten	Greg	Montana DEQ	3.5.2.1 3.5-18 2 Under Prairie Dog Towns, somewhat different vegetative assemblages may occur at Montana prairie dog towns.	Grasses listed are based on available information from the South Dakota Comprehensive Wildlife Conservation Plan.
1494	47	Hallsten	Greg	Montana DEQ	3.5.5.1 3.5-27 2 Heed the comments of landowners regarding the amount of time it will take to dissipate impacts to crops.	Consolidated Response FRM-1 describes potential impacts to farmland and ranches and Keystone's responsibilities to compensate for damage to these crops. The EIS was revised to reflect that the potential impacts to agricultural land from construction and from an oil spill and subsequent response actions may last for one to a few years, depending upon the amount of oil, area impacted, and the type of cleanup actions taken by Keystone. In general, oil on and/or in the soils is weathered through biodegradation by micro-organisms, photodegradation by sunlight, and physical-chemical degradation. These basic processes generally reduce or eliminate the lighter fractions of oil that may be harmful to plants and/or animals and do so in a few months to a year or two. The heavier fractions of the oil (commonly called tar or asphalt) may persist for longer periods of time but are not toxic to organisms. The response actions may disturb the soils and provide habitat for weeds, reduce or remove the native or agricultural vegetation, and otherwise have impacts that may persist for a year or more.
1494	48	Hallsten	Greg	Montana DEQ	3.5.5.1 3.5-31 Tbl 3.5.5-2 Note that at most crossings of Montana streams there is not much riparian forest made up of tall trees as indicated in Table 3.5.5-2. Frenchman Creek is the stream with the most riparian trees and most of these are willows.	Table 3.5.5-1 lists 0.0 miles of forested wetlands crossed in Montana. Table 3.5.5-2 summarizes impacts by pipeline segment.
1494	49	Hallsten	Greg	Montana DEQ	3.5.5.1 3.5-33 Bullets Has NRCS agreed to devote the time to	Consultation with the NRCS is standard practice. As stated in

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					the Keystone XL project to carry out the consultations called for?	the Section 1.5.2.5 of the EIS and in the Construction, Mitigation, and Reclamation Plan in Appendix B, NRCS would be consulted if there is any dispute between the landowner and Keystone as to what areas and to what depth would need to be ripped or chiseled, or the necessity or rates of lime and fertilizer application.
1494	50	Hallsten	Greg	Montana DEQ	3.5.5.1 3.5-33 Bullets What could be done to alleviate compaction of range and pasture lands? Would three passes with a single tooth ripper be sufficient to decompact rangeland soils within the construction ROW?	Section 3.2.2.1 of the EIS and Section 4.11.1 of the Keystone Construction, Mitigation, and Reclamation Plan in Appendix B address soil compaction. The latter includes criteria for successful decompaction and procedures to follow if compaction is not successful.
1494	51	Hallsten	Greg	Montana DEQ	3.5.5.1 3.5-34 Bullets. What could be done to re-establish shrub communities, especially sagebrush communities?	Additional mitigation measures for sagebrush communities specific to Montana is discussed in Appendix I of the EIS and the EIS was revised to incorporate those measures into the mitigation measures listed in Section 3.5.5.2 of the EIS.
1494	52	Hallsten	Greg	Montana DEQ	3.5.5.2 3.5-35 Top of page Our experience based on qualitative observations after construction of the Express Pipeline was that ground squirrels and prairie dogs made use of decompact soils over the trench and in many cases seemed to prefer this zone for burrowing.	Comment acknowledged.
1494	53	Hallsten	Greg	Montana DEQ	3.5.5.2 3.5-36 Is there a more effective way to reestablish diminishing stands of big sagebrush than to simply plant and replant seed? Could planting of tubelings be more effective?	Specific mitigation measures identified by resource agencies were included within Section 3.5.5 of the EIS. Resource agencies have greater site-specific knowledge and recommendations for reclamation techniques. The EIS was revised to added planting big sagebrush tubelings as a mitigation measure as suggested by the commenter.
1494	55	Hallsten	Greg	Montana DEQ	3.6 Section Address the distribution of and potential impacts to reptiles in the study area.	Common reptiles found throughout the area in the vicinity of the proposed Project are listed in Table 3.6.1-1. Potential impacts to reptiles are discussed in Section 3.6.2.4.
1494	56	Hallsten	Greg	Montana DEQ	3.6.1.1 3.6-1 Section Are moose present in the study area in Montana? Are the moose populations large enough to be of concern? What habitats present in the study area do they prefer?	Moose were added to Table 3.6.1-1 in response to several comments. Habitats were described in Table 3.6.1-1. Moose are likely limited to riparian habitats in eastern Montana, especially the Yellowstone River drainage.
1494	57	Hallsten	Greg	Montana DEQ	3.6.1.2 3.6-4 Tb13.6.1-1 Is the eastern gray squirrel found in the Montana portion of the study area? See: http://fieldguide.mt.gov/detail/AMAFB070_1_O.aspx	It is unlikely that this species is present in the vicinity of the proposed Project in Montana and Section 3.6 of the EIS was revised accordingly.
1494	58	Hallsten	Greg	Montana DEQ	3.6.2.4 3.6-22 Section We also have observed snakes that were killed as a result of entanglement in the fine meshes of erosion control blankets.	Section 3.6 of the EIS was revised in response to this comment to state the following: "Erosion control blankets, especially those supported by fine non-biodegradable monofilament meshes, can entangle and entrap snakes, small mammals and birds."
1494	60	Hallsten	Greg	Montana DEQ	3.7.1 3.7-1 & 3.7-2 Tbl 3.7.1-1 Shortnose gar are present in the Missouri River below Fort Peck Dam and in the Milk River in Montana. Pallid sturgeon are present in the Missouri River below Fort Peck Dam. Both these species should be added to Table 3.7.1-1.	Section 3.8 addresses federally-listed threatened and endangered species, including pallid sturgeon. Shortnose gar is a species of concern in Montana, this fish was added to Table 3.7.1-1 and is also discussed in the Appendix I of the EIS.
1494	61	Hallsten	Greg	Montana DEQ	3.7.1 3.7-3 & 3.7-4 Tbl 3.7.1-2 What are the rearing periods after spawning has been completed?	After spawning, the type and duration of habitat use for larval and juvenile fish rearing varies with fish species, life history stage, and site-specific conditions. For most fishes, eggs would be expected to hatch relatively soon after spawning activities (for example, 6 to 9 days for brown bullhead and 3 to 16 days for common carp). Therefore, use of these

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
						waterbodies for larval rearing would be expected to overlap, at least partially, with the identified spawning periods in Table 3.7.1-2. Section 3.7 of the EIS was revised to provide additional information on larval and juvenile fish habitat use.
1494	62	Hallsten	Greg	Montana DEQ	3.7.3.1 3.7-15 & 3.7-16 Last & first respectively While it is true that removing significant amounts of riparian vegetation along the length of a small stream can increase water temperature that is not what is being proposed in Montana. Most of the streams that would be crossed lack tall riparian vegetation and most lack even low growing willows. Substantial changes in solar input are not expected at most stream crossings in Montana. The three major to moderate sized rivers that would be crossed with horizontal directional drills are not expected to have any riparian vegetation affected unless there is an unexpected release of drilling mud.	Comment acknowledged.
1494	63	Hallsten	Greg	Montana DEQ	3.7.3.1 3.7-16 Last Where in Montana is the water table shallow and exposed to the extent that there would be a significant paragraph increase in water temperature during trenching?	Water-bearing zones less than 50 feet below ground surface are presented in Table 3.3.1-2.
1494	64	Hallsten	Greg	Montana DEQ	3.7.3.1 3.7-17 1 What are the potential impacts of a dam and flume stream crossing? They would not require pumps.	Impacts would be similar to the dry open-cut stream crossing method. Consolidated Response WAT-1 addresses stream crossing methods and the associated potential water quality impacts.
1494	65	Hallsten	Greg	Montana DEQ	3.7.3.1 3.7-18 1 While surface water withdrawals may require water use permits in Montana, unless there is an underlying water right that protects in-stream flows, the permit may not contain any environmental protections. Therefore do not rely on the permitting process to limit diversion rates to levels that would protect aquatic resources.	Comment acknowledged.
1494	66	Hallsten	Greg	Montana DEQ	3.7.3.1 3.7-18 2 Frenchman Creek and Box Elder Creek do not contain shortnose gar, shovelnose sturgeon, or paddlefish. There are no records of sauger in Frenchman Creek. Frenchman Creek is listed by MFWP as containing the following recreational species: Northern pike, smallmouth bass, walleye, and yellow perch. The Missouri River below Fort Peck Dam contains the following recreational species: rainbow trout, brown trout, pallid sturgeon, shovelnose sturgeon, paddlefish, lake trout, northern pike, black bullhead, channel catfish, burbot, pumpkinseed, white crappie, yellow perch, sauger, and walleye (DNRC 1994). Check with Montana Fish, Wildlife, and Parks for a list of recreational fish present in the Yellowstone River and other rivers and streams near the proposed diversions.	Section 3.7.3.1 of the EIS was revised in response to this comment.
1494	68	Hallsten	Greg	Montana DEQ	3.8.1.2 3.8-9 5 Additional aerial sage-grouse surveys were conducted by Keystone in 2010 and are attached for your review.	Section 3.8.1.2 of the EIS was revised to include new information from sage-grouse surveys.
1494	69	Hallsten	Greg	Montana DEQ	3.8.1.2 3.8-12 Entire Section Please describe how many miles of distribution line would be located within 4 miles of sage-grouse leks in Montana. Based on the information available to DEQ the transmission line to Pump Station 10 would cross 21.8 miles of core sage-grouse habitat that has been identified by MFWP. The second part of the table below tallies the number of sage-grouse leks within four miles of a	Section 3.8.1.2 of the EIS was revised in response to this comment to add information concerning power distribution lines and sage-grouse habitats in Montana and South Dakota.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					transmission line serving a pump station. [For table see page 8 of PDF 1494].	
1494	70	Hallsten	Greg	Montana DEQ	3.8.3.1 3.8-58 1 Construction of transmission lines and distribution lines in Montana may also affect swift fox (see http://fieldguide.mt.gov/detail_AMAJA03030.aspx).	Section 3.8.3.1 of the EIS was revised in response to this comment to add information concerning power distribution lines and swift fox habitats in Montana and South Dakota.
1494	71	Hallsten	Greg	Montana DEQ	3.8.3.2 3.8-70 1 Would construction of the transmission lines or distribution lines be within one mile of the single bald eagle nest in Montana? If so, describe the possible impacts and mitigating measures.	One active bald eagle nest was identified within 1 mile of the power line route to proposed Pump Station 10 in Montana. Keystone has informed electrical power providers, BEPC, and Western of the requirement to consult with USFWS under the BGEPA relative to impacts to bald eagles.
1494	72	Hallsten	Greg	Montana DEQ	3.8.3.4 3.8-76 2 Check the distribution of northern redbelly dace in Montana. The distribution northern redbelly dace is shown at http://fieldguide.mt.gov/detail_AFCJB31020.aspx .	Section 3.8.3.4 of the EIS was revised to correct the Montana distribution of the Northern redbelly dace. The EIS states that this species occurs in the Upper Missouri River and its tributaries, the Yellowstone River, and the tributaries east of the Powder River.
1494	73	Hallsten	Greg	Montana DEQ	3.8.3.4 3.8-76 3 Check the distribution of pearl dace in Montana. The distribution pearl dace is shown at http://fieldguide.mt.gov/detail_AFCJB54010.aspx .	Section 3.8.3.4 of the EIS was revised to update the distribution of the pearl dace to include the following additional waterbodies: Milk River, Rock Creek, Willon Creek, and Frenchman's Creek. These Montana waterbodies contain potential pearl dace habitat.
1494	74	Hallsten	Greg	Montana DEQ	3.8.3.4 3.8-76 5 The sturgeon chub is found in the Yellowstone and Missouri rivers in Montana http://fieldguide.mt.gov/detail_AFCJB53020.aspx .	Section 3.8.3.4 of the EIS was revised to update the distribution of the sturgeon chub distribution to state that the sturgeon chub can be found in the Powder, Missouri, and Yellowstone Rivers and some of their tributaries in Montana.
1494	75	Hallsten	Greg	Montana DEQ	3.9.10.1 3.9-26 Tbl3.9.10-1 Land Ownership Affected by Power Distribution Lines (Miles Crossed): Do the miles crossed by the power lines take into account the updates from the electrical cooperatives that MDEQ has sent Entrex, as the source of the table is Keystone 2009c?	The EIS has been revised to reflect the latest information on environmental resources and routing.
1494	76	Hallsten	Greg	Montana DEQ	3.10 3.10-1 Bullets Add bullet #12: "Social Benefits and Costs to the U.S. of increased access to Canadian crude."	The EIS has been revised to reflect the latest information on environmental resources and routing.
1494	77	Hallsten	Greg	Montana DEQ	3.10.1.I 3.10-2 Last Paragraph Before the second to last sentence, add the following sentence: "On a national level, the primary benefit of this line would be for PADD III refineries (and ultimately U.S. customers) to gain access to a more reliable and steady source of crude oil supply".	The EIS has been revised to reflect the latest information on environmental resources and routing.
1494	78	Hallsten	Greg	Montana DEQ	3.10.2.2 3.10-46 1 Add to the end of the first full paragraph: "In the short-term construction phase, using the numbers from TransCanada, up to 270 workers (15% of 1,800) from Montana would be needed over about 6 to 8 months. Within each state, additional jobs and income would go to immigrating workers who would leave the area upon project completion. In the long term, a small number of people would be needed to maintain the line in each state, but that beneficial effect would be minimal. Unemployment rates in the study area would probably not be affected in the long-term although there could be a short-term lowering of unemployment during construction in the more rural areas."	The EIS has been revised to reflect the latest information on environmental resources and routing.
1494	79	Hallsten	Greg	Montana DEQ	3.10.2.2 3.10-48 3 At the end of the last full paragraph, please add: "These construction camps would likely reduce impacts on nearby towns and service, but they would not eliminate impacts".	The EIS has been revised to reflect the latest information on environmental resources and routing.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
1494	80	Hallsten	Greg	Montana DEQ	3.10.2.2 3.10-49 3 At the end of the third full paragraph, please indicate how much of the spending on outlays for fuel supplies, hardware needs, and parts/equipment would be done locally. Would it be the majority of spending or a smaller portion?	The EIS has been revised to reflect the latest information on environmental resources and routing.
1494	81	Hallsten	Greg	Montana DEQ	3.10.2.2 3.10-49 Under the headings "Local Economic Activity" and "Tax Revenue and Fiscal Resources", the case for benefits from the line would be helped if some of the numbers were quantified. A model like IMPLAN would have definitely made this section stronger, over the current general language.	The EIS has been revised to reflect the latest information on environmental resources and routing.
1494	82	Hallsten	Greg	Montana DEQ	3.10.2.2 3.10-49 Last Paragraph Before the last sentence (which is also the last paragraph), please add the following paragraph: "In addition to the social benefits from this pipeline, there is a social opportunity cost to the economy of building the pipeline when compared to alternative ways to meet the need of the line (that is, additional oil delivery capacity from Canada to PADD III refineries). Alternative ways to meet the need for additional transfer capacity of crude oil might include expanding existing pipelines, using less oil overall, improvements in oil use efficiency, more domestic production close to PADD III, and developing alternatives to oil. Any social benefits from any of these alternatives that would occur if Keystone XL were not built would be an opportunity cost of this line. The next best alternative to the Keystone XL line would be the actual opportunity cost. It is important to note that this line is likely the only feasible alternative to meet the projected oil import needs for PADD III that this line is designed to serve, and thus the opportunity cost in this case is likely less than the social benefits of the line. (In other words, energy efficiency and the other alternatives would likely not be enough to meet projected import needs)."	The EIS has been revised to reflect the latest information on environmental resources and routing.
1494	83	Hallsten	Greg	Montana DEQ	3.10.2.2 3.10-50 Last Paragraph At the end of the last paragraph and last sentence, please add the following text: "Indeed, effects of up to 600 workers per spread could be significant in rural areas. Most of the effect would occur on smaller towns during construction when workers would be in the area. Most of these effects could be mitigated by Keystone if that is required of them. The effects would almost certainly be short term. Construction camps could take some or most of the public service costs and social costs off of small towns and counties in the area."	The EIS has been revised to reflect the latest information on environmental resources and routing.
1494	84	Hallsten	Greg	Montana DEQ	3.10.2.3 3.10-51 1 Under the heading "Property Damages and Values", the last sentence in the sole paragraph under that heading is insufficient. Please explain why long-term property values would not be affected and cite supporting documentation. Also, within this paragraph, discuss the easement payment that would be given to landowners for having the line on their property. If any damages occurred to land, how would landowners be compensated? Please explain that. Please talk about the following in this section ("Property Damages and Values). There would be some economic costs to landowners, even if they are not significant. These would come from soil compaction, erosion, invasive weeds, plant	Consolidated Response VAL-1 addresses concerns regarding property values. The EIS has been revised to include additional information on property values (see Sections 3.10.2 and 3.13.6.7). Consolidated Response FRM-1 addresses potential ranch of farmland impacts, and Consolidated Response FRM-2 addresses potential impacts to irrigated cropland. Landowners would also be compensated for lost crops and for yields less than those on unaffected lands where lesser yields would result from proposed Project impacts as described in Section 3.9.1.3. Section 3.9.3 of the EIS discusses visual impacts of the proposed Project.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					destruction, and interrupted cropping. Most of this would be on rangeland. Personal uses of the land may also adversely be affected. Also, viewshed values could be affected. Mitigation and proper siting could minimize these impacts. Please discuss these topics further or refer to another section that may discuss these impacts.	
1494	85	Hallsten	Greg	Montana DEQ	3.10.2.2 3.10-54 Section Section numbers off in this area. It goes from 3.10.2.3 to 3.10.2.2 Please add the Heading "Long term Property Values and Landowner Liability Issues" somewhere under 3.10.2.2 Operations Impacts. Please address the following potent	The EIS has been revised to reflect the latest information on environmental resources and routing.
1494	86	Hallsten	Greg	Montana DEQ	3.10.2.2 3.10-54 Section Under 3.10.2.2 Operations Impacts: Are there any economic costs from impacts to recreation or impacts to natural resources? If so, please address them. There would be additional costs to governmental agencies including the Montana DEQ of monitoring the construction and mitigation from this line. This should be addressed somewhere.	The EIS has been revised to reflect the latest information on environmental resources and routing.
1494	87	Hallsten	Greg	Montana DEQ	3.10.2.2 3.10-54 Section Somewhere under the larger heading, "3.10.2.2 Operations Impacts", please add a subheading that says "Social Benefits and Costs from the Line". Under that heading please add the following text: "The main benefit to society from Keystone XL would be to transport incremental crude oil production from the WCSB across the border to meet the growing demand by refineries and markets in the United States PADD III area. There is an increasing need in the U.S. for foreign imports of oil (under current U.S. consumption levels), and an even greater need for imports from "friendly" nations such as Canada. As supporting evidence, there is binding shipper interest in the project, with contracts filling a part of the total capacity of this line. This pipeline would potentially benefit all residents of the U.S. and especially those that get their petroleum from P ADD III refineries (mostly Americans who live on the East Coast and in the Midwest). In other words, the benefits would be national and regional rather than local."Another potential social benefit from the line is more easily allowing P ADD III refineries to operate at or near capacity by providing a reliable source of oil imports to that region. Without this line, currently planned refinery expansions in P ADD III would likely still occur but it is uncertain whether they would run at as full of capacity in the future as they would without this line. This benefit is a bit speculative, as other lines might be built if Keystone were not."There is a social opportunity cost to the economy of building this line when compared to other alternative uses of those resources. This is the opportunity cost of what those jobs, energy, natural resources, and materials could be used for in their next best use in the U.S. Or world economy (note: there is a standard social opportunity cost for every type of economic activity undertaken in the economy). Alternative uses of the resources used to build Keystone might include investments in energy efficiency, improvements in gas mileage efficiency (and thus not needing this line), other economic projects such as buildings or	The EIS has been revised to reflect the latest information on environmental resources and routing.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					bridges, or saving the resources for a later time. This cost is mainly in the form of irretrievable materials, energy, worker hours, and capital used for the line. "There may be indirect benefits and costs from this line including effects on U.S. oil prices (likely to be insignificant) and any secondary effects on the oil market and grid operation as a result of the new pipeline. Also, the more oil obtained from a friendly source, the less that would need to be obtained from unfriendly sources and the less in costs of obtaining oil from unfriendly places."	
1494	88	Hallsten	Greg	Montana DEQ	3.10.2.2 3.10-54 Section Somewhere under the larger heading, "3.10.2.2 Operations Impacts", please add a subheading that says "Project Owner Benefits and Costs from the Line". Under that heading please add the following text: "Gross revenues earned from the pipeline (from shipper tariffs) would benefit TransCanada and potentially its stockholders. Gross revenues would translate into profits to the project owners, if the project earns enough over time. Profits could take the form of higher salaries, bonuses and promotions for its employees. Profits from this project may also increase the ability for TransCanada to expand or reinvest in other projects, and/or possibly result in a higher return for shareholders of TransCanada stock. Profits would likely take several years to make after initial operation (as revenues increase and interest costs on financing decrease). Profits could last the lifetime of the line and would go to both instate and out-of-state residents who are shareholders in the company."Construction and operational costs of the line would be borne by the project owners. Such costs would potentially include construction, operation and maintenance, local, state and federal taxes, mitigation, financing (debt payments), permitting, landowner payments, general overhead costs (e.g. legal staff), contingencies, and fines. Some of these costs may vary depending on final route selection and various mitigation actions required. If such costs were too great, or revenues are not high enough or the project did not get built, net losses could accrue to TransCanada and to company shareholders either in the short run (e.g. line doesn't get built and project owners are stuck with sunk project costs) or in the long run (the line is built and runs at a loss for many years). Another potential cost is the risk of the line being undersubscribed and TransCanada not getting enough shippers to fill it to capacity. At the present time, just over 380,000 BPD of commitment has been obtained for the proposed 900,000 bpd line. This risk may be small in the long run with the significant need for imported Canadian crude into the U.S. and the large refining capacity down in PADD III. On the other hand, the current recession could pose a risk of pushing profits and/or the project out into the future."	The EIS has been revised to reflect the latest information on environmental resources and routing.
1494	89	Hallsten	Greg	Montana DEQ	3.10.2.2 3.10-54 Last paragraph Could you explain the following sentence in the last paragraph? "The Keystone estimate implies an effective tax rate of 4.3 percent on the estimated capital costs. This tax rate is twice that of the Project average and may cause an overstatement of the taxes that would be paid to Montana counties."	The EIS has been revised to reflect the latest information on environmental resources and routing.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
1494	90	Hallsten	Greg	Montana DEQ	The last sentence of the first complete paragraph states: "No existing public service facility expansions are would be required based on current Project projections." Is that really true in the more rural counties? Also, please take the word "are" out.	The EIS has been revised to reflect the latest information on environmental resources and routing.
1494	91	Hallsten	Greg	Montana DEQ	3.11.3.11-1 Section DEQ continues to protest the fact that as a cooperating agency, it has not been allowed to examine the results of the cultural resources survey. DEQ has the means to ensure that all confidential information submitted in regards to cultural resources will be kept confidential and not for public view. It is difficult to make sound decisions regarding line siting and site impacts, if DEQ is not able to review the site information for Montana.	DOS has worked closely with MDEQ, BLM, and the Montana SHPO on developing the methodology for identification and evaluation of sites. MDEQ has been provided with copies of the survey reports and correspondence regarding concurrence between DOS and the Montana SHPO.
1494	92	Hallsten	Greg	Montana DEQ	3.11.1.1 3.11-3 Line 9 Replace "tries" with tribes	The EIS has been revised to reflect the latest information on environmental resources and routing.
1494	93	Hallsten	Greg	Montana DEQ	3.11.1.2 3.11-3 2 Statement regarding integrity types is misleading, as all are not needed to be present for a site to be eligible, and most prehistoric sites are generally not evaluated under setting, feeling or workmanship. Suggest re-wording or clarification.	The EIS has been revised to reflect the latest information on environmental resources and routing.
1494	94	Hallsten	Greg	Montana DEQ	3.11.2.3 3.11-7 4 Replace (globally) use of "tipi ring" with stone ring or stone circle. Use of the term tipi ring is a misnomer and commonly offensive to many tribes.	The EIS has been revised to reflect the latest information on environmental resources and routing.
1494	95	Hallsten	Greg	Montana DEQ	3.13.2.1 3.13-10 Tbl3.13.2-3 Footnote "C" is missing.	The EIS has been revised to reflect the latest information on environmental resources and routing.
1494	96	Hallsten	Greg	Montana DEQ	3.13.5 3.13-17 Bulleted list The seasonal timing of a spill could also affect the impact. If a spill occurs at or near a larger river such as the Yellowstone or Missouri rivers during cold weather when ice is forming and moving in the current but before the ice is solid enough to support people and equipment, the released oil could be transported for much greater distances before response teams could boom and collect it.	The EIS has been revised to reflect the latest information on environmental resources and routing.
1494	97	Hallsten	Greg	Montana DEQ	3.13.4.1 3.13-18 Top of page Where along the pipeline are soil conditions most conducive to corrosion? This should be disclosed in this section of the soils section.	See Section 3.2.2.1 of the EIS for a discussion on corrosion and soil. Keystone would incorporate the corrosion prevention procedures required in the regulations of the Pipeline and Hazardous Materials Safety Administration (PHMSA) and in the relevant PHMSA Project-specific Special Condition (see Appendix U) along the entire pipeline. Keystone would also be required to comply with the corrosion monitoring and repair and replacement requirements of those regulations and conditions. As a result, it is not necessary to identify the specific locations of soils most conducive to erosion.
1494	98	Hallsten	Greg	Montana DEQ	3.13.5.1 3.13-21 Winter Note that the release of relatively warm water from Fort Peck Dam dictates river flow and velocities year round.	The EIS has been revised to reflect the latest information on environmental resources and routing.
1494	99	Hallsten	Greg	Montana DEQ	3.13.5.1 3.13-22 Top of page How long would it take for a pipeline shutdown and depressuring the line if a leak is detected? How far could ejected liquid material be deposited from the pipeline just downstream from a pump station where pressures are higher and just upstream from a pump station where the pressures would be lower?	As described in Sections 2.4.2.1 and 3.13.5.5 of the EIS, Keystone estimates the SCADA system would shut down flow within 12 minutes of detection of a release. In a submittal to the Pipeline and Hazardous Materials Safety Administration (PHMSA) that responded to the issue of the

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
						distance of oil ejected from the pipeline, Keystone provided the following statement: "Industry experience demonstrates that oil flowing through a pipeline buried at this depth would simply pool on the surface in the immediate area of the release. The Keystone XL pipeline will be buried to a depth of 4 feet. The anticipated worst case spray zone for an exposed or above ground pipeline is anticipated to be consistent with industry experience, i.e. in the 75 to 394 foot range." PHMSA concurred with that analysis.
1494	100	Hallsten	Greg	Montana DEQ	3.13.4.6 3.13-32 2nd topic The permanent ROW width is only 50 feet. What would contain a 5,000 bbl spill to the ROW?	The width of the permanent right-of-way of a pipeline is established to provide protection for the pipeline and to allow access for maintenance and monitoring activities. It is not established in relation to the potential size of a spill. The behavior of oil spills from the proposed Project is described in Section 3.13.5 of the EIS.
1494	101	Hallsten	Greg	Montana DEQ	3.13.5 3.13-33 Based on the best available information at this time, what is the probable maximum spill volume in Montana? We recognize that this volume may change based on final design.	As described in Consolidated Response OIL-2, the maximum release is estimated to be about 2.8 million gallons (66,500 barrels). That estimate was developed using the criteria listed in Consolidated Response OIL-2 and is not location specific. That may be the maximum release volume in Montana, or the volume may be lower due to the specifics of valve placement and terrain in Montana.
1494	103	Hallsten	Greg	Montana DEQ	3.13.5.3 3.13-40 Sediments Sediments, especially in armored channels, can be coarse grained.	The EIS has been revised to reflect the latest information on environmental resources and routing.
1494	104	Hallsten	Greg	Montana DEQ	3.13.5.4 3.13-42 3 Does synthetic crude have the same properties as conventional crude oil with regard to its density and other properties?	Consolidated Response OIL-4 addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in this response, that crude oil is similar in composition to other heavy crude oils.
1494	105	Hallsten	Greg	Montana DEQ	3.13.5.4 3.13-43 Top of page While oil may be less prone to infiltrate into wetland vegetation, the recent oil spill in the Gulf of Mexico demonstrates that despite heroic efforts, it can penetrate great distances into wetland vegetation.	As described in Consolidated Response GLF-1, the risks associated with the proposed Project are substantially different from those associated with the BP Deepwater Horizon Project, as are control, containment, and cleanup processes and the potential impacts of released oil. In addition, in Louisiana, the oil penetrated 100 to 200 feet into the marshes in very limited areas and primarily in areas exposed to high waves driven by high winds.
1494	107	Hallsten	Greg	Montana DEQ	3.14.2 3.14-2 - 3.14- Table 3.14.2-1 There are other existing pipelines in Montana than just the ones listed on Table 3.14.2-1, please see 4 attached map and table of existing pipelines in Montana.	Table 3.14.2-1 is a list of representative projects considered in the cumulative impacts assessment. It is not intended to provide a listing of all such projects since there are likely hundreds of existing linear and other projects that have contributed to the cumulative impacts within the area in the vicinity of the proposed project. However, we have added several of the pipeline projects provided to the table.
1494	111	Hallsten	Greg	Montana DEQ	3.14.3 3.14-12 Tbl3.14.3-1 Soils & Sediments section: include with present actions: loss of soil productivity w/in ROW; increase in soil temperature above and around the pipeline (may or may not be beneficial).	Soil productivity would likely not be lost within the right-of-way after reclamation is completed. Section 3.14.3.3 of the EIS was revised to address the increase in soil temperature above the pipeline.
1494	112	Hallsten	Greg	Montana DEQ	3.14.3 3.14-14 & 3.14-15 Tbl3.14.3-1 Past actions: many past actions were conducted without the benefit of archaeological surveyor mitigation, as section 106 was only established in 1966, so the statement indicating that past actions were conducted in accordance with relevant regulations is	Cultural resources have been or are undergoing surveys and are being identified for the proposed Project. The proposed Project would be constructed in accordance with requirements under Section 106 NHPA and other relevant federal, state and local regulations. Additional disturbance to cultural resources

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					inaccurate. Survey and evaluation over 20 years old is generally (depending on the SHPO/agency) considered inadequate by today's standards.	from future projects in the Project area would likely be subject to federal or state regulations that would require surveys, avoidance, and mitigation be conducted prior to installation, so it is likely that portions of the Project corridor with cultural sites would be subject to mitigation and avoidance measures during future projects.
1494	113	Hallsten	Greg	Montana DEQ	3.14.3.2 3.14-20 2 What about the potential impacts from increased soil temperature (i.e., dryer soil, thus less productive over long term)?	Consolidated Response ENV-2 addresses concerns related to pipeline temperature effects.
1494	114	Hallsten	Greg	Montana DEQ	3.14.3.9 3.14-25 Section" Corona and wind generated noise could affect those living close to the interconnecting distribution and transmission lines .. Note that those persons living and working near the lines would have to take precautions to avoid electrocution;	The EIS has been revised to reflect the latest information on environmental resources and routing.
1494	115	Hallsten	Greg	Montana DEQ	3.14.3.12 3.14-27 Section The section on socio-economics does not discuss cumulative impacts at all. It just summarizes the main economic impacts. The main questions to ask in this subsection are:• How would socio-economic impacts from Keystone interact with socio-economic impacts from related actions to Keystone (such as new electricity transmission lines)• How would socio-economic impacts from Keystone interact with socio-economic impacts from unrelated actions to Keystone (highway construction, etc)It is stated in the first sentence of the fourth paragraph that: "The presence of construction workers requiring housing and other services is the primary socioeconomic impact of the proposed Project." That is not necessarily true. Short term jobs, income, property values, social disruption, and the benefits (and opportunity costs) of a friendly source of crude are all larger impacts. The expansion of refineries in P ADD III is not included as an action that would have. a cumulative effect. I therefore assume that this does not need to be dealt with.	The EIS has been revised to reflect the latest information on environmental resources and routing.
1494	116	Hallsten	Greg	Montana DEQ	4.3.3.1 4-11 Section Having walked much of the Express Pipeline in Montana I have to disagree that it crosses much of a densely populated area. There is no Yellow River in Carbon County Montana. Express Pipeline avoids the Pryor mountains and generally parallels an existing natural gas and crude oil pipeline corridor in Carbon County, Montana. There is no reason to believe that landowner negotiations would be any more or less difficult than for opening a new corridor for the proposed project.	Section 4.3.3.1 of the EIS has been revised in response to this comment.
1494	118	Hallsten	Greg	Montana DEQ	5.1.3 5-2 1 "There is currently an effort between DOS, BLM, and MDEQ and other agencies to develop a Memorandum of Understanding (MOU) for the identification, evaluation and protection of paleontological resources. This MOU will be completed prior to the ROD and will be added to the final EIS as an Appendix." Add text clarifying that the proposed MOU would apply to all lands in Montana.	Section 5.0 of the EIS has been deleted since the information in that section is included in the Executive Summary. The text clarification requested by the commenter is presented in Section 3.1.2.2 of the EIS.
1494	119	Hallsten	Greg	Montana DEQ	5.6.1 5-12 Section Would the use of sagebrush tubelings, brush beating rather than stripping the entire construction right-of-way in sage-grouse core habitat, and salvaging the sagebrush plants above the trench for use in reclamation also be methods of preserving and restoring sagebrush habitat?	Mitigation specific to sagebrush communities in Montana is discussed in in Section I-3.4.2.2 of Appendix I of the EIS.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
1494	120	Hallsten	Greg	Montana DEQ	5.9.1 5-19 Last Bullet "The proposed electrical distribution lines and 230-kV transmission line could generate adverse impacts on visual resources due to their high visibility." Add text noting that 115-kV and 138-kV transmission lines to pump stations could generate adverse impacts also.	The EIS has been revised to reflect the latest information on environmental resources and routing.
1494	121	Hallsten	Greg	Montana DEQ	5.9.2 5-20 Bullet 19 "Adjust routing to reduce adverse aesthetic features where possible." Add text clarifying adverse effects on aesthetic features.	The EIS has been revised to reflect the latest information on environmental resources and routing.
1494	122	Hallsten	Greg	Montana DEQ	5.9.3 5-21 1 Add the following for Additional Agency Proposed Mitigation Measures: Wherever practical, place new power transmission lines for pump stations along existing county roads, section lines, or field edges to minimize interference with adjacent agricultural lands.	The text of the EIS has been revised in response to this comment.
1494	123	Hallsten	Greg	Montana DEQ	Figure Section 3.0 Fig 3.1.1-1 Add the traces of the Weldon-Brockton-Froid faults.	Consolidated Response GEO-2 addresses potential seismic hazards.
1494	124	Hallsten	Greg	Montana DEQ	I Attachment 1. DEQ has added in 2.11.2 In the event of unanticipated discoveries of cultural materials on Montana state lands during construction activities, in addition to the provisions outlined in the PA, the owner shall notify DNRC within 48 hours of the initial discovery. In the event of unanticipated discoveries of cultural materials on H-Lands in Montana, in addition to the provisions outlined in the PA, the owner shall notify DEQ within 48 hours of the initial discovery. Re-number the rest to 2.11.3 and 2.11.4	The text of Appendix I has been revised in response to this comment.
1494	126	Hallsten	Greg	Montana DEQ	Under the No Action alternative the relatively stable and secure source of North American Crude oil for the P ADD III market would not be met via the proposed Keystone XL Pipeline.	The EIS has been revised to reflect the latest information on environmental resources and routing.
1494	128	Hallsten	Greg	Montana DEQ	I-2.4.1 I-II Bullet 1 Delete - "despite a very low statistical probability of a leak ... "	Appendix I was revised in response to this comment.
1494	131	Hallsten	Greg	Montana DEQ	I-2.5.2 1-22 2 Line 1: (aka "tipi" terminology is NOT necessary, recommend removing.	Appendix I was revised in response to this comment.
1494	134	Hallsten	Greg	Montana DEQ	1-3.6.2 1-121 1 "In Montana, the proposed route does not cross any state wildlife management areas, state parks, national primitive areas, national monuments, national recreation areas, national forests, or any rivers in reaches designated as wild and scenic." Add text stating "In addition, the proposed route does not cross any national natural landmarks, natural areas, research natural areas, areas of critical environmental concern, research botanical areas, or outstanding natural areas. One special interest area, the Phillips County USFWS Wetland Easement, is crossed on the proposed route. No long-term effects are anticipated for this wetland easement."	The EIS has been revised in response to this comment.
1494	135	Hallsten	Greg	Montana DEQ	1-3.6.2 1-122 3 Add text at the end of this paragraph stating "Proposed transmission lines for Pump Stations 12 and 14 would not cross any recreation areas named above. Although 0.9 mile of State Trust land would be crossed by the proposed line for Pump Station 12 and 1.0 mile of State Trust land would be crossed by the proposed line for Pump Station 14, effects to any dispersed recreation activities that may occur	The EIS has been revised in response to this comment.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					there would be short-term and limited to construction."	
1494	138	Hallsten	Greg	Montana DEQ	1-4.9 1-154 Bullet 6 "Placement of pump stations and mainline valves in cropland would result in the loss of that land for agricultural purposes for the life of the Project. However, Keystone would compensate farmers for lost crops." How long would Keystone compensate farmers for lost crops, during construction or the operation of the pipeline?	Section 3.9.1.3 and Consolidated Response FRM-1 address compensation for lost crops.
1494	139	Hallsten	Greg	Montana DEQ	[discussion of independent sage grouse survey followed by results] Approximate distances of the 47 greater sage-grouse leks identified for this report from various Project-related activities are given in Table 2. Distances are approximate due to: 1) the boundaries of certain Project-related activities would be expected to change as the Project develops; 2) lek locations may be somewhat fluid, moving slightly from year to year; 3) map scale; and 4) rounding error. Nevertheless, Table 2 shows that the proposed Project centerline is <1 mile from four leks, ≥ 1 but <2 miles from five leks, ≥2 but <3 miles from 16 leks, and ≥ 3 but < 4 miles from 11 leks. Further, of 23 leks that are within 4.0 miles of either the proposed centerline or a MT DEQ alternative, only four are closer to the proposed centerline while 14 are closer to a MT DEQ alternative, and five are approximately the same distance from either. No leks are within 4.0 miles of MDEQ route alternatives M TV-5 through MTV-12, and MTV-19 (Map Sheets 1-7). Seven leks are within 4.0 miles of the transmission line to PS-09, three leks are within 4.0 miles of the transmission line to PS'10, two leks are within 4.0 miles of the transmission line to PS-11, six leks are within 4.0 miles of the transmission line to PS-14, and one lek is within 4.0 miles of each of the transmission lines to PS-13, PS-16 and PS-17. A total of 11 leks are within 4.0 miles of a pipe yard.	Section 3.8.1.2 of the EIS was revised in response to this comment to add information regarding the proximity of sage-grouse leks to facilities based on 2010 survey results.
1494	140	Hallsten	Greg	Montana DEQ	[discussion of independent sage grouse survey followed by results] South Dakota Lek Activity SO GFP provided locations of many historical greater sage-grouse leks in Harding County (Map Sheets 7-8). Of these, 63 leks are within 4.0 miles of a Project-related activity, but many of these locations (23) are duplicates or alternate lek sites, reducing the actual number of leks TABLE 2 COMPARISON OF DISTANCE OF MONTANA GREATER SAGE-GROUSE LEKS FROM PROJECT-RELATED ACTIVITIES [For Table see page 29-30 of PDF 1494] within 4.0 miles of the Project to 40. Of these 40 remaining sites, most are historic allocations and/or counts that are ≥20 years old. All historical and "priority" leks within 4.0 miles of a Project-related activity were visited during the April 2010 aerial searches. It is likely that many of the historical leks are no longer active (for example, some lek locations were cultivated). SD GFP also provided the locations of four "priority" leks within 4.0 miles of the Project which are known to be "recently" active. AECOM (2009) counted 15 displaying males at one of these sites (ID 8) in April 2009, but no sage-grouse were seen at any of these leks during the April 2010 aerial searches. Table 3 summarizes information for "priority leks" within 4.0 miles of the Project. [For Table 3 see page 31 of PDF 1494].	Section 3.8.1.2 of the EIS was revised in response to this comment to add information regarding proximity of sage-grouse leks to facilities based on 2010 survey results. Lek surveys completed in 2010 followed protocols specified by resource management agencies.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
1494	141	Hallsten	Greg	Montana DEQ	[discussion of independent sage grouse survey followed by results] Distances of "Priority" Leks from Project-related Activities Approximate distances of the 4 "priority" greater sage-grouse leks from various Project-related activities are given in Table 4. The proposed Project centerline in South Dakota is <1 mile from one lek, ≥1 but <2 miles from one lek, and ≥2 but <3 miles from two leks. ID 8 (active in 2009) is <1 mile from a pump station (PS-16) and its associated transmission line. ID 10 is <1 mile from a pipe yard (PY-12).	Section 3.8.1.2 of the EIS was revised in response to this comment to add information regarding the proximity of sage-grouse leks to facilities based on 2010 survey. Lek surveys completed in 2010 followed protocols specified by resource management agencies.
1494	142	Hallsten	Greg	Montana DEQ	[discussion of independent raptor surveys followed by results] WESTECH Environmental Services. Inc. repeated raptor nest aerial searches for the Project in April 2010, based on the Project's March 2010 centerline. The search corridor was enlarged. And the searches were expanded to include several alternative routes proposed by the Montana Department of Environmental Quality (MT DEQ) as well as transmission lines to proposed pump stations, pipe yards. Contractor yards and other Project-related activities....Following field surveys GPS data were plotted relative to the March. 26 2010 centerline. MDEQ proposed route variations, transmission, lines, and associated facilities (e.g. pipe yards. Contractor yards" etc.) The distance from each feature to active nests was determined within the relevant survey corridor. A summary of the data relevant to the proposed centerline are presented in Attachment 1; a summary of the data relevant to the project transmission lines and facilities that are off the right-of-way (pipe yards, contractor yards, etc.) as represented in Attachment 2. The attached maps depict each nest that was located within the entire 1-mile radius buffer (2 miles total) of the Project and along all 19 MDEQ route variations. Shapefiles that are submitted separately also depict each nest that was located within the 1-mile radius buffer of the Project and along all MDEQ route variations. Since the DEIS has specified a 0.5- mile radius seasonal no-construction buffer, only nests within a 0.5-mile radius of the Project are summarized below. Also, only the 9 preferred MDEQ route variations are compared in Table 2.	Section 3.8.1.2 of the EIS was revised in response to this comment to add information regarding the proximity of sage-grouse leks to facilities based on 2010 survey. Lek surveys completed in 2010 followed protocols specified by resource management agencies.
1494	143	Hallsten	Greg	Montana DEQ	[discussion of independent raptor surveys followed by results] Montana: Raptor nest searches located 52 raptor nests within a 0.5-mile radius of the Project centerline in Montana, six raptor nests within 0.5-mile radius of project transmission lines, and zero raptor nests within 0.5-miles of associated facilities. Table 1 summarizes Montana raptor nest data. Table 1. Raptor Nest Status - Montana, April 2010 [For Table see page 37 of PDF 1494] Raptor nest searches in Montana in 2009 identified 171 nests within the narrower corridor, including active, inactive, and unconfirmed nests. Many of the unconfirmed or unknown nests identified in 2009 were determined to be magpie nests during the 2010 survey. Small raptors, such as merlins (Falco columbarius), may occasionally use magpie nests; however, the likelihood of merlins or other small raptors using magpie nests is very low compared to the likelihood of magpies or other non-raptors using these nests. Consequently, magpie nests were not recorded in 2010. In total, 123 raptor nests were identified	Section 3.6.1.4 of the EIS was revised in response to this comment to add information from aerial stick nest surveys based on 2010 results.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					within 1 mile of the centerline, 20 raptor nests were identified within 1 mile of transmission lines, and 5 raptor nests were identified within 1 mile of associated facilities. A total of 148 raptor nests were located within 1 mile of all proposed Project components in Montana. In addition to searching for raptor nests adjacent to proposed Project components, searches were also completed in a 1-mile radius of each recommended MDEQ route variation. The DEIS identified g preferred MDEQ route variations. Table 2 presents raptor nests that were located within a 0.5-mile radius of the preferred MDEQ route variations and the number of raptor nests within a 0.5 mile radius of the corresponding proposed Project centerline. Table 2, Raptor Nest Status Summary by MDEQ Preferred Route Variation [For Table see page 38 of PDF 1494]	
1494	144	Hallsten	Greg	Montana DEQ	[discussion of independent raptor surveys followed by results] South Dakota: Raptor nest searches located 43 rap tor nests within a 0.5,-mile radius of the Project centerline in South Dakota. 14 raptor nests within 0.5-mile radius of project transmission lines. and 2 raptor nests within 0.5-miles of associated facilities. Table 2 summarizes South Dakota raptor nest data. Table 3. Raptor Nest Status - South Dakota, April 2010 [For table see page 39 of PDF 1494] The 2009 raptor nest searches located 25 nests within the narrower survey corridor. The 2010 raptor nest searches located a total of 78 raptor nests within 1 mile of the centerline, 37 raptor nests within 1 mile of transmission lines, and 3 raptor nests within 1 mile of associated facilities. A total of 118 raptor nests were located within 1 mite of all proposed Project components in South Dakota.	Section 3.6.1.4 of the EIS was revised in response to this comment to add information from aerial stick nest surveys based on 2010 results .
1494	145	Hallsten	Greg	Montana DEQ	[discussion of independent raptor surveys followed by results] Nebraska Raptor nest searches located 36 rap tor nests within a 0.5-mile radius of the Project centerline in Nebraska, 5 raptor nests within D.S-mile radius of project transmission lines, and zero raptor nests within D.5-miles of associated facilities. Table 3 summarizes Nebraska raptor nest data. Table 4. Raptor Nest Status - Nebraska, April 2010 [For table see page 40 of PDF 1494] The 2009 raptor nest searches located 30 nests within the narrower survey corridor. The 2010 raptor nest searches located a total of 58 raptor nests within 1 mile of the centerline, 9 raptor nests within 1 mile of transmission lines, and 3 raptor nests within 1 mile of associated facilities. A total of 70 raptor nests were located within 1 mile of all proposed Project components in Nebraska.	Section 3.6.1.4 of the EIS was revised in response to this comment to updtae aerial stick nest survey data to reflect 2010 survey results.
873	1	Hamer	Nancy		As Nebraska poet Loren Eiseley stated "If there is magic on this planet, it is contained in water." The time to prevent a disaster from happening is now, not once the damage is done. There is grave concern about the supervision of this project, the quality of materials being used, and the result of a "quick fix" which could easily contaminate our land and water. Please say no to TransCanada's plan to run this pipeline through our state and aquifer.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. REG-2, As described in Consolidated Response GLF-1, the risks associated with the proposed Project are substantially different from those associated with the BP Deepwater Horizon Project. Consolidated Response PIP-1 addresses the issue of purchasing pipe for the Project.
875	1	Hamer	Doug		The Keystone Pipeline comes at too great of environmental price tag to the State of Nebraska and its delicate water system. Just say no to the Keystone pipeline project. Any	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					minor screw up which could potentially contaminate the aquifer or our land would be a despicable travesty.	
280	1	Hamilton	Angela		Please do not allow the building of a new pipeline directly through one of the largest underground sources of fresh water in the world. The Ogallala Aquifer is the single most important source of water in the High Plains region, providing nearly all the water for residential, industrial, and agricultural use. Without irrigation from the Ogallala Aquifer, there would be a much smaller regional population and far less economic activity. More than \$20 billion worth of food and fiber depend on the aquifer. There are other routes on which a pipeline could be built.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. and ALT-1.
457	1	Hamilton	Michael		Please stop building any pipeline over any and all parts of the Ogallala Aquifer. There are no promises in life, to do no harm. To build the pipeline would in danger human life, let alone any other life forms, if and when there is a break in the pipeline. Water and oil brim do not mix. We import oil now, down the road after the line brake and or spill, we will be importing water. We will have destroyed fresh water for human use, farmland, etc. At the end of the line, in the refining process, it will take a very large amount of water to process. That discharge water is extremely toxic, and from what I have read cannot be used. Where do you store the toxic water, time, and cost? I guess dump it into the ocean and kill anything and everything. If it enters the food chain, not tomorrow but shortly. We humans will die.	Consolidated Response AQF-3 provides information on hypothetical spills from the Project over two areas of the Northern High Plains Aquifer System and also addresses response actions. The proposed Project does not include construction, retrofit, or operation of any refineries that could receive crude oil transported through the proposed Project. Refinery operations are required to be conducted in compliance with permits that limit air emissions and water discharges, and the proposed Project would not alter those permit requirements.
242	1	Hamling	Marian		I have 160 acres of crop ground that the Canadian Keystone pipeline will come through at the southwest corner. Legal description. NW 1/4 29-18-8, Boone County, Nebraska... The water flows from the southwest to the northeast through the middle of the farm. My concern is that if there is an oil leak during irrigation season there is a possibility of not being able to run a pivot and losing a crop. On hot sunny days, a crop can be lost in a few days. The input cost of a corn crop at approximately \$471.24 an acre is \$75,398.78 on 160 acres. After checking with a Federal Crop Insurance agent, I was informed that Federal crop does not cover this type of situation.	Consolidated Response LIA-1 addresses Keystone's liability if there is a spill of hazardous materials or fuel during construction and from a spill of crude oil from the Project. The commenter described a third party claim that would have to be directed to Keystone for review and payment.
242	2	Hamling	Marian		Another concern is an oil leak getting to a neighbor's farm, could also cause an irrigating problem, or oil and ground cleanup during planting, irrigating or harvest season. Will there be lawsuits from my neighbors? Who will pay for these damages?	If a spill occurs, Keystone would be liable for cleanup costs and related compensation as described in Consolidated Response LIA-1.
242	3	Hamling	Marian		The steel that is going to be used for the Keystone XL Pipeline Project will be coming from China, and is of inferior quality. This steel is 60% lower quality than that which is manufactured by Nucor Steel in Norfolk, Nebr. This pipe, which will be buried only 4 ft. deep and under 1440 PSI. is a huge concern, especially after learning of the leak in Clearbrook, Mn., Nov. 2007, catching fire and killing two workers. Also in June, 2008 an oil leak occurred in Red Deer River, Alberta released 8,400 gals. of crude oil. Also leaks occurred in Pine River, BC, in August 2000, Burnaby, Be July 25, 2007, and Cohasset, Mn in July of 2002. Even small	Consolidated Response PIP-1 addresses the issue of purchasing pipe for the proposed Project. Issues related to the Northern High Plains Aquifer System are addressed in Consolidated Responses AQF-1 through AQF-4. Sections 3.13.5 and 3.13.6 describe potential environmental impacts associated with a spill of oil from the proposed Project.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					releases can contaminate soils, rivers and vegetation and especially the Ogallala Aquifer in Nebraska	
242	4	Hamling	Marian		I also strongly suggest that a Clean Up Fund be provided by TransCanada for catastrophic events such as described above, and for the decommissioning when the pipeline is no longer in use, such as removal of pipeline equipment and restored to original condition.	Consolidated Response LIA-2 addresses the issue of bonding for the proposed Project.
650	1	Hancock	Lynn	Booker/Hancock & Associates	Dear Ms. Orlando:I write in support of TransCanada's Keystone XL crude oil pipeline project and urge the department to grant a permit for the pipeline.This project is a vital link to secure energy supplies for the United States. According to the U.S. Energy Information Administration, oil and natural gas will continue to supply over 50 percent of U.S. energy needs in 2030. Canada is a valued trading partner and our most reliable supplier of foreign-based crude oil. The Keystone project will have the added benefit of potential links to growing domestic supplies of crude oil in Montana and North and South Dakota.The environmental benefits of Keystone XL should not be overlooked.	Comment acknowledged.
650	4	Hancock	Lynn	Booker/Hancock & Associates	Pipelines are the safest, most reliable, economical and environmentally favorable way to transport oil and petroleum products, as well as other energy liquids, throughout the U.S. America depends on the more than 168,000 miles of liquid pipelines to move energy and raw materials our country relies on. Additional pipeline capacity will help consumers and businesses throughout the United States	Comment acknowledged.
650	5	Hancock	Lynn	Booker/Hancock & Associates	This project also stands to provide a powerful private sector economic stimulus. During construction, Keystone XL will create more than 13,000 jobs funded with private investment.	Consolidated Response ECO-1 and Section 3.10.2.2 of the EIS address the potential socioeconomic impacts of the proposed Project.
650	6	Hancock	Lynn	Booker/Hancock & Associates	In addition, local governments will have a steady source of income from economic activity associated with construction and from property taxes the pipeline company will pay.	Consolidated Responses TAX-1 and ECO-1 address the estimated increases in the tax base and the jobs generated by the proposed Project. Also see the revisions to Sections 3.10.2.3 and 3.10.2.4 of the EIS.
650	7	Hancock	Lynn	Booker/Hancock & Associates	Rejection of the permit or suspension of the review would sacrifice the significant economic benefits this project stands to deliver and force U.S. consumers to rely on other sources of crude oil not economically and politically allied with U.S. interests. This would be a mistake. I urge the granting of the permit. Thank you for the opportunity to comment.	Comment acknowledged.
1414	1	Hand	George	Canadian Valley Electric Cooperative, Inc	Canadian Valley Electric Cooperative, Inc., (CVEC), is a rural electric cooperative serving approximately 24,000 retail electric consumers in rural, East Central, Oklahoma. CVEC has been selected as the electric power and energy provider for one of the pumping stations along this pipeline. This particular pump station is located near Cromwell, Oklahoma. This is a very rural area with few job opportunities, struggling schools and a limited tax base. This pipeline project will have a very positive impact on all these concerns both during construction and with the residual long term economic infusion from the pipeline operation into the economy. The opportunity to be the retail electric power and energy provider for this pipeline pump station will have a positive impact on all existing CVEC customers/members as we strive to keep the cost of	Comment acknowledged.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					electricity affordable to rural Oklahomans in our service area. Also this pumping station is fortunately located near an existing 138,000 kV transmission line (same section) thus requiring very little construction of new transmission line.	
1414	2	Hand	George	Canadian Valley Electric Cooperative, Inc	CVEC is supportive of the Keystone XL Pipeline Project and encourages the Department of State's confirmation of this project.	Comment acknowledged.
313	3	Hanrahan	Deborah		Taking into account the soil in and around this river is a very sandy soil which is very permeable and, also highly erosive. An oil spill in this soil would be quick to leach into the groundwater and river.	Section 3.13 of the EIS addresses reliability and safety issues, including calculations of the probability of a spill from the proposed Project and the potential environmental impacts associated with spills. Consolidated Response AQF-3 addresses the permeability of soils over groundwater to penetration of oil .
313	4	Hanrahan	Deborah		The rugged terrain along and near the Cheyenne River is a mixture of extremely steep hills and ridges. Here large land movements are very common. This is where a large area of land (the size of several or more football fields) will break and drop off a steep bank (or cliff) falling several hundred feet below to the river bed taking tons of soil, rocks, trees down in the landslide. The proposed pipeline will cross a very unstable area along the Cheyenne River where these massive landslides are known to occur. Before making your decision, I plead with you to please take into consideration the devastation that would occur if this pipeline would sheer off from the force of a large landslide and spew into the river below.	Consolidated Response GEO-1 addresses landslide potential along the proposed route.
313	5	Hanrahan	Deborah		This would be detrimental not only to the hundreds of thousands of people who rely on this water source for their daily lives, but to the many farms and ranches who need this water for their livestock and crops, which is their very livelihood producing food for the world. And for the abundant wildlife that roam so freely here. Water is our most precious commodity. Water is life.	Consolidated Response FRM-1 addresses potential ranch of farmland impacts, and Consolidated Response FRM-2 addresses potential impacts to irrigated cropland. The impacts associated with implementation of the proposed Project are addressed in Section 3.0 of the EIS. As noted in that section, construction and normal operation the proposed Project would not result in significant environmental impacts. Section 3.13 of the EIS has been revised and addresses reliability and safety issues, including calculations of the probability of a spill from the proposed Project and the potential environmental impacts associated with spills. Keystone would be liable for all costs associated with cleanup and restoration as well as other compensations, as noted in Consolidated Response LIA-1. If a stockpond, well, or stream used as a source of water is affected, Keystone would provide water until the affected water is proven to be acceptable for use.
792	1	Hansen	James	Columbia University	Building a pipeline to carry tar sands oil to the United States makes no sense... Building the pipeline should not be approved.	The commenter's opinion is noted.
792	2	Hansen	James	Columbia University	...Allowing it to be built would be inconsistent with President Obama's frequent statement that we have a "planet in peril". Our planet today is close to climate tipping points. Ice is melting in the Arctic, on Greenland and Antarctica, and on mountain glaciers worldwide. Many species are stressed by environmental destruction and climate change. Continuing fossil fuel emissions, if unabated, will cause sea level rise and species extinction accelerating out of humanity's control.	Consolidated Response GHG-1 addresses the greenhouse gas life-cycle analyses presented in the revised EIS. Climate change is addressed in Section 3.14.3.14. As noted in that Section, implementation of the proposed Project is unlikely to result in a measureable climate change. Consolidated Response P&N-1 addresses the need that the Project has been proposed to meet.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					Increasing atmospheric water vapor is already magnifying climate extremes, increasing overall precipitation, causing greater floods and stronger storms. Stabilizing climate requires restoring our planet's energy balance. The physics is straightforward. The effect of increasing carbon dioxide on Earth's energy imbalance is confirmed by precise measurements of ocean heat gain. The principal implication is defined by the geophysics, by the size of fossil fuel reservoirs. Simply put, there is a limit on how much carbon dioxide we can pour into the atmosphere... Failure to halt these fossil fuel extractions will force today's young people to either find a way to suck CO2 out of the air, at an estimated cost2 of \$40 trillion for 100 ppm of CO2, or suffer a deteriorating climate out of their control. This explains what I mean in saying that building this pipeline makes no sense....	
954	1	Hansen	John	Nebraska Farmers Union	Many members of the Nebraska Farmers Union are directly impacted by the proposed Keystone XL Pipeline and have expressed concerns about the unfair treatment of landowners and the potential environmental impacts the construction of this pipeline could bring.	Consolidated Response EAS-2 addresses issues related to easement negotiations. As noted in that response, DOS has no legal authority in the easement negotiation process. The impacts associated with implementation of the proposed Project are addressed in Section 3.0 of the EIS. As noted in that section, construction and normal operation the proposed Project would not result in significant environmental impacts.
954	2	Hansen	John	Nebraska Farmers Union	After the public information hearings recently held in Nebraska, Nebraska Farmers Union members are more concerned than they were before. The view of our members is that these hearings were long on spin and short on facts. The list of environmental, routing selection, human health, landowner treatment, and environmental concerns were not answered. Instead the list of unanswered questions at this point in the process continues to grow. Landowners and citizens deserve much better information than they have received to date before this pipeline proceeds.	The comment meetings were held to provide the public with the opportunity to comment on the draft EIS consistent with the Council on Environmental Quality's regulations for implementing NEPA. Those meetings were designed to allow time for the public to comment on the draft EIS. They were not intended to be conducted in a question-and-answer format.
954	3	Hansen	John	Nebraska Farmers Union	Nebraska's Sandhills are a very unique and fragile environmental and geologic formation that sets on top of the Ogallala Aquifer.	Issues related to the Sand Hills area are addressed in Consolidated Response ERO-1. Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
954	5	Hansen	John	Nebraska Farmers Union	It appears to us that Keystone XL Pipeline is taking an unnecessary shortcut right through our precious Sandhills. Nebraska Farmers Union asks further consideration of several issues prior to granting a Presidential Permit. What is the purpose of the pipeline? Is it really needed?	Consolidated Response P&N-1 addresses the need that the Project has been proposed to meet. Issues related to the Sand Hills area are addressed in Consolidated Response ERO-1.
954	7	Hansen	John	Nebraska Farmers Union	There should be a complete life cycle analysis by EPA, of tar-sands greenhouse gas emissions, climate-risk issues, and sweet crude or other energy alternatives.	Consolidated Response GHG-1 addresses the greenhouse gas life-cycle analyses presented in the revised EIS.
954	8	Hansen	John	Nebraska Farmers Union	A comprehensive analysis of the many varied site-specific environmental impacts and considerations involving water crossings, soil types and profiles, livestock and wildlife implications, vegetation and re-vegetation, cultural and paleontological resources, and construction and reclamation, as understood and identified by those people and landowners who will be directly impacted along the path of the pipeline.	The impacts associated with implementation of the proposed Project are addressed in Section 3.0 of the EIS. As noted in that section, construction and normal operation the proposed Project would not result in significant environmental impacts. As noted in Consolidated Response ENR-1, the environmental review, including preparation of this EIS, has been conducted consistent with the DOS regulations pertaining to NEPA (22 CFR Part 161) as well as the Council on Environmental Quality (CEQ) regulations for implementing NEPA (40 CFR

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
						Part 1500). As a result, DOS considers the EIS to be in full compliance with the requirements of a NEPA environmental review. Consolidated Response CMT-3 discusses how DOS conducted an extensive public scoping and comment process that included public meetings, opportunities to provide comment at public meetings or in writing by letter, fax, email, or on a website.
954	9	Hansen	John	Nebraska Farmers Union	Are U.S. landowners concerns being represented properly by TransCanada?	Specific landowner concerns are addressed in easement negotiations with Keystone. Consolidated Response EAS-2 addresses issues related to easement negotiations. As noted in that response, DOS has no legal authority in the easement negotiation process.
1386	1	Hansen	Nancy	McCone County Health Center	I write in support of TransCanada's Keystone XL crude oil pipeline project and urge the department to grant a permit for the pipeline... I attended the meeting in Circle on May 19th and land owners shared their concerns; but I truly believe that the majority of people in McCone County support the Keystone project. This would be a huge mistake; and I urge the granting of the permit.	Comment acknowledged.
1386	4	Hansen	Nancy	McCone County Health Center	Securing stable and affordable energy from our North American allies through projects such as the Keystone pipeline is in the national interest. Considering the economic and energy security benefits of these vital resources, we should continue to expand America's access to safe, affordable energy to help ensure improved domestic and global energy security and stable prices for consumers... Pipelines are the [safest,] most reliable, economical [and environmentally favorable] way to transport oil and petroleum products, as well as other energy liquids, throughout the United States... This project also stands to provide a powerful private sector economic stimulus. During construction, Keystone XL will create more than 13,000 jobs funded with private investment. In addition, local governments will have a steady source of income from economic activity associated with construction and from property taxes the pipeline company will pay... Rejection of the permit or suspension of the review would sacrifice the significant economic benefits this project stands to deliver ...	Consolidated Response ECO-1 addresses potential socioeconomic impacts, and Consolidated Response TAX-1 addresses concerns regarding taxes.
1386	5	Hansen	Nancy	McCone County Health Center	Pipelines are the safest, most reliable, [economical and] environmentally favorable way to transport oil and petroleum products, as well as other energy liquids, throughout the United States.	Comment acknowledged.
1386	6	Hansen	Nancy	McCone County Health Center	America depends on the more than 168,000 miles of liquid pipelines to move energy and raw materials. Additional pipeline capacity will help consumers and businesses throughout the United States.	Comment acknowledged.
766	1	Hanson	Jacob	Sustainable Design Solutions	Tar sands are one of the most destructive and inefficient energy sources ever seen, and I find it highly irresponsible and reckless to promote their further development and consumption through building the Keystone XL Pipeline. Considering the net energy, or EROEI (Energy Return on Energy Invested) of tar sands compared to other energy sources makes another strong case against this project. [Tar	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project. Consolidated Response GHG-1 addresses GHG life-cycle analyses. Consolidated Response GHG-2 addresses the potential causal connection of implementation of the proposed Project and expanded oil

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					sands have an EROEI below 2 or 3, while wind, solar, geothermal, biomass, and other renewable sources have EROEI ratios over 10. This shows just how wasteful and unsustainable tar sands are as a source of energy.] Furthermore, the carbon impact per watt of tar-sands-based energy is monumental--3 times more than conventional fuels. If tar sands are allowed to continue development on a large scale, they will profoundly exacerbate the climate crisis and eventually contribute to the largest migration of environmental refugees ever seen, along with wars for resources and chaos on an unprecedented scale. Please consider the well-being of your children and of generations to come, and realize that much more than money or economics is on the table with this decision.	sands production in Alberta and increases in refining.
766	3	Hanson	Jacob	Sustainable Design Solutions	...[If tar sands are allowed to continue development on a large scale,] they will ... eventually contribute to the largest migration of environmental refugees ever seen, along with wars for resources and chaos on an unprecedented scale. Please consider the well-being of your children and of generations to come, and realize that much more than money or economics is on the table with this decision.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project.
1115	1	Hanson	Keni		As a resident of Nebraska, I am extremely concerned about the Keystone XL pipeline and its potential to contaminate the Ogallala Aquifer. I request that you examine this issue further.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
1115	3	Hanson	Keni		... and strongly urge you to halt this project.	Consolidated Response ENR-1 provides information on the Department of State's environmental review process, the National Interest Determination process, and the need to complete those reviews before approving or denying the Presidential permit for the proposed Project.
1115	4	Hanson	Keni		The oil leak in the Gulf should amply demonstrate the problems Nebraska would face in the event of a disruption in the Keystone pipeline.	As described in Consolidated Response GLF-1, the risks associated with the proposed Project are substantially different from those associated with the BP Deepwater Horizon Project. Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
1115	5	Hanson	Keni		Please effectively govern to assure Nebraska has a clean, safe water supply!	Consolidated Response ENR-1 provides information on the Department of State's environmental review process, the National Interest Determination process, and the need to complete those reviews before approving or denying the Presidential permit for the proposed Project.
197	1	Happ	Jeanne		I have read the Keystone XL draft EIS. Will TransCanada be committed to the standards they have outlined in it? Will they be held accountable for environment damage? Will they be persistent in monitoring for oil spills, in the reclamation of the land in the corridor, in repairing damages to roads, & effective in cleaning up of Oil spills which are inevitable?	Consolidated Response SAF-1 describes the regulatory requirements that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project. It also describes the inspections and reviews of the proposed Project that the Pipeline and Hazardous Materials Safety Administration would conduct to ensure compliance with those regulatory requirements. Keystone would also be legally liable for damage during construction, as described in the easement agreements and in the Construction, Mitigation, and Reclamation Plan presented in Appendix B of the EIS; and for costs associated with spills from the Project as described in Consolidated Response LIA-1. Consolidated Response RDS-1 addresses concerns about the condition of roadways and roadway structures associated with construction and operation

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
						of the proposed Project.
197	2	Happ	Jeanne		My concerns include the potential contamination of the Sandhills & Ogallala Aquifer.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
197	3	Happ	Jeanne		My concerns include the loss of Sandhills vegetation & erosion.	Issues related to the Sand Hills area are addressed in Consolidated Response ERO-1.
197	5	Happ	Jeanne		Why is it necessary to build this extension through Montana, S. Dakota, Nebraska, & Kansas when the extension from Cushing will go to the refineries on the coast?	As noted in Section 4.3 of the EIS, the proposed route and alternative routes were developed based on the need to connect to the approved Canadian portion of the proposed Project and to the northern end of the Cushing Extension.
197	6	Happ	Jeanne		The short term boost to the local economy will not make up for the costs of damages to the environment & the cost incurred for roads, etc. by the county taxpayers.	The impacts associated with implementation of the proposed Project are addressed in Section 3.0 of the EIS. As noted in that section, construction and normal operation the proposed Project would not result in significant environmental impacts. Consolidated Response RDS-1 addresses concerns about the condition of roadways and roadway structures associated with construction and operation of the proposed Project as well as traffic safety measures that would be incorporated into the Project. Consolidated Response TAX-1 addresses concerns regarding taxes.
197	8	Happ	Jeanne		Potential liability should not be borne by the landowners.	Consolidated Response LIA-1 addresses Keystone's liability if there is a spill of hazardous materials or fuel during construction or a spill of crude oil from the proposed Project.
197	9	Happ	Jeanne		It will decrease property values and agricultural use.	Consolidated Response VAL-1 addresses concerns regarding property values.
197	10	Happ	Jeanne		Landowners should not have the easement appropriated by eminent domain by a foreign entity.	As described in Section 1.0 of the EIS and in Consolidated Response RES-2, TransCanada-Keystone Pipeline LP (Keystone) is not a foreign corporation. It is a limited partnership organized under the laws of the state of Delaware. Keystone has the same rights as other pipeline companies in the U.S. to propose projects. If easement negotiations with landowners are not successful, Keystone would initiate eminent domain proceedings. Consolidated Response EAS-2 also addresses issues related to easement negotiations and eminent domain.
263	1	Happ	Jeanne		The attached photo of a sand "blowout" shows what can happen in the Nebraska Sandhills when it has been denuded of vegetation. The path of the Keystone XL Pipeline through Wheeler County, Nebraska, is near the east side of this "blowout".	Issues related to the Sand Hills area are addressed in Consolidated Response ERO-1.
263	2	Happ	Jeanne		Will TransCanada be committed to restoring it's corridor through these Sandhills beyond one to five years, even if it takes ten to fifteen years or more?	Issues related to the Sand Hills area are addressed in Consolidated Response ERO-1.
1433	1	Harbert	Karen	Institute for 21st Century Energy	Canada is an important and reliable trade partner and is the world's largest supplier of oil and natural gas to the United States, supplying 12 percent of U.S. petroleum consumption needs and 18 percent of U.S. petroleum imports. ...This stable, long-term energy supply is critical to U.S. energy security at a time when global supplies are often found in geopolitically unstable regions of the world, and production from once reliable sources is declining. The economic impact of the construction of the KXL pipeline is significant.	Comment acknowledged.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
1433	2	Harbert	Karen	Institute for 21st Century Energy	When completed, the KXL pipeline will have the nominal capacity to deliver up to 900,000 barrels per day of crude oil to U.S. refineries. The KXL pipeline project will create 13,000 well-paying construction jobs in 2011-2012. In addition, during construction it will generate \$486.36 million in tax revenues for state governments and \$99.1 million for local entities where the pipeline is located. A report by the Canadian Energy Research Institute (CERI) concluded that the economic impact of Canadian oil sands development is expected to lead to the creation of more than 342,000 new U.S. jobs between 2011 and 2015. In addition, CERI determined that as oil sands production increases in Canada, so will the demand for imported U.S. goods and services, adding all estimated \$34 billion a year to U.S. gross domestic product in 2015, and rising to \$42.2 billion in 2025.	Consolidated Response ECO-1 addresses potential socioeconomic impacts, and Consolidated Response TAX-1 addresses concerns regarding taxes.
1433	3	Harbert	Karen	Institute for 21st Century Energy	Although some parties have opposed the project based on concerns related to greenhouse gas emissions, total greenhouse gas emissions from the Canadian oil sands industry is less than 0.1 percent of global greenhouse gas emissions, and 0.5 percent of U.S. emissions. The oil sands industry is constantly reducing emissions by employing advanced technologies and increasing efficiency, and according to the Canadian Association of Petroleum Producers and Environment Canada, emissions have decreased by more than 30 percent per barrel since 1990.	Consolidated Responses GHG-1 through GHG-5 address concerns related to greenhouse gas, climate change, alternative energy considerations, and approach to assessment of GHG emissions.
1433	4	Harbert	Karen	Institute for 21st Century Energy	The Energy Institute strongly opposes the suspension of review or other delays to this critical project, as well as unwarranted new permitting requirements. The regulatory process for the KXL pipeline project is being conducted in accordance the National Environmental Policy Act. The environmental review of this project has been comprehensive, transparent, and should not be delayed. The Department of State, along with 11 additional cooperating and 10 assisting agencies, counties and resource districts have also been involved in its review. The current process provides a myriad of opportunities for interested parties to comment on the draft Environmental Impact Statement. Suspending the review process of the KXL project would bring about unnecessary delay and uncertainty for potential investors.	Comment acknowledged.
447	1	Harbison	Gerard		I fully support the Keystone XL pipeline extension. America needs sources of oil in stable parts of the world. The pipeline will benefit our state economically, and will pose negligible danger to anyone's livelihood of the environment.	Comment acknowledged.
1113	1	Haring	Alex		The Lincoln Journal Star recently alerted readers to the proposed Keystone pipeline project, designated to run through the Nebraska Sandhills over one of our most precious resources, the Ogallala Aquifer. Today's news story provided us with the above email address.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
1113	3	Haring	Alex		I say route the pipeline around the Sand hills, and put the approval and oversight of the entire project within the Department of the Interior. I suppose that State got control because the project probably has Canadian partners. Canada's environmental record vis a vis US resources is dismal. A recent article suggested that Sandhill landowners	Issues related to the Sand Hills area are addressed in Consolidated Response ERO-1. Alternative routes are addressed in Section 4.3 of the EIS. As described in Section 1.0 of the EIS, DOS is responsible for reviewing applications for Presidential permits for oil pipelines

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					believed that they had no choice re the right away. They believed that if they gave no approval, the project took their land in the path by eminent domain. Does this sound like America?	that cross the border of the United States and is the lead federal agency for the environmental review of the proposed Project. Other federal agencies, including the Department of the Interior, Bureau of Land Management are responsible for reviewing permit applications for lands and resources under their jurisdiction. As noted in Consolidated Response EAS-2, state laws dictate under what circumstances eminent domain may be used and define the eminent domain process within the state. DOS has no legal authority in the easement negotiations or in eminent domain proceedings.
682	1	Harley	Carol		As a longtime taxpaying citizen of the U.S., I urge you to reject the plans for the Keystone XL Pipeline Project. The pipeline is ill-advised. We must wean ourselves from our fossil fuel addiction, regardless of the source of the fuel. It is an obsolete path being kept alive by corporate interests and the complicity of the uneducated masses who are not provided with better choices.	Consolidated Response ENR-1 provides information on the Department of State's environmental review process, the National Interest Determination process, and the need to complete those reviews before approving or denying the Presidential permit for the proposed Project.
1459	1	Harmon	Wagner	Roosevelt County Conservation District	On behalf of the Roosevelt County Conservation District Board of Supervisors we recently received information that there are advocacy groups out there sending letters in support or against the TransCanada Keystone XL Tar Sands Pipeline Project. Our duty as a conservation district is to preserve our natural resources and to help others in preserving our natural resources. We cannot take a stand for or against this project, however, we strongly believe in economic development, wherever that may be, as long as the project has limited impact on the land, people and environment as a whole. We wish you all the best.	Comment acknowledged.
1260	1	Harms	Robert	Northern Alliance of Independent Producers	On behalf of the Northern Alliance of Independent Producers I want to express our support for the Keystone XL pipeline now being considered by the US State Department.	Comment acknowledged.
1260	5	Harms	Robert	Northern Alliance of Independent Producers	We believe it is in our national interest to proceed with permitting the Keystone XL pipeline because it will open markets, currently unavailable to the producers in this region, which will enhance competition and make for a more vibrant market, and displace foreign oil with domestic oil, currently supplying those markets.	Comment acknowledged.
1260	6	Harms	Robert	Northern Alliance of Independent Producers	We believe it is in our national interest to proceed with permitting the Keystone XL pipeline because it will enhance the production of more domestic oil (Bakken and Three Forks) which increases our national energy security.	Comment acknowledged.
1260	7	Harms	Robert	Northern Alliance of Independent Producers	We believe it is in our national interest to proceed with permitting the Keystone XL pipeline because it will improve market efficiencies, by allowing more efficient transportation of domestic oil by pipeline rather than truck or rail (which sometimes requires circuitous routes, thereby exacerbating inefficiencies).	Comment acknowledged.
1260	9	Harms	Robert	Northern Alliance of Independent	We urge you to proceed with necessary permits for the Keystone XL pipeline.	Comment acknowledged.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
				Producers		
1330	1	Harms	Robert	Northern Alliance of Independent Producers	On behalf of the Northern Alliance of Independent Producers I want to express our support for the Keystone XL pipeline now being considered by the US State Department.	Comment acknowledged.
484	1	Harp	Carolyn		I have great concern that the potential, no matter how unlikely, for the Keystone XL Pipeline to contaminate the Ogallala Aquifer which is located in the plains area - particularly under the Nebraska Sandhills and beyond, should bring about some serious rethinking about the project. We are discovering that we cannot always recover easily from accidents that occur as we seek to move ever more petroleum products. The Gulf Coast disaster is a prime example. I strongly urge a change of course in the decisions to allow this pipeline to be laid across the proposed plains areas, because once contamination occurs, it would be nearly impossible to eliminate that contamination from the water which is used for irrigation and other uses by the residents of this huge area. Please consider again the possible consequences, before moving ahead with this dangerous course of action. Thank you for your consideration.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. As described in Consolidated Response GLF-1, the risks associated with the proposed Project are substantially different from those associated with the BP Deepwater Horizon Project.
223	1	Harrel	Richard		Clean air and water, Inc. a citizens environmental organization that has been active since 1966, is concerned about the Keystone pipeline and the use of tar sand oil in Texas refineries. The Beaumont-Port Arthur area is currently out-of-compliance with the Clean Air Act and the use of tar sand oil will increase air emissions from Beaumont and Houston refineries. The boreal forest, that is the source of the tar sands, will be permanently destroyed by clear-cutting and strip mining.	As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries. Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project. Consolidated Response GHG-4 addresses concerns regarding the loss of boreal forest and peat bogs.
1542	64	Harrel	Richard	Clean Air and Water Inc	Clean Air and Water Inc is opposed to this whole project.	Comment acknowledged.
1542	65	Harrel	Richard	Clean Air and Water Inc	We are especially opposed to the use of tar sands, which are dirty and polluting.	Consolidated Response OIL-4 addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils. As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries.
1542	66	Harrel	Richard	Clean Air and Water Inc	We are opposed to anything that has a bad environmental effect, not only on the pipeline itself, but the processing of the material that comes through it.	Comment acknowledged.
591	1	Harrell	Jackson	The Harrell Group	I am writing to support the Keystone XL pipeline and to urge the Department of State to complete its EIS review in a timely manner, with no further delay. Oil pipelines are widely known to be the safest way to transport crude oil. The fact that this line is proposed to be built from stronger steel and buried deeper than most pipelines (four feet, compared with the typical three) suggests that the environmental and safety	As described in Consolidated Response GLF-1, the risks associated with the proposed Project are substantially different from those associated with the BP Deepwater Horizon Project.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					<p>advantage it offers is even greater than for the typical pipeline. Opponents of the project have cleverly tried to gain political advantage from the tragedy in the Gulf by claiming the well blowout at 5,000 feet below the water's surface is reason to be concerned about a land-based pipeline buried under 4 feet of soil. Fact and reason do not support the comparison - and, in fact, if Keystone XL bears any relationship at all to the implications of the Gulf well blowout it is this: the pipeline offers a safer, more environmentally sound way to obtain crude oil needed for US refineries. To summarize: please register my support for the Keystone XL Pipeline Project and your confirmation of the Draft EIS findings and approval for the project. Jackson J. Harrell, Ph.D. President, The Harrell Group Dallas, Texas</p>	
591	2	Harrell	Jackson	The Harrell Group	<p>The Keystone XL pipeline offers several other benefits, US energy security being chief among them. We are, and for years into the future will continue to be, net importers of the crude oil that is necessary to the functioning of our transportation system and, hence, our national security. For much of the oil we need, we rely upon imports from areas which have proven less than dependable. Keystone XL will allow us to lessen that dependency on less reliable suppliers, replacing it with crude oil from our North American neighbor, ally and trading partner, Canada. That's a big plus for our energy security outlook.</p>	Comment acknowledged.
591	3	Harrell	Jackson	The Harrell Group	<p>In addition, the construction and operation of Keystone XL will provide an economic stimulus to the US economy at a time when that is really needed. The billions of dollars TransCanada will spend constructing the pipeline will stimulate even more billions in new spending, and the equivalent of more than 100,000 jobs during construction and development. Longer term, a recent economic study conservatively estimates that the more stable supply of oil the pipeline will provide will annually stimulate roughly \$100 billion in annual spending for the US economy, and stimulate the creation of roughly 250,000 permanent jobs. That's a great deal of benefit for the U.S. - increased energy security, a much-needed economic stimulus and a safe, environmentally positive way to bring to U.S refineries an amount of oil equal to half the amount we currently import from the Middle East or Venezuela. (Plus, pipelines are a far more environmentally sound way to transport oil than are ocean-going tankers.)</p>	Consolidated Response ECO-1 addresses potential socioeconomic impacts, and Consolidated Response TAX-1 addresses concerns regarding taxes.
591	4	Harrell	Jackson	The Harrell Group	<p>As for the oil that will be delivered - US Gulf Coast refineries are equipped to safely process the oil, and the EPA sets strict limits on refinery emissions, regardless of the type of oil being used. There is one other consideration I'd like to mention. Through my company, I have been working with TransCanada for some time now, and I've noticed first-hand how strongly TransCanada actively pursues public engagement. I count that as a big plus, and one I believe should be encouraged in the way our nation's energy and environmental policies are administered.</p>	Comment acknowledged.
591	5	Harrell	Jackson	The Harrell Group	<p>Before closing, let me excerpt from a recent opinion piece in the St. Joseph, MO, News-Press June 12, 2010). The editorial</p>	Consolidated Response OIL-1 provides a summary of the range of spill frequency estimates addressed in the EIS.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					<p>writer comments on another TransCanada project, the recently completed Keystone pipeline, which passes near St. Joseph on its way to delivering Canadian crude oil to Patoka, IL. I include this because I believe the writer offers a perspective and experience with TransCanada that may be worth considering in your current review: "The Keystone pipeline, which runs through Buchanan, Clinton and Caldwell counties in Missouri and Nemaha, Brown and Doniphan counties in Kansas, is subject to more scrutiny from local residents than it might have been just a few months ago. What we have witnessed so far, however, reassures us about the safety of the 30-inch-diameter pipeline. Construction involved oversight by numerous government agencies, environmental groups and the public. Its owner, TransCanada, has fulfilled every obligation and adds, "From a business standpoint, it makes no sense to cut corners." Critics fear breaks in the line that TransCanada says are extremely unlikely and could be easily identified and quickly addressed. Local governments, as well as state and federal agencies, should be vigilant in monitoring the pipeline's environmental impact and demand that TransCanada demonstrate it is prepared for truly worst-case scenarios. On the plus side, employment and the local economy received a boost during construction. Also, it's hard to overstate the benefits of adding to the fuel supply with resources not tied to the Middle East or deep-sea drilling. As long as TransCanada continues to take responsibility for its environmental and social impact, we welcome the Keystone pipeline and the oil flowing through it in our region."</p>	Consolidated Response SAF-1 describes the regulatory requirements and Project-specific Special Conditions that Keystone would comply with to construct, operate, maintain, inspect, and monitor the proposed Project. It also describes the monitoring, inspections, and reviews of the proposed Project that the Pipeline and Hazardous Materials Safety Administration would conduct to ensure compliance with those regulatory requirements.
1283	1	Harris	Joanne		<p>Recently a number of advocacy groups sent a letter seeking suspension of the permitting of the Keystone XL Pipeline. Please reject the request to suspend the process and continue with the review.</p>	Comment acknowledged.
1283	3	Harris	Joanne		<p>Construction of this project stands to bring significant economic benefits to the areas where it will be built.</p>	Comment acknowledged.
1283	5	Harris	Joanne		<p>The permitting processes in place are appropriate and should proceed so that a final determination can be made about the impacts of the project and whether it is in the national interest.</p>	Comment acknowledged.
1409	3	Harris	Dave	McCone County Sheriff's Office	<p>I write in support of TransCanada's Keystone XL crude oil pipeline project and urge the department to grant a permit for the pipeline....I urge the granting of the permit. Thank you for the opportunity to comment.</p>	Comment acknowledged.
1409	5	Harris	Dave	McCone County Sheriff's Office	<p>Considering the economic [and energy security] benefits of these vital resources, we should continue to expand America's access to [safe,] affordable energy to help ensure [improved domestic and global energy security and] stable prices for consumers... Additional pipeline capacity will help consumers and businesses throughout the United States. This project also stands to provide a powerful private sector economic stimulus. During construction, Keystone XL will create more than 13,000 jobs funded with private investment. In addition, local governments will have a steady source of income from economic activity associated with construction and from property taxes the pipeline company will pay. Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					significant economic benefits this project stands to deliver and force U.S. consumers to rely on other sources of crude oil not economically and politically allied with U.S. interests. This would be a mistake.	
1409	7	Harris	Dave	McCone County Sheriff's Office	Pipelines are the safest, most reliable, economical and environmentally favorable way to transport oil and petroleum products, as well as other energy liquids, throughout the U.S. America depends on the more than 168,000 miles of liquid pipelines to move energy and raw materials our country relies on.	Comment acknowledged.
746	1	Harryman	Melanie		Keep the pipeline away from Sandhills. It would be extremely irresponsible to ruin yet another ecological treasure.	Identification of sensitive environments crossed by the proposed Project is discussed in Consolidated Response ENV-1 and ENV-3. Issues related to the Sand Hills area are addressed in Consolidated Response ERO-1. Consolidated Response ALT-1 addresses potential alternative routes, including routes that would avoid much of the Northern High Plains Aquifer system and the Sand Hills area.
579	1	Hart	Debra		I believe any risk of a spill or leak (no matter how insignificant) is too high to safely run this pipeline through the Sand Hills of Nebraska over the Ogallala Aquifer.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
1480	1	Hartan-Marks	Tim		In a time when many of our nation's leaders are fighting to prevent catastrophic climate change the Department of State should not approve a permit for pipelines importing the worlds dirtiest fuel.	Consolidated Response OIL-4 addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils.
1480	2	Hartan-Marks	Tim		The Keystone XL pipeline, if permitted would have devastating effects on local communities in terms of deforestation, water pollution, and epic global warming pollution. The draft EIS lacked proper analysis of the lifecycle of tar sands oil. Over its lifecycle, tar sand synthetic crude oil produces 20% more greenhouse gas pollution than regular crude. An EIS is required to include a "full and fair discussion" of all "direct", "indirect", and "cumulative" effects of the project. To meet this requirement, a proper EIS will include an assessment of the ecological and greenhouse gas impacts associated with the production, delivery, and consumption of this oil.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project. Consolidated Response GHG-1 addresses the greenhouse gas life-cycle analyses presented in the revised EIS.
1480	3	Hartan-Marks	Tim		Tar sands pose a large threat to North America's clean energy future. A proper EIS will demonstrate this. Please do not approve the permit for the XL Keystone Project.	As noted in Consolidated Response ENR-1, the environmental review, including preparation of this EIS, has been conducted consistent with the DOS regulations pertaining to NEPA (22 CFR Part 161) as well as the Council on Environmental Quality (CEQ) regulations for implementing NEPA (40 CFR Part 1500). As a result, DOS considers the EIS to be consistent with the requirements of a NEPA environmental review.
976	1	Harter	John	Protect South Dakota Resources	My name is John Harter, I'm a landowner directly affected by the Keystone XL pipeline. The pipeline is projected to cross my property west of Colome SD, in Tripp County. The area where this will cross my property has a very shallow water aquifer. This year most areas the water table is at or above ground level. I believe that protecting our drinking water source is a matter of national security, with a much higher priority than the need for this oil pipeline.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
976	2	Harter	John	Protect South	It does not make sense to take the chance of damaging	Consolidated Response P&N-1 addresses the need that the

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
				Dakota Resources	valuable water resource's, when this oil product could be refined in Canada and then shipped in already existing line's. The only reason for not doing it this way is that the oil is going to the Gulf Coast to be exported. This show's that the pipeline project is being done out of GREED more then NEED.	Project has been proposed to meet. Consolidated Response P&N-8 addresses issues related to shipping Canadian crude oil to refineries that are closer to the source of oil.
976	4	Harter	John	Protect South Dakota Resources	There have been many questions asked that have not been answered to our satisfaction.	As noted in Consolidated Response ENR-1, the environmental review, including preparation of this EIS, has been conducted consistent with the DOS regulations pertaining to NEPA (22 CFR Part 161) as well as the Council on Environmental Quality (CEQ) regulations for implementing NEPA (40 CFR Part 1500). As a result, DOS considers the EIS to be consistent with the requirements of a NEPA environmental review.
976	5	Harter	John	Protect South Dakota Resources	This comment period is to short for the importance of what we are about to do to our countries water ways and other valuable resources.	Consolidated Response CMT-1 addresses issues related to the length of the comment period for the draft EIS and supplemental draft EIS.
976	6	Harter	John	Protect South Dakota Resources	I would request that this project be denied.	Comment acknowledged.
1556	19	Harter	John		The pipeline thickness when TransCanada come out to our area they said that they were going to put in pipeline nearly one half inch thick all the way through on the line and in high consequence areas there was going to be nearly three-quarter inches thick. So this special permit that they're filing for to reduce it and increase the pressure to me it doesn't make sense. You use cheaper pipe, thinner walled, run it at a higher pressure. That's an environmental disaster waiting.	Keystone has withdrawn its application for a Special Permit as described in Consolidated Response REG-1. As described in Consolidated Response SAF-1, the Pipeline and Hazardous Materials Safety Administration (PHMSA) has regulatory requirements that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project in a manner that protects the health and safety of the public and the environment. In addition, PHMSA developed 57 Project-specific Special Conditions that Keystone has agreed to implement. Incorporation of those conditions would result in a Project that would have a degree of safety over any other typically constructed domestic oil pipeline system under current code and a degree of safety along the entire length of the pipeline system similar to that which is required in HCAs as defined in 49 CFR 195.450.
1556	21	Harter	John		And if you take that a little bit further and you go from what it's going to do to your animals because at least two products in this oil, crude oil that will travel with the water. And if it gets into the water, comes up to the grass, get into the cattle it will make the meat in the cattle unavailable to market.	If there is a spill from the proposed Project, Keystone or the incident response team would inform all landowners in the vicinity of the spill that the release had occurred and advise the landowners of the appropriate precautions. Keystone would be liable for all costs associated with cleanup and restoration as well as other compensations, as noted in Consolidated Response LIA-1. If a stockpond or a well used as a source of water is affected, Keystone would provide water until the affected water is proven to be acceptable for use. If an oil spill affects grass, cattle would be kept from using the area during cleanup activities.
1556	25	Harter	John		There was a statement made by you guys about the safety standards between the 72 percent and the 80 percent pressure run of the pipeline. In my view, you should take your 80 percent pressure of running the pipeline and put those same restrictions on the 72 percent because if I got that running across my land, I want them taking care of it. I want it put in 100 percent safe.	Keystone has withdrawn its application for a Special Permit as described in Consolidated Response REG-1.As described in Consolidated Response SAF-1, the Pipeline and Hazardous Materials Safety Administration (PHMSA) has regulatory requirements that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project. In addition, PHMSA developed 57 Project-specific Special Conditions that Keystone has agreed to implement.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
						Incorporation of those conditions would result in a Project that would have a degree of safety over any other typically constructed domestic oil pipeline system under current code and a degree of safety along the entire length of the pipeline system similar to that which is required in HCAs as defined in 49 CFR 195.450.
1556	65	Harter	John		If this oil is such a great deal, Question 1, why isn't it being refined in Canada? If it's such a good deal, refine it up there; ship it in existing lines that are already here. That would make more sense to me than contaminating hundred of miles of U.S. soil. We've already got existing pipelines.	Consolidated Response P&N-8 addresses issues related to shipping Canadian crude oil to refineries that are closer to the source of oil.
624	2	Hartnett	Allison		Please do not put any oil pipelines on or anywhere near the Ogallala Aquifer or the Nebraska Sandhills area.	Identification of sensitive environments crossed by the proposed Project is discussed in Consolidated Response ENV-1 and ENV-3. Issues related to the Sand Hills area are addressed in Consolidated Response ERO-1. Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
940	1	Harvey	Kevin		I am firmly opposed to the Keystone XL pipeline running through the Ogallala Aquifer. Do not allow this thing the opportunity to do the aquifer what BP is doing to the Gulf.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. As described in Consolidated Response GLF-1, the risks associated with the proposed Project are substantially different from those associated with the BP Deepwater Horizon Project.
1068	1	Harvey	Maureen		Whom It may concern...I appreciate the opportunity as a citizen of the State of Nebraska to comment on a subject which I am surprised isn't getting even more attention especially in light of the Gulf Oil disaster. Given the potential disaster any kind of leak in the proposed pipeline would create in Nebraska, I am disappointed our state's representatives haven't aggressively and loudly joined those of other states in sounding an alarm. Just a couple of weeks ago, an oil pipeline burst in Utah causing environmental damage. Why risk an incident such as this with our priceless aquifer? A leak into our aquifer would devastate our environment and our state.	See Consolidated Response AQF-1, AQF-3, AQF-4, As described in Consolidated Response GLF-1, the risks associated with the proposed Project are substantially different from those associated with the BP Deepwater Horizon Project.
734	1	Hastert	Ava		Keep this pipeline away from the Ogallala Aquifer (largest aquifer in the United States).	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
734	2	Hastert	Ava		Keep this pipeline away from Nebraska's fragile Sandhills.	Identification of sensitive environments crossed by the proposed Project is discussed in Consolidated Response ENV-1 and ENV-3. Issues related to the Sand Hills area are addressed in Consolidated Response ERO-1. Consolidated Response ALT-1 addresses potential alternative routes, including routes that would avoid much of the Northern High Plains Aquifer system and the Sand Hills area.
1557	2	Hatley	Earl		Don't listen to what they say, look at what they have done. At the head of the pipeline in Alberta people are getting cancer.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information on current and future production. As noted in that Consolidated Response, without the proposed Project, oil sands development would continue at or above the current level until at least 2020, with or without the proposed Project.
1557	3	Hatley	Earl		Notification about this project has not been good. People in Okalahoma don't even know about it, but Cushing has already been permitted.	Consolidated Response CMT-2 addresses issues related to comment meetings on the draft EIS and requests for additional public involvement. Consolidated Response INT-1 addresses concerns related to

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
						the Notice of Intent (NOI) to prepare an EIS for the proposed Project.
1557	5	Hatley	Earl		Concerned about the taking of property. If a farmer does not want this through their land, are you going to take their land? Will you pay for it?	As noted in Consolidated Response EAS-2, state laws dictate under what circumstances eminent domain may be used and define the eminent domain process within the state. DOS has no legal authority in the easement negotiations or in eminent domain proceedings. Keystone would be responsible for negotiating the easement agreement with the commentor, not the Department of State.
1557	6	Hatley	Earl		Do Oklahoma independent oil producers benefit from this at all? Or is this just for tar sands and Oklahoma just gets to be the bearer of the pipeline and any accidents that come from it?	Consolidated Response P&N-1 addresses the need for heavy crude oil in the Gulf Coast refineries that the Project has been proposed to meet. At the present time there is not sufficient pipeline capacity to ship heavy crude oil from the Cushing area to the Gulf Coast refineries. The proposed Cushing Marketlink Project described in Section 2.5.4 of the EIS would provide an opportunity for producers in Oklahoma to ship crude oil to Gulf Coast refineries via the proposed Project.
155	3	Hatley	Earl		Notification about this project has not been good. People in Oklahoma don't even know about it, but Cushing has already been permitted.	Consolidated Response INT-1 addresses concerns related to the Notice of Intent (NOI) to prepare an EIS for the proposed Project. Consolidated Response CMT-3 addresses the level of information provided to the public regarding the proposed Project and the draft EIS scoping meeting locations and schedules.
1437	1	Haug	John	Sonnenschein Nath & Rosenthal LLP	This project is a vital link to secure energy supplies for the United States from Canada. Canada is a valued trading partner and the most reliable supplier of foreign-based crude oil.	Comment acknowledged.
1437	2	Haug	John	Sonnenschein Nath & Rosenthal LLP	The environmental benefits of Keystone XL should not be overlooked. The current tragedy in the Gulf underscores the importance of a diverse portfolio of energy supplies. Within the spectrum of viable options, it is appropriate to seek a growing role for oil resources that are:• Land-based; North American; and, Transported by pipeline. TransCanada's Keystone XL project meets each of these criteria.	As described in Consolidated Response GLF-1, the risks associated with the proposed Project are substantially different from those associated with the BP Deepwater Horizon Project.
1437	3	Haug	John	Sonnenschein Nath & Rosenthal LLP	Securing stable and affordable energy from Canada through projects such as the Keystone pipeline will offer more stable prices for consumers as significant interruptions of pipeline operations are few and easily resolved. Pipelines are the safest, most reliable, economical and environmentally favorable way to transport oil and petroleum products, as well as other energy liquids, throughout the U.S. Canada and the U.S. depend on more than 175,000 miles of liquid pipelines to move energy and raw materials safely and reliably. Additional pipeline capacity will help consumers and businesses throughout the United States by providing the means to a dependable source of energy.	Comment acknowledged.
1437	4	Haug	John	Sonnenschein Nath & Rosenthal LLP	This project also stands to provide a powerful private sector economic stimulus. During construction, Keystone XL will create more than 13,000 jobs funded with private investment. In addition, local governments will have a steady source of income from economic activity associated with construction and from property tax revenues paid by the pipeline company.	Consolidated Response ECO-1 addresses potential socioeconomic impacts, and Consolidated Response TAX-1 addresses concerns regarding taxes.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
276	1	Haumann	Ronda		I am against the pipeline passing through the Ogallala Aquifer. If a pipe were to break and there was a leak the aquifer could very easily be ruined. There is a large number of people who depend on the water from the Ogallala Aquifer for their business. Ranches and farms in this area would be gone if the water was not available. People would have to move away from this area if there wasn't water available. The Ogallala Aquifer is a wonderful source of good clean water. I do not think anything should be done that could potentially harm the aquifer.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
276	2	Haumann	Ronda		We need to think and plan long range and by doing so think and plan for disasters that could happen.	Comment acknowledged.
276	4	Haumann	Ronda		The Ogallala Aquifer is fragile and we must plan accordingly. Good clean water is one of our most important assets and we must not do anything to jeopardize the water. I have been in areas where water has to be purchased or piped in from long distances because the underground water locally is not fit to drink. We are so blessed to have the good pure drinkable water that we do. We must guard this water very carefully.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
276	5	Haumann	Ronda		There must be another place this pipeline could go that would not cause such potential damage. I am not a radical environmentalist but I think good common sense dictates that this pipeline not be put through the Ogallala Aquifer because of the potential for a disaster that could ruin our water source. I'm sure some people will say there is no chance of that happening but obviously they didn't think there was any chance of an oil spill of the magnitude of the one in the gulf because there was no backup plan to stop the oil leak. It would be horrible if something like that would happen in the Ogallala Aquifer. Please do not allow this pipeline to be put in.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. Consolidated Response ALT-1 addresses potential alternative routes, including routes that would avoid much of the Northern High Plains Aquifer system. As described in Consolidated Response GLF-1, the risks associated with the proposed Project are substantially different from those associated with the BP Deepwater Horizon Project.
1079	1	HAVLAT	MARVIN	USNR	Nebraskans Have no interest is supplying oil to the Chinese for the Canadians.	Consolidated Response P&N-1 addresses the need that the Project has been proposed to meet, including information on crude oil supply and demand from an analysis specific to the proposed Project. Consolidated Response P&N-4 provides information on investments by Chinese companies in Canadian oil sands projects. The investments of Chinese firms in oil sands projects would have no effect on the ability of the proposed Project to provide the heavy crude oil needed in the Gulf Coast area.
79	1	Hayden	Ron	Sierra Club	The Keystone Pipeline Project should be rejected.	The commenter's opinion is noted.
79	2	Hayden	Ron	Sierra Club	By building this pipeline we will be committing millions of people and future generations to untold miseries due to runaway climate change.	Consolidated Response GHG-1 addresses the greenhouse gas life-cycle analyses presented in the revised EIS. Section 3.14.3.14 addresses climate change.
79	3	Hayden	Ron	Sierra Club	The tar sands are the worst polluting fossil fuels there is... The Tar Sands are an ecological disaster. Please do the right thing for Canada, the US and the people of this world that will be affected by the 11billion tons of CO2 that will be emitted every year from this process. Please draw a line in the sand and say NO MORE! We are going to develop clean energy and the Tar Sands should stay in the ground.	Consolidated Response OIL-4 addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils. Consolidated Response GHG-1 addresses the greenhouse gas life-cycle analyses presented in the revised EIS. Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
						the proposed Project.
303	1	Hayden	Martin		Another even bigger disaster waiting to happen, don't you think?	Consolidated Response SAF-1 describes the regulatory requirements and Project-specific Special Conditions that Keystone would comply with to construct, operate, maintain, inspect, and monitor the proposed Project. It also describes the monitoring, inspections, and reviews of the proposed Project that the Pipeline and Hazardous Materials Safety Administration would conduct to ensure compliance with those regulatory requirements.
1544	239	Hayden	Ron	Sierra Club	Climate change has not been adequately addressed.	Consolidated Response GHG-1 addresses the greenhouse gas life-cycle analyses presented in the revised EIS. Climate change is addressed in Section 3.14.3.14. As noted in that Section, implementation of the proposed Project is unlikely to result in a measureable climate change.
1544	240	Hayden	Ron	Sierra Club	Tearing down the trees in the Boreal Forest removes the largest carbon sink in North America and adds carbon dioxide into the atmosphere.	Consolidated Response GHG-4 addresses concerns regarding the loss of boreal forest and peat bogs.
1544	243	Hayden	Ron	Sierra Club	Tar sands are the most polluting greenhouse gas that we have...we need to stop production of tar sands totally if we want to save the planet...	Consolidated Responses GHG-1 through GHG-5 address concerns related to greenhouse gas, climate change, alternative energy considerations, and approach to assessment of GHG emissions.
231	1	Hayes	Kyle	Beaumont City Manager	As a city official from the State of Texas, we strongly encourage the U.S. Department of State to approve an energy infrastructure project that not only will strengthen long-term energy security in the United States, but also will provide a powerful private sector economic stimulus to the communities along the pipeline route during its construction at a time when our economy continues to struggle. As we understand it, Keystone XL will directly create more than 13,000 high-wage construction and manufacturing jobs during the project's 2011-2012 construction schedule. Many of those jobs will be created in Texas where too many of our residents continue to find it difficult to find good jobs. With Keystone XL, they will have an opportunity to work on the project or for businesses that provide supplies, goods and services for its construction and operation. We enthusiastically support the Keystone XL Pipeline Project and encourage the Department of State to confirm the findings of the Draft Environmental Impact Statement.	Consolidated Response ECO-1 addresses potential socioeconomic impacts, and Consolidated Response TAX-1 addresses concerns regarding taxes.
1429	1	Hayes	Douglas	Sierra Club et al	We recommend that the Department of State re-issue the DEIS for public comment after addressing these significant deficiencies, because under law they must be considered before the Secretary makes a final determination on whether to issue a Presidential Permit.	Comment acknowledged.
1429	2	Hayes	Douglas	Sierra Club et al	The proposed Keystone XL DEIS is particularly troublesome in light of the many recent oil spill disasters.	As described in Consolidated Response GLF-1, the risks associated with the proposed Project are substantially different from those associated with the BP Deepwater Horizon Project.
1429	3	Hayes	Douglas	Sierra Club et al	DOS should issue a new Draft EIS for public comment only after it has a full and fair opportunity to evaluate the risks associated with the PHMSA special permit.	Keystone withdrew its request for a special permit in August 2010. Consolidated Response P&N-6 addresses requests for a supplemental draft EIS.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
1429	4	Hayes	Douglas	Sierra Club et al	<p>Similarly, a string of recent oil pipeline accidents have exposed a lack of oversight of the oil pipeline industry and a lack of spill detection and response plans. In January of 2010; an Enbridge pipeline spilled over 3,000 barrels of crude oil in North Dakota [source cited, pg 2]. In late April, another Enbridge pipeline ruptured and leaked over 210 gallons of tar sands crude oil into Minnesota wetlands. The exact date of the Minnesota spill is unknown because the accident went completely undiscovered until firefighters working in the area happened to notice crude oil covering the ground while investigating a wildfire. In May of 2010, the Trans-Alaska Pipeline, owned partly by BP, had a "series of mishaps" that resulted in a power outage that opened relief valves and spilled several thousand barrels of crude oil [source cited, pg 2]. Luckily, this spill was mostly contained in "backup containers." On June 12, 2010, a massive spill from a Chevron crude oil pipeline was discovered in Salt Lake City, Utah [source cited, pg 3]. The reason for the breach is unknown as of the time these comments were written, and crews are continuing to try to stop the giant oil slick from reaching the Great Salt Lake. On June 23, 2010, a leak was discovered on an abandoned pipeline in Oklahoma after it had spilled over 250 barrels of oil into the Deep Fork of the Canadian River [source cited, pg 3].</p> <p>These repeated accidents demonstrate the very real dangers posed by crude oil pipelines in our communities and a need for increased oversight.</p>	The Pipeline and Hazardous Materials Safety Administration (PHMSA) has oversight responsibility for oil pipelines in the U.S. Consolidated Response SAF-1 describes the regulatory requirements that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project. It also describes the inspections and reviews of the proposed Project that the PHMSA would conduct to ensure compliance with those regulatory requirements.
1429	5	Hayes	Douglas	Sierra Club et al	The DEIS fails to adequately analyze the risks of these spills and fails to contain emergency response plans.	Section 3.13 of the EIS addresses reliability and safety issues of the proposed Project, including calculations of the probability of a spill from the Project and the potential environmental impacts associated with accidental releases. Consolidated Response RES-1 addresses issues related to preparation and review of emergency response plans for the proposed Project.
1429	6	Hayes	Douglas	Sierra Club et al	PHMSA must also evaluate the adequacy of the Emergency Response Plan (ERP) pursuant to NEPA before DOS reissues the DEIS for public comment. The ERP is a major federal action that will significantly affect the quality of the human environment. As such, PHMSA must prepare an EIS that evaluates several alternatives of an ERP, including but not limited to: what emergency response methods and practices should be in place; what types of equipment should be ready and available for emergency response, how much of it should be available, and where it should be stationed along the pipeline route; and how much emergency response personnel should be trained and available along the route.	Consolidated Response RES-1 addresses issues related to preparation and review of emergency response plans for the proposed Project.
1429	7	Hayes	Douglas		The recent oil spills and pipeline ruptures are wake-up calls. If approved, the Keystone XL pipeline would transport nearly a million barrels of heavy tar sands crude oil across America's heartland each day. DOS, PHMSA, and all other federal agencies involved must take every possible precaution to prevent an accident with Keystone XL and ensure that if an accident does occur, local communities and natural resources	Consolidated Response SAF-1 describes the regulatory requirements and Project-specific Special Conditions that Keystone would comply with to construct, operate, maintain, inspect, and monitor the proposed Project. It also describes the monitoring, inspections, and reviews of the proposed Project that the Pipeline and Hazardous Materials Safety Administration would conduct to ensure compliance with those

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					are adequately protected.	regulatory requirements.
1429	8	Hayes	Douglas	Sierra Club et al	Finally, under Executive Order 13,337, a Presidential Permit can only be issued if the proposed project "would be in the national interest" [source cited, pg 4]. For the reasons discussed in these comments, we believe that this proposed pipeline is not in the national interest since it will increase US reliance on fuels from sources such as the Canadian oil sands (also known as tar sands) that are environmentally destructive and that increase damage from global warming.	Consolidated Response P&N-9 describes the National Interest Determination process. Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project. Consolidated Response GHG-1 addresses GHG life-cycle analyses.
1429	9	Hayes	Douglas	Sierra Club et al	For the reasons stated below, the DEIS for the Keystone XL project is legally and technically flawed because the U.S. Department of State ("State Department" or "DOS") failed to adequately assess all of the direct, indirect and cumulative impacts of the project.	The impacts associated with implementation of the proposed Project are addressed in Section 3.0 of the EIS. Section 3.13 of the EIS addresses reliability and safety issues, including calculations of the probability of a spill from the proposed Project and the potential environmental impacts associated with spills. Cumulative impacts are addressed in Section 3.14 of the EIS. The assessments in Section 3.14 were conducted following CEQ guidance on cumulative impact analyses. As noted in Response ENR-1, the environmental review, including preparation of this EIS, has been conducted consistent with the DOS regulations pertaining to NEPA (22 CFR Part 161) as well as the Council on Environmental Quality (CEQ) regulations for implementing NEPA (40 CFR Part 1500). As a result, DOS considers the EIS to be consistent with the requirements of a NEPA environmental review.
1429	10	Hayes	Douglas	Sierra Club et al	The DEIS also improperly defines the project's purpose and need and fails to ensure the scientific integrity of its analysis. Accordingly, we request that the State Department conclude that the project will cause significant unpreventable environmental harm and is not in the national interest, and on these bases choose the no action alternative and deny the application for a Presidential Permit.	Consolidated Response P&N-7 addresses concerns about the stated purpose of the proposed Project in the EIS. Consolidated Response P&N-1 describes the need that the Project has been proposed to meet and provides an explanation of the thorough and independent analysis of need that was conducted for the EIS. The impacts associated with implementation of the proposed Project are addressed in Section 3.0 of the EIS.
1429	11	Hayes	Douglas	Sierra Club et al	Accordingly, we request that the State Department conclude that the project will cause significant unpreventable environmental harm and is not in the national interest, and on these bases choose the no action alternative and deny the application for a Presidential Permit. In the alternative, we request that the State Department fully and completely address the following concerns and re-issue the draft EIS for further public comment.	Consolidated Response P&N-9 describes the National Interest Determination process. Consolidated Response P&N-6 addresses requests for a supplemental draft EIS.
1429	12	Hayes	Douglas	Sierra Club et al	In addition, the tar sands crude carried by the Keystone XL pipeline will feed numerous refineries and spur refinery expansions to process the heavy tar sands crude. See Keystone XL Notice of Intent. 74 Fed. Reg. 5019 (Jan. 28, 2009).	Consolidated Response P&N-1 addresses the need for the proposed Project. Response As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries.
1429	13	Hayes	Douglas	Sierra Club, et al	This project must be considered in connection with other Canadian tar sands pipelines, namely the Alberta Clipper pipeline and the Keystone pipeline.	Douglas

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
1429	14	Hayes	Douglas	Sierra Club et al	This large-scale expansion of pipeline and refinery capacity to transport heavy crude from the Canadian tar sands to the US reflects a feverish rush of oil sands investment and development in Canada that is dependent on a parallel increase in demand in the United States. The corresponding push to expand tar sands oil delivery and refining systems in the US [source cited, pg 6] comes at a time when the nation is looking to reduce its dependence on fossil fuels, expand the development of renewable fuels and reduce its emissions of harmful greenhouse gases [source cited, pg 6].	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project. Consolidated Response GHG-1 addresses GHG life-cycle analyses.
1429	15	Hayes	Douglas	Sierra Club et al	II. REQUEST FOR STAY OF DECISION AND REVISION OF EIS TO ADDRESS PENDING MATTERS A. Pending CEQ Guidance In a letter dated April 23, 2010 to Secretary Clinton, which we incorporate by reference, [Attached as Exhibit 8A] Sierra Club et. at. asked that DOS postpone consideration of the Keystone XL application until Council on Environmental Quality (CEQ) guidance on greenhouse gases and climate change can be finalized and taken into account. In her February 2010 memo to heads of Federal Departments and Agencies, CEQ Chair Nancy Sutley affirmed that the requirements of NEPA are applicable to greenhouse gas emissions and climate change impacts. [source cited, pg 7]. A draft of these guidelines was released by CEQ, 75 Fed. Reg. 8046 (Feb. 23, 2010), but the Keystone XL EIS should not be finalized until after the final CEQ guidelines are issued, so that they can be considered and applied in the final EIS.	Consolidated Response GHG-5 explains that the DOS assessment of GHG emissions was conducted in accordance with CEQ guidance. Consolidated Response GHG-1 addresses the greenhouse gas life-cycle analyses presented in the revised EIS. As noted in Consolidated Response ENR-1, the environmental review, including preparation of this EIS, has been conducted consistent with the DOS regulations pertaining to NEPA (22 CFR Part 161) as well as the Council on Environmental Quality (CEQ) regulations for implementing NEPA (40 CFR Part 1500). As a result, DOS considers the EIS to be consistent with the requirements of a NEPA environmental review.
1429	16	Hayes	Douglas	Sierra Club et al	The greenhouse gas emissions associated with this project and connected actions and their contribution to climate change are critical environmental impacts of the project. Over its entire lifecycle - the synthetic crude oil produced from tar sands emits at least 20% more global warming pollution than conventional oil.	Consolidated Response GHG-1 addresses the greenhouse gas life-cycle analyses presented in the revised EIS.
1429	17	Hayes	Douglas	Sierra Club et al	Furthermore, because tar sands oil is a heavier crude, the U.S. refineries that process it will produce higher levels of pollutants that damage human health and lead to more smog, haze and acid rain. Replacing 900,000 barrels per day of conventional oil with tar sands oil, for example, would result in approximately 38 million metric tons of additional greenhouse gas emissions per year, equal to adding over 6 million cars to our roads.	As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries. Consolidated Response GHG-1 addresses GHG life-cycle analyses.
1429	18	Hayes	Douglas	Sierra Club et al	For example, the EIS must analyze the environmental impacts of increased capacity that may result from additional inputs of petroleum in Montana. The pipeline is projected to have an ultimate capacity of 900,000 bpd, but the capacity may rise significantly when and if the PSC orders TransCanada to allow additional inputs, or the ultimate capacity may simply be reached sooner. An increase in pipeline capacity would amplify the environmental impacts from refining and end use of the petroleum, and may heighten the risk of spills and the severity of environmental impact if a spill were to occur. It would also drastically increase the physical footprint of the project, due to increased pipeline length, access roads, pumping stations, and electric transmission lines. These impacts are reasonably foreseeable indirect, cumulative	Douglas

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					and/or connected actions that must be considered in the EIS.	
1429	19	Hayes	Douglas	Sierra Club et al	Finally, the EIS must examine the environmental impacts of the lateral lines that will transport the Montana oil to their connections with the main Keystone XL pipeline. Specifically, the EIS should contain an analysis of several alternatives for the lateral lines, including analyses of their respective water crossings and proximity to sensitive areas.	The impacts of the connected actions are addressed in the resource portions of Section 3.0. Consolidated Response ALT-3 addresses issues related to transportation of crude oil from the Williston Basin.
1429	20	Hayes	Douglas	Sierra Club, et al	On February 20, 2009 Sierra Club wrote the DOS regarding public participation issues, and we incorporate that letter herein. As set forth in that letter, there has been short notice before public meetings and the remote locations hindered meaningful public participation.	DOS notified the public of the comment meetings and the comment meetings on the draft EIS at least 2 weeks prior to the meeting dates. The meetings were held in the vicinity of the proposed route to provide affected landowners with the opportunity to participate in the meetings.
1429	21	Hayes	Douglas	Sierra Club, et al	We requested a 90-day extension for scoping comments, public meetings in the capitols of each State along the route, and a public meeting in Washington, D.C. to account for these issues.	Consolidated Response CMT-1 addresses issues related to the length of the comment period for the draft EIS and supplemental draft EIS. Consolidated Response CMT-2 addresses issues related to comment meetings on the draft EIS and requests for additional public involvement.
1429	22	Hayes	Douglas	Sierra Club, et al	Hard copies of the DEIS have been made available only in a very limited manner, which is not consistent with the goal of NEPA to enable public participation.	Consolidated Response CMT-6 addresses issues related to the availability of paper copies of the draft EIS.
1429	23	Hayes	Douglas	Sierra Club, et al	We ask DOS to hold open the public notice and comment period and hold additional public hearings and make the DEIS more available, prior to any final decision on the DEIS.	As noted in Consolidated Response CMT-6, DOS provided libraries in the vicinity of the proposed route with paper copies of the draft EIS. As noted in Response CMT-2, DOS also held 19 comment meetings on the draft EIS at locations in the vicinity of the proposed route and the comment period remained open until July 2, 2010.
1429	24	Hayes	Douglas	Sierra Club et al	<p>The Scoping process was also defective because the Department of State Notice of Intent ("NOI") failed to disclose all federal actions that are subject to NEPA review. The NOI disclosed only that the EIS would address action by the DOS, Bureau of Land Management ("BLM"), and Montana Department of Environmental Quality ("MDEQ"). In contrast, the DEIS identifies nine additional cooperating agencies [footnote, page 9]. A number of these agencies have distinct duties under NEPA that must be fulfilled before taking actions related the Keystone XL Pipeline, including the Rural Utilities Service ("RUS"), U.S. Army Corps of Engineers ("USACE"), Western Area Power Administration ("WAPA"), and the Pipeline and Hazardous Materials Safety Administration ("PHMSA") [footnote, pg 9]. However, the NOI did not state which federal actions the DEIS would review and which will be reviewed through subsequent NEPA compliance efforts.</p> <p>For example, on the face of the NOI it is entirely unclear whether any of the actions taken by PHMSA would be subject to NEPA review: Since PHMSA is the only agency, federal or state, responsible for pipeline safety and pipeline spill prevention, its role in this process is critical, as is citizen comment on safety-related matters.</p>	Consolidated Response INT-1 addresses concerns related to the Notice of Intent (NOI) to prepare an EIS for the proposed Project. Relative to PHMSA actions, Keystone has withdrawn its application for a Special Permit as described in Consolidated Response REG-1.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
1429	25	Hayes	Douglas	Sierra Club, et al	The DOS's obligation to comply with NEPA arises separately from the obligations of other agencies to comply with NEPA. The NOI's failure to disclose all federal agencies that intended to seek compliance with NEPA through the EIS and the nature of the specific federal actions related to the Pipeline that are subject to review under NEPA mean that it was not possible for citizens to provide meaningful scoping comments on the full range of federal actions at issue here, including impacts, alternatives, and mitigation measures related to each of these actions.	Consolidated Responses CMT-5 and INT-1 address issues related to the Notice of Intent. Citizens provided scoping comments on all resource issues of concern to the federal agencies involved. Section 1.5 of the EIS provides information on agency involvement in reviewing the proposed Project.
1429	26	Hayes	Douglas	Sierra Club et al	<p>It should be a simple thing to identify which federal actions are subject to NEPA review and which are not so that scoping comments on impacts, alternatives, and mitigation measures of these federal actions are possible. Absent clarity about which federal actions will be reviewed by the EIS, it is entirely possible for citizens to believe that agencies will take subsequent or additional NEPA review beyond this EIS process, just as is planned by PHMSA with regard to the Special Permit. The DOS's failure to issue a legally sufficient NOI resulted in a series of procedural errors during the scoping process that have now cascaded into a whole defective DEIS.</p> <p>In addition, our supplemental scoping comments raised the issue that the DOS failed to adequately identify potential alternative routes in the preparation of its scoping notice as required by 22 C.P.R. § 161.8(d)(1) which incorporates the definition of "notice of intent" contained in 40 C.P.R. § 1508.22 by reference. In relevant part, the definition of "notice of intent" states: "The [notice of intent] shall briefly: (a) Describe ... possible alternatives ..." 40 C.P.R. § 1508.22 (emphasis added). Due to the use of the word "shall," the DOS is required by law to identify alternatives in its notice of intent, should any alternatives be "possible."</p> <p>In its January 28, 2009 Notice of Intent the DOS did not identify a single alternative of any type to the proposed pipeline, such as alternative means of acquiring crude oil supply, alternative means of addressing crude oil demand by reducing demand, alternative routes for the proposed pipeline, alternative means of transportation such as rail transportation, or any alternatives related to specific agency actions, such as alternative border crossings; alternative import volumes; alternative river, stream, and wetlands crossing locations or designs; alternative transmission line configurations; or alternative Emergency Response Plan or Integrity Management Plan conditions. Such failures violate not only the DOS's scoping obligations under NEPA, but the independent obligations of other agencies to provide for adequate scoping.</p>	Consolidated Response INT-1 addresses concerns related to the Notice of Intent (NOI) to prepare an EIS for the proposed Project. Consolidated Response ALT-1 addresses potential alternative routes and system alternatives, including rail and barge networks. Consolidated Response ALT-2 addresses the use of alternative technologies, alternative energy sources, and conservation of energy.
1429	27	Hayes	Douglas	Sierra Club et al	With regard to possible alternative routes, a number of possible alternative routes were identified by TransCanada itself in its Montana Major Facility Siting Act application, which TransCanada filed with the State of Montana approximately a month before the DOS published its Notice of Intent. In	The Notice of Intent made it clear that alternatives would be a substantial part of the environmental review. The Notice of Intent states that "In the EIS, the Department of State will also evaluate reasonable alternatives to the proposed Project or portions of the Project and make recommendations on how to

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					addition, this comment letter discusses additional possible alternative routes that parallel other interstate pipelines. A modest effort on the DOS's part would have disclosed these additional routes.	lessen or avoid impacts on affected resources. In addition, a 'no action alternative' will be considered." DOS also notes that "Alternative alignments for the pipeline route" were considered as on of the "Currently identified issues that the Department believes warrant attention . . ." Consolidated Response ALT-1 and Section 4 of the EIS address potential alternative routes, including following the route of the existing Keystone Oil Pipeline System.
1429	28	Hayes	Douglas	Sierra Club et al	This being said; the NOI should have made clear the limits on federal authority with regard to routing crude oil pipelines. Specifically, no federal agency has general authority to site or route a pipeline. Instead, federal routing authority is limited to the DOS's authority to determine the location of border crossings and the USACE authority to specify the location of crossings of navigable waters. Absent clarity about the scope of federal authority and corresponding descriptions of alternative routes based on this limited federal authority, it was not possible for citizens to understand the practicality or viability of alternative routes. The DOS's failure to identify possible, practical, and viable alternative routes in its Notice of Intent violates 40 C.F.R. § 1508.22.	The NOI accurately described the Department of State's authority under Executive Order 13337 to issue a permit for the construction of facilities at the international border. Consolidated Response INT-1 addresses concerns related to the Notice of Intent (NOI) to prepare an EIS for the proposed Project. Consolidated Response ALT-1 addresses potential alternative routes and system alternatives, including rail and barge networks.
1429	29	Hayes	Douglas	Sierra Club, et al	The CEQ Regulations implementing NEPA advise that when preparing environmental impact statements on broad actions, agencies should consider using programmatic analyses to avoid redundant analyses and effectively address cumulative effects. See 40 C.F.R. § 1502.4(c). The Keystone XL project is one of at least three recent international and multi-state pipelines being permitted by the State Department to increase petroleum transportation services from the crude oil supply in the Western Canadian Sedimentary Basin to refineries in the U.S. Midwest and the Gulf (the others being the Keystone and Alberta Clipper projects). These pipeline programs include many related projects in various stage of development. Because these pipelines have relevant similarities, such as common timing, impacts, alternatives, methods of implementation and subject matter, a programmatic EIS would be useful, and is necessary, to understand the cumulative and future impacts of this new network of pipelines and associated infrastructure.	DOS is responsible for reviewing applications for Presidential Permits for specific crude oil pipelines. The two pipelines referred to by the commenter are addressed in the cumulative impacts assessment in Section 3.14 of the EIS.
1429	30	Hayes	Douglas	Sierra Club, et al	It is clear that the Keystone Pipeline, Keystone Pipeline Extension, and Keystone XL pipeline are so intertwined both in design and operation that they should have been reviewed through a programmatic EIS. It made no sense whatsoever to conduct a NEPA process for the Keystone Extension and Keystone XL Pipelines, since that are elements of a single pipeline and neither segment alone is economically or operationally viable. Accordingly, we request a programmatic EIS be prepared and taken into account in the Keystone XL EIS, before a final decision is rendered in regards to the Keystone XL project.	DOS is responsible for reviewing applications for Presidential Permits for specific crude oil pipelines. The two pipelines referred to by the commenter are addressed in the cumulative impacts assessment in Section 3.14 of the EIS.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
1429	31	Hayes	Douglas	Sierra Club et al	<p>THE DRAFT EIS PROVIDES NO EVIDENCE THAT THE APPROVAL OF THE KEYSTONE XL PIPELINE IS IN THE NATIONAL INTEREST In accordance with Executive Order 13337, issuance of a Presidential Permit for a transboundary pipeline requires the Department of State, in consultation with a number of other agencies, to determine whether granting such a permit would "serve the national interest." [footnote, pg 12] Unfortunately, the DEIS appears to uncritically accept TransCanada's claim that there is a need for the project, abdicating the Department's responsibility to independently determine if the pipeline is in the national interest. More analysis and a clearer process is necessary to allow the Department and other agencies to make a reasoned determination concerning whether approval of the permit would serve the national interest.</p> <p>Specifically, the State Department has not provided transparent criteria and process for making a national interest determination. The State Department should wait and conduct the national interest determination analysis with inter-agency, tribal and public input after the environmental impact statement is finalized so that assessments can be fully integrated. In determining whether or not this pipeline is in the national interest, DOS should examine the purpose of the pipeline and its place in national energy and climate goals.</p> <p>The Keystone XL pipeline is detrimental to climate security goals and, as is shown elsewhere in these comments, is not necessary to meet U.S. demand. The pipeline will mean expansion of tar sands oil production and use, undermining U.S. clean energy and climate goals and harming the environment and public health. The Keystone XL pipeline is not in the national interest.</p>	<p>Consolidated Responses ENR-1 and P&N-9 provide information on the DOS environmental review process, the National Interest Determination process, and the need to complete those reviews before approving or denying the Presidential permit for the proposed Project. As noted in those responses, those are two separate processes and therefore some of the information considered in the determination of national interest is not included in the EIS. The final EIS will be used along with other information in making the determination of national interest. Response P&N-9 describes the National Interest Determination process.</p> <p>Consolidated Response P&N-1 describes the need that the Project has been proposed to meet and provides an explanation of the thorough and independent analysis of need that was conducted for the EIS. The impacts associated with implementation of the proposed Project are addressed in Section 3.0 of the EIS.</p> <p>Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information on current and future production. As noted in that Consolidated Response, without the proposed Project, oil sands development would continue at or above the current level until at least 2020, with or without the proposed Project.</p>
1429	32	Hayes	Douglas	Sierra Club et al	<p>The State Department Has Not Provided Transparent Criteria and Process for Making a National Interest Determination. The draft environmental impact statement (DEIS) for the Keystone XL pipeline does not provide analysis of the national interest, and there has been very little opportunity for the public to address the U.S. national interest in the pipeline [footnote, pg 12]. The DOS Presidential Permit review process is wholly inadequate and illegal, both with regard to the substance of the factors to be considered by the DOS and its review process. In meetings, State Department officials informally encouraged use of the comments on the DEIS to also provide comments on the national interest determination, [footnote, pg 13] but such informal process is not legally sufficient for a decision of this importance and nature.</p> <p>Executive Order 13337 sets out that a national interest determination shall be made in consultation with other government agencies and tribal governments, and that there may be a process for public comment. It also states that the Secretary of State - not the President – may issue rules and regulations and prescribe procedures deemed necessary or desirable to exercise the authority conferred. Instead of</p>	<p>Consolidated Responses ENR-1 and P&N-9 provide information on the DOS environmental review process, the National Interest Determination process, and the need to complete those reviews before approving or denying the Presidential permit for the proposed Project. As noted in those responses, those are two separate processes and therefore some of the information considered in the determination of national interest is not included in the EIS. The final EIS will be used along with other information in making the determination of national interest. Response P&N-9 describes the National Interest Determination process. As noted in Consolidated Response ENR-1, the environmental review, including preparation of this EIS, has been conducted consistent with the DOS regulations pertaining to NEPA (22 CFR Part 161) as well as the Council on Environmental Quality (CEQ) regulations for implementing NEPA (40 CFR Part 1500). As a result, DOS considers the EIS to be consistent with the requirements of a NEPA environmental review.</p>

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					<p>issuing “rules and regulations” and prescribed procedures, the Secretary has instead created an entirely informal, ad hoc, and confusing process in violation of the Administrative Procedures Act and the language of Executive Order 13337 itself [footnote, pg 13]. Apparently due to its ad hoc process, the Department of State seems to have incorrectly conflated the comment process on the DEIS with the comment process that should exist for the national interest determination as set out in sections I and 3 of the Executive Order [footnote, pg 13].</p> <p>The DOS’s failure to properly and legally promulgate rules pursuant to Executive Order 13337 has resulted in a very confused public process with entirely unclear procedural and substantive standards. In contrast, both the Department of Energy and the Federal Regulatory Commission have promulgated regulations, pursuant to Administrative Procedure Act notice and comment requirements, which govern applications for Presidential Permits for high voltage transmission lines and natural gas pipelines, respectively [footnote, pg 13]. The DOS must do no less.</p> <p>The Department of State should conduct the EIS process under NEPA and, separately, a national interest determination under the Executive Order. The national interest determination should include adequate time and clear and transparent procedures for interagency, tribal government and public comment [footnote, pg 13]. The agency, tribal government and public comment and consultation concerning the national interest determination should have the benefit of the analysis and assessments in the environmental impact statement. The agency, tribal government and public comment and consultation should also have the benefit of a draft scoping of what will be included in the national interest determination, the assessments and research upon which the national interest determination will be based and the Department of State’s preliminary conclusions regarding the determination of national interest.</p>	
1429	33	Hayes	Douglas	Sierra Club et al	<p>In addition to the presidential permit, a number of other federal, state, and local requirements exist for the pipeline to be built. The process for considering the application and meeting the requirements is not well coordinated and provides little public transparency. These other requirements include: • Right-of-way Grants and Temporary Use Permits from the Department of Interior Bureau of Land Management. The BLM “considers approval of ROW grant and temporary use permits for the portions of the Project that would encroach on public lands [footnote, pg 14] • Clean Water Act Section 404 permits for stream and wetlands crossings from the Army Corps of Engineers. The Corps “Considers issuance of Section 404 permits for the placement of dredge or fill material in Waters of the U.S., including wetlands [footnote, pg 14] • Historic and cultural review under Section 106 of the National Historic Preservation Act to be carried out by multiple agencies. These agencies are “Responsible for compliance with Section 106 of</p>	<p>The Department of State (DOS) and the cooperating agencies coordinate on the preparation of the EIS for the proposed Project. Each agency will separately conduct the permitting processes required to review and act on Keystone’s applications for environmental permits for the proposed Project. Those permitting processes will be conducted in accordance with each agency’s regulations and guidelines, which include requirements for transparency in the reviews. DOS has no regulatory authority for coordinating the various federal permitting activities or the many state and local permitting activities that would be required for the proposed Project to be approved.</p>

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					NHP A and consultation with interested Tribal agencies. [footnote, pg 14] • State and local approvals for siting, pollution discharge permits, floodplain permits, state highway crossings and pump station zoning among others; the agencies involved in these processes vary from state to state as do the requirements. The complete listing of permits required can be found in Table 1.8-1 of the DEIS. All of these permitting processes should be coordinated so that the analysis, assessment, agency review, tribal government consultation, and public comment regarding the national interest determination can benefit from a full understanding of the various permits, waivers, conditions and other assessments concerning the pipeline.	
1429	34	Hayes	Douglas	Sierra Club et al	In Determining Whether or Not this Pipeline is in the National Interest, DOS Should Examine the Purpose of the Pipeline and Its Place in National Energy and Climate Goals. The DEIS does not adequately layout the case for why the Keystone XL tar sands pipeline is needed to help the United States meet its national energy and climate goals. TransCanada argues that the project would serve these interests “by providing a secure and reliable supply of Canadian crude oil to meet the growing demand by refineries and markets in the US [footnote, pg 15]. But nowhere does the DEIS provide the analysis to back up this assertion. In fact, contrary to TransCanada’s assertions, the evidence suggests that construction of the Keystone XL Pipeline would be detrimental to our country’s national interests in building a clean energy economy, curbing climate change, and reducing national reliance on oil.	Consolidated Response P&N-7 addresses concerns about the stated purpose of the proposed Project in the EIS. As noted in that response, in conducting our NEPA environmental review and our National Interest Determination, we can consider only the stated purpose for the proposed Project. DOS cannot expand the purpose of a privately proposed project beyond that stated by an applicant to address issues such as national energy and climate goals, except to consider whether or not the Project would be in compliance with existing stated goals and policies. Consolidated Response P&N-9 describes the National Interest Determination process.
1429	35	Hayes	Douglas	Sierra Club et al	The national interest determination needs to take into account that expansion of tar sands oil takes the nation in the wrong direction in terms of emissions and undermines the economics of clean energy alternatives that would reduce American dependence on oil. On average, over the full life-cycle, GHG emissions from tar sands-derived fuel are about 20 percent greater than conventional petroleum fuels [footnote, pg 15]. In the case that the Keystone XL pipeline is approved and built to its 900,000 bpd capacity, and the Enbridge Alberta Clipper and TransCanada Keystone pipelines are expanded and filled to capacity, the United States would have the capacity to import over 3 million barrels per day (mbd) of tar sands [footnote, pg 16]. The increased emissions would offset nearly three-quarters of the GHG emissions reductions projected under the recently finalized car and light truck GHG regulations in 2020 [footnote, pg 16]. The vehicle GHG rules are a centerpiece of the Obama Administration climate and energy strategy [footnote, pg 16].	Consolidated Response P&N-1 addresses the need for the proposed Project. Consolidated Response P&N-9 addresses the National Interest Determination. Consolidated Response GHG-1 addresses GHG life-cycle analyses. Consolidated Response ALT-2 addresses the use of alternative technologies, alternative energy sources, and conservation of energy.
1429	36	Hayes	Douglas	Sierra Club et al	The national interest determination should include analysis of what it will take to accomplish these fossil fuel demand reduction goals and what types of barriers expansion of tar sands imports into the United States would pose. For example, more than twenty states are considering similar policies to the California Low Carbon Fuel Standard (LCFS) [footnote, pg 17]. Increased reliance on carbon-intense tar sands oil makes enacting and implementing such standards at	Consolidated Response P&N-1 addresses the need for the proposed Project. Consolidated Response P&N-9 describes the National Interest Determination process. Consolidated Responses GHG-1 through GHG-5 address concerns related to greenhouse gas, climate change, alternative energy considerations, and approach to assessment of GHG emissions. Consolidated Response GHG-6 addresses Low

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					the federal and state level more difficult. Both the industry with vested interest in the tar sands and the Canadian government are working against adoption of such policies. Alberta's Minister of Environment recently traveled to Boston to urge against adoption of a LCFS there. 44 And Canada's Minister of Natural Resources, Lisa Raitt, wrote a letter to Governor Schwarzenegger detailing their opposition to the California LCFS [footnote, pg 17].	Carbon Fuel Standards in the greenhouse gas assessment.
1429	37	Hayes	Douglas	Sierra Club et al	Military leaders have warned that climate change is a "threat multiplier for instability in the most volatile areas of the world [footnote, pg 18]. Climate change is likely to lead to rising sea levels, increased drought, shifting disease vectors and extreme weather events that could destabilize the world's most fragile regions. The Center for Naval Analysis notes that growing desperation among affected populations will increase the likelihood of military conflict. 50 These conflicts could emerge in strategically significant regions, requiring U.S. intervention. Climate change could also contribute to humanitarian crises that would strain U.S. military and economic resources. In May 2009, the Global Humanitarian Forum estimated that climate change already is responsible for 300,000 deaths per year and affects more than 300 million people. By 2030, the affected population will exceed 600 million [footnote, pg 18]. The National Intelligence Council notes that "demands for potential humanitarian responses may significantly tax U.S. military transportation and support force structures, resulting in a strained readiness posture and decreased strategic depth for combat operations [footnote, pg 18]. Given the security threats posed by climate change, it is essential that the U.S. avoid becoming dependent on new high-carbon fuels. This is a critical point for a national interest determination in building this pipeline.	Consolidated Responses GHG-1 through GHG-5 address concerns related to greenhouse gas, climate change, alternative energy considerations, and approach to assessment of GHG emissions. Consolidated Response P&N-9 describes the National Interest Determination process.
1429	38	Hayes	Douglas	Sierra Club et al	The Keystone XL Pipeline is Not Necessary to Meet U.S. Demand The purpose of the proposed pipeline is to increase imports of synthetic crude oil from the Western Canadian Sedimentary Basin ("WCSB") into the United States and to transport this oil to refineries on the Gulf Coast. However, despite TransCanada's claims that the addition of Keystone XL is dictated by increasing U.S. demand and is therefore in the national interest, the reality is that TransCanada is proposing the construction of a new pipeline despite the fact that, with the recent completion of the Enbridge Alberta Clipper and TransCanada Keystone pipeline, significant excess pipeline capacity already exists [footnote, pg 18]. In addition to concerns about the ability of suppliers to fill the pipeline, there are serious questions as to the need for the Pipeline, the impact on U.S. pipeline rates of adding this excess pipeline capacity, the impact on U.S. gasoline prices of high-cost tar sands oil in the domestic production system, and other urgent economic questions that the DEIS addresses scantily or not at all. These questions are critical to answer in the Final EIS, and before making a determination of national interest.	Consolidated Response P&N-1 addresses the need that the Project has been proposed to meet. As noted in that response, the Project has been proposed to meet the heavy crude oil needs of refineries in the Gulf Coast area, not for the U.S. in general. In addition, the Alberta Clipper and existing Keystone pipeline projects serve other markets and do not meet the demands of the Gulf Coast refineries. Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information on current and future production. The Canadian heavy crude oil transported by the Project would be competitively priced or would not be purchased by refiners. A large volume of Canadian crude oil is currently being processed in the U.S. and the replacement of dwindling supplies of Mexican and Venezuelan heavy crude oil with Canadian crude oil from the Project is not expected to have a measureable effect on gasoline prices.
1429	39	Hayes	Douglas	Sierra Club et al	The Keystone XL Pipeline Is Not in the National Interest. If a	Section 1.3 of the EIS and Consolidated Response P&N-9

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					proper analysis was carried out of factors connected with the Keystone XL pipeline pertaining to the national interest of the United States, we believe that the U.S. government would decide that this pipeline is not in the national interest. However, because the DEIS relies primarily on TransCanada's arguments for building the pipeline, there is not sufficient analysis to evaluate serious increased environmental and health impacts associated with increased tar sands extraction, transportation, and refining.	address the National Interest Determination process. Consolidated Response P&N-1 describes the need that the Project has been proposed to meet and provides an explanation of the thorough and independent analysis of need that was conducted for the EIS. As described in Consolidated Responses P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries. Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project.
1429	40	Hayes	Douglas	Sierra Club et al	As noted elsewhere in the comments, the DEIS also underplays and neglects many of the greenhouse gas emissions associated with tar sands production. Were these emissions to be fully accounted for, it would be clear that this pipeline, as well as tar sands development more generally, runs counter to national energy and climate goals and will exacerbate the national security threat of increased climate change.	Consolidated Responses GHG-1 through GHG-5 address concerns related to greenhouse gas, climate change, alternative energy considerations, and approach to assessment of GHG emissions.
1429	41	Hayes	Douglas	Sierra Club et al	By the time this pipeline would likely be filled, the United States should be well on its way to achieving oil savings that make this pipeline at best unnecessary.	Consolidated Response P&N-1 addresses the need that the Project has been proposed to meet. As noted in that Consolidated Response, the Project has been proposed to meet the heavy crude oil needs of refineries in the Gulf Coast area, not for the U.S. in general. In addition, the Alberta Clipper and existing Keystone pipeline projects serve other markets and do not meet the demands of the Gulf Coast refineries.
1429	42	Hayes	Douglas	Sierra Club et al	THE DEIS DOES NOT ADEQUATELY CONSIDER THE PROJECT'S IMPACTS, ALTERNATIVES, AND PURPOSE AND NEED, VIOLATING NEPA AND OTHER STATUTES A. Statement of Purpose and Need DOS must evaluate the purpose and need for the project using unbiased and accurate information to assess the likely future demand for heavy tar sands crude from Canada. Providing an accurate statement of purpose and need is a fundamental requirement of environmental review under NEPA. Simmons v. U.S. Army Corps. Of Eng'rs, 120 F.3d 664, 666 (7th Cir. 1997). The agency responsible for conducting the EIS "bears the responsibility for defining at the outset the objectives of an action" and "must look hard at the factors relevant to the definition of purpose." Citizens Against Burlington, Inc., v. Busey, 938 F.2d 190, 196 (D.C. Cir. 1991). No accurate and reliable information on likely future demand for tar sands crude oil has been developed for the Keystone XL DEIS. Without an adequate assessment of the purpose and need for the project, the entire DEIS is deficient - the DOS cannot possibly take a "hard look" at alternatives and balance costs and benefits of the project as it considers the national interest unless it has first established that the need for the project as proposed is legitimate. In particular, the failure to adequately assess purpose and need has led to DOS's erroneous summary dismissal of the "no action" alternative without justification.	Consolidated Response P&N-7 addresses concerns about the stated purpose of the proposed Project in the EIS. Consolidated Response P&N-1 describes the need that the Project has been proposed to meet and provides an explanation of the thorough and independent analysis of need that was conducted for the EIS, including information from a report prepared under contract to the US DOE regarding development of oil sands projects with and without the proposed Project. As noted in that response, the production capacity of heavy crude oil from Canadian oil sands project is sufficient to supply the proposed Project, existing transportation pipelines, and other proposed and planned pipelines. The analysis of need is properly focused on what the heavy crude oil need is in PADD III. As noted in Consolidated Response Oil-4, the Canadian crude oil that would be transported is similar in composition to other heavy crude oils. Keystone has proposed to meet the heavy crude oil need of PADD III refineries with heavy crude oil obtained from Canadian oil sands projects. Section 4.0 of the EIS has been updated to provide an expanded analysis of alternatives.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
1429	43	Hayes	Douglas	Sierra Club et al	<p>The DEIS improperly relies on increasing crude oil supply in Canada to define the project's purpose instead of examining need for that crude oil in the U.S. The DEIS states that the purpose of the Keystone XL project is "to transport WCSB crude from the border with Canada to existing delivery points in PAOO III that provide connections to existing refineries in PAOO III." DEIS at 1-3. The DEIS supports the alleged need for the pipeline by describing projected increases in crude oil production in the WCSB. OBIS at 1-5. Canadian oil sands production forecasts are not relevant to a consideration of whether increased transportation to the U.S. of tar sands crude oil by the Keystone XL pipeline is necessary or in the national interest. The need for the project in the United States must turn on the domestic need for this crude oil. The DEIS's discussion of expanded crude oil production relies primarily on publications from the Canadian Association of Petroleum Producers (CAPP), a trade association that "represents companies ... that explore for, develop and produce natural gas and crude oil throughout Canada. CAPP's member companies produce about 90 per cent of Canada's natural gas and crude oil [footnote, pg 20]. CAPP's mission, as reported on its website, is to "enhance the economic sustainability of the Canadian upstream petroleum industry." Id. It has as a primary goal to "improve market access, growth and producer netbacks." Id. CAPP clearly has as its purpose to increase exploitation of the tar sands by promoting reliance on tar sands crude, including through improving the delivery infrastructure from the tar sands to consumer markets. CAPP is not an independent or a reliable source of information about the actual demand and need for tar sands crude in the United States. The Draft EIS should not trust the CAPP forecasts because these forecasts have consistently overestimated development rates in the tar sands. With regard to next-year forecasts, the CAPP2008 Report overestimated 2007 tar sands oil supply growth by approximately 6%, the CAPP 2009 Report by approximately 9%, and the CAPP 2010 Report by 3% [footnote, pg 21]. If these year-ahead forecasts consistently overestimate supply growth, then out-year estimates are even more suspect. Further, the CAPP Reports are also not accurate predictors of long-term trends. For example, the CAPP 2007 Report forecast of tar sands oil supply for 2009 was 21 % higher than actual supplies, with the result that this short two-year forecast grossly over-forecast supply growth [footnote, pg 21]</p>	<p>Consolidated Response P&N-1 describes the need that the Project has been proposed to meet and provides an explanation of the thorough and independent analysis of need that was conducted for the EIS. Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information from a report prepared under contract to the US DOE regarding development of oil sands projects with and without the proposed Project.</p>
1429	44	Hayes	Douglas	Sierra Club et al	<p>Further, the CAPP Reports' tar sands production growth rates have also proven to be far from reality. Tar sands oil supply increased at a steady linear rate of approximately 99,000 bpd between 2001 and 2009. In contrast, the CAPP 2007 Report forecast showed a long-term linear growth rate of 226,000 bpd, the CAPP 2008 Report forecast 198,000 bpd, the CAPP 2009 Report forecast 131,000 bpd, and the 2010 Report forecast 136,000 bpd [footnote, pg 21]. All of these forecasts are substantially higher than the historical rate. Put another way, the CAPP 2010 Report forecasts a long-term growth rate 37% higher than the actual historical growth rate, despite that</p>	<p>As noted in Consolidated Response P&N-1 and in Section 1.4 of the EIS, many independent sources were used to assess the need for the proposed Project, including information from an independent study (EnSys 2010) contracted by the Department of Energy. Information from CAPP that was substantiated by other independent sources was referred to in the analysis of need.</p>

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					fact that there is no statistical indication that actual supply growth rate is increasing. It is clear that the CAPP Reports are heavily biased towards rosy growth scenarios and cannot serve as a reasonable basis for forecasted growth in development in the tar sands oil supplies. Thus, the Draft EIS cannot use the CAPP Reports in its alternatives analysis or any market analysis. Instead, to the extent that the DOS bases its analysis on tar sands supply increases, the Draft EIS's forecasts must be based on an independent forecast. To do otherwise would vest far too much authority in the Applicant and its industry allies, who cooperate in the development of the CAPP Reports. A failure to conduct independent forecasts would violate NEPA and its implementing regulations.	
1429	47	Hayes	Douglas	Sierra Club et al	Instead of relying on government forecasts or historical data, the Applicant contends that its commercial contracts with U.S. refineries are sufficient evidence of need for the Keystone XL Pipeline. These contracts represent the past optimistic judgment of a limited number of oil industry executives. Moreover, there is every indication that this judgment was in error. First, investment in tar sands extraction infrastructure has declined dramatically, having lost almost \$90 billion in investment over the past few years [footnote, pg 23]. As noted, current investments in the tar sands continue to be relatively low such that a substantial increase in tar sands oil extraction is entirely speculative. Second, A number of major oil companies have stated that the Keystone XL Pipeline is not needed, including British Petroleum, Imperial Oil, Suncor, and Nexen (Nexen says not needed until 2020) [footnote, pg 23]. Their statements before the National Energy Board of Canada represent the judgment of oil company executives that there is no legitimate commercial need for the Keystone XL Pipeline.	As noted in Consolidated Response P&N-1, information from government forecasts, historical data, and other independent sources provide the basis for the analysis of need presented in Sections 1.2 and 1.4. Consolidated Response P&N-1 also provides an explanation of the thorough and independent analysis of need that was conducted for the EIS.
1429	48	Hayes	Douglas	Sierra Club et al	Third, three of TransCanada's refinery customers sued TransCanada in Alberta to get out of their contracts to ship 95,000 bpd, based on the cost overruns[footnote, pg 23]. These refinery customers argue that TransCanada should not have proceeded with construction because the costs of project development were too high [footnote, pg 23]. If they are held to their contracts, they seek almost a combined \$1 billion in damages [footnote, pg 23]. All three of these customers are relatively small independent refineries that may be hard-pressed to absorb the cost overruns and/or increased costs resulting from underutilization of their contracted capacities. Construction of the Keystone XL Pipeline will only worsen their financial condition and put U.S. jobs at risk. The mere fact that a limited number of oil companies saw a commercial need for the Keystone XL pipeline does not mean that such need currently exists or is likely to exist in the future. A determination of need for the Keystone XL Pipeline should not be based on past commercial judgments made during a temporary development boom and the inflated forecasts of Canadian oil industry boosters. The DOS's determination must be based on an independent forecast prepared for the DOS that examines future U.S. crude oil demand made in light of realistic Canadian export forecasts. Anything less abdicates	In 2010, three entities, each of which had entered into Transportation Service Agreements for the Cushing Extension, had filed separate Statements of Claim against certain of TransCanada's Keystone subsidiaries in the Alberta Court of Queen's Bench seeking declaratory relief or, alternatively, damages in varying amounts. All of the claims have been discontinued on a without-cost and without-liability basis. Therefore there is no connection between these legal actions and the proposed Project's purpose and need.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					critical federal responsibility to self interested private companies.	
1429	49	Hayes	Douglas	Sierra Club et al	By law, EIA is prohibited from factoring in the likely effects future laws and regulations may have on energy demand, even when, as now, it is clear that federal (and state) laws will be enacted over the horizon of the EIA forecasts that will dramatically affect demand for certain types of energy. EIA makes this limitation of the forecasts very clear in its publications: Projections in AEO 2010 generally assume that current laws and regulations affecting the energy sector remain unchanged throughout the projection period (including the implication that laws which include sunset dates do, in fact, become ineffective at the time of those sunset dates). The potential impacts of pending or proposed legislation, regulations, and standards-or of sections of legislation that have been enacted but that require regulations for which the implementing agency will exercise major discretion, or require appropriation of funds that are not provided or specified in the legislation itself-are not reflected in the Reference case projections. AEO 2010, p. 6. [footnote, pg 25]. See also AEO 2009, p. 8 ("The projections in AEO 2009 are based on Federal and State laws and regulations as of November 2008.) In other words, the AEO's projections of future demand for crude oil out to 2035 do not reflect any possible or likely changes in state or federal law or regulation that may affect future demand.	Consolidated Response P&N-1 addresses the need that the Project has been proposed to meet. As noted in that Consolidated Response, the Project has been proposed to meet the heavy crude oil needs of refineries in the Gulf Coast area, not for the U.S. in general. In addition, the Alberta Clipper and existing Keystone pipeline projects serve other markets and do not meet the demands of the Gulf Coast refineries. The EIS relies partially on a study commissioned by the Department of Energy and prepared by EnSys (2010). The EnSys analysis includes a low-demand outlook for US petroleum product demand that is based on a February/March 2010 study by EPA which examined "more aggressive fuel economy standards and policies to address vehicle miles traveled." As stated in the EnSys report "Projections were used from the EPA Scenario A leading to reductions to US petroleum product consumption versus the AEO 2010 outlook starting post 2015 and reaching 1.2 mbd by 2020 and 4.0 mbd by 2030." The low-demand scenario in the EnSys report was developed in close consultation with DOE, EPA, and DOS.
1429	50	Hayes	Douglas	Sierra Club et al	EIA forecasts do not show increased demand for crude oil. Citing the EIA's AEO 2009, the DEIS states that "the volume of crude oil consumed ... domestically, is unlikely to decrease substantially over the next 30 years." DEIS at 1-4, 4-1. This statement is directly contradicted by the very source the DEIS cites in support. In April 2010, EIA published the Annual Energy Outlook 2010, which has more up-to-date forecasts. Neither the AEO 2009 nor the AEO 2010 show an increase in US demand for crude oil. The AEO 2010 forecasts zero increase in demand for crude oil in its forecast to 2035. See AEO 2010 at 3 ("biofuels account for all the growth in liquid fuel consumption in the United States over the next 25 years, while consumption of petroleum-based liquids is essentially flat); AEO 2009 at 7 ("Total U.S. demand for liquid fuels grows by only 1 million barrels per day between 2007 and 2030 ... and there is no growth in oil consumption Growth in the use of biofuels meets the small increase in demand for liquids in the projection."). As shown in Figure I, below, the consumption of fuels from crude oil is expected to decrease slightly from 20.65 to 20.12 million barrels per day between 2006 and 2030. In fact, EIA expects that nation-wide consumption of petroleum-based liquids will have decreased in 2030 by 0.5 million barrels per day compared to 2006. AEO 2009, Table AII (2030 figure calculated from total minus E85). Thus, there is no ground for the assertion in the DEIS that demand for crude oil nation-wide, or in PADD III specifically, requires additional supply of heavy crude from Canada.	Consolidated Response P&N-1 addresses the need that the Project has been proposed to meet. As noted in that Consolidated Response, the Project has been proposed to meet the heavy crude oil needs of refineries in the Gulf Coast area, not for the U.S. in general. In addition, the Alberta Clipper and existing Keystone pipeline projects serve other markets and do not meet the demands of the Gulf Coast refineries. The EIS relies partially on a study commissioned by the Department of Energy and prepared by EnSys (2010). The EnSys analysis includes a low-demand outlook for US petroleum product demand that is based on a February/March 2010 study by EPA which examined "more aggressive fuel economy standards and policies to address vehicle miles traveled." As stated in the EnSys report "Projections were used from the EPA Scenario A leading to reductions to US petroleum product consumption versus the AEO 2010 outlook starting post 2015 and reaching 1.2 mbd by 2020 and 4.0 mbd by 2030." The low-demand scenario in the EnSys report was developed in close consultation with DOE, EPA, and DOS.
1429	52	Hayes	Douglas	Sierra Club et al	In sum, current projections show that demand for petroleum	Consolidated Response P&N-1 addresses the need that the

					based liquid fuels of the type proposed to be delivered in the Keystone XL pipeline will decrease or remain flat. This is true even if one assumed no new federal or state laws will be enacted between now and 2035 that will affect demand for carbon-intensive fuels, US dependence on imported petroleum is expected to decline dramatically over the next 20 years,	Project has been proposed to meet. As noted in that Consolidated Response, the Project has been proposed to meet the heavy crude oil needs of refineries in the Gulf Coast area, not for the U.S. in general. In addition, the Alberta Clipper and existing Keystone pipeline projects serve other markets and do not meet the demands of the Gulf Coast refineries. The EIS relies partially on a study commissioned by the Department of Energy and prepared by EnSys (2010). The EnSys analysis includes a low-demand outlook for US petroleum product demand that is based on a February/March 2010 study by EPA which examined "more aggressive fuel economy standards and policies to address vehicle miles traveled." As stated in the EnSys report "Projections were used from the EPA Scenario A leading to reductions to US petroleum product consumption versus the AEO 2010 outlook starting post 2015 and reaching 1.2 mbd by 2020 and 4.0 mbd by 2030." The low-demand scenario in the EnSys report was developed in close consultation with DOE, EPA, and DOS.
1429	53	Hayes	Douglas	Sierra Club et al	In addition to making clear that overall US demand for crude oil will not increase over the next decades, EIA's newest forecasts also explain that US need for imported crude will "decline dramatically" to 2030, According to EIA's AEO 2009 the US will require only 6,95 million bpd of imported crude in 2030, AEO 2009, Table AI L The EIA's 2009 forecasts predicts a decrease in imports as of 2030 of more than 3 million barrels of crude per day, Figure 3 below, taken from the AEO 2009, shows the dramatic decrease EIA is projecting,	Consolidated Response P&N-1 addresses the need that the Project has been proposed to meet. As noted in that Consolidated Response, the Project has been proposed to meet the heavy crude oil needs of refineries in the Gulf Coast area, not for the U.S. in general. In addition, the Alberta Clipper and existing Keystone pipeline projects serve other markets and do not meet the demands of the Gulf Coast refineries. The EIS relies partially on a study commissioned by the Department of Energy and prepared by EnSys (2010). The EnSys analysis includes a low-demand outlook for US petroleum product demand that is based on a February/March 2010 study by EPA which examined "more aggressive fuel economy standards and policies to address vehicle miles traveled." As stated in the EnSys report "Projections were used from the EPA Scenario A leading to reductions to US petroleum product consumption versus the AEO 2010 outlook starting post 2015 and reaching 1.2 mbd by 2020 and 4.0 mbd by 2030." The low-demand scenario in the EnSys report was developed in close consultation with DOE, EPA, and DOS.
1429	54	Hayes	Douglas	Sierra Club et al	Figure 3. Net Dependence on Imported Liquids Declines In addition to analyzing and forecasting the need for imports, the EIA projections also predict the sources of petroleum to supply expected demand. AEO 2009, Table AI. With regard to crude oil imports, AEO 2009 reports that the 1.6 million barrels per day the United States imported from Canada in 2006 will decrease to 1.38 million barrels per day by 2030. This reduction, represented below in Figure 4, is a 0.7 percent annual decrease in Canadian crude oil imports according to the EIA.	Consolidated Response P&N-1 addresses the need that the Project has been proposed to meet. As noted in that Consolidated Response, the Project has been proposed to meet the heavy crude oil needs of refineries in the Gulf Coast area, not for the U.S. in general. In addition, the Alberta Clipper and existing Keystone pipeline projects serve other markets and do not meet the demands of the Gulf Coast refineries. The EIS relies partially on a study commissioned by the Department of Energy and prepared by EnSys (2010). 						developed in close consultation with DOE, EPA, and DOS.
1429	55	Hayes	Douglas	Sierra Club et al	Figure 4. 2009 AEO Imported Crude Oil From Canada The data show that the existing pipeline infrastructure has sufficient capacity - indeed, more than sufficient capacity - to meet US demand for Canadian crude for at least the next two decades. Overall, demand for petroleum-based fuels is flat; domestic production is expected to increase; and the need for imports declines dramatically. The assertion that future increased US demand necessitates a new large pipeline is without evidentiary support. 4. The EIA forecasts are based on business as usual assumptions; in fact, demand for tar sands crude will be even lower than projected. As noted above, a major limitation of the EIA forecasts is the requirement that EIA ignore any pending or likely future law or regulation in its modeling. There can be no question that new laws and regulations will be enacted in coming years that will dramatically affect the demand for carbon-intensive fuels such as liquid fuel derived from tar sands. It would be unreasonable for the State Department to ignore the very likely, indeed certain, regulation of carbon emissions and the effect such regulation will have on the purported purpose and need for this project in the DEIS.	Consolidated Response P&N-1 addresses the need that the Project has been proposed to meet. As noted in that Consolidated Response, the Project has been proposed to meet the heavy crude oil needs of refineries in the Gulf Coast area, not for the U.S. in general. In addition, the Alberta Clipper and existing Keystone pipeline projects serve other markets and do not meet the demands of the Gulf Coast refineries. The EIS relies partially on a study commissioned by the Department of Energy and prepared by EnSys (2010). The EnSys analysis includes a low-demand outlook for US petroleum product demand that is based on a February/March 2010 study by EPA which examined "more aggressive fuel economy standards and policies to address vehicle miles traveled." As stated in the EnSys report "Projections were used from the EPA Scenario A leading to reductions to US petroleum product consumption versus the AEO 2010 outlook starting post 2015 and reaching 1.2 mbd by 2020 and 4.0 mbd by 2030." The low-demand scenario in the EnSys report was developed in close consultation with DOE, EPA, and DOS.
1429	56	Hayes	Douglas	Sierra Club et al	State and regional initiatives are underway that will lower demand. State, regional and federal initiatives are underway that will dramatically impact demand for tar sands crude in the region of the pipeline, in PADD III, and nationally. Minnesota, for example, has enacted statewide greenhouse gas reduction goals requiring reductions in GHG emissions below 2005 levels 15 percent by 2015, 30 percent by 2025, and 80 percent by 2050. Minn. Stat. § 216H.02. Similarly, Iowa has established a council to develop strategies to reduce GHG emissions by 50 percent. Iowa C. § 455B.851(7). In Montana, Gov. Schweitzer established a Climate Change Advisory Committee to examine state level greenhouse gas reduction opportunities in all sectors in Montana. Other states have undertaken similar efforts. See, e.g., Illinois Exec. Order 2006-11 (establishing advisory council to achieve GHG reductions); Kansas Exec. Order No. 08-03 (establishing advisory group to develop recommendations to reduce greenhouse gas emissions in Kansas). States within PADD III have also undertaken initiatives to reduce greenhouse gas emissions. With Act 696 of 2008 Arkansas created a Commission on Global Warming that recommended that Arkansas adopt a statewide global warming pollutant goal to reduce the state's gross greenhouse gas emissions below 2000 levels by 20 percent by 2020; 35 percent by 2025; and 50 percent by 2035. These recommendations are currently under review. A New Mexico Exec. Order 05-33 established a Climate Change Advisory Group to develop recommendations for reducing New Mexico's total greenhouse gas emissions to 2000 levels by the year 2012, 10 percent below 2000 levels by 2020, and 75 percent below by 2050. These states cannot meet these statutory obligations without significant reductions, over both the near and long-term, in consumption of carbon-intensive fuels. As described herein, fuels derived from tar sands are	Consolidated Responses GHG-1 through GHG-6 address concerns related to greenhouse gas, climate change, alternative energy considerations, and approach to assessment of GHG emissions.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					among the most carbon-intensive of all fuels because of the large amounts of energy used to extract and upgrade the oil sands. Common sense dictates that state policymakers committed to significant GHG reductions will pursue statutory and regulatory requirements that will have the effect of decreasing demand for carbon-intensive fuels.	
1429	60	Hayes	Douglas	Sierra Club et al	In addition, Congress is making progress on comprehensive climate legislation. On June 26, the U.S. House of Representatives passed the American Clean Energy and Security Act of 2009, H.R. 2454, by a vote of 219 to 212. This national climate and energy legislation would establish an economy-wide, greenhouse gas cap-and-trade system and critical complementary measures to help address climate change and build a clean energy economy. On May 12, 2010 Senators John Kerry and Joe Lieberman introduced the American Power Act, which sets concrete GHG emission reduction targets: 17 percent reduction in U.S. carbon pollution from 2005 levels by 2020; 42 percent by 2030; and 83 percent by 2050. These new federal laws will have a direct effect on demand for the crude proposed to be transported through the Keystone XL pipeline.	Consolidated Response P&N-1 addresses the need that the Project has been proposed to meet. As noted in that Consolidated Response, the Project has been proposed to meet the heavy crude oil needs of refineries in the Gulf Coast area, not for the U.S. in general. In addition, the Alberta Clipper and existing Keystone pipeline projects serve other markets and do not meet the demands of the Gulf Coast refineries. The EIS relies partially on a study commissioned by the Department of Energy and prepared by EnSys (2010). The EnSys analysis includes a low-demand outlook for US petroleum product demand that is based on a February/March 2010 study by EPA which examined "more aggressive fuel economy standards and policies to address vehicle miles traveled." As stated in the EnSys report "Projections were used from the EPA Scenario A leading to reductions to US petroleum product consumption versus the AEO 2010 outlook starting post 2015 and reaching 1.2 mbd by 2020 and 4.0 mbd by 2030." The low-demand scenario in the EnSys report was developed in close consultation with DOE, EPA, and DOS.
1429	61	Hayes	Douglas	Sierra Club et al	One mechanisms to achieve carbon reduction goals that is being considered by the Obama Administration is the adoption of a "national low carbon fuel standard." A low carbon fuel standard (LCFS) takes into account the well-to-wheels GHG emission associated with various types of liquid fuels, preferring low-carbon fuels and penalizing high-carbon fuels. Under an LCFS policy, fuel derived from tar sands will be among the least desirable because it is the most carbon intensive. Figure 6, below, is taken from a study conducted for the California Air Resources Board in development of California's LCFS. [footnote, pg 32]	Consolidated Response GHG-6 addresses Low Carbon Fuel Standards in the greenhouse gas assessment.
1429	62	Hayes	Douglas	Sierra Club et al	FIGURE 6. It clearly shows that tar sands fuels for both hybrid electric (HEV) and internal combustion engine (ICEV) cars have the highest carbon intensity of the studied options. Thus, a national low carbon fuel standard, as proposed by the Obama Administration, will further suppress demand for tar sands crude. An economy-wide cap-and-trade program will similarly penalize carbon-intensive energy sources such as fuel derived from tar sands.	Consolidated Responses GHG-1 through GHG-5 address concerns related to greenhouse gas, climate change, alternative energy considerations, and approach to assessment of GHG emissions.
1429	63	Hayes	Douglas	Sierra Club et al	These plans to reduce greenhouse gas emissions build on the provisions of the Energy Independence and Security Act, which prohibits federal agencies from buying alternative or synthetic fuels that have higher lifecycle greenhouse gas emissions than those of conventional Fuels [footnote, pg 33]. The new Energy Act excludes the large federal government sector from the market for tar sands oil, further reducing demand for this source. Finally, it is clear that the Administration intends to end dependence on Middle East and Venezuelan imports through reductions in consumption, not by	Consolidated Response P&N-1 addresses the need that the Project has been proposed to meet. As noted in that Consolidated Response, the Project has been proposed to meet the heavy crude oil needs of refineries in the Gulf Coast area, not for the U.S. in general. In addition, the Alberta Clipper and existing Keystone pipeline projects serve other markets and do not meet the demands of the Gulf Coast refineries. The EIS relies partially on a study commissioned by the Department of Energy and prepared by EnSys (2010). The EnSys analysis includes a low-demand outlook for US

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					displacing such imports with imports from the Canadian oil sands. (As noted above, even without any of the additional savings achieved through Obama Administration policies, the need for imports is already expected to decline dramatically.) Thus, even if Canadian sources were seen as more "secure," such an assumption does not establish a need for additional supply capacity from Canada [footnote, pg 33].	petroleum product demand that is based on a February/March 2010 study by EPA which examined "more aggressive fuel economy standards and policies to address vehicle miles traveled." As stated in the EnSys report "Projections were used from the EPA Scenario A leading to reductions to US petroleum product consumption versus the AEO 2010 outlook starting post 2015 and reaching 1.2 mbd by 2020 and 4.0 mbd by 2030." The low-demand scenario in the EnSys report was developed in close consultation with DOE, EPA, and DOS.
1429	64	Hayes	Douglas	Sierra Club et al	The changes in federal energy and climate policy will have far-reaching effects on crude oil consumption. The State Department must re-evaluate the underpinnings of TransCanada's request for a new pipeline to transport an enormous additional amount of the Earth's dirtiest oil to the United States. Under current and reasonably foreseeable future statutory and regulatory frameworks, US will have no need for increased crude supply, especially not from Canada's tar sands.	Consolidated Response P&N-1 addresses the need that the Project has been proposed to meet. As noted in that Consolidated Response, the Project has been proposed to meet the heavy crude oil needs of refineries in the Gulf Coast area, not for the U.S. in general. In addition, the Alberta Clipper and existing Keystone pipeline projects serve other markets and do not meet the demands of the Gulf Coast refineries. The EIS relies partially on a study commissioned by the Department of Energy and prepared by EnSys (2010). The EnSys analysis includes a low-demand outlook for US petroleum product demand that is based on a February/March 2010 study by EPA which examined "more aggressive fuel economy standards and policies to address vehicle miles traveled." As stated in the EnSys report "Projections were used from the EPA Scenario A leading to reductions to US petroleum product consumption versus the AEO 2010 outlook starting post 2015 and reaching 1.2 mbd by 2020 and 4.0 mbd by 2030." The low-demand scenario in the EnSys report was developed in close consultation with DOE, EPA, and DOS.
1429	65	Hayes	Douglas	Sierra Club et al	In sum, current EIA projections - assuming no new regulation or laws affecting carbon emissions are enacted - show that demand for crude oil is flat and that the need for net imports declines dramatically over the next two decades. Adding to that the certainty that state, regional and federal laws will be enacted to confront the climate change crisis and Americans' dependence on fossil fuels, it becomes very clear that there is no objective or reliable demand forecast that would support the statement of purpose and need in this OBIS. The State Department cannot ignore policymakers' commitments to achieving significant reductions in US consumption of carbon intensive fuels over the short- and long-term. The Secretary herself has said H[w]e will pursue an energy policy that reduces our carbon emissions while reducing our dependence on foreign oil [footnote, pg 34]. The State Department must issue a new DEIS that effectively assesses the purpose and need for TransCanada's proposed project or, alternatively, abandon these permitting proceedings altogether based on the clear evidence that the Keystone XL pipeline will not be needed to meet US demand for Canadian tar sands crude.	Consolidated Response P&N-1 addresses the need that the Project has been proposed to meet. As noted in that Consolidated Response, the Project has been proposed to meet the heavy crude oil needs of refineries in the Gulf Coast area, not for the U.S. in general. In addition, the Alberta Clipper and existing Keystone pipeline projects serve other markets and do not meet the demands of the Gulf Coast refineries. The EIS relies partially on a study commissioned by the Department of Energy and prepared by EnSys (2010). The EnSys analysis includes a low-demand outlook for US petroleum product demand that is based on a February/March 2010 study by EPA which examined "more aggressive fuel economy standards and policies to address vehicle miles traveled." As stated in the EnSys report "Projections were used from the EPA Scenario A leading to reductions to US petroleum product consumption versus the AEO 2010 outlook starting post 2015 and reaching 1.2 mbd by 2020 and 4.0 mbd by 2030." The low-demand scenario in the EnSys report was developed in close consultation with DOE, EPA, and DOS.
1429	66	Hayes	Douglas	Sierra Club et al	However, the Keystone XL Pipeline is a private project, not a federal project. Where NEPA applies to federal action on private projects, the scope of the alternative analysis must relate to the scope of federal authority over the project. Citizens Against Burlington, Inc. v. Busey, 938 F.2d 190,197-198 (D.C. Cir. 1991; Natural Resource Defense Council, Inc.	As noted in Consolidated Response ENR-1, the environmental review, including preparation of this EIS, has been conducted consistent with the DOS regulations pertaining to NEPA (22 CFR Part 161) as well as the Council on Environmental Quality (CEQ) regulations for implementing NEPA (40 CFR Part 1500). As a result, DOS considers the EIS to be

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					<p>v. U.S. Environmental Protection Agency, 822 F.2d 104 (D.C. Cir. 1987); Colo. Env'tl. Coalition v. Dombeck, 185 F.3d 1162, 1175 (10th Cir. 1999); N. Buckhead Civic Assoc. v. Skinner, 903 F.2d 1533, 1542 (11th Cir. 1990). Here, the DOS has completely failed to link its alternatives analysis to particular federal authority.</p> <p>The Draft EIS attempts to cover alternatives dealing with no action, system, and major route alternatives. However, the Pipeline is being proposed in order to fill a perceived future gap in fuel and energy in the United States. The Pipeline is not the only alternative for filling this gap: other alternatives include fuel efficiency, alternative fuels, electric vehicles, other clean transport technologies, and public transportation. The Draft EIS does not adequately address alternatives to expanding U.S. capacity to import tar sands oil.</p>	<p>consistent with the requirements of a NEPA environmental review. Consolidated Response ALT-1 addresses potential alternative routes and system alternatives, including rail and barge networks. Consolidated Response ALT-2 addresses the use of alternative technologies, alternative energy sources, and conservation of energy.</p> <p>The No Action Alternative as appropriate and consistent with CEQ guidance includes a trajectory analysis that considers the likely future developments that could produce environmental impacts without implementation of the proposed Project (see Section 4.0). The EnSys 'No Expansion' scenario is not an appropriate trajectory analysis for the No Action Alternative. Extensive analysis of crude-oil market dynamics and several modes of bulk transportation indicate that a "No Expansion" scenario where all modes of bulk transport for crude oil out of the WCSB remain at 2010 levels through 2030 is highly implausible. For discussion of the EnSys Report, see Sections 1.3.1, 1.4, 3.14.4.2, and 4.1 and Appendix V of the EIS. For discussion of the No Action Alternative, see Section 4.1. See also Consolidated Response CAN-1.</p>
1429	67	Hayes	Douglas	Sierra Club et al	<p>Moreover, the Draft EIS completely fails to examine agency-specific alternatives, such as alternatives related to river crossings and wetland fills where alternatives must be developed pursuant to 33 C.F.R. Part 325, App. B, § 7. b, alternative border crossings pursuant to Executive Order 13337, and alternative means of meeting federal emergency response planning and pipeline integrity planning pursuant to 49 C.P.R. Parts 194 and 195. While EIS may not be limited to only measures that an agency has the authority to adopt, NRDC v Morton, 458 P.2d 827,834 (D.C. Cir. 1972), this does not mean that an EIS can ignore practical alternatives available to specific agencies for their particular federal actions. The DOS's responsibility to determine whether the Keystone XL Pipeline is in the national interest means that the Draft EIS must evaluate national energy policy alternatives to meeting energy demand. However, such broad authority does not excuse the Draft EIS from evaluating alternative embodiments of particular federal agency permitting decisions, such as Army Corps wetland and river crossing decisions.</p>	<p>Section 4 of the EIS addresses alternatives to the proposed action, including the No Action Alternative, systems alternatives, route alternatives, and route variations. Section 3.3 of the EIS addresses river crossings and USACE permitting. Section 3.4 of the EIS addresses wetlands and potential wetland compensatory mitigation. Consolidated Response P&N-9 describes the National Interest Determination process.</p>
1429	68	Hayes	Douglas	Sierra Club et al	<p>The Draft EIS is defective in part because its alternatives analysis focuses exclusively on major policy alternatives without examination of practical, realistic permit-specific alternatives. Such 50,000 foot focus means that the Draft EIS will fail to allow most of the cooperating agencies fulfill their NEPA duties. Unless the Draft EIS discusses alternatives relative to specific federal permits and approvals, it will fail to achieve statutory requirements that each involved agency examine its alternatives to its particular major federal actions. Such failure would mean that the Draft EIS would in effect serve as a programmatic EIS, with the result that cooperating agencies would be required to conduct subsequent NEPA reviews. The purpose of this EIS is to provide an assessment</p>	<p>As noted in Consolidated Response ENR-1, the environmental review, including preparation of this EIS, has been conducted consistent with the DOS regulations pertaining to NEPA (22 CFR Part 161) as well as the Council on Environmental Quality (CEQ) regulations for implementing NEPA (40 CFR Part 1500). As a result, DOS considers the EIS to be consistent with the requirements of a NEPA environmental review. As described in Consolidated Responses P&N-9 and ENR-1, the environmental review process is separate from the National Interest Determination process.</p>

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					of the environmental impacts if a Presidential Permit for the proposed project is approved. Presidential Permits, unlike NEPA analyses, have the burden of looking at not only the narrow field of traditional NEPA factors, but whether the issuance would “serve the national interest [footnote, pg 35]. Therefore, the Draft EIS’s determination that a “no action alternative” is not preferable cites to supply and demand components.	
1429	69	Hayes	Douglas	Sierra Club et al	According to the Draft EIS, a “no action alternative” is not considered preferable because it would not meet the purpose and need of the project which involves both supply and demand components. The draft EIS argues that it is because of the demand in the U.S., the supply available in WCSB, the WCSB as a relatively stable and secure source of North American crude oil for Midwest and Gulf Coast markets and .the desire to reduce our dependence on Middle Eastern oil supplies that makes this alternative not preferable.	As noted in Consolidated Response P&N-1 and in Section 1.4.2 of the EIS, the purpose of the proposed Project is to meet the crude oil needs of refineries in PADD III, not the demand in the U.S. as suggested by the commenter. The EIS also notes that the Canadian crude oil would primarily replace declining exports to PADD III from Mexico and Venezuela and lists several other countries and regions with unstable oil supplies. Additional reasons for eliminating the No Action alternative from further consideration are presented in Section 4.1 of the EIS.
1429	70	Hayes	Douglas	Sierra Club et al	The analysis of national interest only looks at one aspect of how to meet our energy needs. It does not consider that unconventional oil is not the only alternative for our energy future. It also does not consider the security risks from energy sources that increase our contributions to global warming pollution. These alternatives to increasing US reliance on dirty fossil fuels are not only reasonable and feasible, they also better serve the national interest.	As noted in Consolidated Responses P&N-9 and ENR-1, the national interest determination process is separate from the NEPA environmental review process, although the results of the environmental review process are considered in determining whether or not a project is in the national interest. Therefore, the EIS does not present an analysis of national interest. Further, in the national interest determination process, the DOS will consider many issues not addressed in the EIS, including those mentioned by the commenter. Consolidated Response ALT-2 addresses the use of alternative technologies and alternative energy sources.
1429	71	Hayes	Douglas	Sierra Club et al	The draft EIS improperly rejects the No Action Alternative without considering reasonable alternatives to meeting future energy needs in the US. In the race to develop Canada’s tar sands region, a significant obstacle to its growth is the constraint on the pipeline network moving this crude to markets in the United States. Sections 1.2.2 and 4.1.3 of the draft EIS describe how the existing crude oil pipeline export capacity from the Western Canadian Sedimentary Basin is insufficient to accommodate the forecasted crude oil supply growth. The Keystone XL Pipeline is proposed to address this gap, with the possibility of additional future increases in its capacity, draft EIS at 1-3, and to meet a perceived future energy need in the United States. However, the pipeline is not the only alternative for filling this gap: other alternatives include energy efficiency, renewable energy, clean technologies, and demand-side management. NEPA regulations specifically require consideration of energy requirements and conservation in environmental review documents. 40 C.F.R § 1502.16(e). Yet the draft EIS explicitly declines to consider alternatives sources of energy, stating that “the use of alternative forms of energy in place of the proposed Project was not considered in the environmental review of the Project.” draft EIS at 4-1. The only reason given for this failure is the conciusory assertion that “the use of	The Project has been proposed to meet the crude oil needs of refineries in PADD III as described in Consolidated Response P&N-1 and Section 1.4.2 of the EIS, not the needs of the entire U.S. Consolidated Response ALT-2 addresses the use of alternative technologies and alternative energy sources, and Section 4.1 of the EIS has been revised to provide additional information on their use.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					alternative forms of energy would not meet the needs of refiners in PADD III or the purpose of the proposed Project.” This does not constitute the rigorous exploration and objective evaluation of reasonable alternatives that NEPA requires.	
1429	72	Hayes	Douglas	Sierra Club et al	<p>The draft EIS improperly rejects the No Action Alternative without considering existing and proposed crude oil pipeline capacity. In order to weigh the merits of alternatives to the proposed pipeline, the State Department must clarify what capacity already exists to meet current and future US demand for crude oil. In addition to the Keystone XL pipeline, there are numerous other pipelines, including TransCanada’s own newly constructed Keystone I pipeline, and Enbridge’s Alberta Clipper pipeline, both of which will service the purpose of enabling Canadian tar sands crude suppliers to export increased volumes of crude to the U.S. The Keystone I pipeline has the capacity to deliver over 590,000 bpd of crude to PADD III. Alberta Clipper provides capacity for an additional 450,000 bpd. In addition, Enbridge’s Lakehead system has capacity to deliver 2.42 million barrels per day of Canadian crude to the Midwest [footnote, pg 37] and ExxonMobile’s Pegasus pipeline can deliver 96,000 bpd of crude to the Gulf.</p> <p>Moreover, the draft EIS does not account for other proposed pipelines that would extend to the Pacific Ocean through Alberta or the Gulf Coast. For example, Kinder Morgan Canada’s proposed Chinook Pipeline would deliver 300,000 bpd of Canadian tar sands heavy crude from Alberta, Canada to the Gulf Coast of Texas beginning in 2012. Altex has also proposed a 300,000 bpd pipeline along a similar route. The draft EIS must consider the need for the Keystone XL pipeline in light of these other proposals.</p>	<p>The Project has been proposed to meet the crude oil needs of refineries in PADD III as described in Consolidated Response P&N-1 and Section 1.4.2 of the EIS, not the needs of the entire U.S. Section 1.4.2 of the EIS provides information on the current capacity to supply crude oil to the U.S. as well as to PADD III. That assessment includes information on the exiting Keystone Oil Pipeline and the Alberta Clipper Project.</p> <p>The EIS need analysis relies partially on analyses performed by EnSys (2010 and 2011) that assess export and delivery of WCSB crude oils to PADDs II and III on the proposed Transmountain TMX1, TMX2, and TMX3 expansions, the proposed Kinder Morgan Northern Leg, the proposed Enbridge Northern Gateway Project, the existing Enbridge Alberta Clipper, the existing Keystone Oil Project, the proposed Enbridge Monarch Cushing to Gulf Project, and the proposed CN Rail/Altex PipelineOnRail Project, and other potential rail and barge projects.</p>
1429	73	Hayes	Douglas	Sierra Club, et al	An enormous expansion in transport capacity has already been added to the pipeline systems that serve US refineries. The DEIS fails to take account of this already-permitted increase in capacity in its discussion of the purpose and need for TransCanada’s proposal. It also fails to address this additional capacity availability in evaluating the no action alternative.	The EIS considers existing, proposed, and potential transport capacity in analyzing the need for the proposed Project. The No Action Alternative analysis also considers these existing, proposed, and potential transportation pathways.
1429	74	Hayes	Douglas	Sierra Club et al	The State Department must explore what the ultimate capacity of the existing pipeline system is compared to accurate projections of future liquid fuel consumption in order to thoroughly evaluate the no action alternative. Without a clear understanding of the supply delivery capacity of existing lines, the State Department cannot evaluate whether the no action alternative is a reasonable choice. An enormous expansion in transport capacity has already been added to the pipeline systems that serve US refineries. The draft EIS fails to take account of this already-permitted increase in capacity in its discussion of the purpose and need for TransCanada’s proposal. It also fails to address this additional capacity availability in evaluating the no action alternative.	The EIS considers existing, proposed, and potential transport capacity in analyzing the need for the proposed Project. The No Action Alternative analysis also considers these existing, proposed, and potential transportation pathways.
1429	75	Hayes	Douglas	Sierra Club et al	System Alternatives The Draft EIS’s analysis is defective because it fails to adequately consider system alternatives related to pipeline size, interconnection with other pipelines,	The EIS has been revised to include smaller diameter pipelines (see Section 4.4.2). As noted in Section 1.2 of the EIS, Keystone has commitments for transporting 600,000 bpd

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					and the separate utilities of the Steele City and Gulf Coast Segment alternatives. NEPA has long required consideration of alternative size of projects. Here, the evidence indicates that the Keystone XL Pipeline is oversized. Yet the Draft EIS fails to consider any alternative pipeline capacities, alternative pipe diameters, or alternative pipe pressures. Instead the Draft EIS asserts that a full 900,000 barrels per day of oil flow is needed. Such assumption prematurely and improperly eliminates consideration of a practical and commercially viable alternative to the project.	in the proposed Project (including the crude oil that would be transported from the Bakken Marketlink Project (see Section 2.5.3 of the EIS), and the proposed Project has an initial capacity of 700,000 bpd.
1429	76	Hayes	Douglas	Sierra Club et al	Also, the Draft EIS fails to consider interconnection options, such as using capacity on the Enbridge System to bring oil into the U.S., and then interconnect the Keystone System at that border crossing. Further, the Draft EIS fails to consider whether interconnection of the Keystone XL Pipeline to any existing oil pipelines and terminals north of Cushing, OK, would provide systemic benefits related to greater flexibility of use than a "bullet" pipeline to the Gulf Coast.	<p>Keystone has applied for a Presidential permit at the border near Morgan, Montana to connect to the Canadian portion of the Keystone XL Project which would extend to that location. The Canadian portion of the Project has been approved by the Canadian National Energy Board. However, Section 4.3 addresses alternative routes with alternative border crossing locations.</p> <p>Section 4.2.1.4 of the EIS addresses the issue of connecting to the Enbridge Alberta Clipper pipeline.</p> <p>Connecting to existing oil pipeline and terminals north of Cushing and increasing flexibility would not meet the purpose of the proposed Project and would not contribute to meeting the heavy crude oil needs of PADD III refineries. Any such alternative would also require constructing a pipeline from Cushing to PADD III delivery points which would generally result in the same impacts as the proposed Gulf Coast and Houston Lateral segments of the proposed Project.</p>
1429	77	Hayes	Douglas	Sierra Club et al	The Draft EIS fails to consider the alternative of building only the Gulf Coast Segment, because this would allow substantial volumes of crude oil to flow between Cushing, OK, and the Gulf Coast, while maintaining the option of building more capacity if and when U.S. demand and Canadian extraction capacity are proven. Suncor Inc. proposed this alternative to in the National Energy Board proceedings in Canada. Although this option would not provide as much capacity as TransCanada's proposal, such capacity is not needed for the foreseeable future anyway, with the result that the existing Keystone Pipeline would be used more fully. This alternative should also be considered in combination with reducing the size of the Keystone XL Pipeline to match forecasted demand between Cushing, OK, and the Gulf Coast.	Constructing on the Gulf Coast Segment would require supplying Canadian crude oil to the Cushing Oil Terminal in the quantities required to meet the needs of PADD III refineries. The commenter is incorrect when stating that "such capacity is not needed for the foreseeable future" as indicated in Consolidated Response P&N-1 and Section 1.4.2 of the EIS, and in consideration of the existing contracts that Keystone has for delivering 600,000 barrels of Canadian crude oil per day (bpd) to delivery points in PADD III. Constructing only the Gulf Coast Segment would also require that the existing Keystone Oil Pipeline System have the capacity to deliver sufficient volumes of Canadian crude oil to meet the needs of PADD III refineries. Section 4.2 of the EIS (System Alternatives) has been updated to include the information on the existing Keystone Oil Pipeline System and make it clear that it does not have sufficient capacity to transport the contracted 600,000 bpd of oil to the Cushing terminal.
1429	78	Hayes	Douglas	Sierra Club et al	Alternate routes The central problem with the EIS analysis of alternate routes is that no U.S. agency at the state or federal level actually has the authority to change the full pipeline route. The DOS has authority to determine the location of border crossings, but the DOS has failed to base its alternatives analysis on the merits of different border crossing locations. Rather, the Draft EIS assumes that the location of the border crossing is fixed near the town of Morgan,	Keystone has applied for a Presidential permit at the border near Morgan, Montana to connect to the Canadian portion of the Keystone XL Project which would extend to that location. The Canadian portion of the proposed Project has been approved by the Canadian National Energy Board. However, Section 4.3 of the EIS includes alternative routes that have alternative border crossing locations.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					Montana, when it is entirely within the President's foreign affairs authority to determine the location of the border crossing. Predetermination of this exercise of discretion violates NEPA. Further, the Army Corps has authority over the location of river crossings, but this authority is not equivalent to the authority to approve a route. Further, there is some jurisdiction within agencies such as the Montana Department of Environmental Quality to guide route decisions, but even that authority was abdicated during the application review process (see below) because the applicants had already chosen a route without reference to Montana standards. Other states along the route have no routing authority, except some de minimis discretion at the county level. Performing an analysis of alternative routes for the purely theoretical purpose of NEPA review, when no agency has authority to act on proposed alternatives, is a sham and an abuse of the NEPA process that gives participants an entirely false impression that their participation might somehow influence the outcome.	<p>As described in Section I-2.3 of Appendix I of the EIS, the Montana DEQ (MDEQ) has worked diligently to address alternative routes, route variations, and minor realignments in Montana. MDEQ exercised its right and obligation to require that the applicant pursue alternative routes and rightfully carried out its duties on behalf of the citizens of Montana.</p> <p>As noted in Consolidated Response ENR-1, the environmental review, including preparation of this EIS, has been conducted consistent with the DOS regulations pertaining to NEPA (22 CFR Part 161) as well as the Council on Environmental Quality (CEQ) regulations for implementing NEPA (40 CFR Part 1500). As a result, DOS considers the EIS to be consistent with the requirements of a NEPA environmental review.</p>
1429	79	Hayes	Douglas	Sierra Club et al	The EIS also fails to consider existing pipeline routes, including the route of the recently completed Keystone pipeline, which begins in Alberta and would require only a relatively short additional section to reach the Gulf coast. At no point does the EIS attempt to justify the additional disruption, destruction and risk of an entirely new pipeline route.	Consolidated Response ALT-1 and Section 4.3 address potential alternative routes, including use of the existing Keystone Oil Pipeline System route.
1429	80	Hayes	Douglas	Sierra Club, et al	The DEIS fails to adequately demonstrate that efforts were properly made to avoid or minimize wetland, stream and river impacts. As described above; the DEIS's acceptance of TransCanada's stated need for the project fails to account for projections of stagnant or declining demand for liquid fossil fuels. The DEIS thus rejects the No Action Alternative based on this faulty statement of purpose and need. However, the No-Action Alternative is the practicable alternative with the least damage to the aquatic environment. Thus, the currently proposed impacts to hundreds of rivers and streams and several hundred acres of wetlands should not be permitted under Section 404 and should not be allowed.	Section 3.3 of the EIS addresses stream crossings, including permitting requirements and potential impacts. As noted in Consolidated Response WAT-1, prior to commencing any stream crossing construction activities, Keystone would be required to obtain a permit under Section 404 of the Clean Water Act (CWA) and, in some cases, under Section 10 of the Rivers and Harbors Act of 1899 administered by the USACE and a CWA Section 401 water quality certification as per state regulations. These federal and state agencies would require measures to limit unnecessary impacts to aquatic and riparian species and their habitat during construction as a condition of the crossing permits. In Montana each crossing of a perennial stream would be reviewed in the field by personnel from the Montana Department of Environmental Quality and specific requirements for stream crossings would be determined upon completion of that review. The potential impacts to water quality associated with waterbody crossings along with relevant mitigation measures are addressed in Section 3.3.2.2 of the EIS.
1429	81	Hayes	Douglas	Sierra Club, et al	[T]he pipeline will cross vital water resources the Corps has not been protecting under the Act, meaning that no CWA permitting or mitigation requirements would apply. As such, impacts to water resources are not properly accounted for and analyzed under the OBIS.	Section 3.3 of the EIS addresses stream crossings, including permitting requirements and potential impacts. As noted in Consolidated Response WAT-1, prior to commencing any stream crossing construction activities, Keystone would be required to obtain a permit under Section 404 of the Clean Water Act (CWA) and, in some cases, under Section 10 of the Rivers and Harbors Act of 1899 administered by the USACE and a CWA Section 401 water quality certification as per state regulations. These federal and state agencies would require measures to limit unnecessary impacts to aquatic and riparian species and their habitat during construction as a condition of

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
						the crossing permits. In Montana each crossing of a perennial stream would be reviewed in the field by personnel from the Montana Department of Environmental Quality and specific requirements for stream crossings would be determined upon completion of that review. The potential impacts to water quality associated with waterbody crossings along with relevant mitigation measures are addressed in Section 3.3.2 of the EIS. The potential impacts to water quality associated with waterbody crossings along with relevant mitigation measures are addressed in Sections 3.3.3 through 3.4.5 of the EIS.
1429	82	Hayes	Douglas	Sierra Club et al	System alternatives would also have less impact on water resources and be practicable. It is possible use of existing pipelines could meet the need of this project, thus being practicable, and would avoid and minimize impacts to water resources as required by law. In terms of pipeline placement, dismissed alternatives would have less impact on water resources. The "Western Alternative," is one such alternative that may be both practicable and less damaging to water resources. The draft EIS admits that "[p]otential positive attributes to this alternative include the avoidance of the Missouri River crossing just to the east of the Fort Peck 87 draft EIS at 1-2.4.2.	System alternatives are addressed in Section 4.2 of the EIS, including statements explaining why they were not considered reasonable alternatives to the proposed Project. Similarly, the reasons for determining that alternative pipeline routes were not preferable to the proposed route are presented in Section 4.3 of the EIS.
1429	83	Hayes	Douglas	Sierra Club et al	In terms of pipeline placement, dismissed alternatives would have less impact on water resources. The "Western Alternative," is one such alternative that may be both practicable and less damaging to water resources. The draft EIS admits that "[p]otential positive attributes to this alternative include the avoidance of the Missouri River crossing just to the east of the Fort Peck Reservoir and the avoidance of crossings of reaches of the Niobrara River that have been included with the federal Wild and Scenic River program." draft EIS at 4-17. Not mentioned, but also a potential reduction in impacts to water resources of this more westerly route, is the avoidance of vital and sensitive prairie potholes generally located in the more eastern portions of Montana and South Dakota. Additionally, the preferred Gulf Coast Section alternative (GCS-A) has considerable more impacts to wetlands than the rejected alternative (GCS-B), which is only 6 miles longer. draft EIS at 4-18, Tbl. 4.3.5-1. GCS-A has more than 280 acres of impacts than GCSB (853.3 compared to 573.3). The cited reason for rejected GCS-B is its "greater length" and "associated greater area of impact and [stream/river] crossings." Yet, while this alternative does have more waterway crossings, the difference in wetland impacts (280 less acres of impacts for the rejected alternative) dwarfs the difference in stream crossings (13.2 more acres of impacts). Tbl. 4.3.5-1. The added six miles of length hardly makes this alternative impracticable, especially when almost 98% of this rejected alternative would parallel existing ROWs of other linear facilities. [See footnote pg. 71].	The proposed Missouri River crossing would be accomplished using the horizontal directional drilling method and would not result in a significant impact. The reach of the proposed crossing site of the Niobrara River is not part of the Wild and Scenic River program. As noted in the EIS, the proposed Project would not cross prairie potholes. Alternative GCS-B would cross more agricultural land, rangeland and grassland, developed land, more open water and rivers and streams than the proposed route. In addition, Alternative GCS-B would be in close proximity to more developed areas along its route than the proposed route. DOS considers the reasons stated for rejecting Alternative GCS-B to be reasonable and adequate.
1429	84	Hayes	Douglas	Sierra Club et al	C. The DEIS does not Adequately Address the Direct, Indirect and Cumulative Impacts of the Keystone XL Pipeline . The Keystone XL project will enable increased tar sands crude extraction in Canada contribute to perpetuation of use of oil	As noted in Consolidated Response ENR-1, the environmental review, including preparation of this EIS, has been conducted consistent with the DOS regulations pertaining to NEPA (22 CFR Part 161) as well as the Council on Environmental

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					and inhibit development of alternative energy, and the EIS should consider the impacts of tar sands vis a vis alternative energy sources.	<p>Quality (CEQ) regulations for implementing NEPA (40 CFR Part 1500). As a result, DOS considers the EIS to be consistent with the requirements of a NEPA environmental review.</p> <p>Consolidated Response ALT-2 addresses the use of alternative technologies, alternative energy sources, and conservation of energy. The impacts associated with implementation of the proposed Project are addressed in Section 3.0 of the EIS. Section 3.13 of the EIS addresses reliability and safety issues, including calculations of the probability of a spill from the proposed Project and the potential environmental impacts associated with spills.</p> <p>Cumulative impacts are addressed in Section 3.14 of the EIS. The assessments in Section 3.14 were conducted following CEQ guidance on cumulative impact analyses. As noted in Consolidated Response ENR-1, the environmental review, including preparation of this EIS, has been conducted consistent with the DOS regulations pertaining to NEPA (22 CFR Part 161) as well as the Council on Environmental Quality (CEQ) regulations for implementing NEPA (40 CFR Part 1500). As a result, DOS considers the EIS to be consistent with the requirements of a NEPA environmental review.</p>
1429	85	Hayes	Douglas	Sierra Club et al	The proposed Keystone XL project will enable further expansion of tar sands development in the Western Canada Sedimentary Basin in the province of Alberta. The existing crude oil pipeline export capacity from Canada's tar sands region is insufficient to accommodate the forecasted crude oil supply growth. DEIS at 1-5. Limits on infrastructure limit expansion of tar sands oil extraction, while increased infrastructure for importing and refining tar sands oil, increases the pressure for rapid development in the Canadian tar sands. This expansion of tar sands development only exacerbates the many existing environmental and social problems caused by tar sands production in that region [footnote, pg 40].	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information on current and future production. As noted in that Consolidated Response, without the proposed Project, oil sands development would continue at or above the current level until at least 2020, with or without the proposed Project.
1429	86	Hayes	Douglas	Sierra Club et al	The U.S. demand for tar sands and infrastructure for transportation (including pipelines) have a close causal relationship with tar sands extraction in Canada. The U.S. is by far the biggest customer of Canadian tar sands. For example, the 2010 report of Corporate Ethics International et al., "The Tar Sands Invasion," [footnote, pg 40] states that 99% of exported Western Canadian crude goes to the United States. According to the Keystone XL DEIS, in 2008, Canada was the largest exporter of crude oil to the U.S., shipping approximately 1.7 million bpd (70 percent of total production) from western Canada to the U.S. And CAPP (2009) predicted that demand from Canadian refineries would increase by only about 0.076 million bpd by 2015. Therefore, it is expected that Canada will continue to export the bulk of its crude oil production to the U.S. market. DEIS at 1-5. Other customers, Asia for example, are no current or viable substitute for this market since there is insufficient infrastructure to transfer the Canadian crude there and the Asian markets are not	Consolidated Response P&N-1 addresses the need that the Project has been proposed to meet. Consolidated Response ALT-2 addresses the use of alternative technologies, alternative energy sources, and conservation of energy. Consolidated Response GHG-2 addresses the potential causal connection of implementation of the proposed Project and expanded oil sands production in Canada and increases in refining. Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information on current and future production. As noted in that response, without the proposed Project, oil sands development would continue at or above the current level until at least 2020, with or without the proposed Project.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					developed to receive it [footnote, pg 41]. What the DEIS overlooks is that U.S. oil consumption can be expected to increase simply because adding million of barrels per day of new supplies to the U.S. market will shift the long-term supply curve, even if refineries are at capacity, since this additional source of oil will perpetuate operation of the refineries and the use of oil in the United States as opposed to developing alternative energy sources. The DEIS also overlooks, and should be revised to analyze, the impact of this supply of oil. Even if the supply brought in by the Keystone XL project were not enough to effect price, this increased supply and availability of oil will inhibit or replace development of alternative technologies. In the transportation sector this includes for example natural gas or hydrogen vehicles. In the power generation sector this includes for example wind, solar, nuclear and natural gas. This was explained in an analogous case, Mid-States Coalition for Progress v. Surface Transportation Board, 345 F.3d 520, 549 (8th Cir. 2003), where the court invalidated an FEIS for a rail line transporting coal on the grounds that it failed to explore the indirect effects of the project on the market for alternative sources of energy that had lesser air quality impacts.	
1429	87	Hayes	Douglas	Sierra Club et al	Although Mid-States involved a coal train, the same principles apply here. We also refer you to and incorporate by reference: "How the Oil Sands Got to The Great Lakes Basin: Pipelines, Refineries and Emissions to Air and Water," (University of Toronto 2008) [footnote, pg 41]. The report discusses how "continued reliance on oil might inhibit the development of alternative energy sources such as wind or solar power [footnote, pg 41]. Also, that report refers to a 2008 report from the United States Conference of Mayors, which discusses how "continued . . . production and purchase of these higher-carbon, unconventional or synthetic fuels slows the United States' transition to clean, renewable energy sources [footnote, pg 41]. Thus, the importation of tar sands affects the energy market and inhibits the development of alternative sources of energy. The perpetuation of oil consumption that is caused or contributed to by tar sands displaces development of alternative sources of energy. Thus the relevant comparison of environmental impacts is not the combustion of fuels derived from heavy synthetic crude compared to those derived from conventional crude oil. Instead, the impacts of combustion and use of heavy synthetic fuels should be compared to other reasonable alternatives such increased use of alternative fuels and improving energy efficiency and thus reducing the demand for oil.	Consolidated Response ALT-2 addresses the use of alternative technologies and alternative energy sources. As noted in Consolidated Response P&N-1 and Section 1.4.2 of the EIS, PADD III refineries currently have a need for heavy crude oil to replace dwindling supplies from Mexico and Venezuela. The Project has been proposed to meet the heavy crude oil needs of refineries in the Gulf Coast area, not for the U.S. in general. In addition, the Alberta Clipper and existing Keystone pipeline projects serve other markets and do not meet the demands of the Gulf Coast refineries. The EIS relies partially on a study commissioned by the Department of Energy and prepared by EnSys (2010). The EnSys analysis includes a low-demand outlook for US petroleum product demand that is based on a February/March 2010 study by EPA which examined "more aggressive fuel economy standards and policies to address vehicle miles traveled." As stated in the EnSys report "Projections were used from the EPA Scenario A leading to reductions to US petroleum product consumption versus the AEO 2010 outlook starting post 2015 and reaching 1.2 mbd by 2020 and 4.0 mbd by 2030." The low-demand scenario in the EnSys report was developed in close consultation with DOE, EPA, and DOS.
1429	88	Hayes	Douglas	Sierra Club et al	As discussed in greater detail below, the global warming impacts of tar sands oil extraction are felt not only in Canada but also in the United States, particularly in northern Alaska, where temperatures have increased at almost twice the global average rate [footnote, pg 42]. These impacts are the reasonably foreseeable effects of increasing tar sands production and transport capacity and should be included in the analysis of the environmental impacts of the proposed project.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1. Consolidated Responses GHG-1 through GHG-5 address concerns related to greenhouse gas, climate change, alternative energy considerations, and approach to assessment of GHG emissions.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
1429	89	Hayes	Douglas	Sierra Club et al	Open pit mines and intensive drilling are turning the boreal forest into a wasteland. the tar sands are a geologic formation that lie beneath approximately 149,000 square kilometers of Alberta's northeastern boreal forest. The Boreal is home to many species sensitive to industrial development, such as caribou and lynx. Many of these species migrate across the US/Canadian border. But open pit mining turns this valuable ancient forest into a wasteland, destroying acres of forest and polluting waters. Some 32 million acres of ecosystem are being destroyed in Canada [footnote, pg 43]. Drilling in the tar sands requires such a complex network of wells, roads, and pipes in areas where drilling is taking place, that every part of the forest will be within a few hundred yards of an industrial intrusion. Although the companies in the tar sands assert that the land is reclaimed after mining, there has not yet been any mine fully reclaimed [footnote, pg 43]. Forest, peatlands, and wetlands ecosystems are highly complex, and it is unlikely they will regenerate in areas filled with mine waste [footnote, pg 43]. Peat bogs are the single best carbon sink of any habitat in terms of tons of carbon captured and stored. Their destruction in this process adds to the negative global warming impacts as stored greenhouse gases are released and capture capacity is lost [footnote, pg 43].	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1. Consolidated Responses GHG-1 through GHG-5 address concerns related to greenhouse gas, climate change, alternative energy considerations, and approach to assessment of GHG emissions.
1429	90	Hayes	Douglas	Sierra Club et al	Toxic waste and large-scale water withdrawals threaten delicate wetlands and river ecosystems. Both mining and drilling operations in the tar sands have severe impacts on water supply and quality in Alberta. To extract the tar sands the soil is strip-mined and subjected to high temperature steam to separate the oil from the sand producing a heavy, dirty crude. If the sands lie too deep beneath the surface for strip mining (generally over 100 meters), in situ extraction is used by heating the tar sands to the bitumen can flow to a well and be pumped to the surface [footnote, pg 43].	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1. Consolidated Responses GHG-1 through GHG-5 address concerns related to greenhouse gas, climate change, alternative energy considerations, and approach to assessment of GHG emissions.
1429	91	Hayes	Douglas	Sierra Club et al	The tar sands region is rich in wetlands in the form of bogs, fens, shallow ponds, shoreline marshes, and river delta systems, such as the Peace-Athabasca Delta just downstream from the tar sands (to the north). The Alberta Chamber of Resources has identified water use as one of the top-four key challenges for mining operations [footnote, pg 43]. Mining operations require dredging wetlands and taking large amounts of water from the rivers. The ecological integrity of any aquatic ecosystems requires that adequate flows and seasonal variations in flow be maintained. Fish populations such as walleye, goldeye, and long-nose sucker are vulnerable, particularly when water withdrawals reduce winter habitat in the Athabasca River. 105 But water allocations for existing, approved, and planned tar sands mining operations are expected to quadruple over allocations for existing projects in 2004 [footnote, pg 44].	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1. Consolidated Response GHG-4 addresses concerns regarding the loss of boreal forest and peat bogs.
1429	92	Hayes	Douglas	Sierra Club et al	In-situ operations that take water from underground aquifers can also harm the area's water supply. The hydrology in this region is a complex network of underground freshwater and saline aquifers, ground waters, and wetlands. The links among these systems are not yet fully understood, nor are the	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					impacts of the water withdrawals on surface land and waters [footnote, pg 44]. One specific concern is that taking water out of underground aquifers could cause surface water tables to sink - for example, causing a loss of wetlands [footnote, pg 44]. Tar sands mines also require extensive human-made wastewater reservoirs or "tailings ponds" that pose another potential threat to wildlife and water. Collectively, these pools of waste cover almost 20 square miles, and are so vast that they can be seen from space [footnote, pg 44]. The high concentrations of pollutants such as naphthenic acids in tar sands tailings ponds are acutely toxic to aquatic life [footnote, pg 44]. To chase off migratory birds, propane cannons go off at random intervals and scarecrows stand guard on floating barrels. Many of the tailings ponds are next to water bodies such as the Athabasca River, and there are concerns about potential leakage from existing tailings ponds and from future "remediated" or buried tailings. Alberta Environment does not regulate naphthenic acids, and future management of these pollutants is fraught with uncertainty [footnote, pg 44]. The deadly nature of these tailings ponds was demonstrated in May 2008 when over 1,600 migrating ducks died after landing in a tar sands tailings pond [footnote, pg 44].	
1429	93	Hayes	Douglas	Sierra Club et al	The analysis set forth in the DEIS concerning cumulative impacts associated with petroleum refining is insufficient in four major respects. First, it impermissibly relies on the Clean Air Act ("CAN") and Clean Water Act ("CWA") permitting process at individual refineries to address environmental issues associated with the processing of product delivered via the Project rather than presenting independent analysis, which is both required by law and central to the purpose of NEPA environmental review. As a result, it neglects to address a number of critical areas of potential environmental impact associated with refineries.	As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries.
1429	94	Hayes	Douglas	Sierra Club et al	Second, the draft EIS fails to adequately analyze a variety of possible supply and demand scenarios for clean energy and different grades of crude oil. Instead of making an earnest effort to analyze what oil the bitumen from the Keystone XL pipeline would be displacing, how much of it would be additional, and what alternatives there are to the project, the draft EIS makes contradictory, unsupported assumptions in what appears to be an attempt to further the project.	Consolidated Response P&N-1 addresses the need that the Project has been proposed to meet. As noted in that Consolidated Response, the Project has been proposed to meet the heavy crude oil needs of refineries in the Gulf Coast area, not for the U.S. in general. In addition, the Alberta Clipper and existing Keystone pipeline projects serve other markets and do not meet the demands of the Gulf Coast refineries. The EIS relies partially on a study commissioned by the Department of Energy and prepared by EnSys (2010). The EnSys analysis includes a low-demand outlook for US petroleum product demand that is based on a February/March 2010 study by EPA which examined "more aggressive fuel economy standards and policies to address vehicle miles traveled." As stated in the EnSys report "Projections were used from the EPA Scenario A leading to reductions to US petroleum product consumption versus the AEO 2010 outlook starting post 2015 and reaching 1.2 mbd by 2020 and 4.0 mbd by 2030." The low-demand scenario in the EnSys report was developed in close consultation with DOE, EPA, and DOS. A conclusion of the EnSys report is "[i]f KXL were not built, the scenario analyses show there is a demand for alternative projects to be implemented that would lead, over time, to

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
						crude flows from WCSB to PADD2 and thence from PADD2 to the PADD3 Gulf Coast broadly similar to those that would be provided by KXL." This conclusion suggests that with or without KXL, WCSB crude oil would reach Gulf Coast refineries to replace heavy crude oil from current sources that are either diminishing or subject to political uncertainty.
1429	95	Hayes	Douglas	Sierra Club et al	Third, the analysis assumes without basis a wide distribution of the product delivered by the Project to refineries throughout PADD II and PADD III, and based on this assumption declines to provide any analysis of region-specific impacts on air quality. In fact, however, it is possible to predict the destination of a substantial amount of the Keystone XL crude with more specificity, based upon publicly available information concerning market factors and physical constraints, such that air quality impacts in these destination communities can and should be assessed with specificity as well.	As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries. Consolidated Response OIL-4 also addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils.
1429	96	Hayes	Douglas	Sierra Club et al	Finally, the draft EIS fails to comply with the Department's obligation to assess the impacts of the action on minority and low-income communities, many of which are already heavily impacted by high levels of pollution and will be harmed further by the pollution likely to stem from refining the project crude.	As discussed in the EnSys 2010 report, the quantity of crude oil refined in PADD III is driven by market conditions and is independent of the existence of the proposed Project. The proposed Project would provide access to WCSB crude oil in PADD III refineries that would supplant supplies from other sources, including Venezuela and Mexico. As discussed in Section 3.13.5.1 of the EIS and Consolidated Response OIL-4, the composition of WCSB crude oils that could be transported by the proposed Project is not dissimilar from other heavy crude oils currently refined in PADD III. There is therefore no credible evidence that implementation of the proposed Project would lead to disproportionate adverse impacts on minority and low income populations near PADD III refineries.
1429	97	Hayes	Douglas	Sierra Club et al	The DEIS refinery impacts analysis is grounded in assertions that any air quality impacts associated with refining of product delivered via the Project will be addressed in CAA permitting of the refineries. Specifically, the DEIS states as follows: The existing refineries processing heavy crude oil in PADD II and PADD III are designed and permitted to refine heavy crude oil and the processing of heavy crude oil transported via the proposed Project is not expected to influence the exceedance of any permitted thresholds. EPA is the federal agency with the authority to implement and enforce requirement [sic] of the Clean Air Act. State agencies with approved State Implementation Plans (SIPs), including Texas and Louisiana, have been delegated authority by the EPA to administer an air quality permitting program. The permitting process is designed to avoid significant cumulative impacts to regional air quality associated with emissions. DEIS at 3.14-33	As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries. Consolidated Response OIL-4 also addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils.
1429	99	Hayes	Douglas	Sierra Club et al	These statements contravene NEPA's requirement that the EIS evaluate the reasonably foreseeable cumulative impacts of the Project. Cumulative impacts are "the impact[s] on the environment which result[] from the incremental impact of the action when added to other past, present, and reasonably foreseeable future actions regardless of what agency (Federal or nonFederal) or person undertakes such other actions." 40 C.F.R. § 1508.7. Reliance on EPA's permitting processes as a	As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					substitute for independent analysis of environmental impacts under NEPA is therefore entirely inappropriate. It is settled law that NEPA requires a separate "hard look" at a project's cumulative impacts, and that assuming that these cumulative impacts will not exist because such permitting processes exist is no substitute for the appropriate analysis. See, e.g., <i>Wyo. Outdoor Council v. U.S. Army Corps of Eng'rs</i> , 351 F.Supp.2d 1232, 1243 (O.Wyo.2005) (noting that "by their very nature" cumulative impacts cannot be adequately assessed via such segmented permitting processes and holding that reliance on such permitting is unacceptable under NEPA). The purpose at the heart of NEPA - and in particular its cumulative impact analysis requirements - is to provide the type of comprehensive environmental analysis that may otherwise be missed in piecemeal permit-by-permit analysis of individual facilities, media, and construction activities. Here, inappropriate reliance in the DEIS on CAA and CWA permitting requirements for refineries results in significant deficiencies in the analysis. Regarding the change in emissions of criteria pollutants associated with proposed refinery expansions in Illinois, Indiana, and Michigan, the DEIS states: As a result of improvements in control technologies and the use of offsets, these refinery upgrades and expansions generally resulted in an overall increase in carbon monoxide, and a decrease in emissions of particulate matter, sulfur dioxide, and nitrogen dioxides. DEIS at 3.14-34.	
1429	100	Hayes	Douglas	Sierra Club et al	The assumption in the DEIS is that "any refinery expansions or upgrades at refineries that would receive crude oil from the Project would likely be required to adhere to the same or comparable regulatory standards." DEIS at 3.14-34. However, the emissions decreases that the DEIS claims have occurred, and tend to occur, during the permitting process for refineries increasing their capacity of heavy crude oil processing are often from unrelated improvements, and do not imply that the actual emissions impacts of the project will be low. The emissions estimates produced in netting analysis pursuant to CAA prevention of significant deterioration ("PSO") and nonattainment new source review ("NNSR") requirements are not simple estimates of increases associated with a particular permitted activity. Rather, they are the sum of raw emissions increase estimates - which are often very significant for expansions to allow processing of tar sands crude - and any other legally creditable emissions increases and decreases at the facility within a multi-year "contemporaneous" time frame. See 40 C.F.R. 52.21; 40 C.F.R. 51.166(b).	As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries. Consolidated Response OIL-4 also addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils.
1429	101	Hayes	Douglas	Sierra Club et al	Thus, in many cases, the actual emissions increase associated with processing crude delivered via the Project will be entirely offset in the permitting process by past unassociated emissions decreases. In such case, the net emissions derived from the permitting process will not reflect the full projected actual increase associated with an expansion project. Indeed, in one major recent expansion project, at BP's Whiting refinery in northwest Indiana, hundreds of tons of increases in sulfur dioxide (SO2) were offset by emissions reductions taken many years ago at the facility, such that they	As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries. Consolidated Response OIL-4 also addresses the composition of the Canadian crude oil that would be transported by the proposed Project, including concerns relative to the corrosivity and erosivity of the crude oil. As noted in that Consolidated Response, that crude oil is similar in composition and

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					were not reflected in the final netting numbers used to determine the need for more stringent emission controls. It is the purpose of NEPA analysis to see past such limitations of permitting analysis and to look more comprehensively at the real impacts of a project.	properties to other heavy crude oils that are currently transported within the U.S. pipeline system and similar in composition and properties to other heavy crude oils that are currently refined in PADD III.
1429	102	Hayes	Douglas	Sierra Club et al	With respect to water emissions the DEIS analysis is extraordinarily thin and falls far short of what is required and appropriate under NEPA. The DEIS does no more than recite. In cursory fashion a few of the technical upgrades that have sometimes been associated with refinery expansion projects to reduce associated wastewater and stormwater emissions. This "analysis" fails to acknowledge or address the fact that, in several instances (e.g., the BP Whiting refinery expansion and the ConocoPhillips Wood River refinery expansion), significant increases in discharges to clean water bodies as a result of tar sands refinery expansions have been allowed under CWA anti-degradation regulations based upon a purported showing that the increase is "necessary to accommodate important economic or social development [footnote, pg 47] in BP's water permit. for example, the company attributes increases in ammonia discharges directly to the equality of the Canadian crude, saying that bitumen has 4.5 times the nitrogen of conventional crude. Because of this, they say, they will have an increase of more than 2,000lbs of ammonia in their process wastewater [footnote, pg 47]. In this case, the permit would have allowed the facility to emit a higher level of pollution. The DEIS should not assume that permits will not allow facilities to emit additional pollution and must do the analysis for such a situation. In any event, for purposes of NEPA review, any increased discharge to water must be considered as part of cumulative impacts analysis regardless of whether state regulators have determined in the permitting context that the increase is "necessary."	As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions or discharges in Gulf Coast refineries. Consolidated Response OIL-4 also addresses the composition of the Canadian crude oil that would be transported by the proposed Project, including concerns relative to the corrosivity and erosivity of the crude oil. As noted in that Consolidated Response, that crude oil is similar in composition and properties to other heavy crude oils that are currently transported within the U.S. pipeline system and similar in composition and properties to other heavy crude oils that are currently refined in PADD III.
1429	103	Hayes	Douglas	Sierra Club et al	Moreover, the DEIS merely recites possible ranges of pollutants, without examining the possible environmental effects of these pollutants. The DEIS reiterates the conclusory assertion that "required air permitting ... would avoid significant cumulative impacts to air quality," and uses this as justification to completely neglect to quantify the possible impacts that increased pollution would have upon the environment and human health. DEIS at 3.14-36. Such a cursory treatment of pollution increases from the refining of heavy crude oil does not satisfy the agency's obligations under NEPA to take a "hard look" at the cumulative effects of the Project. <i>Kleppe v. Sierra Club</i> , 427 U.S. 390,410 n.21 (1976).	Section 3.14.3.14 assesses cumulative impacts and at no point indicates they do not exist. Section 3.14.3.14 states, "While the refineries that could receive crude oil are not part of the Project, refinery operations could potentially result in cumulative impacts to air quality in the general Project area or beyond if changes in the type or quantity of emissions occurred in the future." In addition, Section 3.14.3.14 reiterates that state permitting processes for existing, upgraded or new refining facilities are designed to avoid significant cumulative impacts to regional air quality associated with emissions. However, as described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries. Consolidated Response OIL-4 also addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils.
1429	104	Hayes	Douglas	Sierra Club et al	b. Lack of analysis of different clean energy and oil supply and	A conclusion of the EnSys (2010) report is "[i]f KXL were not

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					demand scenarios In several places, the DEIS asserts that the crude supplied by the Project will not likely increase overall refining of heavy crude, because the Project crude will simply be replacing existing heavy crude supplies. Specifically, it states: Since light crude supplies are decreasing, refinery upgrades and expansions that allow for the refining of heavy crude oil, especially along the Gulf Coast, are occurring and would continue to occur whether or not the Project is constructed. DEIS at 3.14-35. This statement makes multiple unsupported assumptions. First, it assumes that the increased supply of heavy crude caused by the project will have no effect on refinery behavior. This assumption is entirely unrealistic and such assumptions have been held to be unacceptable by courts. In Mid-States Coalition for Progress v. Surface Transportation Board, 345 P.3d 520, 549 (8th Cir. 2003), for example, the court rejected an agency's contention that it need not examine how a rail line which would increase the availability of coal would affect the long-term demand for coal by utility companies versus other cleaner fuel sources. The situation here is closely analogous. The Department must seriously examine the extent to which the increased availability of bitumen will lead, over time, to an increased demand for bitumen vis-a-vis cleaner crude sources and alternative energy.	built, the scenario analyses show there is a demand for alternative projects to be implemented that would lead, over time, to crude flows from WCSB to PADD2 and thence from PADD2 to the PADD3 Gulf Coast broadly similar to those that would be provided by KXL." This conclusion suggests that with or without KXL, WCSB crude oil would reach Gulf Coast refineries to replace heavy crude oil from current sources that are either diminishing or subject to political uncertainty. As noted in EnSys (2011), there are may different potential options for transporting WCSB crude to the Gulf Coast refineries in response to market demand there if the proposed Project is not permitted. Additionally, as discussed in Section 3.13 of the EIS, the composition of WCSB heavy crude oils is similar to the composition of heavy crude oils currently within the crude oil slates of Gulf Coast refineries. Finally, as in shown in Table 3.14.3-5 in the EIS and as discussed in the text of Section 3.14.3, refinery crude slate quality (as indicated by API gravity and sulfur content) is not highly sensitive to the percentage of WCSB crude oil in the crude slate mix. Therefore, it is unlikely that there would be any significant change in refinery emissions should the proposed Project be implemented.
1429	105	Hayes	Douglas	Sierra Club et al	Instead of making these unsupported, contradictory assumptions as it does in the draft EIS, the State Department should conduct and present the results of a study about what types of oil the bitumen from the Keystone XL pipeline would be displacing, how much of it would be additional, (i.e. additional supply leading to increased refining, which would not occur in the absence of the project) and what alternatives there are to the project. The study should then look to the additional pollution that will be caused by displacement of alternative energy and cleaner crudes and by additional bitumen refining. [footnote, pg 48] This assessment should be conducted refinery by refinery. As discussed below, it is possible to narrow down the refineries that may receive Keystone XL blended bitumen significantly more than the draft EIS does.	As noted in Consolidated Response P&N-1, Section 1.4.2 of the EIS is an independently conducted, unbiased discussion of supply and demand and explains that crude oil transported by the Project would primarily replace (not displace) declining supplies of Mexican and Venezuelan crude oil. Consolidated Response OIL-4 addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that Consolidated Response, that crude oil is similar in composition and properties to other heavy crude oils that are currently transported within the U.S. pipeline system and similar in composition and properties to other heavy crude oils that are currently refined in PADD III. Consolidated Response P&N-3 addresses issues related to refinery emissions, including refining if the PADD III refineries expand their current output of refined product. Further, over 100,000 bpd of oil-sands derived Canadian crude oil is currently being refined in PADD III refineries.
1429	106	Hayes	Douglas	Sierra Club et al	It is possible that that this analysis will yield accurate and definitive numbers concerning the destination of the Project crude and the anticipated additional processing of bitumen (as opposed to replacement of current processing) that will occur as a result. To the extent that it is possible to make that determination, then it is essential that DOS do so, rather than relying on cursorily stated and entirely unsupported assumptions regarding this highly technical and complex matter.	The information on need for the proposed Project is neither cursory nor based on unsupported assumptions. As noted in Consolidated Response P&N-1, Section 1.4.2 of the EIS is an independently prepared, unbiased assessment of supply and demand, and is based on the projections of government agencies with the responsibility for conducting assessments of supply and demand, as well as the assessments of other experts in supply and demand analyses, and the findings of independent studies commissioned by the Department of Energy (EnSys 2010 and 2011).
1429	107	Hayes	Douglas	Sierra Club et al	We also recognize the possibility that, given the highly complex and difficult nature of such an estimate (which may	As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					depend upon knowledge of specific equipment at each affected refinery [footnote, pg 49], it will not be possible for DOS to make a precise refinery-by-refinery estimate. In such a case, however, DOS must fulfill its duty to provide the information that is available and to make a credible estimate based on generally accepted methods. [footnote, pg 49] It is appropriate that, to the extent a more complete analysis cannot be done, DOS has attempted to craft an analysis which would provide some information to the public by estimating an upper bound on additional air pollution that might be created by refining of the project crude. However, due to the flawed netting analysis and the lack of any analysis concerning increases in water pollutants, the analysis has failed in its task. Further, the analysis makes no attempt to narrow down the location or the actual impacts of these emissions on public health or the environment.	would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries. Consolidated Response OIL-4 also addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils.
1429	108	Hayes	Douglas	Sierra Club et al	The DEIS disregards the very real possibility that, in the absence of the Project, cleaner energy sources might replace the dirty crude being refined by many of the refineries in question. Instead, it proceeds on the premise that oil demand will be high and completely unaffected by oil supply or the availability of alternative energy sources. This possibility that, in the absence of the project, cleaner energy sources may be utilized more fully is also supported by multiple statements, policies, and analyses by the Obama administration. For example, a recent EPA analysis indicates that technologically feasible oil-saving policies in the transportation sector alone could save as much as 6.7 million barrels per day by 2030 [footnote, pg 49]. Given the very real possibility of a transition to a clean energy economy, instead of continuing reliance on oil, the Project must be treated for purposes of cumulative impacts analysis as a cause of both continued processing of crude at current levels, and of refinery expansions that might not otherwise occur.	Consolidated Response P&N-1 addresses the need that the Project has been proposed to meet. Consolidated Response ALT-2 addresses the use of alternative technologies, alternative energy sources, and conservation of energy.
1429	109	Hayes	Douglas	Sierra Club et al	Thus, the likelihood of the "worst case scenario" upper-bound air emissions analysis presented in the DEIS analysis should be thoroughly analyzed, which is not done in the DEIS. DEIS at 3.14-35 to 36. As discussed above, the upper-bound emissions analysis is inadequate in that the only data provided are total pollution ranges calculated via a flawed "netting" methodology. Additionally, the DEIS fails to consider the location-specific effects of these increases on the human environment.	Section 3.14.3.14 includes an estimation of increased emissions related to the Project based on the available information. As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries. Consolidated Response OIL-4 also addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils.
1429	110	Hayes	Douglas	Sierra Club et al	The DEIS declines to provide any analysis of refinery impacts in specific regions and locations, asserting flatly that such analysis is not possible given the wide geographic array of possible destinations for the Project crude. The DEIS sets forth only an overall estimate of potential emission increases based on extrapolation from PSDINNSR netting totals in the Motiva and Hyperion refinery permits.	It is unlikely that the proposed Project would impact refinery emissions examined in discrete areas. Refineries identified as candidates to receive heavy crude oil from the proposed Project already have the equipment installed to process such heavy oil and are already processing it in significant quantities. There is no indication that the proposed Project would actually induce those refiners to expand or upgrade. The refineries that have made the capital investments necessary to process

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
						heavier crude oils (which can total billions of dollars) have a significant financial incentive to obtain these heavy crude oils. In addition to the fact that heavy crude oils typically sell at lower prices than light crudes, these heavy crude refineries cannot process a lighter crude slate as efficiently. As indicated in comments on the supplemental draft EIS received from IHS CERA, if a refinery configured to process a heavy slate of crude oil were constrained to processing only a light crude oil slate, the volume of gasoline and diesel fuels produced could decrease by 15-20 percent. Not only would the refiner be paying relatively more for that light slate of crude oil, it would be producing less gasoline and diesel from it. This is the primary reason refiners would not typically replace a heavy crude oil slate with 100 percent light crudes. Although the EnSys (2010) report presented results on a PADD-wide basis, the modeling reflects sub-PADD details built into the WORLD model, including different refinery processing capabilities. If there is no projected change in PADD-wide crude slate quality, that indicates that there is no change in relative crude slate-quality within more discrete areas within the PADD.
1429	111	Hayes	Douglas	Sierra Club et al	As discussed above, this estimate is based on the faulty assumption that net emissions estimates generated in connection with NSR permitting reflect actual project-related emissions increases. DEIS at 3.14-34 to 36. That problem notwithstanding, the emissions numbers presented in the DEIS are quite high. The DEIS concludes that the project could result in the release of an additional: 1,736 tons of nitrogen oxides, 4,500 tons of carbon monoxide, 4,654 tons of sulfur dioxide, 2,353 tons of particulate matter and 1,061 tons of volatile organic compounds per year. DEIS at 3.14-36. The particulate matter estimate is almost 29 times the amount released by a medium-sized refinery, the Valero Houston facility [footnote, pg 50], (See Table 1.)	As discussed in Section 3.14.3 of the EIS, a conservative hypothetical maximum emissions estimate was developed by assuming that the entire crude oil volume transported by the proposed Project would be heavy crude oil, that it would be incremental to the volume of crude oil currently refined in PADD III, and that it would be refined at upgraded refineries. Using the emissions estimates discussed above for the Motiva refinery upgrade and the proposed Hyperion refinery project, this hypothetical maximum emissions estimate was calculated by multiplying the maximum proposed Project throughput (830,000 bpd) by the emission rates per barrel reported for Motiva or Hyperion since these refineries are assumed to be typical for recently upgraded refineries implementing BACT. It should be noted that this proposed maximum throughput is less than the maximum throughput assumed at the time of the draft EIS. Using these assumptions, the hypothetical maximum annual emissions of NOX would range between about 1,514 and 1,604 tons, CO emissions would range between about 3,804 and 4,148 tons; SO2 emissions would range between about 1,791 and 4,290 tons, particulate matter emissions would range between 1,186 and 2,170 tons, and VOC emissions would be about 1,718 tons. However, since the crude oil transported by the proposed Project would be replacing crude oil from other sources, the majority of the emissions generated from refining crude oil transported by the proposed Project would not result in incremental increases to refinery emissions in either PADD II or PADD III. Additionally, it is expected that approximately one-third of the volume transported by the proposed Project would not be heavy crude oil, particularly in light of the proposed Bakken Marketlink and Cushing Marketlink connected actions.
1429	112	Hayes	Douglas	Sierra Club et al	The sulfur dioxide estimate is more than 100 times the total sulfur dioxide emitted at that facility. Even for those pollutants for which the DEIS produces relatively low estimates, Table I	See Response to Comment 111 above.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					still indicates that the project will produce the equivalent of 5.8 times as much volatile organic compounds, 6.3 times as much nitrogen oxides, and 14.7 times as much carbon monoxide as a medium-sized US refinery. Even compared to the largest refinery in the country, the ExxonMobil Baytown facility, [footnote, pg 50] the project would still produce almost three times the sulfur dioxide and about one and a half times the particulate matter of such a facility. When combined with the high probability that the vast majority of project crude will be refined in a very small number of communities, as discussed later in this subsection, the additional pollutant loads on these communities are equivalent to building a number of new medium-sized refineries in these areas.	
1429	113	Hayes	Douglas	Sierra Club et al	Table 1 - DEIS Projected Pollutants Compared to 2008 Emissions of Selected Refineries In the face of the magnitude of these emissions estimates, it is inappropriate and unacceptable that the DEIS makes no effort whatsoever to specify where these fairly massive potential emission increases would take place. Specifically, the DEIS justifies its failure to provide location-specific analysis as follows: It is not possible to predict with certainty how refining the heavy crude oil transported via the proposed Project would impact air quality, or even where those impacts would occur. The potential refinery expansions are in various stages of planning and implementation, and each refinery is unique in regard to the size and type of expansion or upgrade, the type of best available control technology (BACT) that has been or would be implemented, the status of the expansions, the availability of air emissions modeling, and the resulting impact of associated emissions relative to existing conditions. DEIS at 3.14- 33 to 34.	See Response to Comment 110.
1429	114	Hayes	Douglas	Sierra Club et al	In the first instance, these broad assumptions regarding the destination of Project crude reflect a dereliction of DOS's duty to seek out specific information concerning adverse impacts. Where an evaluation of reasonably foreseeable significant adverse impacts requires information which is unavailable or incomplete, CEQ guidelines require that DOS obtain that information where the "overall costs of obtaining [the information] are not exorbitant [footnote, pg 52] If DOS cannot obtain the information, it is required to include a summary of "existing credible scientific evidence" relevant to those impacts and to evaluate those impacts based on "theoretical approaches or research methods generally accepted in the scientific community [footnote, pg 52] DOS could likely obtain much of the information needed to predict where the project crude will be refined. For instance, TransCanada could provide DOS with details of the shipping commitments the company has already signed, which total 380Mb/d (more than half of the initial 700Mb/d Keystone XL pipeline capacity) in order to determine where the crude will be refined [footnote, pg 52].	As noted in Consolidated Response ENR-1, the environmental review, including preparation of this EIS, has been conducted consistent with the DOS regulations pertaining to NEPA (22 CFR Part 161) as well as the Council on Environmental Quality (CEQ) regulations for implementing NEPA (40 CFR Part 1500). As a result, DOS considers the EIS to be consistent with the requirements of a NEPA environmental review.
1429	115	Hayes	Douglas	Sierra Club et al	However, even if the department cannot obtain such information, it can certainly summarize credible evidence concerning where the crude is likely to end up. As a factual	See Response to Comment 110.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					<p>matter, DOS's unsupported claims that the project crude could end up at any refinery in PADD II or PADD III are simply inconsistent with market realities. In view of capacity and cost constraints, it is clear that the overwhelming majority of the crude delivered via the Project would go to a limited number of refineries clustered in two specific areas. Analysis by the Canadian National Energy Board (NEB) found the market for the project crude to be limited to only fifteen refineries. (See Table 2.) An independent analysis by Accufacts attached to these comments (the "Accufacts Report") notes that "PADD II refineries are unlikely to refine more than a small fraction of the bitumen transported via the Keystone XL pipeline" because the area is "short on [bitumen] refining and long on pipeline capacity" that can bring bitumen to the area [footnote, pg 52]. The Accufacts Report therefore concludes that the vast majority of project crude will go to PADD III and identifies 22 refineries in the area that have the necessary "process building blocks" to be able to accept bitumen. Accufacts Report at 1, 7. (See Table 2.) The DEIS itself acknowledges that "there are some refineries ... that would be more likely to receive the oil." DEIS at 3.14-32 to 33. Yet despite that acknowledgement, and despite the publicly-available contrary information set forth in the NEB analysis and the Accufacts Report, the DEIS simply recites that there are a total of 85 refineries in PADDs II and III (27 in PADD II and 58 in PADD III) and neglects to engage in any analysis about which of these refineries are likely to process significant amounts of the Keystone XL bitumen (or are even capable of doing so). DEIS at 3 14-33</p>	
1429	116	Hayes	Douglas	Sierra Club et al	<p>The NEB Analysis and Accufacts Report are consistent in finding that the vast majority of project crude is likely to go to two localities within a small geographical area. The analyses are also wholly incompatible with the Department's contention that it is impossible make any predictions concerning where the crude will end up. Together, they provide a strong indication that the Department has not complied with its duty to provide the relevant evidence that can be obtained and to make use of theoretical approaches or generally accepted methods to evaluate impacts where full information is not available [footnote, pg 54].</p>	See Response to Comment 110 above.
1429	117	Hayes	Douglas	Sierra Club et al	<p>As discussed above, even the DEIS's flawed estimate of the additional pollution generated by the project indicates that permitting the project would be equivalent to siting a large number of new medium-sized refineries in these areas. Given that there is very little actual ambiguity regarding the refining destination of the crude delivered via the Project, it is imperative that the DEIS provide careful analysis of the impact of increased refining emissions on the affected region. The Houston Texas City and Port Arthur areas are already burdened with a heavy pollutant load, in particular from refinery emissions. It is essential to understand from the DEIS analysis what additional burden would result to the environment and public health from the increased supply of dirty, heavy crude delivered via the pipeline to refineries in these areas.</p>	<p>The comment is in error. See Response to Comment 110 above. As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries. Also see Consolidated Response JUS-1 which addresses potential impacts to minority and low-income populations.</p>

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
1429	118	Hayes	Douglas	Sierra Club et al	In addition to the Department's responsibility to analyze the specific local effects of air and water pollution caused by refining tar sands heavy crude, the department is also required, under Executive Order 12898, to address and attempt to minimize disproportionate impacts on minority and low-income populations [footnote, pg 55]. However, the draft EIS makes no effort to assess the environmental justice implications of the substantial increases in pollution likely to occur in communities around refineries.	As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries. Also see Consolidated Response JUS-1 which addresses potential impacts to minority and low-income populations.
1429	119	Hayes	Douglas	Sierra Club et al	Using CEQ guidelines [footnote, pg 55] the draft EIS identifies counties along the project corridor in which significant low-income or minority populations exist. draft EIS at 3.10-29 to 36. While all of the effects of the project on the identified counties should be analyzed, the low-income and minority communities in these counties are likely to be especially impacted by additional air and water pollution. This is particularly the case in light of the evidence presented in Subsection C that the refinery-related impacts are likely to be concentrated in a few specific localities, in which such communities can be identified.	See Response to Comment 110 above. As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries. Also see Consolidated Response JUS-1 which addresses potential impacts to minority and low-income populations.
1429	120	Hayes	Douglas	Sierra Club et al	...two of the counties identified by the draft EIS as containing minority and low income populations (Harris County, TX and Jefferson County, TX) are home to all of the refineries estimated to take crude in the Houston and Port Arthur areas. (The Texas City refineries are in Galveston County, which is not analyzed in the draft EIS, as discussed below.) These two communities are already heavily impacted by air and water pollution. Port Arthur, located in Jefferson County, Texas, was chosen by the EPA in November of last year as one of ten communities across the country in which the Agency is beginning a pilot program on environmental justice in order to address pronounced "environmental and human health challenges [footnote, pg 56]. Moreover, Jefferson County is designated as being in nonattainment with National Ambient Air Quality Standards (NAAQS) [footnote, pg 56].	As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries. Also see Consolidated Response JUS-1 which addresses potential impacts to minority and low-income populations.
1429	121	Hayes	Douglas	Sierra Club et al	The absence of analysis in the draft EIS on increased local air and water pollution from refineries also results in a failure to even assess the possible environmental impacts on minority and low-income populations that are outside the project corridor, but likely to be affected by Keystone XL. For instance, according to the NEB and Accufacts studies discussed in subsection C above there is likely to be significant refining of project crude in Galveston County, where the Texas City refineries are located. In addition, the studies identify a discrete number of other refineries located elsewhere which may refine project crude. (See Table 4.) The draft EIS should determine whether these counties contain significant low-income or minority populations under the CEQ guidelines and then go on to assess the possible impacts on these communities that might stem from additional refining of heavy crude.	See Response to Comment 110 above. As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries. Also see Consolidated Response JUS-1 which addresses potential impacts to minority and low-income populations.
1429	122	Hayes	Douglas	Sierra Club et al	Table 4- Counties-Parishes not Analyzed for Environmental Justice Impacts but Contain a Refinery Identified as Likely to Accept Project Crude - The draft EIS currently provides an	See Response to Comment 110 above. As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					under-inclusive list of counties with low-income and minority populations. It makes no effort to determine what effects the project will actually have on these communities or to document the existing problems in these areas that might be exacerbated by the project. The draft EIS must do more if the Department is to take seriously its responsibility to "make achieving environmental justice part of its mission by identifying and addressing ... disproportionately high and adverse human health or environmental effects of its activities on minority ... and low-income populations [footnote, pg 57].	independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries. Also see Consolidated Response JUS-1 which addresses potential impacts to minority and low-income populations.
1429	124	Hayes	Douglas	Sierra Club et al	As described above, extraction and refining of tar sands oil is extremely energy and greenhouse gas intensive. A life-cycle analysis of the GHG emission of tar sands oil shows significantly increased carbon dioxide emissions over conventional oil [footnote, pg 58]. A report by the Polaris Institute states that production of tar sands oil currently releases about three times more greenhouse gas emissions than pumping conventional oil producing about 85.5 kg of carbon dioxide per barrel of tar sands oil [footnote, pg 58]. The increase comes primarily from the fuel needed for the extraction of the tar sands (in most cases significant amounts of natural gas) and in the fugitive emissions from the overall process. The exploitation of this resource is resulting in Canada's violation of its Kyoto Protocol obligations and driving the outsourcing the refining part of the equation to the US, which is not a signatory party to the Kyoto treaty. !d.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information on current and future production. As noted in that Consolidated Response, without the proposed Project, oil sands development would continue at or above the current level until at least 2020, with or without the proposed Project. Consolidated Response GHG-1 addresses the greenhouse gas life-cycle analyses presented in the EIS.
1429	125	Hayes	Douglas	Sierra Club et al	While exploitation of the tar sands will generate up to one-third more greenhouse gas pollution than conventional oil, the mining of the tar sands compounds the global warming effect because it destroys hundreds, potentially thousands, of square miles of some of the best natural carbon sequestration on the planet. The tar sands are located in the boreal regions of northern Alberta, an area covered with forest and peatbogs. Removal of the trees and stripping away the bog removes the ecosystem's ability to store that carbon, but also ends up releasing previously stored carbon when the bogs dry out. !d. On average, 516 tons of carbon are stored per acre of peatland, by far the largest level of carbon sequestration of any organic system. Multiplying the 516 tons per acre by the number of acres destroyed in tar sands extraction adds up very quickly, compounding the extremely negative carbon equation of tar sands exploitation [footnote, pg 59].	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information on current and future production. As noted in that Consolidated Response, without the proposed Project, oil sands development would continue at or above the current level until at least 2020, with or without the proposed Project. Consolidated Response GHG-1 addresses the greenhouse gas life-cycle analyses presented in the EIS.
1429	126	Hayes	Douglas	Sierra Club et al	To get a true sense of the life cycle GHG emissions attributable to tar sands oil, the GHG emissions generated during extraction and upgrading must be added to the emissions generated by refining the tar sands crude into final petroleum products and to the emissions associated with combustion or the final end use of those fuels.	Consolidated Response GHG-1 addresses the greenhouse gas life-cycle analyses presented in the EIS.
1429	127	Hayes	Douglas	Sierra Club et al	Dr. Sahu's reasoning can be applied to calculate the GHG emissions associated with the Keystone XL pipeline, as the projects are substantially similar. The only significant differences between the two pipelines are their routes and ultimate capacity. Because both pipelines will transport the same type of heavy crude from Alberta to U.S. refineries, we	Consolidated Response GHG-1 addresses the greenhouse gas life-cycle analyses presented in the revised EIS.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					can assume that approximately 200 kg equivalent CO2 is emitted for every cubic meter of Keystone XL crude refined, and the life cycle figure per cubic meter is just over 3500 kg CO2 equivalent. The Keystone XL pipeline will have an ultimate capacity of 900,000 barrels of crude per day. Therefore, the refining of Keystone XL crude alone would emit 21.11 million kg of CO2 equivalent per day, or over 8.4 million tons per year. The life-cycle CO2 equivalent emitted by Keystone XL would be approximately 369.6 million kg per day, or approximately 149 million tons per year [footnote, pg 60]. Over the pipeline's expected lifetime of 50 years or more, the project can be expected to contribute at least 7.4 billion tons of CO2 equivalent to the earth's atmosphere.	
1429	128	Hayes	Douglas	Sierra Club et al	By any standards, 149 million tons per year is a significant figure. A large coal-fired power plant may generate 5 to 10 million tons of CO2 equivalent per year and the entire state of Montana is projected to emit 38.5 million metric tons of CO2 equivalent in 2010 [footnote, pg 60]. Because these emissions will have severe impacts on the health, welfare, economy, and environment of the region, the nation, and the planet as a whole, the State Department should conclude that the Keystone XL project has severe unmitigated adverse environmental impacts and reject the application for a Presidential Permit.	Consolidated Response GHG-1 addresses the greenhouse gas life-cycle analyses presented in the revised EIS. Consolidated Response ENR-1 provides information on the Department of State's environmental review process, the National Interest Determination process, and the need to complete those reviews before approving or denying the Presidential permit for the proposed Project.
1429	129	Hayes	Douglas	Sierra Club et al	By contrast, the DEIS concludes that "refining the crude oil transported by the project would result in total emissions in the range of 1.3 to 17.2 million tons of CO2 per year." DEIS at 3.14-41. This range is a drastic underestimation of actual GHG emissions associated with this project. Any subsequent NEPA document must consider the full life-cycle GHG emissions to provide decision makers with a clearer of the true climate change impacts.	Since the time of the draft EIS, DOS has conducted an extensive analysis of potential incremental carbon emissions associated with extraction, transportation, refining and combustion of crude oil that would be transported by the proposed Project. As stated in Section 3.14.3 of the EIS, the full range of incremental GHG emissions estimated across the reference crudes and sub-set of studies is 3 to 17 MMTCO2e annually at the near term initial throughput (of 700,000bpd) or 4 to 21 MMTCO2e annually at the potential throughput (of 830,000 bpd). This overall range of 3 to 21 MMTCO2e is equivalent to annual GHG emissions from the combustion of fuels in approximately 588,000 to 4,061,000 passenger vehicles or the CO2 emissions from combusting fuels used to provide the energy consumed by approximately 255,000 to 1,796,000 homes for one year. The differentials presented here are based on life-cycle emission estimates for current or near-term conditions in the world oil market, as can be seen from the reference years used in each report. Over time, however, the GHG emission estimates for fuels derived from both WCSB oil sands crude oils and the reference crude oils are likely to change.
1429	130	Hayes	Douglas	Sierra Club et al	The DEIS does not adequately address the Keystone XL project's global warming impacts. The few pages of the DEIS that the State Department devotes to the impacts of greenhouse gas emission fails to comprehensively describe or quantify the indirect emissions of GHGs and does not analyze the local, regional, or global environmental impacts of CO2 emissions from the Keystone XL pipeline and related facilities.	Consolidated Responses GHG-1 through GHG-5 address concerns related to greenhouse gas, climate change, alternative energy considerations, and approach to assessment of GHG emissions.
1429	131	Hayes	Douglas	Sierra Club et al	The DEIS considers the direct GHGs emitted during the three years of pipeline construction, (235,378 tons of GHG	As stated in Section 3.14.3, Indirect GHG emissions associated with electrical generation for the proposed Project

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					equivalent), mainly from the combustion of diesel fuel by construction equipment and vehicles. DEIS at 3.14-39. It also estimates the total GHG emissions from the operation of pipeline to be approximately 85 tons of CO2 equivalent per year. This projection fails to consider the GHGs emitted as a result of the necessary electrical generation during construction and operation of the pipeline, which the DEIS notes may be approximately 4.4 million tons per year. There is absolutely no discussion or reasoning to support this estimation, no alternatives proposed that would result in less electricity required, and no mitigation measures proposed.	pump stations are estimated at approximately 2.6 to 4.4 million tons of CO2 per year for a proposed initial capacity of 700,000 bpd and a potential capacity of 830,000 bpd, respectively, as calculated using EPA AP-42 emission factor for large diesel engines and assuming 30 pump stations with 79 to 132 pumps rated at 6,500 hp.
1429	132	Hayes	Douglas	Sierra Club et al	The DEIS also applies a number of different methodologies to calculate the GHG emissions from refining the oil transported by the pipeline and concludes that refining the oil transported by Keystone XL would result in total carbon emissions in the range of 1.3 to 17.2 million tons of CO2 per year. DEIS at.14-41. The DEIS only assesses the significance of the GHG emissions associated with operation and construction of the pipeline, concluding that "It is estimated that the amount of GHG emissions from Project construction and operations should not constitute a substantial contribution to the U.S. or global emissions due to the low percentage emission presented above, as compared with national and global emissions." Id. at 3.14-41. This conclusion fails to consider the total life-cycle GHG impacts (including the construction and operation of the pipeline, the extraction, upgrading, processing, and refining of the tar sands crude oil, and the end-use combustion of the refined product) as compared to U.S. and global emissions.	Consolidated Response GHG-1 addresses the greenhouse gas life-cycle analyses presented in the revised EIS. Since the time of the draft EIS, DOS has conducted an extensive analysis of potential incremental carbon emissions associated with extraction, transportation, refining and combustion of crude oil that would be transported by the proposed Project. As stated in Section 3.14.3 of the EIS, the full range of incremental GHG emissions estimated across the reference crudes and sub-set of studies is 3 to 17 MMTCO2e annually at the near term initial throughput (of 700,000bpd) or 4 to 21 MMTCO2e annually at the potential throughput (of 830,000 bpd). This overall range of 3 to 21 MMTCO2e is equivalent to annual GHG emissions from the combustion of fuels in approximately 588,000 to 4,061,000 passenger vehicles or the CO2 emissions from combusting fuels used to provide the energy consumed by approximately 255,000 to 1,796,000 homes for one year. The differentials presented here are based on life-cycle emission estimates for current or near-term conditions in the world oil market, as can be seen from the reference years used in each report. Over time, however, the GHG emission estimates for fuels derived from both WCSB oil sands crude oils and the reference crude oils are likely to change.
1429	134	Hayes	Douglas	Sierra Club et al	The analysis of GHG emissions in the DEIS does not account for (1) refinery upgrades and expansions necessary to accommodate the increased volumes delivered by the pipelines; (2) the upstream emissions generated by the increased tar sands development induced by increased US transport and refining capacity; (3) the reasonably foreseeable future expansion of the Keystone XL pipeline capacity from 700,000 to 900,000 barrels per day; (4) the cumulative impacts of refining crude delivered by similar and connected pipeline expansions; or (5) the downstream use of the oil. Because it omits these significant indirect and cumulative sources of greenhouse emissions the State Department's treatment of the global warming impacts is inadequate.	Consolidated Response GHG-1 addresses the greenhouse gas life-cycle analyses presented in the revised EIS. As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries. Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project.
1429	135	Hayes	Douglas	Sierra Club et al	Finally, despite the significant emissions of greenhouse gases resulting from the project, the DEIS fails to assess the impacts of global warming pollution on any environmental receptor such as wildlife, vegetation, water resources, humans, or land. Nor does the DEIS consider the economic impacts of emitting 149 million tons of CO2 equivalent annually. Peer reviewed studies have been performed modeling the economic costs of	In the interest of broadening the GHG impact analysis, EPA recommended in its comments on the supplemental draft EIS that another means or tool be used, such as an estimate of the social cost of carbon (SCC) associated with the potential increases of GHG emissions. To support this recommendation, EPA indicated that this tool is used by federal agencies including EPA in assessing the costs and

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					global warming and CO2 emissions [footnote, pg 61]. For example, it has been- estimated that each ton of CO2 emitted causes- approximately \$85 in damage. Id. This indicates that the true cost of the pipeline amounts to approximately 12.6 billion dollars per year, which is a cost that is bourn by society at large. These impacts of the project must be fully analyzed before the EIS is finalized. Center for Biological Diversity v. National Highway Traffic Safety Administration, 508 F.3d 508, 550 (9th Cir. 2007) ("The impact of greenhouse gas emissions on climate change is precisely the kind of cumulative impacts analysis that NEPA requires agencies to conduct.").	benefits of major rulemakings and in compliance with Executive Order 12866, Regulatory Planning and Review. However, this Executive Order would not apply to the DOS EIS because the federal action addressed in the EIS is not a rulemaking. The most applicable requirements for preparing EISs are derived from the Council on Environmental Quality's (CEQ) regulations for implementing the National Environmental Policy Act. In those regulations (40 CFR 1502), CEQ states in Section 1502.23 entitled, Cost-benefit analysis, "For purposes of complying with the Act, the weighing of the merits and drawbacks of the various alternatives need not be displayed in a monetary cost-benefit analysis and should not be when there are important qualitative considerations." Consequently, a federal agency has discretion in the analytical approaches, methods, and tools that it employs in an EIS to describe and analyze potential impacts. In addition, as per guidance from CEQ in 40 CFR Section 1502.22, DOS notes that the estimates of the GHG impacts of the proposed Project over its entire lifetime are incomplete and unavailable (as discussed in the previous response). To support this assertion and as discussed in Section 3.14.3.14, three main factors will significantly affect the relative GHG intensity of oil sands crudes relative to reference crudes in the future. First, GHG emissions from extraction will increase in the future for most reference crudes as it will take more energy to extract crude from increasingly depleted oil fields and to explore for further resources. Second, the relative mix of oil sands crudes developed from in situ versus mining extraction methods transported in the proposed Project will change in the future. As discussed in the EIS, in situ extraction—which is generally more energy- and GHG-intensive than mining—will represent a larger share of oil sands production in the future. Third, the GHG intensity of oil sands crudes will change due to extraction and upgrading technology improvements, but there is a high level of uncertainty in the implementation and performance of these technologies. Therefore, the GHG impacts of the proposed Project throughout the lifetime of the Project are highly uncertain and the information needed to develop GHG impacts estimates is incomplete.
1429	136	Hayes	Douglas	Sierra Club et al	The DEIS failed utterly to assess the climate forcing effects of significant black carbon emissions associated with the project. A rapidly growing body of scientific literature published since the Fourth Assessment Report of the Intergovernmental Panel on Climate Change identifies black carbon, a component of fine particulate matter (PM2.5), as a critical climate forcing agent, and suggests that reducing these emissions may be among the most effective near-term strategies for slowing Arctic warming and the melting of sea ice, the Greenland ice sheet, and glaciers and snow pack around the world [footnote, pg 62]. It has been estimated that the "soot effect on snow albedo may be responsible for a quarter of observed global warming [footnote, pg 62].	As noted in Section 3.12, there would be minor emissions of particulates associated with construction and operation of the proposed Project.
1429	137	Hayes	Douglas	Sierra Club et al	The proposed Keystone XL pipeline will involve multiple, significant sources of black carbon! PM2.5 emissions. Many of	As noted in Section 3.12, there would be minor emissions of particulates associated with construction and operation of the

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					these sources, particularly those sources related to the extraction of tar sands to supply the pipeline, are not considered in the DEIS. Additionally, even where PM2.5 emissions are, for example from diesel construction equipment, the DEIS fails to assess the significant climate forcing effect of the black carbon fraction of those emissions - the Environmental Protection Agency estimates the black carbon fraction of diesel PM2.5 emissions to be over 60% on average.	proposed Project.
1429	138	Hayes	Douglas	Sierra Club et al	The myriad on and off-road diesel vehicles, generators, construction equipment and earth moving equipment associated with construction of the pipeline and related facilities, tar sands extraction, as well as the oil sands plants in Alberta, are all significant sources of particulate matter, and thus black carbon, emissions. As they are all located above 40 degrees latitude, they are of particular concern as these emissions are the major source of black carbon deposition in the Arctic. (The DEIS mentions only that diesel generators will be installed for backup power at the Superior Terminal without noting either the climate or health impacts of black carbon emissions.) The particulate emissions associated with refining the tar sands oil should also be considered in the context of their global warming impacts.	As noted in Section 3.12, there would be minor emissions of particulates associated with construction and operation of the proposed Project.
1429	139	Hayes	Douglas	Sierra Club et al	According to a recent article in the Toronto Star [footnote, pg 63] quoting an Environment Canada study obtained under the Access to Information Act, increases in production at Alberta's oil sands plants will result in a net increase in conventional air pollution. The report indicates that particulate matter emissions would increase by more than 60 percent. The DEIS should consider the increased emissions that result from increased tar sands development to supply the Keystone XL and related pipelines in the US.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project.
1429	140	Hayes	Douglas	Sierra Club et al	Another example of inadequate context and information is the lack of analysis of thresholds of climate change, or tipping points. This is an important aspect of the environmental setting in which this proposed project will operate, and is a cumulative impact that must be considered in any subsequent NEPA document. The CEQ regulations require that an agency "evaluate reasonably foreseeable significant environmental effects on the human environment," even where information relevant to making this evaluation is "incomplete or unavailable." 40 C.F.R. § 1502.22. If this is the case, the agency must clearly show that the information is "lacking" by providing what credible scientific information it does have on these reasonably foreseeable impacts and making an effort to analyze these impacts based on this information. What information the agency must provide depends upon the costs of obtaining the information. See id.	As noted in Consolidated Response ENR-1, the environmental review, including preparation of this EIS, has been conducted consistent with the DOS regulations pertaining to NEPA (22 CFR Part 161) as well as the Council on Environmental Quality (CEQ) regulations for implementing NEPA (40 CFR Part 1500). As a result, DOS considers the EIS to be consistent with the requirements of a NEPA environmental review.
1429	141	Hayes	Douglas	Sierra Club et al	The DEIS contains no information on tipping points and the dangerous impacts of irreversible climate change. By failing to include this information, one can only conclude that DOS believed the information to be "incomplete or unavailable." As such, the DEIS violates NEPA. It is well accepted that there will be tipping points, and ample evidence demonstrates that	As noted in Consolidated Response ENR-1, the environmental review, including preparation of this EIS, has been conducted consistent with the DOS regulations pertaining to NEPA (22 CFR Part 161) as well as the Council on Environmental Quality (CEQ) regulations for implementing NEPA (40 CFR Part 1500). As a result, DOS considers the EIS to be

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					unchecked greenhouse gas emissions will also result in irreversible climate change. In fact, various studies have attempted to quantify when such a threshold may be reached. In its report, for example, the IPCC concluded: • Continued greenhouse gas emissions at or above current rates are expected to cause further warming and to induce many changes during the 21st century that will very likely be larger than those of the 20th century. • Anthropogenic warming and sea level rise would continue for centuries due to the time scales associated with climate processes and feedbacks, even if greenhouse gas concentrations were to be stabilized. • With current global climate change mitigation policies and related sustainable development practices, global GHG emissions will continue to grow over the next few decades. • In order to stabilize the concentrations of GHGs in the atmosphere, emissions would need to peak and decline thereafter.	consistent with the requirements of a NEPA environmental review.
1429	142	Hayes	Douglas	Sierra Club et al	In sum, by failing to disclose the true nature of climate change, the DEIS is fatally flawed, as DOS is required to "describe the environment of the area to be affected or created by the alternatives under consideration." 40 C.F.R. § 1502.15. The establishment of the baseline conditions of the affected environment is a fundamental, practical requirement of the NEPA process. See Half-moon Bay Fisherman's Marketing Ass'n v. Carlucci, 857 F.2d 505,510 (9th Cir. 1988) ("[without establishing ... baseline conditions ... there is simply no way to determine what effect [an action] will have on the environment, and consequently, no way to comply with NEPA."): To comply with NEPA, the DEIS must be revised to include this information and recirculate for public comment.	As noted in Consolidated Response ENR-1, the environmental review, including preparation of this EIS, has been conducted consistent with the DOS regulations pertaining to NEPA (22 CFR Part 161) as well as the Council on Environmental Quality (CEQ) regulations for implementing NEPA (40 CFR Part 1500). As a result, DOS considers the EIS to be consistent with the requirements of a NEPA environmental review.
1429	143	Hayes	Douglas	Sierra Club et al	The DEIS fails to adequately consider the downstream impacts of refining the heavy crude oil and using the finished petroleum product (most likely combustion of transportation fuels). In fact, the DEIS is completely silent on the issue of end use combustion of the Project's crude oil supplied by the project. See DEIS at 3.14-1-43. This glaring omission renders the DEIS in violation of NEPA and NEPA regulations. DOS must re-issue a DEIS that fully analyzes the life-cycle GHG emissions from the transported crude oil, including the likely combustion of the refined product by consumers. Assessment of the indirect impacts of increased imports of tar sands oil must include consideration of the air quality and climate change impacts of increased consumption of liquid petroleum-based fuels. In Mid-States Coalition for Progress v. Surface Transp. Board, 345 F.3d 520 (8th Cir. 2003), the Eighth Circuit held that the agency must include analysis of the indirect impacts from increased use of coal in an EIS examining a railroad intended to deliver coal from the Powder River Basin in Wyoming to Midwestern and eastern utilities. The court Comment Acknowledged that the increased coal use was likely and foreseeable and the environmental effects of burning more coal must be included in the EIS. Id. at 549. Similarly here, the Keystone XL pipeline will insert up to 900,000 barrels per day (and combined with other tar sands pipelines currently being built or planned in Minnesota and	Consolidated Responses GHG-1 through GHG-5 address concerns related to greenhouse gas, climate change, alternative energy considerations, and approach to assessment of GHG emissions. As noted inn Consolidated Response GHG-5, the maximum potential capacity of the proposed Project is 830,000 bpd.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					across the Upper Midwest over 2 million barrels per day) into the energy markets for refining into liquid fuels. The State Department must examine the full suite of environmental effects, not just from Keystone XL, but from the similar, and/or connected pipelines, from the resulting increases in tar sands extraction operations, the related refineries, and from the very use of the tar sands-derived fuel in the U.S.	
1429	145	Hayes	Douglas	Sierra Club et al	345 F.3d at 549. Similarly here, the increased access to crude oil provided by Keystone XL increases the use of oil-based liquid fuels relative to alternative fuel sources. Thus the likely and foreseeable environmental effects of burning more liquid fossil fuels, including the air and water quality impacts and the displacement effects on the development of renewable fuel sources, must be included in the EIS.	Consolidated Response P&N-1 addresses the need that the Project has been proposed to meet. Consolidated Response ALT-2 addresses the use of alternative technologies, alternative energy sources, and conservation of energy.
1429	146	Hayes	Douglas	Sierra Club et al	The relevant comparison is not the combustion of fuels derived from heavy synthetic crude compared to those derived from conventional crude oil. Instead, the impacts of combustion and use of heavy synthetic fuels should be compared to other reasonable alternatives such increased use of alternative fuels and improving energy efficiency and thus reducing demand for oil.	Consolidated Response ALT-2 addresses the use of alternative technologies and alternative energy sources and the effect of such use on the demand for crude oil in PADD III refineries.
1429	147	Hayes		Sierra Club et al	The draft EIS notes that the heavy crude oil supplied by this project will be used in many applications other than transportation fuel, including power generation. draft EIS at 3.14-36. Thus the draft EIS must consider how and to what extent the availability of heavy crude oil will displace each type of alternative and renewable fuel source and initiative, including but not limited to wind, solar, geothermal, nuclear and natural gas power generation; energy efficiency and public transportation initiatives; and electric, hybrid, and biofuel other high efficiency automobiles; and energy efficient heating systems and designs for homes and buildings.	Consolidated Response ALT-2 addresses the use of alternative technologies and alternative energy sources. If approved and implemented, the proposed Project would allow the refineries to continue production at current throughput levels, which would have a minimal effect on alternative fuels and technologies since the refined product is currently needed by consumers.
1429	148	Hayes	Douglas	Sierra Club et al	The DEIS does not adequately address the impacts on wetlands and water resources.	Sections 3.3 and Section 3.4 of the EIS address the potential impacts to water resources and wetlands, respectively.
1429	149	Hayes	Douglas	Sierra Club et al	The DEIS also makes clear that the project fails to comply with basic requirements of the CWA. As discussed in these comments above, the purpose and need of this project is unlawfully narrow and not substantiated. A proper purpose and need would reveal that a this project is not necessary to meet energy needs. As such, the No-Action Alternative is the practicable alternative with the least damage to the aquatic environment. Thus, the currently proposed impacts to hundreds of rivers and streams and several hundred acres of wetlands should not be permitted under Section 404 and should not be allowed.	As noted in Consolidated Responses P&N-1 and P&N-7, the purpose of the Project stated in the EIS meets NEPA requirements and the need analysis presented in Section 1.4 of the EIS has been determined based on a thorough and independent analysis. Section 4.0 has been updated to provide an expanded analysis of alternatives, including an expansion of the No Action alternative.
1429	150	Hayes	Douglas	Sierra Club et al	System alternatives would also have less impact on water resources and be practicable. As the draft EIS states: "A system alternative would render construction of the pipeline unnecessary, although some modifications or additions to other existing pipeline systems would be required to increase the current capacity of those systems... [See footnote pg. 70] As stated in these comments above, the draft EIS projected demand well exceeds what EIA has demonstrated future	Consolidated Response P&N-1 addresses the need that the Project has been proposed to meet. Consolidated Response ALT-2 addresses the use of alternative technologies, alternative energy sources, and conservation of energy. Consolidated Response P&N-5 addresses issues related to investments in other technologies.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					demand to be. Although existing pipelines like the Exxon Mobil Pegasus may not be able to accommodate the 900,000 bpd that the Keystone pipeline can carry, demand does not show such carrying capacity is needed. As such, it is possible use of existing pipelines could meet the need of this project, thus being practicable, and would avoid and minimize impacts to water resources as required by law. Again, this practicable alternative would almost certainly result in far less impact to aquatic resources and should demand that CWA permits not be issued for the impacts associated with the preferred alternative.	
1429	151	Hayes	Douglas	Sierra Club et al	Similarly, the DEIS dismisses use of other planned pipelines (such as the Altex, Chinook Maple Leaf, Trailbreaker, and Enbridge-BP Delivery System pipelines) as alternatives to building the Keystone XL on the basis that "[p]art of the purpose and need of the Project is to provide up to 900,000 bpd of crude oil to PADD III in as short a timeframe as possible... [See footnote pg. 70] Again, the assumptions about the amount of capacity needed are baseless. A proper assessment based on an appropriate purpose and need would likely demonstrate that the project is not needed at all, and that any carrying capacity needed could be accommodated by other proposed pipelines [See footnote pg. 70] with overall minimization of impacts to water resources. This again leads to a conclusion that impacts for this project cannot be permitted under the CWA.	As noted in Consolidated Response P&N-1 and P&N-7, the purpose of the Project stated in the EIS meets NEPA requirements and the need analysis presented in Section 1.4 of the EIS has been determined based on a thorough and independent analysis. Section 4.0 has been updated to provide an expanded analysis of alternatives, including an expansion of the No Action alternative.
1429	152	Hayes	Douglas	Sierra Club et al	In terms of pipeline placement, while the draft EIS states that decisions regarding placement considered a variety of factors, including environmental concerns and avoidance of large wetland complexes and large waterbodies, it makes no mention of attempting to avoid smaller resources [See footnote pg. 70] As stated in the draft EIS, the vast majority of impacted streams and wetlands are smaller resources (e.g., 350 of 389 stream crossings in MT are to intermittent/ephemeral streams; for SD the number is 331 of 354 crossing; for NE, 127 of 160 crossings; for OK, 273 of 368; for TX, 413 of 633 crossings). There is no indication that the pipeline route was chosen in a manner that would avoid or minimize impacts to these vital resources. Moreover, the draft EIS explicitly states that expediency was an overriding concern in pipeline placement: "Development of alternatives also considered the desire to reduce the line miles of pipeline that would be required to reach the Project terminus... [See footnote pg. 70] A look at a map of the pipeline route shows that the desire to create a direct route was an overriding concern. [See footnote pg. 70] There is no indication in the draft EIS that appropriate consideration was given to modifying the pipeline route to avoid smaller water resources. The excuses given for not choosing routes that would have less impacts to water resources are not tenable and fails to makes those alternatives not "practicable." This shows that, again, the project does not meet basic permitting CWA requirements. It also violates NEPA by not properly examining impacts to smaller water resources - the vast majority of those impacted - and not appropriately comparing the various	As noted by the commenter, the avoidance of major areas of environmental concern was a key consideration in establishing the proposed route. In accomplishing that task, a basic route was established with "connecting" segments between the portions of the route areas that were set to avoid the areas of major environmental concern. Generally there are few options for those segments, and alternative routes typically cross essentially the same streams, wetlands, and other smaller resource areas. Keystone made adjustments to the route to avoid as many of those areas as possible, and may make further minor adjustments during final design, assuming those adjustments are in compliance with all relevant federal, state, and local permit requirements. In addition, the two sentences that followed the text quoted in the comment explain why reducing the line miles of pipe is important: "As a general rule, each mile of the proposed Project would impact approximately 13.3 acres during construction and 6.0 acres during operation (the exact acreage is dependent on such factors as the construction methods, workspaces, and access roads). As a result, there generally are environmental advantages to keeping the length of pipe required to reach the Project destination as low as possible while considering all other issues of concern." The reason for minimizing the length of pipe where appropriate has nothing to do with expediency.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					impacts of alternatives to the preferred alternative.	
1429	153	Hayes	Douglas	Sierra Club et al	The dismissed "Western Alternative," is one such alternative that may be both practicable and less damaging to water resources. The draft EIS admits that "[p]otential positive attributes to this alternative include the avoidance of the Missouri River crossing just to the east of the Fort Peck Reservoir and the avoidance of crossings of reaches of the Niobrara River that have been included with the federal Wild and Scenic River program." [See footnote pg. 71] Not mentioned, but also a potential reduction in impacts to water resources of this more westerly route, is the avoidance of vital and sensitive prairie potholes generally located in the more eastern portions of Montana and South Dakota.	The proposed Missouri River crossing would be accomplished using the horizontal directional drilling method and would not result in a significant impact. The reach of the proposed crossing site of the Niobrara River is not part of the Wild and Scenic River program. As noted in the EIS, the proposed route does not cross prairie potholes.
1429	154	Hayes	Douglas	Sierra Club et al	Similarly, the preferred route for the Houston Lateral section (Houston Lateral Alternative A) has significantly more wetland impacts (236.5 acres to 165.5 acres) than the rejected alternative (Houston Lateral Alternative B). While the rejected alternative is longer, has more stream crossings, and may have more difficulty in terms of meeting compliance with the Coastal Zone Management Act, there is still an inadequate showing that the route is not practicable and does not have less overall impact on aquatic resources than the alternative route chosen.	The assessment of the Houston Lateral alternatives presented in Section 4.3.6 of the EIS does not state that Alternative HL-B "is not practicable" as suggested by the commenter, and the comparison of the impacts of the two routes was not based only on impacts to aquatic resources. Section 4.3.6 provides a comparison of the two route alternatives that considers the potential impacts of many environmental resources. As stated in that section, Alternative HL-A is a shorter route than Alternative HL-B and would therefore affect fewer total acres than Alternative HL-B. Alternative HL-A would also impact fewer acres of agricultural land and developed land and would cross fewer streams and rivers. The right-of-way of Alternative HL-B would extend across 27 more miles (367 more acres) of land that is within the authority of the Texas Coastal Management Program than that of Alternative HL-A; land within that management program includes valuable natural coastal resources which are to be preserved, protected, developed, and where possible, restored or enhanced through a comprehensive management program. Although Alternative HL-A would cross more wetlands than Alternative HL-B, the overall comparison of the impacts of the two routes indicated that Alternative HL-B does not offer an environmental advantage over the applicant's proposed route (Alternative HL-A) and was therefore eliminated from further analysis.
1429	155	Hayes	Douglas	Sierra Club et al	Likewise, crossing methods do not appropriately seek to avoid and minimize impacts to water resources in violation of the CWA. Rather than ensuring the least environmentally damaging practicable alternative is used, convenience seems to be the overriding concern in regards to which crossing methods are used. This fails to comply with the law. For instance, the DEIS states that "approximately 621 intermittent waterbodies would be crossed by the proposed Project (Appendix E). In the event that these intermittent waterbodies are dry or stagnant at the time of crossing, conventional upland cross-country construction techniques would be used. The pipeline would be installed with the open-cut wet crossing method if water is flowing at the time of installation. The specific method used for each crossing would be based on site-specific analyses of conditions at the time of installation so that the method selected would result in lower levels of	As a part of the CWA Section 404 permitting process for the proposed Project, Keystone would be subject to USACE review and approval of the most appropriate crossing method for watercourses. Consolidated Response WAT-1 addresses stream crossing methods and the associated potential water quality impacts.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					environmental impact.”	
1429	156	Hayes	Douglas	Sierra Club et al	Similarly, crossing methods for many streams seem to be improperly allowed to occur at the whim of land owners and managers, again in violation of the CWA. “The actual crossing method employed at an individual perennial stream would depend on permit conditions from USACE and other relevant regulatory agencies, as well as additional conditions that may be imposed by landowners or land managers at crossing locations.” The DEIS also does not address the fact that the Corps of Engineers may decline to find jurisdiction over certain stream crossings (see below), meaning that for some streams no CWA permit conditions may apply. Thus, this analysis falls short under NEPA as well, as it fails to adequately assess possible impacts from stream crossings. To comply with NEPA, the DEIS must analyze the possible impacts from the Corps not asserting jurisdiction over certain water resources.	<p>All stream crossing methods used must meet the requirements of federal and state permits obtained for those crossings. If landowners have specific requests in addition to those requirements that are consistent with environmental permits and regulations, Keystone would consider accommodating the landowner.</p> <p>Consolidated Response WAT-1 addresses stream crossing methods and the associated potential water quality impacts. Section 3.3 of the EIS addresses permitting requirements and potential impacts. As noted in Consolidated Response WAT-1, prior to commencing any stream crossing construction activities, Keystone would be required to obtain a permit under Section 404 of the Clean Water Act (CWA) and, in some cases, under Section 10 of the Rivers and Harbors Act of 1899 administered by the USACE and a CWA Section 401 water quality certification as per state regulations. These federal and state agencies would require measures to limit unnecessary impacts to aquatic and riparian species and their habitat during construction as a condition of the crossing permits. In Montana each crossing of a perennial stream would be reviewed in the field by personnel from the Montana Department of Environmental Quality and specific requirements for stream crossings would be determined upon completion of that review. The potential impacts to water quality associated with waterbody crossings are addressed in Section 3.3.2.2 of the EIS.</p>
1429	157	Hayes	Douglas	Sierra Club et al	The analysis of wetlands crossings also demonstrates a failure to comply with the CWA, as the timing of the crossings are more concerned with convenience than reducing impacts. The DEIS states that, “Pipeline construction across wetlands would be similar to typical conventional upland cross-country construction procedures, with modifications to reduce the potential for affects to wetland hydrology and soil structure. The wetland crossing methods used would depend largely on the stability of the soils at the location at time of construction.” [See footnote pg. 72] As with streams, there is no attempt to ensure crossings are timed during periods of lower water or other times to ensure an avoidance or minimization of impacts.	All wetlands and stream crossings will receive construction mitigations as described in Keystone’s Construction, Mitigation, and Reclamation Plan (Appendix B of the DEIS) and any other applicable guidance from the U.S. Army Corps of Engineers (USACE) in compliance with the Clean Water Act. Keystone has committed to follow the same construction, mitigation, and reclamation plan for all wetland crossings regardless of whether the wetland qualifies as jurisdictional under the USACE Section 404 permits. The only difference would be the requirement for compensatory mitigation for permanent wetland losses. Most wetlands would be restored after pipeline construction. DOS revised the quoted sentence in the EIS to the following: “Pipeline construction across wetlands would use construction techniques designed to retain the hydrological, soil structure, and vegetation characteristics of wetlands. The specific construction method used for each wetland crossing would depend largely on the stability of the soils at the location at the time of construction.” While some wetland crossings may be completed when the wetland is “dry”. Most wetlands would be expected to retain some water during most months of the year. Restricting construction across individual wetlands to only periods when the individual wetland is dry or at minimum water levels would not be practicable because the “wetness” of an individual wetland will depend on a combination of factors that are not necessarily predictable including local and regional precipitation patterns and season changes. Wetland crossings are designed to

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
						retain the hydrological, soil structure, and vegetation characteristics of wetlands and are specific to the amount of water within the wetland during construction. Wetland crossing methods are designed to minimize the total length of time the wetland is disturbed prior to restoration.
1429	158	Hayes	Douglas	Sierra Club et al	With no accurate accounting for when crossings will occur, the DEIS does not adequately assess the impacts to wetlands from the project. To be protective of wetlands, DOS should require that dry crossings should occur unless TransCanada can demonstrate that such crossings are impracticable or not possible.	Construction mitigation for wetland crossings are described in Keystone's Construction, Mitigation, and Reclamation Plan (Appendix B of the EIS). While some wetland crossings may be completed when the wetland is "dry". Most wetlands would be expected to retain some water during most months of the year. Restricting construction across individual wetlands to only periods when the individual wetland is dry would not be practicable because the "wetness" of an individual wetland will depend on a combination of factors that are not necessarily predictable including local and regional precipitation patterns and season changes. Wetland crossings are designed to retain the hydrological, soil structure, and vegetation characteristics of wetlands and are specific to the amount of water within the wetland during construction. Wetland crossing methods are designed to minimize the total length of time the wetland is disturbed prior to restoration.
1429	159	Hayes	Douglas	Sierra Club, et al	There are a total of 341 perennial waterbodies and 621 intermittent waterbodies. Aside from the 38 that will be crossed by the HDD method, there is no requirement that less damaging alternatives to open-cut will be used and only a statement that dam-and-pump and flume crossings will be used "where technically feasible" or "where practicable" on unspecified "environmentally sensitive waterbodies." Dam-and-pump and flume crossings are standard techniques in the pipeline industry for achieving a dry crossing and are therefore practicable. DOS should examine the impacts of not using the least damaging practicable crossing methods.	Consolidated Response WAT-1 addresses stream crossing methods and the associated potential water quality impacts. Section 3.3 of the EIS addresses stream crossings, including permitting requirements and potential impacts. As noted in Consolidated Response WAT-1, prior to commencing any stream crossing construction activities, Keystone would be required to obtain a permit under Section 404 of the Clean Water Act (CWA) and, in some cases, under Section 10 of the Rivers and Harbors Act of 1899 administered by the USACE and a CWA Section 401 water quality certification as per state regulations. These federal and state agencies would require measures to limit unnecessary impacts to aquatic and riparian species and their habitat during construction as a condition of the crossing permits. In Montana each crossing of a perennial stream would be reviewed in the field by personnel from the Montana Department of Environmental Quality and specific requirements for stream crossings would be determined upon completion of that review.
1429	160	Hayes	Douglas	Sierra Club et al	In violation of NEPA the DEIS also does not demonstrate that stream banks will be properly restored and does not adequately analyze the impacts of failing to restore such banks. The DEIS states that "after pipeline installation, stream banks would be restored to preconstruction contours or to a stable configuration" Stable configuration could mean the use of "rock riprap, gabion baskets (rock enclosed in wire bins), log walls, geo-grids, willow cuttings, or alternative wood-based structured where required by regulatory authorities." Stabilization methods like riprap, log walls and other methods, can often have severe deleterious impacts on streams. They can alter or negatively impact important functions such as stream evolution processes, riparian succession, sedimentation processes, habitat, and biological community interactions, with resulting adverse impacts to aquatic wildlife.	Consolidated Response WAT-1 addresses concerns regarding potential water quality impacts. Issues related to the potential for erosion adjacent to stream banks and private land is addressed in Consolidated Response ERO-2.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					This means that once functional banks could be made stable, but have important functions permanently degraded. These impacts are not assessed by the DEIS.	
1429	161	Hayes	Douglas	Sierra Club et al	The DEIS further notes several impacts to water resources that could potentially be severe, but fails to quantify or describe them in a manner that provides meaningful information regarding the severity of the impacts. This violates NEPA. For instance, the DEIS states that the project will result in "temporary increase in turbidity and changes in wetland hydrology and water quality." However, how long is temporary? And when will the impacts occur? During times when, for instance, certain aquatic life may be breeding or foraging and could be dramatically impacted by turbidity? And will the turbidity and sedimentation cause long-term problems such as destruction or degradation or fish or amphibian breeding habitat? The DEIS leaves these important issues unaddressed.	As noted in Section 3.0, "Temporary impacts would generally occur during construction, with the resources returning to pre-construction conditions almost immediately afterward." Section 3.7 of the EIS addresses potential impacts to fisheries resources due to construction and normal operation of the proposed Project.
1429	162	Hayes	Douglas	Sierra Club et al	The DEIS violates NEPA by failing to take into account the impacts of climate change on water resources. Science is clear that climate change will greatly impact water quality. It will both increase pollutant loading to waters and make existing pollution problems more acute. The U.S. Environmental Protection Agency (EPA) has acknowledged that climate change will cause several alarming threats to water quality such as warming water temperatures that change contaminant concentrations in water and alter aquatic system uses, new patterns of rainfall and snowfall that alter water supply for drinking and other uses including use by wildlife and lead to changes in pollution levels in aquatic systems, and more intense storms that threaten water infrastructure and increase polluted stormwater runoff. [See footnote pg. 74] Specifically, EPA has concluded that "[t]he number of waters recognized as 'impaired' is likely to increase, even if pollution levels are stable." [See footnote pg. 74] This is largely because warmer temperatures will lead to warmer water, which holds less oxygen, and can foster harmful algal blooms and increase the toxicity of some pollutants. [See footnote pg. 74] Similarly, EPA has found that more extreme water-related events, such as increased and more intense storms, will have negative water quality impacts by causing more intense flooding and other events that result in high flows, increased sediment and erosion, and a resulting increase in nutrients, pathogens, and toxins entering waterbodies. [See footnote pg. 74] Temperature increases will also change aquatic biology, disrupting aquatic system health and often resulting in the establishment of invasive and non-indigenous species in certain waters at the expense of native species.200 As EPA has determined, this alone may "result in significant deterioration of aquatic ecosystem health in some areas." [See footnote pg. 74] Additionally, climate change will change flow rates in streams and lakes, change the size of streams and wetlands, and result in other disruptions relating to the flow, quantity, and presence of water in many of our waters. [See footnote pg. 74]	Consolidated Response ENV-6 addresses concerns regarding the influence of climate change on the potential impacts of the proposed Project.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
1429	163	Hayes	Douglas	Sierra Club et al	The Keystone XL project will have multiple impacts to hundreds of waterbodies, including certain waterbodies, like intermittent streams, prairie pothole wetlands and Rainwater Basin wetlands that are serious risk of impacts from climate change. Many of the direct and indirect impacts will occur over time. Additionally, many of the waterbodies impacted are already impaired for the very type of pollutants (e.g., TSS and nutrients) that will increase in actual amount and/or polluting effect as a result of climate change. [See footnote pg. 74] In violation of NEPA, the DEIS simply fails to analyze how impacts from the project will be compounded by climate change. This failure means that many potential harms have not been given a hard look.	The impacts associated with implementation of the proposed Project are addressed in Section 3.0 of the EIS, including potential impacts to waterbodies and wetlands. Consolidated Response ENV-6 addresses concerns regarding the influence of climate change on the potential impacts of the proposed Project.
1429	164	Hayes	Douglas	Sierra Club et al	The potential impacts not examined by the DEIS are numerous. For instance, the pipeline will cause changes in alteration of freeze-thaw timing due to increased water temperatures associated with heat input from the pipeline. [See footnote pg. 74] Freeze and thawing cycles will also be impacted by climate change. Yet, the DEIS does not analyze these freeze-thaw timing changes and consequent impacts in light of that fact that they will compounded over time by climate change. This failure overlooks some potentially enormous impacts. For instance, it is clear that climate change will facilitate the establishment of invasive species (see below), which can be extremely opportunistic. By clearing ROWs for the pipeline and accompanying infrastructure, opportunities may be presented for invasives to be introduced from both construction and operation activities. Warmer soil temperatures from the pipeline plus warming weather could make conditions extremely favorable for certain invasive species to establish themselves and out-compete or infect native species.	Consolidated Response ENV-2 addresses concerns related to pipeline temperature effects. Consolidated Response ENV-6 addresses concerns regarding the influence of climate change on the potential impacts of the proposed Project. Consolidated Response NOX-1 addresses issues related to noxious weeds.
1429	165	Hayes	Douglas	Sierra Club et al	Furthermore, impacts to some wetlands that will be cleared of vegetation, partially or completely, such as forested and scrub/shrub wetlands will regenerate slowly. Due to climate change, forested or scrub/shrub areas may regenerate in a manner that favors growth of very different species than previously existed in these areas, potential dramatically altering the resource once it is restored. The DEIS completely fails to account for the long-term regeneration and restoration of these resources in light of climate change.	Consolidated Response ENV-6 addresses concerns regarding the influence of climate change on the potential impacts of the proposed Project. Consolidated Response SOI-2 addresses concerns regarding topsoil, backfill, and restoration. Consolidated Response WAT-2 addresses concerns regarding a compensatory mitigation plan for jurisdictional wetlands and potential impacts to non-jurisdictional wetlands.
1429	166	Hayes	Douglas	Sierra Club et al	The DEIS additionally states that there will be permanent alteration in water-holding capacity due to alteration or breaching of water-retaining substrates in the prairie pothole and Rainwater Basin regions as a result of the project, but does not discuss impacts that may arise from such alterations in light of climate change, which will also affect water levels in these resources. [See footnote pg. 75] Changes in water holding capacity can severely impact the function of waters such as depressional wetlands like prairie potholes or Rainwater Basin wetlands. The amount of water in such wetlands, the length of time water stays in these resources, and the depth of water dramatically impact the resources use by wildlife. Wildlife, such as waterfowl, depend on potholes	As stated in Section 3.4 of the EIS all prairie pothole wetlands would be avoided by the proposed Steele City Segment of the pipeline. Consolidated Response ENV-6 addresses concerns regarding the influence of climate change on the potential impacts of the proposed Project. Consolidated Response WAT-2 addresses concerns regarding a compensatory mitigation plan for jurisdictional wetlands and potential impacts to non-jurisdictional wetlands.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					and other depressional wetlands to have water at certain times for breeding, foraging and migratory fly over. [See footnote pg. 75] "The Prairie Pothole Region is the most productive habitat for breeding ducks in the world. It produces 50--80% of the continent's ducks, even though it represents only 10% of the continent's total wetland area." [See footnote pg. 75] Too much, or too little, water can greatly impact the use of these resources to waterfowl and other wildlife. Climate change promises to dramatically impact water level in depressional wetlands in the Great Plains. Some shallow, temporary wetlands may simply dry up. Deeper, more permanent wetlands may become shallow, temporary wetlands due to climate change. [See footnote pg. 75]The DEIS fails to analyze how permanent alterations in water holding capacity of depressional wetlands when compounded by water level changes brought about by climate change will impact these resources and associated wildlife This violates NEPA.	
1429	167	Hayes	Douglas	Sierra Club et al	The DEIS also fails to properly analyze impacts to floodplains. It states that, "Floodplain terraces and low floodplains are found along the project route. Two pump stations and 10 MLVs would be in the 100-year floodplain as currently proposed, but the effect of those facilities on floodplain function is expected to be minor." As we have seen across the country, flooding within the 100-year floodplains have become more significant and more frequent. Also, flooding within the 100-year floodplain has also become more frequent and severe. The DEIS limits its analysis of floodplain impacts to current 100-year floodplains identified by Federal Emergency Management Agencies mapping. FEMA's mapping has been alleged to be unreliable and inaccurate by members of Congress, and an investigation by the General Accounting Office is underway. Moreover, the mapping does not reflect changes in floodplains due to climate change, which almost certainly will expand the number of areas that see frequent flood events. As such, the DEIS analysis of floodplain impacts fails to consider the likely changes in flood patterns and in the present and future extent of floodplains themselves.	FEMA is the current agency with floodplain regulatory oversight. FEMA mapping is the best available information, at the time of design and construction. Consolidated Response GEO-3 addresses potential geologic hazards including floodplain crossings.
1429	168	Hayes	Douglas	Sierra Club et al	The DEIS also makes other assumptions regarding flooding that simply will not hold up over time. For instance, the DEIS states that "The pipeline would be constructed under river channels with potential for lateral scour." However, there is no indication that this includes river channels that currently may not be at risk for lateral scour, but will likely be at-risk for lateral scour as a result of increased flood events due to climate change.	Section 2.3.3.5 of the EIS describes the waterbody crossing methods that would be used for the proposed Project. Channel crossings would require a Section 404 permit issued by the U.S. Army Corps of Engineers (USACE). Specifications for addressing scour for the crossings would be included in the USACE permits. Consolidated Response GEO-3 addresses potential geologic hazards including floodplain crossings.
1429	169	Hayes	Douglas	Sierra Club, et al	The project will additionally have profound impacts to groundwater resources. The DEIS states that, "Potential impacts to groundwater during construction activities of the Project and its connected actions include: Groundwater quality degradation during or after construction resulting from disposal of materials and equipment; Temporary increases in local groundwater levels due to infiltration of hydrostatic testing waters." As with surface waters, changes in	Issues related to aquifers along the proposed Project corridor are addressed in Consolidated Responses AQF-1 through AQF-4. Consolidated Response ENV-6 addresses concerns regarding the influence of climate change on the potential impacts of the proposed Project.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					precipitation and snowmelt will impacts groundwater quality as well as recharge rates. Mitigation measures to compensate for these impacts described in the DEIS do not take climate change impacts into account. As such, the DEIS fails to adequately analyze and account for the likely impacts to groundwater resources that will be caused by the project.	
1429	170	Hayes	Douglas	Sierra Club, et al	The DEIS does not consider potential effects of project on mercury levels in waters and acid rain in violation of NEPA.	As described in Consolidated Responses P&N-1, and P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions or discharges in Gulf Coast refineries.
1429	171	Hayes	Douglas	Sierra Club, et al	The project will result in increased refining of heavy crude oil. Increased refining will cause more mercury and suspended solids being released into the waters through air deposition, as well as increased acid rain. Mercury and acid rain pose known threats to aquatic species and water quality, including to aquatic wildlife that is already struggling due to habitat change being caused by climate change, massive disruptions of the food web from invasive species, and the ongoing persistent effects and bio-accumulation of toxins such as mercury and PCBs.	As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries.
1429	172	Hayes	Douglas	Sierra Club et al	Mercury is of chief concern. Mercury is a trace component of all fossil fuels, including natural gas, gas condensates, crude oil, coal, tar sands, and other bitumens. The use of fossil hydrocarbons as fuels provides the main opportunity for releasing emissions of the mercury they contain into the atmospheric environment, but other avenues also exist in production, transportation, and processing systems. These other avenues may cause mercury to be released directly to air, water, or solid waste streams. [See footnote pg. 77] Once in the environment, mercury bioaccumulates in the food chain and can poison particularly species at the top of the food chain like large fish, birds, and people. Mercury is a particular health concern with younger children and women. [See footnote pg. 77] In violation of the NEPA, the DEIS fails to adequately examine the impacts of mercury and acid rain.	As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries.
1429	173	Hayes	Douglas	Sierra Club et al	Mitigation measures are inadequate violating both NEPA and the CWA. Several of the listed mitigation measures fail to explain how they will appropriately mitigate impacts or whether practicable alternatives exist that would result in less impacts to aquatic resources. This violates NEPA by failing to properly account for the project's impacts and shows that the project will not meet CWA permitting requirements. For example, the DEIS states that the use of herbicides or pesticides will be prohibited within 100 feet of any wetland, unless allowed by the appropriate land management or state agency. Foremost, this requirement is not even mitigation: it allows herbicide and pesticide use where it currently would be allowed and appears to add no additional requirement. Beyond that, there is no explanation as to whether 100 feet will properly reduce impacts or how that number was chosen. It appears to be a completely arbitrary number. This similarly applies to a variety of other non-mandatory mitigation measures that use 100 feet	Keystone has followed the typical Federal Energy Regulatory Commission guidelines for planned construction activities, including the buffer zones described in the EIS and in Keystone's Construction, Mitigation, and Remediation Plan. As stated in Section 3.3.2.2 of the EIS, prior to commencing any stream crossing construction activities, Keystone would be required to obtain a permit under Section 404 of the Clean Water Act (CWA), and in some cases, under Section 10 of the Rivers and Harbors Act of 1899 administered by the USACE and a CWA Section 401 water quality certification in accordance with state regulations. The USACE and the state agencies would require measures to limit unnecessary impacts to aquatic and riparian species and their habitat during construction as a condition of the crossing permits.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					as the suggested distance for activities (e.g., "Avoid parking equipment maintenance and repairs in upland locations at least 100 feet from waterbodies and wetlands, if possible;" "Perform all equipment maintenance and repairs in upland locations at least 100 feet from waterbodies and wetlands, if possible;" Hydrostatic test manifolds would be located more than 100 feet away from wetlands and riparian areas to the maximum extent possible) Similarly, there is no explanation as to why the 85-foot wide corridor construction zone mitigation measure is either protective or the least damaging width practicable. Nor is there any guidance about what sort of "soil conditions" would permit TransCanada to ignore this width requirement and impact a wider corridor. This makes it impossible assess whether these protective measures will actually be used, and, if so, to what extent and to what effect.	
1429	174	Hayes	Douglas	Sierra Club et al	In violation of NEPA, the DEIS does not properly account for the fact that many impacted wetlands and water bodies are not being regulated under CWA by the Corps and therefore may not receive mitigation for impacts	All wetlands will receive construction mitigations as described in Keystone's Construction, Mitigation, and Reclamation Plan (Appendix B of the DEIS) and any other applicable guidance from the U.S. Army Corps of Engineers. Keystone has committed to follow the same construction, mitigation, and reclamation plan for all wetland crossings regardless of whether the wetland qualifies as jurisdictional under the U.S. Army Corps of Engineer Section 404 permits. The only difference would be the requirement for compensatory mitigation for permanent wetland losses. Most wetlands would be restored after pipeline construction. See additional discussion of this issue in Consolidated Response WAT-2.
1429	175	Hayes	Douglas	Sierra Club et al	The DEIS relies on CWA protections to conclude that mitigation measures will protect waters from the impacts of the pipeline. However, due to two Supreme Court decisions, Solid Waste Agency of Northern Cook County v. U.S. Army Corps of Engineers, 531 U.S. 159 (2001) and Rapanos v. United States, 547 U.S. 715 (2006) and subsequent Corps and EPA guidance documents interpreting those decisions, the status of CWA protections for many important waters that will be impacted by the project, such as intermittent streams and so-called "isolated" wetlands, is in doubt.	All wetlands will receive construction mitigations as described in Keystone's Construction, Mitigation, and Reclamation Plan (Appendix B of the DEIS) and any other applicable guidance from the U.S. Army Corps of Engineers. Keystone has committed to follow the same construction, mitigation, and reclamation plan for all wetland crossings regardless of whether the wetland qualifies as jurisdictional under the U.S. Army Corps of Engineer Section 404 permits. The only difference would be the requirement for compensatory mitigation for permanent wetland losses. Most wetlands would be restored after pipeline construction. See additional discussion of this issue in Consolidated Response WAT-2.
1429	176	Hayes	Douglas	Sierra Club et al	The overwhelming majority of streams impacted are intermittent or ephemeral (350 in MT; 331 in SD; 127 in NE; 273 in OK; 415 in TX). In terms of the wetlands, the pipeline crosses the interior of the country, where a great number of depressional, geographically isolated wetlands exist. While the DEIS never quantifies the number of "isolated" waters that will be impacted, the DEIS acknowledges that "[w]etlands throughout Montana, South Dakota, Nebraska, Kansas, Oklahoma, and Texas include isolated depressional wetlands, glaciated kettlehole wetlands, and sinkhole wetlands, as well as isolated floodplain wetlands such as oxbows." Due to a 2003 guidance document interpreting the SWANCC decision, the Corps is not protecting geographically isolated wetlands such as prairie potholes under the CWA meaning that developers have been free to impact and destroy these	All wetlands will receive construction mitigations as described in Keystone's Construction, Mitigation, and Reclamation Plan (Appendix B of the DEIS) and any other applicable guidance from the U.S. Army Corps of Engineers. Keystone has committed to follow the same construction, mitigation, and reclamation plan for all wetland crossings regardless of whether the wetland qualifies as jurisdictional under the U.S. Army Corps of Engineer Section 404 permits. The only difference would be the requirement for compensatory mitigation for permanent wetland losses. Most wetlands would be restored after pipeline construction. See additional discussion of this issue in Consolidated Response WAT-2.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					valuable resources without any federal safeguards under the CWA.	
1429	177	Hayes	Douglas	Sierra Club et al	The DEIS never examines the extent to which jurisdictional uncertainty and Corps implementation of the SWANCC and Rapanos decisions affects its conclusions regarding impacts to water resources. While acknowledging that "[w]etland impacts that affect non-jurisdictional wetlands under Section 404 would not require mitigation," the DEIS never even roughly quantifies these impacts and does not discuss possible impacts to streams due to possible questions of CWA jurisdiction. Instead, the DEIS relies heavily on the existence of CWA protections to conclude impacts will be accounted for when this may not be the case. For instance, the DEIS states that [w]here the HDD method is not used for major waterbody crossings or for waterbody crossings where important fisheries resources could be impacted, Keystone would develop a site-specific plan addressing proposed additional construction and mitigation procedures. Prior to commencing any stream crossing construction activities, Keystone would obtain a permit under Section 404 of the Clean Water Act (CWA) through the USACE and Section 401 water quality certification as per state regulations. If required, Keystone would work with the applicable permitting agency to develop specific crossing and sediment handling procedures for contaminated or impaired waters. Keystone would develop specific construction and crossing methods for sensitive/protected waterbodies in conjunction with USACE and U.S. Fish and Wildlife Service (USFWS) consultation. Keystone would develop a frac-out plan in consultation with the regulatory agencies for HDD crossings." The DEIS fails to mention the possibility that in many instances both Section 404 and 401 safeguards would not be invoked.	All wetlands will receive construction mitigations as described in Keystone's Construction, Mitigation, and Reclamation Plan (Appendix B of the DEIS) and any other applicable guidance from the U.S. Army Corps of Engineers. Keystone has committed to follow the same construction, mitigation, and reclamation plan for all wetland crossings regardless of whether the wetland qualifies as jurisdictional under the U.S. Army Corps of Engineer Section 404 permits. The only difference would be the requirement for compensatory mitigation for permanent wetland losses. Most wetlands would be restored after pipeline construction. See additional discussion of this issue in Consolidated Response WAT-2.
1429	178	Hayes	Douglas	Sierra Club et al	Case law has called into question jurisdiction for even perennial streams. This fact is not acknowledged or accounted for by the DEIS. For the hundreds of intermittent and ephemeral streams the Corps may determine are not jurisdictional, similar protections may also not be applied. Yet, the DEIS seems oblivious to this risk, stating that, "Prior to any stream crossing construction activities, Keystone would obtain a permit under Section 404 [of the CWA] through the USACE and Section 401 water quality certification as per state regulations.," DOS is in no position to require such permits to be issued and it is ultimate the Corps and EPA, or a court, that will determine whether or not certain crossings require permits. While commenters believe such waters deem protection, DOS is in no position to assume that stream crossing will necessarily be subject to CWA protections. To comply with NEPA, the DEIS must take this serious risk to waters into account, and cannot rely on assumptions about CWA protections ameliorating water impacts without assessing the extent to which those protections are assured.	All wetlands will receive construction mitigations as described in Keystone's Construction, Mitigation, and Reclamation Plan (Appendix B of the DEIS) and any other applicable guidance from the U.S. Army Corps of Engineers. Keystone has committed to follow the same construction, mitigation, and reclamation plan for all wetland crossings regardless of whether the wetland qualifies as jurisdictional under the U.S. Army Corps of Engineer Section 404 permits. The only difference would be the requirement for compensatory mitigation for permanent wetland losses. Most wetlands would be restored after pipeline construction. See additional discussion of this issue in Consolidated Response WAT-2.
1429	179	Hayes	Douglas	Sierra Club, et al	The DEIS violates NEPA by failing to assess impacts to wetlands and water resources from pump stations, mainline valves, roads and other associated developments.	Sections 3.3 and 3.4 of the EIS address the impacts of pump stations, valve stations, roads, and other ancillary facilities to wetlands and water resources.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
1429	180	Hayes	Douglas	Sierra Club et al	The project will impact, in addition to the pipeline route, wetlands and water resources associated with 30 new pump stations, 74 intermediate mainline valves of which 24 are check valves located downstream of major river crossings, approximately 50 new access roads and approximately 400 temporary access roads. However, the DEIS did not assess the associated developments: "The Project would disturb a total of 554 acres of wetlands (not including pipe storage yards, rail sidings, contractor's yards, access roads, or construction camps)", These impacts could potentially be enormous, as roads, storage yards and similar developments can disturb or destroy water resources by directly impacting them by crossing through them, or by causing stormwater discharges, erosion, changes in water temperature by removing shading vegetation, and other similar impacts.	Estimated impacts from ancillary facilities outside of the 110-foot ROW were added to the wetland analysis. Most ancillary facilities are sited outside of wetlands and away from streams and total impacts to wetlands from these facilities are estimated at less than 30 acres or temporary impact during construction and about 11 acres of permanent impact during operations (see added Tables 3.4.3-3 and 3.4.3-4.) Keystone is currently consulting with the State of Nebraska concerning permanent wetland impacts at Pump Station 22. Consolidated Response WAT-2 addresses concerns regarding a compensatory mitigation plan for jurisdictional wetlands and potential impacts to non-jurisdictional wetlands.
1429	181	Hayes	Douglas	Sierra Club, et al	The impacts from associated developments are not quantified or analyzed in a manner that could be characterized as a "hard look." The DEIS hints at the scale of the potential impacts it fails to examine. The impacts of building 40 pipe storage yards, 19 contractor yards, 400 temporary access roads, and 50 permanent roads on wetlands, streams, rivers and other waters are not analyzed. This is a blatant oversight in violation of NEPA.	Sections 3.3 and 3.4 of the EIS address the impacts of pump stations, valve stations, roads, and other ancillary facilities to wetlands and water resources.
1429	182	Hayes	Douglas	Sierra Club et al	The DEIS hints at the scale of the potential impacts it fails to examine, acknowledging that "extra workspace areas away from the construction ROW would be required during construction of the Project for use as pipe storage sites, railroad sidings and contractor yards, Pipe storage sites would be required at 30-mile to 80-mile intervals and contractor yards would be required at approximately 60-mile intervals. It is estimated that 40 pipe storage yards and 19 contractor yards would be required for the proposed Project." Additionally, extension road construction would large in scale as well: "Construction of some temporary roads would be required in addition to upgrading of existing roads. Approximately 400 temporary access roads are needed to provide adequate access to the construction sites. Private roads and any new temporary access roads would be used and maintained only with permission of the landowner or land management agency. Some short, permanent access roads from public roads to the proposed tank farm, pump stations, delivery facilities, and intermediate MLVs would also be necessary. Approximately 50 permanent access roads would be needed. Prior to construction, the location of new permanent access roads would be finalized." These roads must be relatively wide, as "access road temporary and permanent disturbance estimates are based on 30-foot roadway width required to accommodate oversized vehicles. All non-public roads are conservatively estimated to require upgrades and maintenance during construction." However, the impacts of building 40 pipe storage yards, 19 contractor yards, 400 temporary access roads, and 50 permanent roads on wetlands, streams, rivers and other waters are not analyzed. This is a blatant oversight in violation of NEPA.	Consolidated Response WAT-3 and Section 3.3.2 of the EIS address concerns regarding potential impacts to wetlands and waterbodies due to construction of ancillary facilities.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
1429	183	Hayes	Douglas	Sierra Club et al	The DEIS violates NEPA by failing to adequately analyze the impacts of refineries. The DEIS summarily dismisses potential impacts of refinery expansion to water quality by asserting that new refineries or other existing refineries that propose upgrades would be required to satisfy NPDES discharge requirements and thus would avoid significant impacts to water quality. This is an inadequate analysis of the potential impacts to water quality and aquatic ecosystems. Increased transportation of crude oil from Canadian tar sands for refining in the United States can be expected to increase water pollution from US refineries. An agency cannot ignore the environmental impacts of a project on the expectation that other federal agencies will address them. Additionally, the DEIS again does not account for what types of waters are being discharged into and whether these waters will continue to be protected by federal and state agencies responsible for implementing the NPDES program. As a result of the SWANCC and Rapanos decisions, certain major polluting facilities have made arguments they no longer need NPDES permits for their discharges. This oversight violates NEPA.	As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions or discharges in Gulf Coast refineries.
1429	184	Hayes	Douglas	Sierra Club, et al	The DEIS provides inadequate analysis of releases of drilling fluid and drilling fluid additives in violation of NEPA. Drilling fluid, consisting primarily of bentonite, is used with the HDD and guided bore crossing technique. Additives are often used to improve the likelihood of a successful bore (obtaining a better seal, and avoiding some frac-outs), but they can have other effects as well. In other words, additives should be regarded as part of the mitigation approach and carefully examined. The DEIS states that mitigating measures may be needed in the instances of a fracout when HDD is used, but does not discuss additives and their possible impacts. This topic is important and is not adequately addressed in the DEIS.	Consolidated Response WAT-4 addresses concerns regarding the potential for the release of drilling fluids during horizontal directional drilling.
1429	185	Hayes	Douglas	Sierra Club, et al	Analyses of releases of drilling fluid and drilling fluid should have been more thoroughly covered as previous completed projects, such as the MinnCan project, saw large releases of drilling mud that impacted several streams. The DEIS fails to describe additives to drilling mud or their possible impacts. The large amounts of drilling mud released on the MinnCan project likely meant that concentrations in the water column were high. Drilling fluids may enter wetlands as well. Large amounts of fluids entered the surface and subsurface of wetlands on the MinnCan project, including, for example, releases into the Hay Creek wetland which caused a dome to develop within the wetlands. This is essentially fill into the wetland of bentonite and additives, which could cause long term impacts and chemical changes in wetland soils, and permanent destructive changes to native plant communities in those wetlands. To comply with NEPA, a thorough analysis of the risks and possible impacts associated with drilling fluid needs to occur.	Consolidated Response WAT-4 addresses concerns regarding the potential for the release of drilling fluids during horizontal directional drilling.
1429	186	Hayes	Douglas	Sierra Club, et al	The pipeline will cross and will disturb a number of outstanding resource value rivers, streams and wetlands. To comply with NEPA, a thorough analysis of the risks and	Consolidated Response WAT-4 addresses concerns regarding the potential for the release of drilling fluids during horizontal directional drilling.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					possible impacts associated with drilling fluid needs to occur.	
1429	187	Hayes	Douglas	Sierra Club et al	The DEIS provides inadequate analysis of impacts to groundwater and surface water from an oil spill or leak in violation of NEPA. The Keystone XL pipeline will pass through areas where groundwater is close to the surface and where rural populations rely entirely on groundwater for domestic and agricultural water supply. [See footnote pg. 83] Some of the major aquifers that the Keystone XL pipeline will pass over include the Northern Great Plains Aquifer System; the troubled Ogallala Aquifer which extends throughout a significant portion of the Great Plains and is a critical source of water supply for that area; the Trinity Aquifer; Texas Coastal Uplands Aquifer; and Texas Coastal Lowlands Aquifer. [See footnote pg. 83] Many of these aquifers are close to surface or are overlain by karst formations or soils permeable to oil.	Issues related to aquifers along the proposed Project corridor are addressed in Consolidated Responses AQF-1 through AQF-4. Consolidated Response AQF-3 provides information on hypothetical spills from the Project over two areas of the Northern High Plains Aquifer System.
1429	188	Hayes	Douglas	Sierra Club et al	Among the many substances in crude-oil are chemicals such as benzene, toluene, ethylbenzene, xylene and other lightweight chemical compounds. These compounds are more water soluble and can disperse further and more rapidly in both surface and ground waters than other crude oil substances. The record for pipeline safety is troubling. The DEIS shows that on average, there have been 5 "serious" spills nationwide from hazardous liquid pipeline systems, [See footnote pg. 83] The number of "significant" spills is even greater at 143 per year over the last 20 years, with a gross loss of 137,821 barrels spilled and less than half that amount being "recovered." [See footnote pg. 83] The causes of these spills are myriad: corrosion, human error, excavation damage natural force damage and other causes. [See footnote pg. 83] Given that the DEIS projects that between .81 and 3.86 spills or leaks spilling between 18,000 and 60,000 gallons per year are likely to occur, [See footnote pg. 83] these compounds pose a serious threat to water quality. A significant spill could migrate into the groundwater and impact drinking water and irrigation water supplies. [See footnote pg. 83] Moreover, the DEIS's conclusion that "large to very large spills would be unlikely to occur" needs to be re-evaluated in light of the painful on-going lesson in the Gulf of Mexico where promises about the safety of oil technology have rung tragically hollow.	Consolidated Response OIL-4 addresses the composition of the Canadian crude oil that would be transported by the proposed Project, including concerns relative to the corrosivity and erosivity of the crude oil. As noted in that Consolidated Response, that crude oil is similar in composition and properties to other heavy crude oils that are currently transported within the U.S. pipeline system and similar in composition and properties to other heavy crude oils that are currently refined in PADD III. Impacts to water quality from an oil spill are addressed in Sections 3.13.5 and 3.13.6 of the EIS. Consolidated Response OIL-1 provides a summary of the range of spill frequency estimates addressed in the EIS. Consolidated Response OIL-2 addresses maximum-sized releases from the Project and addresses concerns about corrosion rate comparisons between the Alberta transmission pipeline system and the U.S. transmission pipeline system. Issues related to aquifers along the proposed Project corridor are addressed in Consolidated Responses AQF-1 through AQF-4. As described in Consolidated Response GLF-1, the risks associated with the proposed Project are substantially different from those associated with the BP Deepwater Horizon Project.
1429	189	Hayes	Douglas	Sierra Club et al	The DEIS acknowledges that impacts to waters - both surface and ground - from spills may occur. The DEIS states that "[a] large spill could affect drinking water sources .and irrigation water supplies." [See footnote pg. 83] The DEIS also concedes that "[s]ubstantial spills of refined products, especially diesel and substantial to very large spills of crude oil may reach groundwater where the overly in soils are porous and not water saturated, and the water table is relatively near the surface." [See footnote pg. 83]In a curt analysis, the DEIS on the one hand concludes that "it is not anticipated that groundwater quality would be affected by disposal activities, spills or leaks during construction activities," but on the other hand concedes that "shallow or near-surface aquifers are ... present beneath the proposed [pipeline] route." [See footnote pg. 83] Similarly, the DEIS	Issues related to aquifers along the proposed Project corridor are addressed in Consolidated Responses AQF-1 through AQF-4. Consolidated Response RES-1 addresses issues related to preparation and review of the required emergency response plans for the proposed Project.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					notes that "[r]outine operation and maintenance is not expected to affect groundwater resources; however, if a crude oil release occurred, crude oil could migrate into subsurface aquifers and into areas where these aquifers are used for water supplies." [See footnote pg. 84] Despite these brushed aside major risks, the DOS's conclusion that there is little cause for worry is based on its belief that "Keystone's ERP" would handle any potential event. [See footnote pg. 84]	
1429	190	Hayes	Douglas	Sierra Club et al	This faith is misplaced and overlays a failure to adequately detail which aquifers and surface water areas are at risk. A spill over just one of the resources placed at risk - for instance, the Ogallala Aquifer - could prove catastrophic. The proposed pipeline would bring crude through fragile Sandhills over the Ogallala Aquifer. The soil in this area is extremely porous and any leaks would be quickly absorbed like a sponge, contaminating the drinking water and agricultural irrigation waters potentially as widely as from South Dakota to Texas. The aquifer is already imperiled by being overused and many researchers are concerned it will dry up in coming decades, threatening drinking supplies for many states [See footnote pg. 84]. The toxics spilling from a tar sands pipeline could be devastating. The DEIS also does not analyze how geology, vegetation, soil composition and land use could impact how oil would be dispersed into and through surface or groundwater or identify areas with characteristics that put them at greater risk. Again, given the likelihood of a significant oil spill, this treatment of the potentially catastrophic impacts of the pipeline on water resources is inadequate.	Issues related to aquifers along the proposed Project corridor are addressed in Consolidated Responses AQF-1 through AQF-4.
1429	191	Hayes	Douglas	Sierra Club, et al	[T]he DEIS does not investigate or explain the placement of shut-off valves or other possible mechanisms that could be used to avoid harmful consequences to sensitive natural resources. The pipelines cross numerous sensitive streams and wetlands. Yet, shut-off valves will only be placed on large perennial streams with no explanation as to why other significant streams and wetlands will not have shut-off valves, given both the value of these resources and the fact that an intermittent stream during times of flow has as much potential to rapidly carry spilled oil downstream as does a perennial stream. The DEIS should explore and explain the availability or shut-off valves or other mechanisms to protect sensitive resources from the effects of spills and leaks.	Consolidated Response SAF-1 describes the regulatory requirements that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project. Those regulations include requirements for the placement of valves. In addition, as noted in Consolidated Response SAF-1 and Section 3.13.1, Keystone has agreed to incorporate 57 Special Conditions (see Appendix U of the EIS) into the proposed Project as requested by PHMSA, including special requirements for valve placement. Special Condition 22 stipulates the requirements for valve locations and the maximum distance between valves. Additional potential mitigation measures are also described in Consolidated Response SAF-1.
1429	192	Hayes	Douglas	Sierra Club et al	The DEIS fails to adequately analyze wildlife impacts from pipeline construction and operation. Impacts to wildlife are not properly analyzed under NEPA, and DOS also appears to be in violation of the Endangered Species Act for not properly consulting on the impacts of the pipeline to threatened and endangered species. The project will result in immense impacts along the project route due largely to habitat loss, modification, and fragmentation. Construction of the proposed Project would result in loss and alteration of about 22,493 acres of wildlife habitat, including 11,533 acres of grasslands and rangelands, 2,523 acres of forested habitat, and 554 acres of wetland habitats (including 271 acres of forested wetlands)." [See footnote pg. 85] This loss and fragmentation	The approach for wildlife assessments is addressed in Consolidated Response WIL-1. The EIS describes and discloses the mechanisms for potential Project-related construction and operation impacts to wildlife and their habitats. Impacts to wildlife and wildlife habitats including loss and alteration are addressed in Sections 3.5, 3.6, 3.7, and 3.8 of the EIS. Section 7 consultations have been completed. DOS considers the EIS, including assessments of potential impacts to wildlife, to be consistent with the requirements of a NEPA environmental review.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					has the potential to be especially harmful in areas, such as forests and shrub-land that will recover over a longer period time.	
1429	193	Hayes	Douglas	Sierra Club et al	The impacts of habitat fragmentation are documented and well-known. Studies have shown that the fragmentation of a species' habitat can threaten that species survival for a variety of reasons. These include: reduction of total habitat area; vulnerability during dispersal to other patches of habitat (increased risk of predation to species during movement); isolation of a species population; edge effects (e.g., more "edge" habitat that changes the type and distribution of species); changes in microclimate (e.g., forested areas tend to be shadier, more humid and less windy, but more edge can alter these micro climates). [See footnote pg. 85] The DEIS acknowledges these impacts of habitat fragmentation, stating that predator movement will be facilitated by the existence of a right of way (right-of-way) for the pipeline; predator opportunities will be increased by fragmentation as more "edge" habitat is created for predation and parasitism (like cowbird nesting invasions); and fragmentation will impact movement of amphibians, reptiles, small mammals and some bird species, but fails to properly analyze their impacts on species. [See footnote pg. 85]	Habitat fragmentation issues are addressed in Section 3.6.2 of the EIS. DOS considers the EIS, including assessments of potential impacts to wildlife, to be consistent with the requirements of a NEPA environmental review. Section 3.14 of the EIS was revised to include information on projected climate change in relation to Project-related impacts and mitigations. Consolidated Response ENV-6 also addresses concerns regarding the influence of climate change on the potential impacts of the proposed Project.
1429	194	Hayes	Douglas	Sierra Club et al	Primarily, a glaring omission in DOS's analysis is that none of these wildlife impacts are assessed in terms of how they will be amplified by climate change. Adaptation to climate change will be key to the survival of species and ecosystems. Adaption will require migration of species and habitat areas. However, land use changes, such as fragmentation, will place additional hurdles to such migration, making a dire situation even bleaker. [See footnote pg. 86] Studies have concluded that, "Genetic constraints upon adaptation, together with land cover changes that impede gene flow, are likely to reduce the rate of adaptation well below the unusually rapid pace of expected future climate change." [See footnote pg. 86].	Consolidated Response ENV-6 addresses concerns regarding the influence of climate change on the potential impacts of the proposed Project.
1429	195	Hayes	Douglas	Sierra Club et al	Much of the habitat fragmentation associated with the project and associated or similar projects will remain permanent, creating potentially permanent barriers to some species' migration and/or making such migration more difficult by, for instance, introducing areas where predation is likely to occur. In violation of NEPA, the DEIS does not examine the impacts of this habitat fragmentation, destruction and disturbance in the context of future species movement driven by the need to adapt to climate change. It must do so.	Project-related impacts to important wildlife habitats identified through scoping and consultation with federal and state agencies would be minimized to the extent practicable. Potential impacts are addressed in Sections 3.5, 3.6, 3.7, and 3.8 of the EIS. Section 3.14 of the EIS includes information on projected climate change in relation to Project-related impacts and mitigations. Consolidated Response ENV-6 also addresses concerns regarding the influence of climate change on the potential impacts of the proposed Project
1429	196	Hayes	Douglas	Sierra Club et al	The DEIS further fails to analyze the impacts to wildlife in terms of effects on water supply from the project compounded by climate change. For instance, the DEIS does not analyze the affect that changes in wetlands water levels caused by the project will have on waterfowl and other migratory bird breeding in light of the fact that climate change will also modify these water levels. These compounded impacts could potentially eliminate countless acres of prime waterfowl production areas like the Prairie Pothole and Rainwater Basin wetlands. [See footnote pg. 86]	As stated in Section 3.4 of the EIS, all prairie pothole wetlands would be avoided by the proposed Steele City Segment of the pipeline. Consolidated Response ENV-6 addresses concerns regarding the influence of climate change on the potential impacts of the proposed Project.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
1429	197	Hayes	Douglas	Sierra Club et al	The introduction of invasive species is also improperly analyzed. The pipeline ROW will cut through native grassland, shrub, and forest communities and would remove vegetation including sagebrush and native grasses, creating an unvegetated strip over the pipeline trench and adjacent construction areas. Subsequent revegetation may not provide habitat features comparable to pre-project conditions. The DEIS acknowledges that: "After removal of vegetation cover and disturbance to the soil, reestablishment of vegetation communities could be delayed or prevented by infestations of noxious weeds and invasive plants. Vegetation removal and soil disturbance during construction could create optimal conditions for the establishment of many weeds." [See footnote pg. 87]	Keystone would implement measures to prevent the spread of noxious weeds and invasive aquatic animals as described in Sections 3.5.5.4 and 3.7.3.1 of the EIS. Section 3.7.3.1 of the EIS was revised to include additional measures Keystone would implement to prevent the spread of aquatic invasive species. The measures described were recommended by federal and state management agencies. Disturbed soils would be revegetated as quickly as possible and equipment would be cleaned after use within infected areas. These are the primary deterrents to establishment and expansion of noxious weeds. In addition, Consolidated Response NOX-1 addresses issues related to noxious weeds.
1429	198	Hayes	Douglas	Sierra Club et al	Because many invasive species are fast-growing, highly opportunistic ecological generalists, land use change and alteration generally favors biological invasion. [See footnote pg. 88] Introduction of non-native aquatic species can compete with native species and transmit diseases. [See footnote pg. 88] As protection against invasives, the DEIS provides that, "During construction, the Contractor shall clean the tracks, tires, and blades of equipment by hand (track shovel) or compressed air to remove excess soil prior to movement of equipment out of weed or soil-borne pest infested areas or utilize cleaning stations to remove vegetative materials using water under high pressure." [See footnote pg. 88] This is insufficient to protect sensitive ecosystems from the spread of invasive species. Small organisms may be hidden in crevices and other dangers, such as disease-spreading parasites, bacteria and viruses, are completely invisible to the naked eye. Additionally, the DEIS only states that such cleaning/decontamination will occur "before entering areas either identified as sensitive habitats or new ROW." [See footnote pg. 88] The DEIS does not explain why such measures would not be used in existing right of ways, construction areas, or other locations where invasives could easily be introduced, become established and negatively impact native species.	Keystone would implement measures to prevent the spread of noxious weeds and invasive aquatic animals as described in Sections 3.5.5.4 and 3.7.3.1 of the EIS. Section 3.7.3.1 of the EIS was revised to include additional measures Keystone would implement to prevent the spread of aquatic invasive species. The measures described were recommended by federal and state management agencies. Disturbed soils would be revegetated as quickly as possible and equipment would be cleaned after use within infected areas. These are the primary deterrents to establishment and expansion of noxious weeds. In addition, Consolidated Response NOX-1 addresses issues related to noxious weeds.
1429	199	Hayes	Douglas	Sierra Club et al	Plans for preventing the spread of invasive species from hydrostatic testing equipment are also inadequate, and the DEIS fails to account for these shortcomings. Measures apply only in areas "where zebra mussels are known to occur" and the measures only call for a "thorough cleaning" of equipment. [See footnote pg. 88] The project will apparently not take preventive measures to stop invasives spreading where zebra mussels are not present. This is a wholly unacceptable risk that must be examined. Also, as stated above, a "thorough cleaning" may not remove all invasives that could be contained in equipment and subsequently spread to other waterbodies. The utmost precaution should be taken in preventing the spread of invasive species, since they are a pollutant that spreads exponentially over time, and once established, are nearly impossible to eradicate and incredibly costly to manage. Climate change will make it ever the easier for such invasives to spread, and harder to control such	Keystone would implement measures to prevent the spread of noxious weeds and invasive aquatic animals as described in Sections 3.5.5.4 and 3.7.3.1 of the EIS. Section 3.7.3.1 of the EIS was revised to include additional measures Keystone would implement to prevent the spread of aquatic invasive species. The measures described were recommended by federal and state management agencies. Disturbed soils would be revegetated as quickly as possible and equipment would be cleaned after use within infected areas; these are the primary deterrents to establishment and expansion of noxious weeds. Small changes in soil temperature would have local, not regional scale impacts and would likely be indistinguishable from exposure to local noxious weed sources. In addition, Consolidated Response NOX-1 addresses issues related to noxious weeds.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					invasives. These impacts are not examined by the DEIS and must be given a hard look.	
1429	200	Hayes	Douglas	Sierra Club et al	The DEIS additionally fails to properly detail the impacts to wildlife caused by the construction of the pipeline. Many potentially harmful activities will be associated with the construction of the pipeline. For instance, the DEIS does not address this construction in detail or provide mitigation measures for the construction of some temporary roads that would be required in addition to upgrading of existing roads. Approximately 400 temporary access roads are needed to provide adequate access to the construction sites. [See footnote pg. 89] The DEIS does not address impacts from driving fuel trucks - such as collisions - which would be transported daily by fuel trucks from the yards to the construction area for equipment fueling or the impact of building "temporary bridges (e.g., subsoil fill over culverts, timber mats supported by flumes, railcar flatbeds, flexifloat apparatus)" which "would be installed across all perennial water bodies to allow construction equipment to cross with reduced disturbance. [See footnote pg. 89]	The approach for wildlife assessments is addressed in Consolidated Response WIL-1. Potential construction impacts to wildlife are addressed in Section 3.6, 3.7, and 3.8 of the EIS. Mitigation for construction impacts are also included in these sections. Details on construction methods are provided in Section 2.3 of the EIS and in Keystone's Construction, Mitigation, and Reclamation Plan (Appendix B of the EIS). The EIS includes an assessment of the habitat impacts due to construction of temporary and permanent access. Wildlife mortality due to collisions with vehicles are addressed in Sections 3.6 and 3.8, and potential fuel spills and associated environmental effects are addressed in Section 3.13. Use of temporary bridges is described in Section 3.7 of the EIS. Construction mitigation measures are described within each resource portion of Section 3.0 and in Keystone's Construction, Mitigation, and Reclamation Plan (Appendix B of the EIS). Issues related to the potential for erosion adjacent to stream banks and private land is addressed in Consolidated Response ERO-2.
1429	201	Hayes	Douglas	Sierra Club, et al	The methods proposed in the DEIS for water body and wetland crossings are unnecessarily destructive in many instances, and these impacts are not properly analyzed or compared to less destructive potential alternatives.	Consolidated Response WAT-1 addresses stream crossing methods and the associated potential water quality impacts. Issues related to the potential for erosion adjacent to stream banks and private land is addressed in Consolidated Response ERO-2.
1429	202	Hayes	Douglas	Sierra Club, et al	Approximately 621 intermittent waterbodies would be crossed by the proposed Project. In the event that these intermittent waterbodies are dry or stagnant at the time of crossing, conventional upland cross-country construction techniques would be used. However, the pipeline would be installed with the open-cut wet crossing method if water is flowing at the time of installation. The open-cut wet crossing method is potentially more harmful to wildlife and wildlife habitat than other methods by causing the discharge of suspended solids and other pollutants into waters, many of which are already impaired. There is inadequate explanation as to both the number of waters that might be impacted by this method, or why efforts are not made to ensure crossings at times when a less harmful method can be used.	Consolidated Response WAT-1 addresses stream crossing methods and the associated potential water quality impacts. Keystone would prefer to construct stream crossings during low flow periods, or for intermittent streams, when there is no flow. However, the timing of stream crossing will be determined by the limitations imposed in environmental permits, weather conditions, and other variables. As noted in Consolidated Response WAT-1, prior to commencing any stream crossing construction activities, Keystone would be required to obtain a permit under Section 404 of the Clean Water Act (CWA) and, in some cases, under Section 10 of the Rivers and Harbors Act of 1899 administered by the USACE and a CWA Section 401 water quality certification as per state regulations. USACE and/or the relevant state permitting agencies would determine the stream crossing method for the streams crossed. Issues related to the potential for erosion adjacent to stream banks and private land is addressed in Consolidated Response ERO-2.
1429	203	Hayes	Douglas	Sierra Club et al	The DEIS fails to adequately analyze the Project's indirect and cumulative impacts on wildlife (including transboundary impacts). The EIS must "provide full and fair discussion of significant environmental impacts and shall inform decision-makers and the public of the reasonable alternatives which would avoid or minimize adverse impacts or enhance the quality of the human environment. [See footnote pg. 89] In addition to the direct effects of the proposed project, this discussion must include analysis of "indirect effects which ... are later in time or farther removed in distance, but are still	The impacts associated with implementation of the proposed Project are addressed in Section 3.0 of the EIS. Section 3.13 of the EIS addresses reliability and safety issues, including calculations of the probability of a spill from the proposed Project and the potential environmental impacts associated with spills. Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information on current and future production. As noted in that

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					reasonably foreseeable.” [See footnote pg. 89] An EIS must also consider the cumulative impacts of the proposed federal agency action together with past, present and reasonably foreseeable future actions, including all federal and non-federal activities. [See footnote pg. 90] Courts have routinely held that agencies may not break a project or activity into components in order to avoid the full range of environmental analysis and that cumulative impacts analysis is necessary for all reasonably foreseeable results of the action under consideration, [See footnote pg. 90].	response, without the proposed Project, oil sands development would continue at or above the current level until at least 2020, with or without the proposed Project. Cumulative impacts are addressed in Section 3.14 of the EIS. In addition, Section 3.13.4 of the EIS includes discussions of extraterritorial concerns. The assessments in Section 3.14 were conducted following CEQ guidance on cumulative impact analyses. As noted in Consolidated Response ENR-1, the environmental review, including preparation of this EIS, has been conducted consistent with the DOS regulations pertaining to NEPA (22 CFR Part 161) as well as the Council on Environmental Quality (CEQ) regulations for implementing NEPA (40 CFR Part 1500). As a result, DOS considers the EIS to be consistent with the requirements of a NEPA environmental review.
1429	204	Hayes	Douglas	Sierra Club et al	The DEIS must also consider transboundary impacts. In this case, the DEIS must consider the extensive impacts in Canada from the tar sands development spurred by this and similar pipeline projects that provide a market for this dirty fuel. Under NEPA’s obligation to provide “full and fair discussion of significant environmental impacts,” the DOS must consider the full extent of reasonably foreseeable direct, indirect, and cumulative environmental impacts both within the United States and in Canada. The Council on Environmental Quality (CEQ) addresses this issue in its Guidance on NEPA Analyses for Transboundary Impacts. [See footnote pg. 90] The CEQ guidance clarifies that “NEPA law directs federal agencies to analyze the effects of proposed actions to the extent they are reasonably foreseeable consequences of the proposed action, regardless of where those impacts might occur.” [See footnote pg. 90] CEQ concludes that “agencies must include analysis of reasonably foreseeable transboundary effects of proposed actions in their analysis of proposed actions in the United States.” [See footnote pg. 90] Thus, the CEQ guidance unambiguously conveys the necessity of considering impacts on the environment within the U.S. and beyond its borders. The United States District Court for the District of Columbia recently cited the CEQ guidance document when it expressly rejected agency arguments that the NEPA “hard look” obligation stops at the border. In <i>Government of the Province of Manitoba v. Salazar</i> , No.02-2057, 2010 U.S. Dist. WL 744713 (D.D.C. June 7, 2010), which concerned a dispute over a federal project designed to withdraw water from Lake Sakakawea and transfer it via pipeline for use in Minot and other areas of North Dakota, the Court ruled that the Bureau of Reclamation must consider “(1) the cumulative impacts of water withdrawal on the water levels of Lake Sakakawea and the Missouri River, and (2) the consequences of biota transfer into the Hudson Bay Basin, including Canada.” <i>Id.</i> at *1 (emphasis added).	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information on current and future production. As noted in that response, without the proposed Project, oil sands development would continue at or above the current level until at least 2020, with or without the proposed Project. Cumulative impacts are addressed in Section 3.14 of the EIS. In addition, Section 3.13.4 of the EIS includes discussions of extraterritorial concerns. The assessments in Section 3.14 were conducted following CEQ guidance on cumulative impact analyses.
1429	205	Hayes	Douglas	Sierra Club et al	The Keystone XL DEIS fails to properly analyze the reasonably foreseeable consequences of permitting the pipeline in Canada, primarily the impacts associated with tar sands mining including extensive water withdrawals and tailings ponds and the resulting impacts to wildlife. The DEIS	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project. Section 3.14.3.14 of the EIS addresses cumulative impacts associated with greenhouse

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					must take a “hard look” at these impacts abroad. Given CEQ’s recognition that analysis of trans boundary impacts is a constructive step towards implementation of treaty obligations, DOS should also consider the recent International Court of Justice “ICJ” ruling in a dispute between Argentina v. Uruguay, involving pollution from pulp mills constructed along a shared river. [See footnote pg. 91] In its decision, the ICJ stated that “it may now be considered a requirement under general international law to undertake an environmental impact assessment where there is a risk that the proposed industrial activity may have a significant adverse impact in a transboundary context, in particular, on a shared resource.” Id. at 61. Just as in Argentina v. Uruguay, the instant project involves cooperation between two countries to undertake an industrial activity that impacts shared resources, primarily wildlife including wildlife (migratory birds) protected by a treaty between the United States and Canada. The DOS acknowledges that this Project will have significant impacts on the environment both in the U.S and in Canada. Under CEQ guidance and the clear precedent of the Manitoba decision, the NEPA obligation to take a “hard look” at reasonably foreseeable direct, indirect, and cumulative impacts does not end at the international border.	gases, and Section 3.14.4 addresses extraterritorial concerns.
1429	206	Hayes	Douglas	Sierra Club et al	In addition to transboundary impacts, DOS fails to adequately analyze the impacts of expanded U.S. pipeline carrying capacity and refining of heavy crude from the Canadian tar sands. Moreover, the DEIS does not consider the environmental impacts of tar sands extraction or the indirect end use impacts of increased consumption of tar sands oil. Thus the DEIS fails to satisfy NEPA’s indirect and cumulative analysis requirement.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information on current and future production. As noted in that response, without the proposed Project, oil sands development would continue at or above the current level until at least 2020, with or without the proposed Project. Cumulative impacts are addressed in Section 3.14 of the EIS. In addition, Section 3.13.4 of the EIS includes discussions of extraterritorial concerns. The assessments in Section 3.14 were conducted following CEQ guidance on cumulative impact analyses. As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries. Similarly, use of refined products produced and sold by the Gulf Coast refineries would continue along recent trends assuming the economy is not drastically altered.
1429	207	Hayes	Douglas	Sierra Club et al	a. The DEIS fails to adequately analyze the indirect and cumulative impacts of refining heavy tar sands crude. The Draft EIS does not adequately consider all of the indirect and cumulative impacts of refinery expansions necessary to refine the increased amount of tar sands oil that will be imported into the United States. [See footnote pg. 91] Although, as described above, commenters believe that there is no evidence of future increases in demand for liquid fossil fuels, the stated purpose and need for the Keystone XL pipelines as set forth in the DBIS relies on the proposition that there is. DOS must either revise their assessment of the need for a new crude oil pipeline or they must fully assess the impacts of	The assessment of need is not based on the premise that there will be need for future increases in demand for heavy oil in U.S. Consolidated Response P&N-1 addresses the need that the Project has been proposed to meet. As noted in that response, the Project has been proposed to meet the heavy crude oil needs of refineries in the Gulf Coast area, not for the U.S. in general. Consolidated Response OIL-4 addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils. As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					the pipeline according to the assumptions on which the project is premised. Moreover, permitting investment in this pipeline and the associated infrastructure will lock in dependence on oil at a time when development of alternative sources of energy is a priority for achieving the current administration's energy security and climate change goals. Sunk capital costs make it more difficult to development necessary alternatives to fossil fuels because existing technologies frequently have an economic advantage over new technologies trying to break into the market.	proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries or the composition of products produced and sold by those refineries. Similarly, use of refined products produced and sold by the Gulf Coast refineries would continue along recent trends assuming the economy is not drastically altered. Consolidated Response ALT-2 addresses the use of alternative technologies, alternative energy sources, and conservation of energy.
1429	208	Hayes	Douglas	Sierra Club et al	The DEIS fails to adequately analyze the indirect and cumulative impacts of tar sands extraction on Birds and Wildlife. The tar sands are a geologic formation that lie beneath approximately 149,000 square kilometers of Alberta's northeastern boreal forest. The Boreal Forest is a permanent or temporary home to many species sensitive to industrial development, such as caribou, whooping crane, and lynx. Many of these species migrate across the U.S./Canadian border. But open pit mining turns this valuable ancient forest into a wasteland, destroying acres of forest and polluting waters. Drilling in the tar sands requires such a complex network of wells, roads, and pipes in areas where drilling is taking place, that every part of the forest will be within a few hundred yards of an industrial intrusion. Although the companies in the tar sands assert that the land is reclaimed after mining, there has not yet been any mine fully reclaimed. [See footnote pg. 92] Forest, peatlands, and wetlands ecosystems are highly complex, and it is unlikely they will regenerate in areas filled with mine waste. [See footnote pg. 92] Acre for acre, peat bogs are the single best carbon sink of any habitat in terms of tons of carbon captured and stored. [See footnote pg. 92] Their destruction in this process adds to the negative climate change impacts as stored greenhouse gases are released and capture capacity is lost. The indirect impacts to the Boreal Forest that result from this project such as increased tar sands extraction and related activities such as the construction of highly toxic tailings ponds, as well as the cumulative impacts resulting to the Boreal Forest from this and other pipeline projects, tar sands extraction, water withdrawals, tailings ponds, and other activities involved in the construction and operation of both the pipelines and the tar sands extraction, has not be adequately examined by the DEIS.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information on current and future production. As noted in that response, without the proposed Project, oil sands development would continue at or above the current level until at least 2020, with or without the proposed Project. Consolidated Response GHG-4 addresses concerns regarding the loss of boreal forest and peat bogs. Consolidated Response ENV-4 addresses issues related to oil sands production and migratory birds. In addition, Section 3.13.4 of the EIS has been revised to expand discussions of extraterritorial concerns.
1429	209	Hayes	Douglas	Sierra Club et al	The DEIS fails to adequately analyze the indirect and cumulative impacts on Birds. i. Toxic waste and large-scale water withdrawals threaten delicate wetlands and river ecosystems. Both mining and drilling operations in the tar sands have severe impacts on water supply and quality in Alberta. To extract the tar sands the soil is strip-mined and subjected to high temperature steam to separate the oil from the sand producing a heavy, dirty crude. If the sands lie too deep beneath the surface for strip mining (generally over 100 meters), in situ extraction is used by heating the tar sands to the bitumen can flow to a well and be pumped to the surface, [See footnote pg. 93]	The approach for wildlife assessments is addressed in Consolidated Response WIL-1. Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project. Consolidated Response ENV-4 addresses issues related to oil sands production and migratory birds.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
1429	210	Hayes	Douglas	Sierra Club et al	In-situ operations that take water from underground aquifers can also harm the area's water supply. The hydrology in this region is a complex network of underground freshwater and saline aquifers, ground waters, and wetlands. The links among these systems are not yet fully understood, nor are the impacts of the water withdrawals on surface land and waters. [See footnote pg. 93] One specific concern is that taking water out of underground aquifers could cause surface water tables to sink - for example, causing a loss of wetlands and habitat. [See footnote pg. 93] Current tar sands operations are permitted to remove enough water to meet the needs of a city of 2 million people, and water removal is projected to increase by 50 percent as planned tar sands projects become operational. Changes to Alberta's rivers and underground reservoirs could have profound impacts on the hundreds of thousands of birds that are dependent on the wetland habitats in the tar sands and Peace-Athabasca Delta and other parts of the Mackenzie River watershed. [See footnote pg. 94]	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information on current and future production. As noted in that Consolidated Response, without the proposed Project, oil sands development would continue at or above the current level until at least 2020, with or without the proposed Project. Consolidated Response ENV-4 addresses issues related to oil sands production and migratory birds.
1429	211	Hayes	Douglas	Sierra Club et al	Tar sands mines also require extensive human-made wastewater reservoirs or "tailings ponds" that pose an enormous potential threat to wildlife and water. Collectively, these pools of waste cover approximately 50 square miles - an area twice the size of Manhattan and are so vast that they can be seen from space. [See footnote pg. 94]. These waste holding facilities and their associated dikes are some of the largest human-made structures in the world. The largest tailings ponds measure more than 3 miles across. [See footnote pg. 94] The high concentrations of pollutants in tar sands tailings ponds are acutely toxic. [See footnote pg. 94] The toxicity of the ponds is due to their mixture of bitumen, salts, naphthenicacids, and polycyclic aromatic hydrocarbons (PAHs) together with water, sand, silt, and fine clay. Naphthenic acids, when first released from the mining process, can be acutely toxic, as can PAHs. Both naphthenic acids and PAHs can have sublethal impacts on animals including carcinogenic and mutagenic effects [See footnote pg. 94]	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information on current and future production. As noted in that Consolidated Response, without the proposed Project, oil sands development would continue at or above the current level until at least 2020, with or without the proposed Project.
1429	212	Hayes	Douglas	Sierra Club et al	These ponds represent a serious threat to the hundreds of thousands of waterfowl that migrate through the Athabasca River valley each year. [See footnote pg. 94] Annual bird mortality from landings and drowning in the oily water in current tar sands tailings ponds could range from more than 8,000 birds to well over 100,000. A doubling of tailings ponds-likely with proposed tar sands mining expansions spurred by the Keystone XL pipeline and other U.S. pipelines-would increase projected annual bird deaths to between 17,000 to 300,000 individuals. [See footnote pg. 94] It is difficult to estimate the number of birds that may be killed annually at tar sands tailings ponds, but one recent paper noted that hundreds of birds are typically known to be oiled every year at each of 10 or more tailings ponds in the region. [See footnote pg. 94]	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information on current and future production. As noted in that Consolidated Response, without the proposed Project, oil sands development would continue at or above the current level until at least 2020, with or without the proposed Project. Consolidated Response ENV-4 addresses issues related to oil sands production and migratory birds.
1429	213	Hayes	Douglas	Sierra Club et al	As some of the largest bodies of water in the area, these tailings ponds represent seemingly attractive short-term	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					resting stops for upward of 400,000 migrant waterfowl heading to the Peace-Athabasca Delta and beyond. Unfortunately, these ponds can serve as death traps for waterfowl and shorebirds, which can become oiled with waste bitumen after landing in a pond. Oiled birds can become weighed down and incapable of flight or can face death from hypothermia after their feathers lose their insulating properties. Heavily oiled birds often sink rapidly, making it difficult to measure the number of birds killed on the tailings ponds. The deadly effects of these tailings ponds are most likely to be seen during early spring, when natural water bodies are still frozen and the tailings ponds are the area's only open water, and during severe weather conditions, when migrating birds are forced out of the sky into any seemingly suitable habitat. To chase off migratory birds, propane cannons go off at random intervals and scarecrows stand guard on floating barrels. However, these measures often do not work, as was sadly evidenced by a spring 2008 incident where approximately 1,600 waterfowl died after landing in these immense, toxic ponds. [See footnote pg. 95] At least 38 species have been documented as casualties on tar sands tailings ponds, including many waterfowl and shorebird species but also birds such as Red-tailed Hawk, Willow Ptarmigan, Evening Grosbeak, and Tree Swallow. [See footnote pg. 95]	information on current and future production. As noted in that Consolidated Response, without the proposed Project, oil sands development would continue at or above the current level until at least 2020, with or without the proposed Project. Consolidated Response ENV-4 addresses issues related to oil sands production and migratory birds.
1429	214	Hayes	Douglas	Sierra Club et al	Additionally, since many of the tailings ponds are next to water bodies such as the Athabasca River, and there are concerns about potential leakage from existing tailings ponds and from future "remediated" or buried tailings. Alberta Environment does not regulate naphthenic acids, and future management of these pollutants is fraught with uncertainty. [See footnote pg. 95]The DEIS fails to examine these indirect and cumulative impacts. It must do so.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information on current and future production. As noted in that response, without the proposed Project, oil sands development would continue at or above the current level until at least 2020, with or without the proposed Project. Section 3.13.4 of the EIS includes discussions of extraterritorial concerns.
1429	215	Hayes	Douglas	Sierra Club et al	Impacts from Tar Sands Extraction. Expansion of tar sands extraction in the Boreal Forest resulting from this project and other tar sands pipeline projects will also have a significant impact on birds, many of which migrate between the U.S. and Canada. Strip mining causes habitat loss. Tailing ponds kill oiled birds (as described above). Drilling fragments habitat. Intensive water withdrawals harm wetlands and water habitats. Bioaccumulation of air and water toxins endanger bird health. And climate change threatens their habitats and food supplies. [See footnote pg. 95] The projected strip mining of 740,000 acres (300,000 hectares) of forests and wetlands in the tar sands will result in the loss of breeding habitat for between 480,000 and 3.6 million adult birds. The corresponding impact on breeding will mean a loss of between 4.8 million and 36 million young birds over a 20-year period, to between 9.6 million and 72 million birds over a 40-year period. [See footnote pg. 95] Tar sands drilling projects are projected to result in the loss of more forest-dependent bird habitat than strip mining and could harm as many as 14.5 million breeding birds from direct habitat loss and as many as 76 million birds from fragmentation and habitat degradation over a 30 to 50 year period. [See footnote pg. 96]	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information on current and future production. As noted in that Consolidated Response, without the proposed Project, oil sands development would continue at or above the current level until at least 2020, with or without the proposed Project. Consolidated Response ENV-4 addresses issues related to oil sands production and migratory birds.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
1429	216	Hayes	Douglas	Sierra Club et al	Among the birds that are threatened by the loss of the Boreal Forest habitat, several are on the Audubon Society Watch List, such as Canada and Bay-breasted Warblers, Olive-sided Flycatcher, and Rusty Blackbird, due to their rapid decline in numbers and loss of habitat. The Whooping Crane - which is listed as endangered under the Endangered Species Act - is of particular concern because the only naturally remaining migratory population nests in the Wood Buffalo National Park just north of the tar sands mines. Birds from this population migrate over the Boreal Forest and occasionally stop-over in wetlands. Their breeding success is jeopardized in dry years, and most climate change scenarios predict more dry years within the region where they nest. Further, heavy water withdrawals for the extraction of the tar sands may eventually drain the wetlands on which the Whooping Cranes depend.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information on current and future production. As noted in that response, without the proposed Project, oil sands development would continue at or above the current level until at least 2020, with or without the proposed Project. Therefore, the proposed Project is not expected to alter the extent of oil sands development in Alberta, Canada near the Wood Buffalo National Park. Section 3.14.4 of the EIS includes information on environmental impacts and regulation of oil sands development in Canada. Consolidated Response GHG-4 addresses concerns regarding the loss of boreal forest and peat bogs. Consolidated Response ENV-4 addresses issues related to oil sands production and migratory birds.
1429	217	Hayes	Douglas	Sierra Club et al	Overall, combining the various estimates of the loss of birds from mining and in situ operations, Natural Resources Defense Council (one of the groups commenting) projects a cumulative impact ranging from a low of about 6.4 million birds lost to as high as 166 million forest dependent birds lost over 30 to 50 years. This represents a potential decline of between 10 to 50 percent of forest-dependent breeding birds based only on loss of adult breeding birds. And even beyond the direct habitat effects outlined here, there are many other impacts to birds that, while harder to quantify, are known or expected to cause further major negative problems for birds and other wildlife as tar sands development increases. [See footnote pg. 96] These indirect and cumulative impacts must be assessed. They are not.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information on current and future production. As noted in that Consolidated Response, without the proposed Project, oil sands development would continue at or above the current level until at least 2020, with or without the proposed Project. Consolidated Response ENV-4 addresses issues related to oil sands production and migratory birds.
1429	218	Hayes	Douglas	Sierra Club et al	The DEIS fails to adequately analyze the indirect and cumulative impacts to other species. Migratory birds are not the only animals endangered by the expansion of tar sand mining in the Boreal Forest. Woodland Caribou (<i>Rangifer tarandus-caribou</i>) and Grizzly Bears, listed as threatened or endangered in both the U.S. and Canada, also rely heavily on the Boreal Forest for their critical habitat. Both species need large expanses of forest, undisturbed by human activity, to effectively maintain their numbers. [See footnote pg. 96] Caribou, which survive winters on lichen in old growth forests, often more than 60 years old, are threatened by the loss of these woods. They also require large amounts of space to avoid predators [See footnote pg. 96] Further, the increase in young forest attracts other prey animals and increases the occurrence of predators, while roads, pipeline right of ways, and increased infrastructure increases the efficiency of predators and access for human hunters. [See footnote pg. 97]	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information on current and future production. As noted in that Consolidated Response, without the proposed Project, oil sands development would continue at or above the current level until at least 2020, with or without the proposed Project. Section 3.14.4 of the EIS addresses extraterritorial concerns.
1429	219	Hayes	Douglas	Sierra Club et al	Grizzly Bears (<i>Ursus arctos horribilis</i>) are threatened by loss of habitat, especially for females raising young, which "often inhabit remote areas away from the presence of other bears in order to maximize cub safety and facilitate undisturbed interactions of mothers with their cubs." [See footnote pg. 97] The northwest population is listed as of "special concern" in Alberta by Canada, and the species is listed as "threatened"	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information on current and future production. As noted in that Consolidated Response, without the proposed Project, oil sands development would continue at or above the current level until at least 2020, with or without the proposed Project. Consolidated Response GHG-4 addresses concerns

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					by the US FWS across virtually all of the lower 48 states. Any further industrialization or human incursion into the Boreal Forest presents significant dangers to these species.	regarding the loss of boreal forest and peat bogs.
1429	220	Hayes	Douglas	Sierra Club et al	As detailed above, extraction practices in Canada will also have impacts to fish species, with fish populations such as walleye, goldeye, and long-nose sucker are vulnerable, particularly when water withdrawals reduce winter habitat in the Athabasca River. Water allocations for existing, approved, and planned tar sands mining operations are expected to quadruple over allocations for existing projects in 2004. [See footnote pg. 97] These impacts are not considered by the DEIS. They must be.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information on current and future production. As noted in that Consolidated Response, without the proposed Project, oil sands development would continue at or above the current level until at least 2020, with or without the proposed Project. Section 3.14.4 of the EIS addresses extraterritorial concerns.
1429	221	Hayes	Douglas	Sierra Club et al	In addition to species impacted in Canada, increased refining in the Gulf Coast means more mercury and suspended solids being released into the waters as well as increased acid rain. This may further endanger aquatic species in the Gulf Coast and other areas that are already struggling in the face of habitat modification due to climate change, massive disruptions of the food web from invasive species, and the ongoing persistent effects and bio-accumulation of toxins such as mercury and PCBs. Major impacts are likely from tar sands air and water pollution causing the accumulation of toxins in tissues, from acid rain and nitrogen deposition, air pollution and heavy metals. Birds can inhale, ingest, or come into contact with contaminants; these contaminants can build up in the tissues and lead to weakened birds, problems with reproduction, and often to eventual death. Pollution can also lead to changes in habitat and food which will indirectly harm the health of birds. And these effects are not limited to birds-. Tar sands toxins can affect other wildlife and local human populations as well. [See footnote pg. 97]	As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries. Discharges from refineries would have to be in compliance with National Pollutant Discharge Elimination Systems permits issued to the refineries. Those permits typically limit the amount of mercury and suspended solids in the discharges. Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information on current and future production. As noted in that Consolidated Response, without the proposed Project, oil sands development would continue at or above the current level until at least 2020, with or without the proposed Project.
1429	222	Hayes	Douglas	Sierra Club et al	The DEIS fails to consider the indirect and cumulative impacts that increased tar sands extraction generated by new pipeline and refining capacity would have on sensitive species in both the US and Canada. This failure should be addressed before the EIS is finalized.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information on current and future production. As noted in that Consolidated Response, without the proposed Project, oil sands development would continue at or above the current level until at least 2020, with or without the proposed Project. As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries. The volume of refining that occurs in PADD III is controlled by market demands for refined petroleum products produced in PADD III. Further, the proposed Project would not increase total crude oil deliveries to the U.S. in general or PADD III in particular, but would largely replace decreasing heavy crude oil deliveries to PADD III from other existing sources.
1429	223	Hayes	Douglas	Sierra Club et al	3. Additional Cumulative and Indirect Impacts on Wildlife in Light of Climate Change. This project serves to both be an initial disrupter of grassland/rangeland and scrubland habitat particularly in the northern sections of the project, and to add to already existing fragmentation problems in the Gulf Coast section of the project. [See footnote pg. 98] The DEIS	Consolidated Response ENV-6 addresses concerns regarding the influence of climate change on the potential impacts of the proposed Project. Consolidated Response ENV-1 addresses concerns related to sensitive and fragile environmental and ecosystems

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					concludes that such disruption causes impacts on species as they adjust to the changes brought about by the project and that "[i]ncreased movement or displacement of species dependent on the disturbed habitats could reduce carrying capacities, reproductive effort, or survival., [See footnote pg. 98] The DEIS notes that "[l]ong-term cumulative impacts on wildlife would occur in areas where habitat is not allowed to return to preconstruction conditions and in areas where long time periods are required for wildlife habitat to become re-established. Implementation of appropriate mitigation measures, including habitat restoration, would minimize most long-term cumulative impacts on wildlife., [See footnote pg. 98] Again, when looking at cumulative impacts, the DEIS completely omits any assessment of the impacts of climate change on both the long term impacts to species of cumulative habitat fragmentation coupled with the stresses of climate change, as well as the influence that climate change will have on restoration of forested areas and other habitats that will only "recover" over the long-term.	
1429	224	Hayes	Douglas	Sierra Club et al	The DEIS also fails to assess the cumulative impacts the Project and other heavy crude oil pipelines will have on the actual emissions of greenhouse gases. These pipelines encourage the production of this extremely carbon intensive fuel source at the expense of development of cleaner, lower emissions fuel sources. In order to foster informed public participation, a NEPA analysis must contain a "reasonably thorough" discussion that addresses important issues "up front." Nat 'l Parks & Conservation Ass'n v. Bureau of Land Mgmt., 586 F.3d 735, 750. (9th Cir. 2008). Accordingly, an agency's decision is clearly arbitrary and capricious and must be set aside when the agency has "entirely failed to consider an important aspect of the problem" Motor Vehicle Mfrs. Ass'n v. State Farm Mut. Auto. Ins. Co., 463 U.S. 29, 43 (1983). In other words, if a land management agency has completely failed to analyze a particular environmental issue, it is entitled to no deference, and its decision must be set aside. Oregon Natural Desert Ass'n v. Bureau of Land Mgmt., 531 F.3d 1114, 1142 (9th Cir. 2008). In Massachusetts v. Environmental Protection Agency, 549 U.S. 497 (2007), the U.S. Supreme Court acknowledged the reality of climate change.	Consolidated Responses GHG-1 through GHG-5 address concerns related to greenhouse gas, climate change, alternative energy considerations, and approach to assessment of GHG emissions.
1429	225	Hayes	Douglas	Sierra Club et al	Subsequently, the Ninth Circuit Court of Appeals addressed the need to assess climate change in Center for Biological Diversity v. National Highway Traffic Safety Administration, 538 F.3d 1172 (9th Cir. 2008). In Center for Biological Diversity, the Court found that a federal agency had violated NEPA by failing to consider the cumulative impact of carbon dioxide emissions on climate change. More specifically, this Court held that "[t]he impact of greenhouse gas emissions on climate change is precisely the kind of cumulative impacts analysis that NEPA requires agencies to conduct." [See footnote pg. 99] The court in Center for Biological Diversity did not find persuasive the agency's argument that many other factors outside of its control are causing climate change. On the contrary, it stressed the importance of addressing	Consolidated Responses GHG-1 through GHG-5 address concerns related to greenhouse gas, climate change, alternative energy considerations, and approach to assessment of GHG emissions. Section 3.14.3.14 of the EIS addresses climate change in relation to cumulative impacts.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					individual incremental actions that foreseeably and collectively contribute to climate change. Late last year, the EPA filed a formal finding that climate change poses serious adverse impacts to public health and the environment. [See footnote pg. 99] There is little question that tar sands development and refinement will emit greenhouse gases and contribute to climate change. Yet, the impacts of climate change on wildlife are ignored by the DEIS.	
1429	226	Hayes	Douglas	Sierra Club et al	The DEIS also fails to examine the impacts of the proposed Project on threatened and endangered species in light of climate change. There are many endangered species facing threats from climate change, and this proposed Project exacerbates their plight. [See footnote pg. 99] For instance, melting of the polar ice has led to the listing of the polar bear as threatened, and the elkhorn and staghorn coral specifically discuss the impacts of climate change in their final listings. Other endangered animals being threatened by climate change include the Southwestern Willow Flycatcher, the Mexican Spotted Owl, the Bald Eagle, Salmon, and Desert Bighorn Sheep. The DEIS addresses only species that would be directly impacted by the proposed Project, when it should also have taken into consideration species that will lose significant habitat to climate change.	Consolidated Response ENV-6 addresses concerns regarding the influence of climate change on the potential impacts of the proposed Project, and Section 4.14 of the EIS includes information on the influence of climate-change on potential Project impacts. Section 3.8 of the EIS addresses impacts to threatened and endangered, and sensitive species. Endangered animals and plants discussed in the EIS are those identified during consultation with the U.S. Fish and Wildlife Service and other federal and state resource management agencies.
1429	227	Hayes	Douglas	Sierra Club et al	A recent Draft NEPA Guidance issued by the Council of Environmental Quality finds that climate change may add stressors upon the environment that need consideration. [See footnote pg. 99] Climate change threatens to push many species to the brink of extinction and will make additional stressors, like the project, upon species more damaging to species' chances of survival. [See footnote pg. 99] The ESA requires that DOS, in consultation with FWS, examine "the direct and indirect effects of an action on the species and critical habitat, together with the effects of other activities that are interrelated or interdependent with that action that will be added to the environmental baseline." [See footnote pg. 100] The "environmental baseline" is "the past and present impacts of all Federal, State, or private actions and other human activities in the action area, the anticipated impacts of all proposed Federal projects in the action area that have already undergone formal or early section 7 consultation, and the impact of State or private actions which are contemporaneous with the consultation in process." [See footnote pg. 100] "Indirect effects" are "those that are caused by the proposed action and are later in time, but still are reasonable foreseeable." [See footnote pg. 100] The disturbance and fragmentation of habitat and the emission of greenhouse gases caused by the project are clearly direct effects that must be considered. These actions also have indirect effects on these species, especially when habitat fragmentation is viewed in light of climate change and how that may impacts species migration, breeding, feeding and other necessities for survival. Yet, the DEIS fails to assess how climate change, in combination with the project, will impact ESA listed species. [See footnote pg. 100] It must do so.	Consolidated Response ENV-6 addresses concerns regarding the influence of climate change on the potential impacts of the proposed Project. As noted in Section 3.8 of the EIS, DOS formally consulted with the U.S. Fish and Wildlife Service in addressing the potential effects of the proposed Project on threatened or endangered species. The results of that consultation are consistent with the regulatory requirements associated with implementation of the Endangered Species Act and are documented in the Biological Assessment presented in Appendix T of the EIS.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
1429	228	Hayes	Douglas	Sierra Club et al	The Proposed Project Will Result in Violations of the Endangered Species Act and Migratory Bird Treaty Act. The DEIS completely fails to analyze the impacts of the proposed Project to endangered species in Canada, and, as described below, inadequately fails to analyze the impacts to endangered species in the United States. Three species listed as endangered under the ESA in both the U.S. and Canada - the Whooping Crane, the Woodland Caribou, and the Piping Plover - are clearly affected by the proposed pipeline and any DOS approval of a presidential permit allowing for the construction of the proposed pipeline because the pipeline will facilitate development of tar sands in Canada that will adversely impact these species. There is no mention in the DEIS that the required consultation with US FWS has occurred regarding impacts to these species from the development of tar sands, or that such consultation is occurring or will occur. This failure to comply with the ESA and analyze impacts to these species also violates NEPA.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information on current and future production. As noted in that response, without the proposed Project, oil sands development would continue at or above the current level until at least 2020, with or without the proposed Project. Section 3.14.4 of the EIS includes information on endangered species and migratory bird resources shared with Canada, including a discussion of regulation and potential Project impacts. Neither Section 7 of the United State's Endangered Species Act (ESA), nor the Section 7 consultation and analysis process under the ESA's implementing regulations addresses species outside the borders of the United States and nothing in the plain language of Section 7 indicates that it applies to transboundary effects. Consultation with U.S. Fish and Wildlife Service under ESA is discussed in Section 3.8.1 and the consultation history is summarized in the Biological Assessment presented in Appendix T of the EIS.
1429	231	Hayes	Douglas	Sierra Club et al	The infrastructure required by tar sands development has the potential to block caribou movement, concentrating populations into smaller, more isolated patches where they become more susceptible to predation and will face significant social and reproductive challenges. As the populations of woodland caribou and other sensitive species decline, species more tolerant to disturbance, such as moose and deer, will increase. [See footnote pg. 103] These changes lead to increases in the number of predators, especially wolves, and a subsequent increase in predation threat to caribou.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information on current and future production. As noted in that Consolidated Response, without the proposed Project, oil sands development would continue at or above the current level until at least 2020, with or without the proposed Project.
1429	232	Hayes	Douglas	Sierra Club et al	Reductions in caribou range are caused not only by the actual loss and fragmentation of habitat but also by caribou avoiding quality habitat because of noise and increased human presence. [See footnote pg. 103] Sensory disturbance has the potential to effect caribou survival and/or reproduction by increasing their rate of movement, decreasing the amount of time spent feeding, and preventing caribou from using high quality forage and cover resources[See footnote pg. 103]	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information on current and future production. As noted in that Consolidated Response, without the proposed Project, oil sands development would continue at or above the current level until at least 2020, with or without the proposed Project.
1429	233	Hayes	Douglas	Sierra Club et al	As stated above, the Canadian Boreal Forest is one of the world's most important breeding areas for migratory birds. The only wild, migratory population of the endangered Whooping Crane nests solely in the Wood Buffalo National Park just north of the largest tar sands deposits. Birds from this population migrate through the tar sands region and are highly dependent on wetland locations as stop over points along their route [See footnote pg. 103] Tar sands mining causes habitat loss, damage to wetlands, and air and water contaminants that pose a serious threat to the whooping crane. [See footnote pg. 103]	Consolidated Response GHG-4 addresses concerns regarding the loss of boreal forest and peat bogs.
1429	234	Hayes	Douglas	Sierra Club et al	Site preparation for surface mining requires draining all lakes and wetlands, diverting any rivers that flow through the minable area, clearcutting forests, and removing vegetation. [See footnote pg. 103] This results in direct habitat loss and reduces the amount of quality habitat for the whooping crane on its long migration. Although the industry is required to somehow reclaim lands they have altered, it is unlikely that	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information on current and future production. As noted in that Consolidated Response, without the proposed Project, oil sands development would continue at or above the current level until at least 2020, with or without the proposed Project.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					these landscapes will ever be fully restored. [See footnote pg. 104] Peatlands, a type of wetland and favored habitat for the whooping crane, take thousands of years to develop and cannot be recreated. Wetlands surrounding tar sands deposits that are not directly destroyed may dry up as a result of groundwater extraction and consequent lowering of the water table. [See footnote pg. 104] Low flows may prevent recharge and can increase the concentration of pollutants in the water. In the coming decades, almost 10% of the region's wetlands will be destroyed. [See footnote pg. 104]	
1429	235	Hayes	Douglas	Sierra Club et al	In the absence of wetlands, whooping cranes and other migratory birds may be drawn to tailings ponds, massive pools of toxic waste created as a byproduct of mining. As detailed above, tailing ponds provide fatal magnets for birds, including the whooping crane, that use the region. [See footnote pg. 104] Tailings ponds could represent a loss of a significant proportion of the population of species with limited numbers, such as the whooping crane whose safe passage through the tar sands region is the first step to a successful breeding season. [See footnote pg. 104]	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information on current and future production. As noted in that Consolidated Response, without the proposed Project, oil sands development would continue at or above the current level until at least 2020, with or without the proposed Project. Consolidated Response ENV-4 addresses issues related to oil sands production and migratory birds. Section 3.14.4 of the EIS includes information on endangered species and migratory bird resources shared with Canada.
1429	236	Hayes	Douglas	Sierra Club et al	Toxins that seep into the air and water from tar sands operations may also threaten the whooping crane. Tar sands mining releases contaminants into the air through upgrading and refining processes, emissions from vehicles, and from tailings ponds. Contaminants are released into the water through leakage from tailings ponds and from the release of treated water into the Athabasca River. Many of the toxins released are eventually deposited into aquatic systems through acid rain and runoff.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information on current and future production. As noted in that response, without the proposed Project, oil sands development would continue at or above the current level until at least 2020, with or without the proposed Project. Consolidated Response ENV-4 addresses issues related to oil sands production and migratory birds. Section 3.14.4 of the EIS includes information on endangered species and migratory bird resources shared with Canada.
1429	237	Hayes	Douglas	Sierra Club et al	The piping plover is listed as threatened under the Endangered Species Act. Piping plovers are migratory birds that breed each summer in the Boreal Forests underlying the tar sands. Their nesting territories often include small creeks or wetlands, which will likely be impacted by tar sands development either directly, as a result of draining, or indirectly through lower water tables and the release of contaminants (see above discussion both generally and in terms of the whooping crane). [See footnote pg. 104] As quality habitat declines, the likelihood of plovers landing in tailings ponds increases. Piping plovers are also very sensitive to noise and the presence of humans. Sensory disturbance in the tar sands region has the potential to effect piping plover reproduction. [See footnote pg. 104] Too much disturbance may cause the parent birds to abandon their nest.	Consolidated Response ENV-4 addresses issues related to oil sands production and migratory birds. Section 3.14.4 of the EIS includes information on endangered species and migratory bird resources shared with Canada.
1429	238	Hayes	Douglas	Sierra Club et al	The ESA requires that the action agency must consult with and comply with the Opinion of the Secretary of the Interior on fulfilling its section 7(a)(1) and (2) duties on these three species (the woodland caribou, whooping crane, and piping plover). Thus, the DEIS must include information on the impact on the Canadian and U.S. habitats of these three species not only to fulfill the statutory scope of NEPA, but of the ESA as well.	Neither Section 7 of the Endangered Species Act (ESA), nor the Section 7 consultation and analysis process under the ESA's implementing regulations addresses species outside the borders of the United States. Nothing in the plain language of Section 7 indicates that it applies to transboundary effects. Additional information for potential Project-related effects to shared endangered species has been added to Section 3.14.4 Extraterritorial Concerns.
1429	239	Hayes	Douglas	Sierra Club et al	Inadequate Information Exists to Assess Effects on Species in	Impacts to wildlife and wildlife habitats including loss and

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					<p>the US. Conclusions made in the DEIS and the Appendix T Draft Biological Assessment that the proposed Project will not affect or will not adversely affect several ESA listed species lack adequate supporting information to conclude that several species will not be adversely affected and that formal consultation under section 7(a)(2) of the ESA is not required. This violates both the ESA, and NEPA. Applicable ESA regulations require that "each Federal agency shall review its actions at the earliest possible time to determine whether any action may affect listed species or critical habitat. If such a determination is made, formal consultation is required, except as noted in paragraph (b) of this section." Formal consultation need not occur "if, as a result of the preparation of a biological assessment ... or as a result of informal consultation with the Service ... the Federal agency determines, with the written concurrence of the Director, that the proposed action is not likely to adversely affect any listed species or critical habitat." The DEIS concludes that the proposed Project "may affect," but is "not likely to adversely affect" several ESA listed species: the black-footed ferret, interior least tern, whooping crane, pallid sturgeon, Texas prairie dawn flower, piping plover, Arkansas River shiner, and Western prairie fringed orchid. The DEIS also concludes that several species - such as red-cockaded woodpecker, several sea turtle species, and the Topeka shiner will not be effected by the proposed Project. However, these conclusions appear to be based on little more than the prepared Draft Biological Assessment of Keystone (Appendix T of the DEIS). The DEIS does include documentation of consultation letters or other correspondence from U.S. FWS regarding the consultation process, meeting summaries between U.S. FWS, Keystone and/or the State Department, field surveys regarding the species at issue, or other similar supporting documentation. Without such supporting information, it is impossible to assess whether the conclusions in the DEIS regarding impacts to ESA listed species are correct, whether these species will not be adversely affected the proposed Project, or what the actual impacts of the proposed Project on these species are.</p>	<p>alteration are addressed in Sections 3.5, 3.6, 3.7, and 3.8 of the EIS. Section 7 consultations have been completed .. DOS considers the EIS, including assessments of potential impacts to wildlife, to be consistent with the requirements of a NEPA environmental review.</p>
1429	240	Hayes	Douglas	Sierra Club et al	<p>The justification given in Appendix T for not including supporting documentation is that field survey reports "contain specific location information that is confidential." The DEIS fails to provide any reason why the information is deemed to be confidential. Generally, such information is not exempt from disclosure. See, e.g., Nat'l Ass'n of Homebuilders v. Norton, 309 F.3d 26 (D.C. Cir. 2003) (information regarding location of ESA listed cactus ferruginous pygmy owl must be described and neither ESA nor Freedom of Information Act exempts such disclosure where agency raised as defenses for withholding information landowner privacy, that disclosure was not in the best interests of the species, that the information was confidential commercial or financial information, and that the information was exempted under FOIA's deliberative process privilege). In this case, it is difficult to understand how the information in the Appendices to the Draft Biological Assessment could be deemed confidential and withheld. Such</p>	<p>Specific location information for protected animals and plants was included in the survey reports submitted to U.S. Fish and Wildlife Service (USFWS) for evaluation with the Biological Assessment. These reports were withheld as confidential to protect the listed species. Public release of this information is at the discretion of the USFWS.</p>

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					information contains field surveys for several species along various parts of the proposed Project, consultation letters, and other routine information. DOS must provide this information, or adequately explain why it legally cannot be provided.	
1429	241	Hayes	Douglas	Sierra Club et al	Approval of the Project Would Be Arbitrary and Capricious Under the Administrative Procedure Act Because the Project Will Be In Violation of the Migratory Bird Treaty Act. The APA governs judicial review of agency action. A court shall "hold unlawful and set aside agency action, findings, and conclusions found to be arbitrary, capricious, an abuse of discretion, or otherwise not in accordance with law." [See footnote pg. 106] Said another way, an agency action will be set aside if it breaks the law. An agency action that breaks the law, such as the Migratory Bird Treaty Act ("MBTA"), is vulnerable to suit seeking to enforce the no-take requirement of the MBTA [See footnote pg. 106]	The approach for wildlife assessments is addressed in Consolidated Response WIL-1. Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project. Consolidated Response ENV-4 addresses issues related to oil sands production and includes additional information on Canada's Migratory Bird Conservation Act and Consolidated Responses ENV-4 and WIL-2 address concerns regarding oil sands development and migratory birds.
1429	242	Hayes	Douglas	Sierra Club et al	Tar sands production is likely to cause the loss of millions of migratory birds that nest in the forests and wetlands of the region. [See footnote pg. 107] The tar sands deposits lie in the Boreal Plains ecozone. [See footnote pg. 107] This region is an important breeding habitat for 22 to 170 million resident birds and an important flyway for wetland-dependent birds. [See footnote pg. 107] It is also one of the world's most important breeding areas for migratory birds, with 1 to 3 billion individual birds from at least 300 species known to regularly breed there. [See footnote pg. 107] Approximately 30 percent of all shorebirds (7 million) and 30 percent of all land birds (1 to 3 billion) that breed in the United States and Canada do so within the Boreal. [See footnote pg. 107] Approximately 94 percent of individual birds migrate out of the Boreal area after breeding. [See footnote pg. 107]	Consolidated Response ENV-4 addresses issues related to oil sands production and migratory birds.
1429	243	Hayes	Douglas	Sierra Club et al	Birds in the United States would be taken as well, in violation of the MBTA. Construction of the pipeline would likely result in both direct mortalities to migratory birds through collision with vehicles, nest disturbances and destruction and other impacts, and indirect fatalities through increases in predation opportunities and habitat disturbance.	Keystone is coordinating with U.S. Fish and Wildlife Service to minimize potential incidental take of migratory birds. The Migratory Bird Treaty Act (MBTA) has no provision to allow unauthorized take of migratory birds. The U.S. Fish and Wildlife Service (USFWS) recognizes however, that some birds could be killed during construction and operation of energy infrastructure even if all know reasonable, prudent, and effective measures to protect birds are used. Keystone would work with USFWS to identify and implement effective steps to avoid take of migratory birds and minimize loss, destruction, and degradation of migratory bird habitat. USFWS Office of Law Enforcement focuses its resources on investigating and prosecuting individuals and companies that take migratory birds without identifying and implementing all reasonable, prudent and effective measures to avoid take.
1429	244	Hayes	Douglas	Sierra Club et al	Approval of the Project Would Be Arbitrary and Capricious Under the Administrative Procedure Act Because the Project Will Be In Violation of the Fish and Wildlife Coordination Act. As outlined above, it is a violation of the APA for an agency action to not be in accordance with the law. The Fish and Wildlife Coordination Act provides the following: [W]henver the waters of any stream or other body of water are proposed or authorized to be impounded, diverted, the channel	One USFWS listed species, the American burying beetle, was determined to be potentially adversely affected by the proposed Project. As a result, DOS began formal consultation with USFWS to develop conservation measures and compensatory mitigation. During formal consultation three proposed implementing agreements are being developed that would go into effect only if the DOS determines to issue a permit for the proposed Project. These proposed

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					deepened, or the stream or other body of water otherwise controlled or modified for any purpose whatever, including navigation and drainage, by any department or agency of the United States, or by any public or private agency under Federal permit or license, such department or agency first shall consult with the United States Fish and Wildlife Service, Department of the Interior, and with the head of the agency exercising administration over the wildlife resources of the particular State wherein the impoundment, diversion, or other control facility is to be constructed, with a view to the conservation of wildlife resources by preventing loss of and damage to such resources as well as providing for the development and improvement thereof in connection with such water-resource development [See footnote pg. 108]	implementing agreement concern: (1) the establishment of an American Burying Beetle Habitat Conservation Trust; (2) the monitoring of American burying beetle mitigation and reclamation of lands affected by the proposed Project; and (3) the establishment of a Reclamation Performance Bond. Based on the formal consultation, USFWS is formulating a Biological Opinion that would be required prior to the issuance of a Record of Decision under NEPA by DOS or any other federal cooperating agency. (see Appendix T and Section 3.8 of the EIS).
1429	245	Hayes	Douglas	Sierra Club et al	The specific reports and recommendations of the Secretary and the state agency on the wildlife aspects of such projects must be made part of the responsible federal agency's report. [See footnote pg. 108] It is intended that the reports and recommendations be based on surveys and investigations to determine possible damage to wildlife resources and measures that should be adopted to prevent that loss or damage. [See footnote pg. 108] Federal agencies must give full consideration to the reports. [See footnote pg. 108] This has not occurred.	Comments and recommendations concerning potential wildlife impacts from construction and operation of the Project submitted by federal and state resource agencies during scoping, through administrative EIS reviews, through reviews of Project-specific survey recommendations and reports, and through reviews of the draft EIS were considered and incorporated into the EIS.
1429	246	Hayes	Douglas	Sierra Club et al	This pipeline proposes to cross a total of 341 perennial waterbodies and 621 intermittent waterbodies. Although there is a section of the DEIS which accedes that wetlands will be crossed, it does not specify quantity, locations, or the length of pipeline which will invade the wetland area.	Each water and wetland crossed by the Keystone Proposed Project is listed in Appendix E of the EIS. This listing includes the length of each crossing. Section 3.4 summarizes the length and area of wetlands crossed in Tables 3.4.3-1 and 3.4.3-1 of the EIS.
1429	247	Hayes	Douglas	Sierra Club et al	The DEIS does not adequately address the destruction of irreplaceable native grassland ecosystems and Impacts on the Sand Hills. Although the DEIS acknowledges that "conservation of native prairie remnants is a high priority throughout the project area" and that the Sand Hills are "one of the few remaining examples of a functioning prairie ecosystem," the Pipeline route will cross over 336 miles of native grasslands that may take a century or more to recover from the excavation. These are irreplaceable resources of national and international value that cannot simply be replanted.	Identification of sensitive environments crossed by the proposed Project is discussed in Consolidated Response ENV-1 and ENV-3. Issues related to the Sand Hills area are addressed in Consolidated Response ERO-1.
1429	248	Hayes	Douglas	Sierra Club et al	In recent years increasing amounts of scarce remaining native grasslands have been plowed under to meet agricultural needs. The native prairie remnants on the High Plains and Great Plains are biologically unique, contain high biological diversity, and provide critical ecosystem services to the region, including carbon sequestration. Pipeline construction and operation will permanently alter this ecosystem by causing increased soil erosion, introduction and expansion of noxious weed populations, long-term damage to delicate soils, alteration of vegetation due to increased soil temperatures, and a risk of minor to catastrophic spills along the full Pipeline route.	Identification of sensitive environments crossed by the proposed Project is discussed in Consolidated Responses ENV-1 and ENV-3. Issues related to the Sand Hills area are addressed in Consolidated Response ERO-1. Information on soil temperature effects are presented in Appendix L of the EIS and in Consolidated Response ENV-2. Section 3.13 of the EIS addresses reliability and safety issues, including calculations of the probability of a spill from the proposed Project and the potential environmental impacts associated with spills.
1429	249	Hayes	Douglas	Sierra Club et al	In Section 3.5.2 (under Terrestrial Vegetation), the first sentence is inaccurate with regard to the degree of alteration	Impacts to native grasslands are addressed in Sections 3.5.5 and 3.6.2 of the EIS. Additional discussions on impacts to

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					“by agriculture, urban, industrial development. “prairie dogs”. [See footnote pg. 109] It is inaccurate to say that native vegetation communities “throughout” the project area have been so altered. Some of these areas have been altered very little. Their excavation would represent, in some cases, the first alteration by human hands. Section 3.5.2 includes other factual errors. For example, grasses are either bunch grasses or sodforming, not both. [See footnote pg. 109] The discussion of “Traditionally Used Native Plants” at Section 3.5.2.4 requires updating and/or additions to scientific names.	sagebrush habitats specific to Montana are presented in Appendix I of the EIS. Additional information on Keystone’s process for identifying and mitigating impacts to native grasslands are discussed in Consolidated Response ENV-3. Also, The commenter has misread the opening sentence. The sentence lists the anthropogenic (agriculture, urban, and industrial) and natural processes (fire, bison grazing, prairie dogs) through which native vegetation communities are “altered”. There is no degree of anthropogenic alteration stated or implied. Further, the EIS was revised to remove “bunch” and to include “purple (or prairie) coneflower (Echinacea spp.)” All other traditionally used native plants include scientific names.
1429	250	Hayes	Douglas	Sierra Club et al	It should also be stated regarding the Sand Hills that most of the lakes in this region represent the water table. The risk of aquifer contamination is therefore exceptionally high in this area.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
1429	251	Hayes	Douglas	Sierra Club et al	The DEIS Fails to Consider Fully the Risk of Noxious Weed Introduction. Table 3.5.5-4 (Noxious Weed Sources Occurring Along the Steele City Segment of the Project) underestimates the noxious weed species active in Nebraska. The DEIS does not reflect the fact that noxious weeds ‘Sericea [Chinese] lespedeza’ and Johnsongrass grow in Nebraska. Table 3.5.4-1 (Federal, State, or Local Noxious Weeds Potentially Occurring Along the Project Route) has omissions and should be revised with the assistance of a specialist in affected prairie ecosystems.	Consolidated Response NOX-1 addresses issues related to noxious weeds. Table 3.5.5-4 of the EIS was compiled from weed surveys completed by Keystone across the proposed Project ROW. It is not intended to represent a comprehensive list of weeds in Nebraska. The noxious weeds identified as occurring within counties crossed by the proposed Project are included in Table 3.5.4-1 of the EIS. Neither Sericea [Chinese] lespedeza (Lespedeza cuneata) or Johnsongrass (Sorghum halepense) are considered noxious weeds in Nebraska (see http://www.agr.state.ne.us/division/bpi/nwp/nwp1.htm). Keystone has worked with experts in restoration of native prairie habitats as noted in the document entitled Sand Hills Construction/Reclamation Unit included in Appendix H of the EIS.
1429	252	Hayes	Douglas	Sierra Club et al	Section 3.5.5.1 does not address the fact that increasing soil temperature might allow for southern plants to move northward. An additional concern is that the newly created microclimate may allow invasion of new noxious weeds. Research on soil temperatures increases (Appendix L) extensively cites an article, Dunn et al. that is unpublished. Since it has not gone through a scientific peer review process, the Dunn article should neither be used nor cited in the document. Other cited research is primarily related to crops, and the only article on the impact of native grass species involves a natural gas pipeline installed 17 years ago.	Consolidated Response ENV-2 addresses concerns related to pipeline temperature effects. Keystone acknowledged in Appendix L that the article prepared by Dunn et al. is a pre-published draft. Consolidated Response NOX-1 addresses issues related to noxious weeds.
1429	253	Hayes	Douglas	Sierra Club et al	Further research needs to be done to determine if more relevant and newer peer-reviewed research exists that can provide a stronger basis for decision-making. The small section regarding revegetation monitoring (Appendix L, section v.) discusses a CRP field re-established after a crude oil pipeline was installed, but again the research is not in a peer-reviewed journal and was conducted by a paid environmental service firm. The 20-50% increase in temperature they quote from the Knapp article is not a correct conclusion from the article. It is an overstatement. The Knapp article is attached to these comments as an exhibit.	This report in Appendix L was provided by Keystone, and information specific to modeled pipeline temperatures was used in the EIS. The 20 to 50 percent increase in temperature was not used in the EIS. Additionally, DOS conducted follow on due diligence discussions with a Sand Hills restoration expert (Wedin pers. comm.. 2011).
1429	254	Hayes	Douglas	Sierra Club et al	The DEIS Plans Inadequately for Revegetation. At several	The EIS was revised with regard to estimated times for

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					points, the DEIS makes faulty assumptions, proposes insufficient measures, or is unclear about revegetation planning for highly sensitive areas. For example, one growing season of discouraging livestock grazing will be inadequate for establishment. Establishment will likely take five to ten years.	recovery of vegetation. Issues related to the Sand Hills area are addressed in Consolidated Response ERO-1. The provision for exclusion of grazing would be dependent on the landowner. These concerns are also addressed in Consolidated Responses ENV-1 and ENV-3.
1429	255	Hayes	Douglas	Sierra Club et al	The recommendation by regulatory agencies on prohibiting burning also is not clear. [See footnote pg. 110] The DEIS is unclear on whether local ecotypes will be used for seed mixes in replanting and offers no supporting evidence for the assertion that the reseeding plan will restore the biodiversity that will be destroyed by the construction process. [See footnote pg. 110] Dr. Stubbendieck believes it will not.	Agency recommendations are presented as they were received. Reclamation of Sand Hills vegetation and recommended seed mixes were discussed with regional experts including: Dr. Jerry Volesky, Dr. Dave Wedin, Dr. David Loope, Dr. Alexander Smart, and Dr. Eric Mousel. Native grass species that will be used in the seed mix include those that were recorded during pedestrian surveys of the proposed Project and that have been recommended by the NRCS, university scientists, and the Nebraska Department of Roads. Additional information on Sand Hills construction and reclamation is included in Appendix H of the EIS.
1429	256	Hayes	Douglas	Sierra Club et al	For the Sand Hills region, certain specifics are lacking or inappropriate to the unique soil conditions. There is little topsoil development in this area, so stockpiling it would be of little value on the uplands. Revegetation methods specific to the Sand Hills are inadequate. Some are untested in the region (such as imprinting the soil). Wind erosion is a major concern that remains unaddressed. Fencing would also be needed to remove animal traffic in these areas.	Identification of sensitive environments crossed by the proposed Project is discussed in Consolidated Response ENV-1 and ENV-3. Issues related to the Sand Hills area are addressed in Consolidated Response ERO-1. Additionally, DOS conducted follow on due diligence discussions with a Sand Hills restoration expert (Wedin pers. comm.. 2011).
1429	257	Hayes	Douglas	Sierra Club et al	The sixth bullet point in Section 3.5.5 fails to discuss the impact of increased soil temperatures on the soil microbial community or the impact on native vegetation. Section 3.5.5.1 (General Vegetation Resources paragraph) misrepresents the length of time it will take for vegetation to establish to preconstruction conditions. Studies have shown a much longer reestablishment period, for example, 20-40 years in the short grass prairie, but less time for Sand Hills or tall grass prairies. In Section 3.5.5.1, it is unclear whether the time period for shrub land re-establishment would be if the shrubs were re-introduced or natural colonization was allowed to occur.	Consolidated Response ENV-2 addresses concerns related to pipeline temperature effects.
1429	258	Hayes	Douglas	Sierra Club et al	Finally, we note that Section 3.8 (Threatened and Endangered Species) omits consideration of the federally endangered Blowout Penstemon (<i>Penstemon haydenii</i>) population in Rock County, Nebraska.	The proposed route would not cross known populations or suitable habitat for the blowout penstemon (<i>Penstemon haydenii</i>) in Rock County, Nebraska and no associated facilities would be constructed in this county. The blowout penstemon was not identified as occurring near the proposed route during Section 7 Endangered Species Act consultations with either the U.S. Fish and Wildlife Service or the Nebraska Game and Parks Commission. Further discussion about the blowout penstemon can be found in Section 3.8.1.7 of the EIS.
1429	259	Hayes	Douglas	Sierra Club et al	The DEIS does not Adequately Address the Risks and Impacts of Spills and Operational Leaks. The Pipeline raises environmental and public safety issues distinct from those associated with conventional crude oil pipeline systems. The DEIS does not adequately address these unique concerns, including pipeline routing, pipe quality, construction standards, operation and maintenance, and emergency response; We request that DOS condition the grant of the Permit on a requirement that the fifty-one special permit conditions	The proposed Project route is appropriately addressed in Section 2 of the EIS and impacts associated with construction and operation of that route are addressed in Section 3 of the EIS. Section 3.13 of the EIS addresses impacts associated with a crude oil spill along the route. Consolidated Response PIP-1 addresses the issue of purchasing pipe for the Project. Consolidated Response SAF-1 describes the regulatory requirements and Project-specific Special Conditions that Keystone would comply with to construct, operate, maintain,

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					imposed on the original Keystone pipeline by PHMSA be imposed on the full length of the Keystone XL project as well. We further request that DOS condition the grant of the Permit on the use of the thicker pipe proposed only for High Consequence Areas on the full length of the Pipeline. Using a design factor and operating stress level of 80 percent of the steel pipe's specified minimum yield strength ("SMYS") in rural areas, in addition to thicker pipe, will provide the maximum level of safety over the lifecycle of this pipeline. The devastating consequences of a pipeline failure to agricultural, wildlife, cultural and other resources along the route should dictate the application of the highest possible standards for the length of the Pipeline.	<p>inspect, and monitor the proposed Project. It also describes the monitoring, inspections, and reviews of the proposed Project that the Pipeline and Hazardous Materials Safety Administration would conduct to ensure compliance with those regulatory requirements. . In addition, PHMSA developed 57 Project-specific Special Conditions that Keystone has agreed to implement. DOS, in consultation with PHMSA, has determined that incorporation of those conditions would result in a Project that would have a degree of safety over any other typically constructed domestic oil pipeline system under current code and a degree of safety along the entire length of the pipeline system similar to that which is required in HCAs as defined in 49 CFR 195.450. Consolidated Response RES-1 addresses issues related to preparation and review of the required emergency response plans for the proposed Project. Keystone has withdrawn its application for a Special Permit as described in Consolidated Response REG-1.</p> <p>As noted in Consolidated Response OIL-4, the crude oil that would be transported by the proposed Project is similar to other heavy crude oils refined in the U.S. and transported by other pipeline systems. As a result pipeline routing, pipe quality, construction standards, operation and maintenance, and emergency response for the proposed Project would be similar to those aspects of other crude oil pipelines currently operating in the U.S. In addition, there are many pipelines currently transporting crude oil derived from Canadian oils sands. The environmental reviews of those pipeline systems were no different from environmental reviews conducted for pipelines transporting "conventional" crude oil.</p>
1429	260	Hayes	Douglas	Sierra Club et al	Lastly, as discussed in subsection 6, Operations and Maintenance Items, because of the higher temperature at which this pipeline will operate, internal and external corrosion will be a major risk. Given the advanced state of various corrosion mitigation technologies such as recent developments in fusion bonded epoxy ("FBE") coatings, improvements in cathodic protection design and operation, and requirements for cleaning pigs and corrosion inspection with high resolution smart pigs, we request that DOS expand its conditions for corrosion mitigation to include all of the above.	Consolidated Response OIL-4 addresses the composition of the Canadian crude oil that would be transported by the proposed Project, including concerns relative to the corrosivity and erosivity of the crude oil. As noted in that Consolidated Response, that crude oil is similar in composition and properties to other heavy crude oils that are currently transported within the U.S. pipeline system and similar in composition and properties to other heavy crude oils that are currently refined in PADD III. Corrosion prevention and reduction measures are also described in Section 2.3 of the EIS. Consolidated Response SAF-1 describes the regulatory requirements that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project. Those regulations include the requirements mentioned by the commenter (see 49 CFR 195, Subpart H -- Corrosion Control). In addition, PHMSA Special Conditions 9, 34, 37, 39, 49, and 52 address corrosion monitoring, repair, and reporting (see Appendix U). PHMSA Special Condition 15 includes temperature limitations and related requirements for the proposed Project (see Appendix U).
1429	261	Hayes	Douglas	Sierra Club et al	The unique nature of the oil being moved plays an important role in the design, operation, and maintenance of the Keystone XL system as well as the effectiveness of oil spill response, so a brief discussion of several important tar sands oil characteristics is warranted.	Consolidated Response OIL-4 addresses the composition of the Canadian crude oil that would be transported by the proposed Project, including concerns relative to the corrosivity and erosivity of the crude oil. As noted in that Consolidated Response, that crude oil is similar in composition and

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
						properties to other heavy crude oils that are currently transported within the U.S. pipeline system and similar in composition and properties to other heavy crude oils that are currently refined in PADD III. Consolidated Response RES-1 addresses issues related to preparation and review of the required emergency response plans for the proposed Project.
1429	262	Hayes	Douglas	Sierra Club et al	Tar sands oil and synthetic crude. The bitumen oil produced from tar sands is not typical crude oil. This oil is very heavy with a gravity that can range from 7 to 13 0 API, which is very close to the gravity of water of 10o API. The bitumen is very thick or viscous at normal temperatures and either must be heated or blended with various lighter oil stocks, such as condensate or gas oil "cutter" stocks, to permit the blended mixture to flow under pipeline design conditions. While not addressed in the DEIS, the published tariffs for the Keystone project (which has the same pipeline origination point, the Hardesty Terminal in Alberta, Canada), places an upper viscosity limit (as a function of varying temperature over the year), and lower gravity quality specifications for any oil entering this pipeline system to assure that the pipeline stays within its designed operating parameters, with warmer months of the year permitting higher viscosity, thicker blends, of bitumen. [See footnote pg. 112]	Consolidated Response OIL-4 addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils. In addition, Section 3.13.5.1 presents information on the requirements of the Federal Energy Regulatory Commission's tariff that would be imposed on the crude oil that would be transported in the proposed Project as well as the relevant Project-specific Special Conditions developed by the Pipeline and Hazardous Materials Safety Administration and agreed to by Keystone.
1429	264	Hayes	Douglas	Sierra Club et al	Properly specified and manufactured pipe should not permanently yield during an appropriate high pressure hydrotest, even one calling for a minimum pressure test of 100% SMYS required for increasing the design factor to 0.8 (normal maximum design factor is 0.72 calling for a minimum 90% SMYS hydrotest pressure, and results in thicker pipe at the same design pressure). Steel pipe that has yielded to some limited upper value may not be unsafe, but such lower quality pipe segments, if left in the pipeline (obviously for pipe that has not failed during the hydrotest), must be evaluated at their actual realized lower value properties, not the properties ordered or specified for the pipe. It is critical that future anomaly evaluations for these specific lower quality pipe segments utilize the values reflective of the poorer quality of that pipe segment, or the segment should be replaced with solid quality pipe.	Keystone has withdrawn its application for a Special Permit as described in Consolidated Response REG-1. Consolidated Response PIP-1 addresses the issue of purchasing pipe for the Project. As described in Consolidated Response SAF-1, the Pipeline and Hazardous Materials Safety Administration (PHMSA) has regulatory requirements that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project. In addition, PHMSA developed 57 Project-specific Special Conditions that Keystone has agreed to implement. DOS, in consultation with PHMSA, has determined that incorporation of those conditions would result in a Project that would have a degree of safety over any other typically constructed domestic oil pipeline system under current code and a degree of safety along the entire length of the pipeline system similar to that which is required in HCAs as defined in 49 CFR 195.450. All issues related to design specifics, testing, and operation of the proposed pipeline system are under the jurisdiction of PHMSA, as explained in Sections 2.3, 2.3.1, and 3.13.1 and in Consolidated Response SAF-1. As a result, PHMSA would address issues regarding testing and pipe replacement such as those raised by the commenter.
1429	265	Hayes	Douglas	Sierra Club et al	PHMSA, in granting the special permit for the original Keystone project, exceeded current federal pipeline safety regulations by requiring that "All girth welds must be NDE by radiography or alternative means." [See footnote pg. 114] This special permit requirement for the Keystone Pipeline project exceeds that stated in the Keystone XL draft EIS, "All girth welds must be inspected, repaired, and non-destructively examined in accordance with §§195.228, 195.230 and 195.234." [See footnote pg. 115] Since these draft EIS	Keystone has withdrawn its application for a Special Permit as described in Consolidated Response REG-1. As noted in Section 2.3.2.4 of the EIS, all welds would be inspected using non-destructive radiographic, ultrasonic, or other methods that provide an equivalent or better level of safety as those required in 49 CFR Part 195. All aspects of welding, including reporting, would be conducted in compliance with the requirements of 49 CFR 195.228 and PHMSA Special Conditions 4, 5, 6, 12, 18, and 20 (Appendix U of the EIS).

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					referenced sections of the federal regulations do not require important quality verification via radiological (or ultrasonic) inspection of all liquid pipeline girth welds, it is critical that there be no misunderstanding that all girth welds in the special permit sections must be so inspected. It is also unclear if girth weld non-destructive testing means inspection by radiograph or ultrasonic testing, and if such inspection will also occur in non special permit areas (i.e., HCAs). Many companies and other countries (including Canada) now incorporate this important construction quality inspection on all their transmission pipeline girth welds and require such important records to be maintained for the life of the pipeline. It is also unclear from the draft EIS if all girth weld radiological or ultrasonic inspection records are to be maintained for the life of the pipeline. This should be a simple matter to clarify.	Welds that do not meet established specifications would be repaired or removed and replaced. Once the welds are approved, a protective epoxy coating would be applied to the welded joints to inhibit corrosion.
1429	266	Hayes	Douglas	Sierra Club et al	For example, federal pipeline safety regulations do not require that all girth welds that join pipeline segments be radiologically or ultrasonically inspected, even segments in HCAs. [See footnote pg. 115] Prudent pipeline operators constructing new pipeline exceed current federal safety minimums, and provide such high tech inspections to assure the quality of all girth welds. Smart pigging currently cannot inspect girth welds to the level of detail or quality as that of radiologically or ultrasonically inspection. Such girth weld radiologically or ultrasonically inspection records should be maintained for the life of the pipeline as is required in many other countries.	As noted in Section 2.3.2.4 of the EIS, all welds would be inspected using non-destructive radiographic, ultrasonic, or other methods that provide an equivalent or better level of safety as those required in 49 CFR Part 195. In addition, Special Condition 55 requires that Keystone maintain all records demonstrating compliance with all Special Conditions for the useful life of the pipeline.
1429	267	Hayes	Douglas	Sierra Club et al	Operation and maintenance items. a. Temperature. Given the amount of energy driving the electric pumps and the viscosity of the oil, the oil temperature in the pipeline will increase and range from approximately 100°F to 140°F, depending on the pipeline's throughput and the season of the year. [See footnote pg. 115] PHMSA has placed a 150°F maximum temperature limit on the Keystone pipeline for various technical reasons, and this restriction should also be placed on the Keystone XL pipeline. [See footnote pg. 115] The increase in temperature as the crude oil flows down the pipeline increases the energy efficiency of the pipeline as the oil thins with higher temperature, making it easier to flow down the pipeline. Temperature increase, however, markedly raises the risks of corrosion attack (both internal and external) to the pipeline. Corrosion will be a bona fide risk of concern for this system, well beyond that for a normal liquid pipeline operating at much lower temperatures. Technology has sufficiently advanced to substantially mitigate various forms of corrosion attack if various corrosion mitigation practices are prudently applied in the operation and maintenance of the pipeline. We highly caution not to overly rely on corrosion inhibitor or corrosion coupons to prevent or control the risk of internal corrosion on this system. Cleaning pigs and prudent runs of high resolution smart pigs provide an important safety net in monitoring various forms of corrosion. It is also important to note that PHMSA has required an import safety net for special permit areas in requiring that general corrosion with predicted metal loss greater than 40% wall thickness be repaired within 180 days. [See footnote pg. 116] Pipe in HCAs only has to be	PHMSA Special Condition 15 includes temperature limitations and related requirements for the proposed Project (see Appendix U). As a result, the temperature of the oil in the pipeline would be similar to that of other crude oil transported in pipelines in the U.S. and does not represent an increase in corrosion potential. Consolidated Response OIL-4 addresses the composition of the Canadian crude oil that would be transported by the proposed Project, including concerns relative to the corrosivity and erosivity of the crude oil. As noted in that Consolidated Response, that crude oil is similar in composition and properties to other heavy crude oils that are currently transported within the U.S. pipeline system and similar in composition and properties to other heavy crude oils that are currently refined in PADD III. Corrosion prevention and reduction measures are also described in Section 2.3 of the EIS. Consolidated Response SAF-1 describes the regulatory requirements that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project. Those regulations include the requirements mentioned by the commenter (see 49 CFR 195, Subpart H -- Corrosion Control). In addition, PHMSA Special Conditions 9, 34, 37, 39, 49, and 52 address corrosion monitoring, repair, and reporting (see Appendix U).

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					repaired within 180 days if general corrosion loss exceeds 50% of nominal wall. [See footnote pg. 116]	
1429	268	Hayes	Douglas	Sierra Club et al	Overpressure protection. Federal pipeline safety regulation concerning maximum operating pressure ("MOP") indicates that "No operator may permit the pressure in a pipeline during surges or other variations from normal operation to exceed 110 percent of the operating pressure limit established ... " [See footnote pg. 116] PHMSA has reinforced this overpressure requirement in the special permit conditions. [See footnote pg. 116] The regulations are moot about how to prevent such overpressure and it is not illegal to exceed 110% MOP provided the pipeline doesn't fail [See footnote pg. 116] Exceeding 110% MOP that results in a release from the pipeline may lead to criminal prosecution in the U.S. Overpressure protection design and effectiveness should be taken very seriously, especially for this liquid pipeline system, given several unique characteristics associated with this pipeline such as bitumen, horsepower, and batching operation. SCADA operation and design can play an important role in preventing overpressure events. SCADA operation and control room intervention, even fast scan SCADA systems, however, should never be relied on to provide failsafe overpressure protection. Given that an overpressure event in excess of 110% MOP could indicate a serious systemic problem, we request a permit condition that all events in excess of 110% MOP be reported to PHMSA within 24 hours of the event, even if there is no release.	Consolidated Response OIL-4 addresses the composition of the Canadian crude oil that would be transported by the proposed Project, including concerns relative to the corrosivity and erosivity of the crude oil. As noted in that Consolidated Response, that crude oil is similar in composition and properties to other heavy crude oils that are currently transported within the U.S. pipeline system and similar in composition and properties to other heavy crude oils that are currently refined in PADD III. Batching of shipments in pipelines is a common practice and not unique to the proposed Project, and there is nothing unique about the horsepower used at the pump stations. Special Conditions 16 and 29 present overpressure conditions.
1429	269	Hayes	Douglas	Sierra Club et al	Backup power requirement for fail safe equipment. From the DEIS there is no backup power to the mainline electric motors and this is not necessarily a problem. There appears to be a backup system of the SCADA operation and certain MLVs. The DEIS is not clear if other safety related equipment, such as critical core communication or tank level monitoring, has an adequate and independent electric power supply that will assure safe pipeline operation is maintained, especially during an upset associated with an electric power loss.	All issues related to design specifics and operation of the proposed pipeline system are under the jurisdiction of the Pipeline and Hazardous Materials Administration (PHMSA), as explained in Sections 2.3, 2.3.1, and 3.13.1 and in Consolidated Response SAF-1. PHMSA is responsible for review of the safety of the Project. The EIS describes the basic elements of design, construction, and operation that need to be considered in assessments of the potential impacts of construction and normal operation. As a result, not all equipment that would be installed if the Project is approved is listed and not all operating conditions are listed. Impacts due to a spill are based on spill size and basic location, irrespective of the cause of a spill (see Sections 3.13.4 and 3.13.5. Backup battery power is provided at the pump stations. All mainline valves can be operated remotely, or if there is interference in the remote control system, they activate automatically in response to specific pressure information. The PHMSA Project-specific Special Conditions (see Appendix U) include a requirement for remote backup power for the valves.
1429	270	Hayes	Douglas	Sierra Club et al	It is also worth noting that because of the ability for PHMSA to impose additional requirements as a result of the special permit request, PHMSA had added requirements on the Keystone pipeline system incorporating additional SCADA requirements related to National Transportation Safety Board ("NTSB") pipeline safety investigations and recommendations that have recently been codified into federal pipeline safety	Consolidated Response OIL-3 addresses the leak detection capabilities of the proposed Project, including the SCADA system, supplementary leak detection methods, physical leak detection methods, and concerns related to smaller leaks from the pipeline that may be under the SCADA detection threshold. As described in Consolidated Response SAF-1, the Pipeline and Hazardous Materials Safety Administration

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					regulations. [See footnote pg. 117] These improvements increase the effectiveness of the SCADA, its presentation and alarm system, and incorporate control room management practices that increase the proficiency and the efficiency of the important control room operators remotely overseeing and operating the pipeline system.	(PHMSA) has regulatory requirements that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project in a manner that protects the health and safety of the public and the environment. In addition, PHMSA developed 57 Project-specific Special Conditions that Keystone has agreed to implement. Incorporation of those conditions, including many conditions related to SCADA (see Appendix U of the EIS).
1429	271	Hayes	Douglas	Sierra Club et al	Operation and maintenance manpower. The DEIS indicates that operation and maintenance of the pipeline would typically be accomplished by Keystone personnel and only about twenty U.S. employees will comprise a permanent operational workforce. [See footnote pg. 117] Note that this number does not include Operations Control Center personnel as the control room (and SCADA) for the pipeline operation is in Calgary, Canada. While the DEIS is moot about the number of contract employees that will also assist the pipeline operator in certain operation, maintenance, and oil spill response activities, twenty employees sounds like a very small number to; cover a 24/7 pipeline operation of approximately 1,700 miles of 36-inch pipe, 32 pump stations with multiple pumps (even though electric drivers simplify the pump station complexity), 74 main line valves, a tank farm, metering equipment, cathodic protection systems, and assorted telecommunication and monitoring as well as safety equipment, that have to be periodically inspected, calibrated and tested, as well as cover round the clock 24/7 response to operating needs or demands. In fairness to the operator, this low number may reflect a reliance on contract personnel to perform many less critical operational and maintenance activities associated with maintaining the safety of the pipeline. A more detailed review of the work tasks, work load, and requirements, while under the discretion of the pipeline operator, is warranted to assure adequate coverage of maintenance and operational core activities.	Pipeline maintenance and monitoring would be conducted in compliance with Pipeline and Hazardous Materials Safety Administration (PHMSA) regulatory requirements and the applicable Special Conditions presented in Appendix U of the EIS. As described in Consolidated Response SAF-1, PHMSA has regulatory requirements that Keystone must comply with to construct, operate, maintain, inspect, and monitor the proposed Project in a manner that protects the health and safety of the public and the environment. In addition, PHMSA developed 57 Project-specific Special Conditions that Keystone has agreed to implement. DOS, in consultation with PHMSA, has determined that incorporation of those conditions would result in a Project that would have a degree of safety over any other typically constructed domestic oil pipeline system under current code and a degree of safety along the entire length of the pipeline system similar to that which is required in HCAs as defined in 49 CFR 195.450. Consolidated Response RES-1 addresses issues related to preparation and review of the required emergency response plans for the proposed Project.
1429	272	Hayes	Douglas	Sierra Club et al	Emergency response plan or oil spill response. PHMSA's approval of the Keystone XL Pipeline Emergency Response Plan is a major federal action subject to NEPA. [See footnote pg. 118]	Consolidated Response RES-1 addresses issues related to preparation and review of emergency response plans for the proposed Project.
1429	273	Hayes	Douglas	Sierra Club et al	Since federal law requires only that emergency response plans be approved before operation, without specifying how long before operation approval is required and without prohibiting or specifying any particular review procedures, it is entirely possible for PHMSA to comply with both the requirements of federal pipeline law and NEPA. DOS's failure to include a draft Emergency Response Plan means that Draft EIS provides no opportunity to comment on this critical issue. Instead, the Draft EIS presents merely a general description of federal emergency response planning law, with no details about how the federal government will protect citizen and the environment from the Keystone XL Pipeline.	Consolidated Response RES-1 addresses issues related to preparation and review of emergency response plans for the proposed Project.
1429	274	Hayes	Douglas	Sierra Club et al	PHMSA actions under federal pipeline law are subject to NEPA in part because federal pipeline law preempts state and local pipeline safety requirements, with the result that PHMSA	Consolidated Response RES-1 addresses issues related to preparation and review of emergency response plans for the proposed Project.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					actions are the exclusive form of mitigation for impacts related to oil spills from this pipeline. Absent full review of Emergency Response Plan alternatives related to, for example, amount of spill response equipment, number of spill response personnel, location of spill response personnel and equipment, alternative spill response strategies, time for response, worst-case spill scenarios, and mitigation options, the Draft EIS will not consider meaningful alternatives and mitigation related to the primary risk posed by the pipeline to citizens and the environment, namely oil spills.	
1429	275	Hayes	Douglas	Sierra Club et al	Absent consideration of a Keystone XL Pipeline Emergency Response Plan through this NEPA review, citizens will have no opportunity to comment on the sufficiency of federal actions intended to protect them from oil spills from this pipeline.	Consolidated Response RES-1 addresses issues related to preparation and review of emergency response plans for the proposed Project.
1429	276	Hayes	Douglas	Sierra Club et al	Given several references in the DEIS, additional details about emergency response planning are needed because of the unusual properties of blended bitumen and the temperatures at which the pipeline will be operating that can make oil recovery process and equipment needs substantially different than that for more conventional lighter crude oil blends.	Consolidated Response RES-1 addresses issues related to preparation and review of emergency response plans for the proposed Project. As noted in Consolidated Response OIL-4, the Canadian crude oil that would be transported by the proposed Project would be similar to other heavy crude oil transported by pipeline in the U.S. In addition, the temperature of the oil transported would not be different from that of other heavy crudes transported as noted in Project-specific Special Condition 15 that Keystone has agreed to (see Section 3.13.1.1 and Appendix U of the EIS).
1429	277	Hayes	Douglas	Sierra Club et al	Impacts of Oil Spills and Operational Leaks on Soils and Water Quality. According to section 3.3.1.1 of the Draft EIS, the proposed route for the Keystone Pipeline Project passes directly over a number of shallow aquifers in the eastern Dakotas and Nebraska. Many of these shallow aquifers along the proposed pipeline route are close enough to the surface to be directly replenished by rainfall and hydraulically connected to surface waters. This means that any leak or spill from the pipeline has the potential to contaminate these underlying aquifers, and unlike surface waters, they cannot be directly accessed for the purpose of clean-up and mitigation measures. Many rural residents and rural communities rely on both private and public wells that draw potable water from these shallow aquifers. In addition, rural residents actively engaged in production agriculture are likely to have irrigation systems and livestock that also depend on these shallow aquifers as a primary water source. The Draft EIS does not adequately address the full range of consequences that would result from a catastrophic leak or spill along the pipeline that occurs over an underlying shallow aquifer.	Issues related to aquifers along the proposed Project corridor are addressed in Consolidated Responses AQF-1 through AQF-4. Consolidated Response OIL-1 addresses the likelihood of spills from the Project. Consolidated Response OIL-2 addresses maximum-sized releases from the Project. Consolidated Response FRM-1 addresses potential ranch or farmland impacts, and Consolidated Response FRM-2 addresses potential impacts to irrigated cropland. Section 3.13 of the EIS addresses the full range of potential consequences that could result from a catastrophic spill from the proposed Project.
1429	278	Hayes	Douglas	Sierra Club et al	At section 5.3.1, the Draft EIS concludes that “[m]any of the aquifers present beneath, or in the vicinity of, the proposed route are isolated by the presence of glacial till,” which would offer a measure of protection from contamination. For those near-surface aquifers that do not have this overlying layer of protection, the Draft EIS notes that “measures have been proposed ... to reduce the potential impact of leaks and spills during construction.” (emphasis added) The Draft EIS does not address what measures would be implemented to protect	Section 3.13.6.3 provides an assessment of the potential impacts to surface water and groundwater due to a spill from the proposed Project. Issues related to aquifers along the proposed Project corridor are addressed in Consolidated Responses AQF-1 through AQF-4. Consolidated Response SAF-1 describes the regulatory requirements and Project-specific Special Conditions that Keystone would comply with to construct, operate, maintain, inspect, and monitor the proposed Project. It also describes the monitoring,

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					these aquifers during the operation lifetime of the pipeline. What, for example, would be the proposed mitigation measures if the sole available drinking water supply for several rural municipalities and surrounding farmsteads is contaminated by a spill from the pipeline? What contaminants would be released into the groundwater in the event of such a spill? What would be the likely duration of such contamination? If a spill from the pipeline could permanently contaminate a shallow aquifer that rural residents rely on for their potable water, is it appropriate to route the pipeline over such aquifers, or are there viable alternatives? The Draft EIS does not address these issues, which are vital to the health and livelihood of the rural residents who depend on these aquifers as their sole source of potable water. The final EIS should more thoroughly examine the risk to shallow aquifers posed by the Keystone Pipeline Project.	inspections, and reviews of the proposed Project that the Pipeline and Hazardous Materials Safety Administration would conduct to ensure compliance with those regulatory requirements. Required emergency response plans for the proposed Project are discussed in Consolidated Response RES-1. As discussed in Section 3.13 of the EIS, federal, state, and local agencies would participate in response activities and soil, surface water, and groundwater cleanup consistent with their authorities and duties under applicable regulations and consistent with the requirements of the Emergency Response Plan and the Pipeline Spill Response Plan. A list of applicable regulations relative to remediation of crude oil spill contamination at the federal and state level is provided in Table 3.13.5-10. Required mitigation for crude oil or oil products spill impacts would be determined by these agencies.
1429	279	Hayes	Douglas	Sierra Club et al	Water is a priceless resource in the region to be traversed by the Pipeline. The DEIS indicates in many segments of the report that the pipeline will not cross any sole-source aquifers. We question the correctness of these statements and request further documentation of affected aquifers. There are many factors that must be considered should a pipeline release affect an aquifer pipeline approval must be conditioned on the exercise of all due precautions.	Consolidated Response AQF-2 addresses pipeline routing through shallow aquifers. In addition, there are no sole source aquifers crossed by the pipeline as designated by EPA Region 6, 7, and 8.
1429	280	Hayes	Douglas	Sierra Club et al	This is especially important to avoid serious contamination of critical aquifers such as the Ogallala Aquifer that plays a very important water supply role along parts of the Pipeline route. Remediation could include actually digging up soil contaminated with the very thick bitumen blends in the event various other remediation approaches are ineffective.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. Required emergency response plans for the proposed Project are discussed in Consolidated Response RES-1. As discussed in Section 3.13 of the EIS, federal, state, and local agencies would participate in response activities and soil, surface water, and groundwater cleanup consistent with their authorities and duties under applicable regulations and consistent with the requirements of the Emergency Response Plan and the Pipeline Spill Response Plan. A list of applicable regulations relative to remediation of crude oil spill contamination at the federal and state level is provided in Table 3.13.5-10. Required mitigation for crude oil or oil products spill impacts would be determined by these agencies. As noted in Consolidated Response OIL-4, the Canadian crude oil that would be transported by the proposed Project would be similar to other heavy crude oil transported by pipeline in the U.S. As discussed in Section 3.13.5.1 of the EIS, if a spill occurs, the behavior of the released Canadian crude oil would be the same as that of other heavy crude oils. Therefore, the recovery process and the equipment needed would be the same as those applicable to other heavy crude oils.
1429	281	Hayes	Douglas	Sierra Club et al	There is a specific type of aquifer, called a karst aquifer that usually merits special attention given its unique characteristics. Considerable discussion is presented in the DEIS related to the pipeline and the exposure to subsidence to the pipeline in karsts. While federal pipeline safety regulations require the pipeline operator to consider abnormal	See Consolidated Response AQF-3 for a discussion on the potential for groundwater resources (aquifers) to be impacted by the proposed Project. As described in the EIS, potential karst features are present in the Niobrara Formation in Nebraska. This formation is typically covered by 50 feet of sediment, so impacts to these karst features (if filled with

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					load threats such as that from subsidence, the more critical issue is the threat that the pipeline has to the karst aquifer as a water source. Karst aquifers consist mainly of water flow structures that can cause released oil in such an environment to more rapidly move through the aquifer. The fracture structure of a karst aquifer makes oil removal, especially the heavier oil moved by the pipeline, extremely difficult, if not impossible, to remove. Regarding pipeline routing, special precautions should be exercised in karst aquifers and any aquifers that may have rapid migration phenomena in the event a pipeline oil release can reach such structures, especially if these aquifers are sole sources of water. Pipelines that can affect sole source aquifers, especially karst-like aquifers, are identified as unusually sensitive areas marked for special pipeline integrity management protocols in federal pipeline safety regulation covering HCAs.	water), would be limited. In southeastern Oklahoma and Texas, karst features may be present in flat-lying carbonate rock. However, the proposed Project route does not cross any principal karst aquifers. The nearest principal karst aquifers are the Arbuckle-Simpson aquifer, located approximately 12 miles to the west and Ozark Plateau Karst Aquifer, located approximately 90 miles to the east in northeastern Oklahoma.
1429	282	Hayes	Douglas	Sierra Club et al	Table 3.1.4-3 in the DEIS lists approximately fifty miles of the pipeline that cross karst aquifers as identified by national scale karst maps. The DEIS goes on to state "Keystone would consult with the respective state geological survey departments to identify the most up-to-date sources of data on karst-related subsidence hazards along the proposed route." DEIS at 3.1-20. We request that such karst aquifers be screened as to their potential to be impacted by an oil spill (leak or rupture) from the pipeline. If such an analysis finds the pipeline to be a serious threat, the pipeline should be routed out of the karst risk area, or effective pipeline mitigation efforts incurred to prevent contamination from the pipeline.	See Consolidated Response AQF-3 for a discussion on the potential for groundwater resources (aquifers) to be impacted by the proposed Project. As described in the EIS, potential karst features are present in the Niobrara Formation in Nebraska. This formation is typically covered by 50 feet of sediment, so impacts to these karst features (if filled with water), would be limited. In southeastern Oklahoma and Texas, karst features may be present in flat-lying carbonate rock. However, the proposed Project route does not cross any principal karst aquifers. The nearest principal karst aquifers are the Arbuckle-Simpson aquifer, located approximately 12 miles to the west and Ozark Plateau Karst Aquifer, located approximately 90 miles to the east in northeastern Oklahoma.
1429	283	Hayes	Douglas	Sierra Club et al	These comments are equally true for impacts to soils, whose unique biological significance at many points along the route is discussed in Section IV.B above. We request a separate analysis of risks and impacts to agricultural and native soils, native biota, and productive capacity.	Impacts related to native soils, native biota, and agriculture are addressed in Sections 3.2, 3.5, and 3.9 of the EIS. Productive capacity is not addressed since Keystone would compensate landowners for lost productivity as described in its Construction, Mitigation, and Reclamation Plan in Appendix B.
1429	284	Hayes	Douglas	Sierra Club et al	We further request that the permit be conditioned on national best practice requirements for abandonment and mitigation, including bonding, land restoration requirements, provision for damage claims, and reversion on nonuse. We suggest the Iowa pipeline abandonment law as one model. [See footnote pg. 122] Other relevant models include Canadian federal pipeline abandonment regulations, and those in use in Santa Barbara County, California.	Concerns regarding bonding and decommissioning are addressed in Consolidated Response LIA-2.
1429	285	Hayes	Douglas	Sierra Club et al	The DEIS does not Adequately Address the Potential Adverse Impacts of the Pipeline on Historic Cultural Resources of Native American Nations along the Route.	Potential impacts to cultural resources are addressed in Section 3.11.3.1 of the EIS. DOS considers this assessment to be in compliance with Section 106 and NEPA environmental review requirements. Mitigation measures for adversely affected historic and cultural resources have been developed under a Programmatic Agreement (PA) consistent with the requirements of Section 106 of the NHPA (see Appendix S to the EIS).
1429	286	Hayes	Douglas	Sierra Club et al	The Draft EIS identifies at Table 3.11.4-1 a list of Native American nations who have been contacted by the Department of State regarding possible impacts of the proposed pipeline on historic cultural tribal resources,	Consolidated Response CUL-1 and Section 3.11.4.3 of the EIS address the consultation process between DOS and Indian tribes. As noted in Consolidated Response CUL-1, a Programmatic Agreement (PA) has been developed for the

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					pursuant to the requirements of 36 CFR 800.2. According to the EIS, many of these consultations are still "on-going," and some nations and tribes have not formally responded to communications from the Department of State. Although the proposed pipeline route does not currently cross any lands owned by the various Native American nations and tribes consulted with as a part of this process, federal regulations require a process of formal consultation for any properties of "historic significance" to Native American nations and tribes. [See footnote pg. 123] These same regulations further require that the relevant federal agency "must, except where appropriate to protect confidentiality concerns of affected parties, provide the public with information about an undertaking and its effects on historic properties and seek public comment and input." [See footnote pg. 124.] To date, the public has been provided with no information about the potential adverse impacts of the Pipeline on cultural resources of Native American nations and tribes along the proposed pipeline route. Indeed, it would be impossible for the Department of State to have done so, because formal consultations with affected Native American nations and tribes were incomplete at the time the Draft EIS was published. In order for all affected parties, including members of the general public, to adequately comment in this important issue, it is vital that the Department of State complete the required process of consultation with affected Native American nations and tribes prior to publishing a final EIS. It is also vital that the results of these consultations be made available for public comment, as required by federal regulation. Without gathering this information through a rigorous process of formal consultation and subjecting the findings and conclusions to public comment, the impacts of the Pipeline on important Native American cultural resources cannot be properly predicted or adequately mitigated by a final EIS.	Project under Section 106 of the National Historic Preservation Act. The PA includes mitigation measures for known adverse effects and provides a process for ongoing surveys to be conducted in areas where access was not granted during the EIS process. The Traditional Cultural Property (TCP) reports (noted in Section 3.11.4-3 of the EIS) may not be disclosed due to concerns regarding confidentiality. Potential impacts to cultural resources are addressed in Section 3.11.3.1 of the EIS. DOS considers this assessment to be in compliance with NEPA environmental review requirements.
1429	287	Hayes	Douglas	Sierra Club et al	V. LEGAL INADEQUACIES IN THE EIS AND THE PRESIDENTIAL PERMIT PROCESS. A. DOS Cannot Act as the Lead Agency in the NEPA Process. DOS cannot and should not act as the lead agency in the NEPA process for the Keystone XL pipeline. The NEPA regulations set forth a list of factors for determining the lead agency on a project involving more than one federal agency. 40 CFR § 1501.5. These include magnitude of agency's involvement, project approval and disapproval authority, expertise concerning the action's environmental effects, duration of agency's involvement, and sequence-of agency's involvement. [d. DOS abused its discretion in assuming the role of lead agency for several reasons, including but not limited to (a) DOS' claimed involvement over the pipeline is limited to border facilities; (b) DOS has little or no expertise concerning the environmental impacts of oil pipelines or tar sands development; and (c) DOS will contend that its NEPA process is legally unreviewable.	As noted in Consolidated Response ENR-1, the environmental review, including preparation of this EIS, has been conducted consistent with the DOS regulations pertaining to NEPA (22 CFR Part 161) as well as the Council on Environmental Quality (CEQ) regulations for implementing NEPA (40 CFR Part 1500). As a result, DOS considers the EIS to be consistent with the requirements of a NEPA environmental review.
1429	288	Hayes	Douglas	Sierra Club et al	DOS should not be the lead agency because its involvement in the project is minor compared to the involvement of other agencies. DOS acted as the lead agency and conducted an	Consolidated Response REG-2 addresses issues related to concerns about the Department of State being the lead federal agency for the NEPA environmental review and the permits

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					EIS, including mitigation measures and permit conditions, for the entire Alberta Clipper tar sands pipeline. During litigation, however, DOS has claimed that its Presidential Permit regulates only the Alberta Clipper pipeline at the actual border and does not extend beyond the first mainline shutoff valve. [See footnote pg. 124] The extent of DOS' claimed involvement, then, is limited to the international border. [See footnote pg. 124] This is hardly a level of involvement that would warrant DOS acting as the lead agency for a pipeline: that would transport hazardous material across six states. The extent of other agencies' involvement is far greater. [See footnote pg. 124] For example, DOT is tasked with ensuring that the pipeline design, construction, operation, and emergency response plans comply with safety standards and protect the communities and sensitive areas along the entire route of the pipeline. The Army Corp of Engineers issues permits for the thousands of water crossings in each of the states along the length of the pipeline to ensure the protection of the environment and natural resources and local communities. [See footnote pg. 124]	and regulatory approvals that Keystone would have to obtain to construct, operate, maintain, monitor, and inspect the Project.
1429	289	Hayes	Douglas	Sierra Club et al	Courts have generally required that the agency with the major responsibility over the action to act as the lead agency. See Natural Res. Def. Council, Inc. v. Callaway, 524 F.2d 79, 86 (2d Cir. 1975). In Callaway, the court reviewed the Navy's lead agency determination and held that it was the proper lead agency because it was "active in all aspects of the project" and "was responsible for ... seeing that the work was properly performed." Id. at 86; see also Hanly v. Mitchell, 460 F.2d 640, 645 (2d Cir. 1972). Here, DOS is not active in all aspects of the Keystone XL project, as is DOT and the Army Corp of Engineers. It is not tasked with ensuring that the pipeline is built and operated pursuant to pipeline safety regulations. DOS' only involvement is issuing a permit for the border crossing based on whether the project serves the national interest.	Consolidated Response REG-2 addresses issues related to concerns about the Department of State being the lead federal agency for the NEPA environmental review and the permits and regulatory approvals that Keystone would have to obtain to construct, operate, maintain, monitor, and inspect the Project.
1429	290	Hayes	Douglas	Sierra Club et al	DOS also lacks any expertise that would to qualify as the lead agency. DOS is the agency that handles matters of diplomacy, foreign affairs, and foreign policy concerns. It has no expertise or experience with pipeline regulation, evaluating the environmental and social impacts of tar sands infrastructure, or ensuring that plans are in place to prevent oil spills and to respond if an accident were to occur. The Pipeline and Hazardous Materials Safety Administration (DOT) would be a logical choice for lead agency because it has particular expertise in pipeline design, safety, and regulation.	Consolidated Response REG-2 addresses issues related to concerns about the Department of State being the lead federal agency for the NEPA environmental review and the permits and regulatory approvals that Keystone would have to obtain to construct, operate, maintain, monitor, and inspect the Project.
1429	291	Hayes	Douglas	Sierra Club et al	Finally, it is improper for DOS to assume the role of lead agency and subsequently contend that its NEPA process is legally unreviewable. DOS has done exactly that with respect to two recent tar sands pipelines that are similar to Keystone XL.	Consolidated Response REG-2 addresses issues related to concerns about the Department of State being the lead federal agency for the NEPA environmental review and the permits and regulatory approvals that Keystone would have to obtain to construct, operate, maintain, monitor, and inspect the Project.
1429	292	Hayes	Douglas	Sierra Club et al	DOS took the lead role in the preparation of an EIS for the Keystone I pipeline, which culminated in a Final Environmental	Consolidated Response REG-2 addresses issues related to concerns about the Department of State being the lead federal

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					Impact Statement (FEIS) and the issuance of a ROD and Presidential Permit in February of 2008. When environmental groups challenged DOS's NEPA compliance, DOS took the position that because Executive Order 13337 delegated the President's inherent authority to issue border crossing permits, the DOS NEPA process was an unreviewable Presidential action rather than an agency action. Federal district court judges in Washington, DC and South Dakota agreed with DOS and held that courts could not examine the adequacy of the NEPA process, allowing DOS to avoid accountability. [See footnote pg. 125] DOS took the same position with respect to the Alberta Clipper pipeline in 2009, arguing that the Presidential Permit and accompanying NEPA documents were unreviewable Presidential actions. [See footnote pg. 125]	agency for the NEPA environmental review and the permits and regulatory approvals that Keystone would have to obtain to construct, operate, maintain, monitor, and inspect the Project.
1429	293	Hayes	Douglas	Sierra Club et al	DOS is sure to make the same argument, as it has in the three previous tar sands pipeline cases, in an attempt to avoid accountability on the Keystone XL NEPA process. If DOS again prevails on this argument, it would suggest that DOS can completely disregard NEPA laws and regulations, issue a wholly inadequate EIS, and escape any review by the courts.	Consolidated Response REG-2 addresses issues related to concerns about the Department of State being the lead federal agency for the NEPA environmental review and the permits and regulatory approvals that Keystone would have to obtain to construct, operate, maintain, monitor, and inspect the Project.
1429	294	Hayes	Douglas	Sierra Club et al	No agency should be permitted to routinely assume the role of lead agency for a narrow class of projects and routinely exempt itself from judicial review, as it would contravene the basic purpose and intent of NEPA-to ensure that agencies consider the environmental impacts of their decision.	Consolidated Response REG-2 addresses issues related to concerns about the Department of State being the lead federal agency for the NEPA environmental review and the permits and regulatory approvals that Keystone would have to obtain to construct, operate, maintain, monitor, and inspect the Project.
1429	295	Hayes	Douglas	Sierra Club et al	A NEPA process that is shielded from judicial review, as DOS advocates for in cases of tar sands pipeline permits, would violate the meaning of, and congressional intent behind NEPA. Therefore, DOS should step aside and allow an agency with more involvement and expertise in pipeline issues to assume the role of lead agency.	Consolidated Response REG-2 addresses issues related to concerns about the Department of State being the lead federal agency for the NEPA environmental review and the permits and regulatory approvals that Keystone would have to obtain to construct, operate, maintain, monitor, and inspect the Project.
1429	296	Hayes	Douglas	Sierra Club et al	DOS Lacks Authority to Issue Presidential Permits. DOS does not have the constitutional or statutory authority to issue the Keystone XL Presidential Permit. Every action taken by the President or an executive agency must come from some legal source-either a statute or the constitution. No statute authorizes DOS to issue Presidential Permits for oil pipelines, and the U.S. Constitution requires Congress, not the executive branch, to exclusively regulate matters of foreign commerce.	Consolidated Response P&N-9 describes the National Interest Determination process. Consolidated Response ENR-1 provides information on the Department of State's environmental review process, the National Interest Determination process, and the need to complete those reviews before approving or denying the Presidential permit for the proposed Project.
1429	297	Hayes	Douglas	Sierra Club et al	The proposed Keystone XL pipeline is a clear example of foreign commerce that falls under the control of Congress. Courts have interpreted Congress's foreign commerce power very broadly. "The [Supreme] Court has been unwavering in reading Congress' power over foreign commerce broadly." . United States v. Clark, 435 F.3d 1100, 1113 (9th Cir. 2006) (citations omitted) (discussing the "complete power of Congress over foreign commerce" and noting that Congress can regulate services as well as goods, and regulate the "channels of commerce."); see also Gibbons v. Ogden, 22 U.S. 1, 193 (1824) (stating that "it has ... been universally	Consolidated Response REG-2 addresses issues related to concerns about the Department of State being the lead federal agency for the NEPA environmental review and the permits and regulatory approvals that Keystone would have to obtain to construct, operate, maintain, monitor, and inspect the Project.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					admitted that [the words of the Commerce Clause] comprehend every species of commercial intercourse between the United States and foreign nations."); Bankers Ass'n v. Shultz, 416 U.S. 21, 46 (1974) (stating that Congress' plenary authority over foreign commerce "is not open to dispute"); Buttfeld v. Stranahan, 192 U.S. 470, 492-93 (1904) (describing the "complete power of Congress over foreign commerce"); U.S. v. Bredimus, 352 F.3d 200, 208 (5th Cir. 2003) ("Congress's authority to regulate foreign commerce is even broader than its authority to regulate interstate commerce").	
1429	298	Hayes	Douglas	Sierra Club, et al	Oil pipelines are matters of foreign commerce, as evidenced by the long history of congressional regulation of oil pipelines. See The Hepburn Act of 1906, Pub.L. No. 59-337, § 1, 34 Stat. 584, 584 (expanding the Interstate Commerce Act to cover interstate oil pipelines; U.S. v. Ohio Oil Co., 234 U.S. 548, 560-561 (1914) (upholding the constitutionality of the Hepburn Act under the interstate commerce clause); Department of Energy Organization Act of 1977, 42 U.S.C.A. § 7111 et seq. (transferring regulatory authority over oil pipelines to Federal Energy Regulatory Commission ("FERC")). In State v. Brown, a federal court held that the Trans-Alaska Pipeline System was a matter of foreign commerce despite the fact that the pipeline did not cross an international or state border, and noting that "[t]here is no question that [the Export Administration Act of 1979, which regulates the pipeline], operates well within the sphere of the foreign commerce power." State v. Brown, 850 F.Supp. 821 (D. Alaska 1994).	Consolidated Response REG-2 addresses issues related to concerns about the Department of State being the lead federal agency for the NEPA environmental review and the permits and regulatory approvals that Keystone would have to obtain to construct, operate, maintain, monitor, and inspect the Project.
1429	299	Hayes	Douglas	Sierra Club et al	The Keystone XL pipeline, which will import up to 900,000 barrels a day of tar sands crude oil and transport it across the international border and across six states from Alberta, Canada, to Texas, is a matter of foreign and interstate commerce. Congress is the only entity that can constitutionally issue a permit to import a product such as tar sands into the U.S.	Consolidated Response REG-2 addresses issues related to concerns about the Department of State being the lead federal agency for the NEPA environmental review and the permits and regulatory approvals that Keystone would have to obtain to construct, operate, maintain, monitor, and inspect the Project. Keystone has withdrawn its application for a Special Permit as described in Consolidated Response REG-1.
1429	300	Hayes	Douglas	Sierra Club et al	Congress may delegate its authority to regulate foreign commerce to the President. See Target Sportswear Inc. v. U.S., 875 F. Supp. 835, 838 n.2 (Ct. Int'l Trade 1995) ("Fundamentally, under the U.S. Constitution the authority to regulate foreign commerce and trade with other nations lies exclusively with the Congress ... [but] Congress may delegate such authority to the Executive."). Congress has delegated its permitting authority over many other specific types of cross-border facilities, such as bridges (International Bridge Act, 33 U.S.C. § 535(b) (1972)), natural gas pipelines (Natural Gas Act, 15 U.S.C.A. § 717 et seq. (1938)), and telegraph cables (Kellogg Act, 47 U.S.C.A. § 34 et seq. (1921)). It has not, however, delegated permitting authority over international oil pipelines to the President, DOS, or any executive agency.	Consolidated Response REG-2 addresses issues related to concerns about the Department of State being the lead federal agency for the NEPA environmental review and the permits and regulatory approvals that Keystone would have to obtain to construct, operate, maintain, monitor, and inspect the Project.
1429	301	Hayes	Douglas	Sierra Club et al	Absent a delegation of power from Congress, the President cannot regulate commerce. In the seminal case of Youngstown Sheet and Tube Co. v. Sawyer, 343 U.S. 579 (1952), the Court held that the Secretary of Commerce's	Consolidated Response REG-2 addresses issues related to concerns about the Department of State being the lead federal agency for the NEPA environmental review and the permits and regulatory approvals that Keystone would have to obtain

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					wartime seizure of domestic steel mills under an Executive Order exceeded the President's constitutional power. The court found the seizure unconstitutional because, like in the instant case, there was no express constitutional language granting the power to the President, nor was there a statute authorizing it. Id. at 585-87.	to construct, operate, maintain, monitor, and inspect the Project.
1429	302	Hayes	Douglas	Sierra Club et al	The Keystone XL Presidential Permit, if issued, would also be ultra vires. The Executive's regulation of foreign commerce cannot exceed that which was delegated by Congress. Target Sportswear v. U.S., 875 F.Supp. 835, 841 (Ct. Int'l Trade 1995). Congress has made partial delegations of authority to specific executive agencies, not including the State Department, for very limited aspects of international oil pipeline regulation. For example, Congress delegated limited authority to the Department of Transportation (DOT) in the Hazardous Liquid Pipeline Safety Act of 1979, Pub.L. 96-129, 93 Stat. 1003. Congress also specified the Executive's role in the safety of international pipelines in the Pipeline Safety Act of 1992, Pub.L. 102-508, 106 Stat. 3289; Energy Policy Act of 1992, Pub.L. 102-486, 49 U.S.C. § 112 et seq.; and the Pipeline Inspection, Protection, Enforcement, and Safety Act, Pub.L. 109- 468, 49 U.S.C. §60134 et seq., (2006).	Consolidated Response REG-2 addresses issues related to concerns about the Department of State being the lead federal agency for the NEPA environmental review and the permits and regulatory approvals that Keystone would have to obtain to construct, operate, maintain, monitor, and inspect the Project.
1429	303	Hayes	Douglas	Sierra Club et al	In any of those statutes, Congress could have authorized the State Department to issue permits for international oil pipelines, but it did not. That indicates a congressional intent to reserve authority over both international and domestic oil pipelines. See I.N.S. v. Chadha, 462 U.S. 919, 954 n.16 (1983) (an executive agency "cannot reach beyond the limits of the statute" and is "always subject to check by the terms of the legislation that authorized it; and if that authority is exceeded it is open to judicial review as well as the power of Congress to modify or revoke the authority entirely ... "). Because the State Department's action is beyond those limited grants of authority, its action is unconstitutional and ultra vires. Id; and Guy W. Capps, Inc., 204 F.2d at 658.	Consolidated Response REG-2 addresses issues related to concerns about the Department of State being the lead federal agency for the NEPA environmental review and the permits and regulatory approvals that Keystone would have to obtain to construct, operate, maintain, monitor, and inspect the Project.
1429	304	Hayes	Douglas	Sierra Club et al	Any constitutional authority that the President may have over this pipeline under his foreign affairs or commander-in-chief powers, which commenters dispute, would be limited to the actual international border crossing and nothing more. This permit would exceed the President authority, as it would regulate 1,379 miles of pipeline and related facilities in six states.	Consolidated Response REG-2 addresses issues related to concerns about the Department of State being the lead federal agency for the NEPA environmental review and the permits and regulatory approvals that Keystone would have to obtain to construct, operate, maintain, monitor, and inspect the Project.
1429	305	Hayes	Douglas	Sierra Club et al	The DOS has not Complied with APA Rulemaking. We are also concerned that DOS has not complied with the Administrative Procedure Act's notice and comment requirements before. 5 U.S.C. §553. While Exec. Order No. 13337 contains some guidance on procedures and standards for review, mainly whether the issuance of the permit would "serve the national interest," the Executive Order does not include a complete permit application process, or specify how the DOS is to determine whether or not a pipeline is in the "national interest." The only guidance document regarding the issuance of presidential permits is a "Fact Sheet" entitled "Applying for Presidential Permits for Border Crossing	Consolidated Response REG-2 addresses issues related to concerns about the Department of State being the lead federal agency for the NEPA environmental review and the permits and regulatory approvals that Keystone would have to obtain to construct, operate, maintain, monitor, and inspect the Project.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					Facilities (Canada)" (Fact Sheet) that sets forth more specific parameters with respect to both the contents of permit applications and the application review process. This Fact Sheet is a statement of general applicability and future effect designed to implement, interpret, and prescribe law and policy and describing the Department's organization, procedure, and practice requirements as they relate to the substantive rights of the applicant and US citizens who may be directly impacted by a grant of the requested permit. Therefore, the Fact Sheet is subject to APA rulemaking requirements in 5 U.S.C. § 553, including the APA's notice and comment requirements.	
1429	306	Hayes	Douglas	Sierra Club et al	We are also concerned that DOS has not complied with the Administrative Procedure Act's notice and comment requirements before. 5 U.S.C. §553. While Exec. Order No. 13337 contains some guidance on procedures and standards for review, mainly whether the issuance of the permit would "serve the national interest," the Executive Order does not include a complete permit application process, or specify how the DOS is to determine whether or not a pipeline is in the "national interest." The only guidance document regarding the issuance of presidential permits is a "Fact Sheet" entitled "Applying for Presidential Permits for Border Crossing Facilities (Canada)" (Fact Sheet) that sets forth more specific parameters with respect to both the contents of permit applications and the application review process. This Fact Sheet is a statement of general applicability and future effect designed to implement, interpret, and prescribe law and policy and describing the Department's organization, procedure, and practice requirements as they relate to the substantive rights of the applicant and US citizens who may be directly impacted by a grant of the requested permit. 1429	307	Hayes	Douglas	Sierra Club et al	Prior to issuing the Fact Sheet, the DOS did not follow the Administrative Procedure Act's (APA) notice and comment requirements for rule making. DOS's failure to comply with these requirements is in violation of law.	Consolidated Response REG-2 addresses issues related to concerns about the Department of State being the lead federal agency for the NEPA environmental review and the permits and regulatory approvals that Keystone would have to obtain to construct, operate, maintain, monitor, and inspect the Project.
184	1	Hays	Patricia		Please, I beg of you, do not allow an oil pipeline to cross the Ogallala Aquifer. It is an irreplaceable, valuable resource. There are no guarantees that can be made that the aquifer will never be sullied. How would it ever be restored if it were polluted? Please, I implore you, do not promote this project. Haven't we all learned from recent events? When an accident does occur--who among us wants to be the one to have to say, "oh dear, we're so sorry." Please, let us protect this magnificent, natural wonder. It is truly unique and worthy of respect.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. As described in Consolidated Response GLF-1, the risks associated with the proposed Project are substantially different from those associated with the BP Deepwater Horizon Project.
927	1	Headley	Chris		I am absolutely opposed to this pipeline and I do not want it in my state.	Comment acknowledged.
1193	1	Healey, Jr	Ralph		We need the oil the pipeline will transport but the safety aspects of the pipeline need review –	As described in Consolidated Response SAF-1, the Pipeline and Hazardous Materials Safety Administration (PHMSA) has regulatory requirements that Keystone must comply with to

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
						construct, operate, maintain, inspect, and monitor the proposed Project in a manner that protects the health and safety of the public and the environment. In addition, PHMSA developed 57 Project-specific Special Conditions that Keystone has agreed to implement. Incorporation of those conditions would result in a Project that would have a degree of safety over any other typically constructed domestic oil pipeline system under current code and a degree of safety along the entire length of the pipeline system similar to that which is required in HCAs as defined in 49 CFR 195.450. It also describes the inspections and reviews of the proposed Project that the Pipeline and Hazardous Materials Safety Administration would conduct to ensure compliance with those regulatory requirements.
1193	3	Healey,Jr	Ralph		Need a monitoring system so that if there is a leak we know about it right away and can respond.	Sections 2.4 and 3.13.4.5 of the EIS and Consolidated Response OIL-3 describe the monitoring systems that Keystone would use for the proposed Project.
1193	4	Healey,Jr	Ralph		Need remotely controlled motor operated isolation valves so that sections of the line can be closed off to limit spills. Need to have response teams available 24/7 who can quickly respond to breaks or leaks.	The EIS sections 2.4.2 and 3.13.5.5 describe the remotely controlled valve systems that will stop the flow of oil if a leak is detected. In addition, as noted in Consolidated Response SAF-1 and Section 3.13.1, Keystone has agreed to incorporate 57 Project-specific Special Conditions (see Appendix U of the EIS) into the proposed Project as requested by Pipeline and Hazardous Materials Safety Administration including special requirements for valve placement and for remotely controlled valves. Consolidated Response RES-1 addresses issues related to preparation and review of the emergency response plan for the proposed Project.
1130	1	Heckman	Terri		To Whom It May Concern: I am writing to express my concern, no outrage, to the potential building of an oil pipeline through the heart of Nebraska! ... I urge the Department of State to disallow this pipeline to be built across the great state of Nebraska.	Consolidated Response ALT-1 addresses potential alternative routes, including routes that would avoid much of the Northern High Plains Aquifer system.
1130	2	Heckman	Terri		The Keystone XL pipeline would carry tar sands oil, the dirtiest oil, ...	Consolidated Response OIL-4 addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils.
1130	3	Heckman	Terri		[The Keystone XL pipeline would carry tar sands oil, the dirtiest oil,] through one of the most fragile ecosystems in the U.S; the Nebraska Sandhills. It would travel under several major rivers in Nebraska including the scenic Niobrara River which holds unique plant life not found anywhere else, and the Platte River which is vital to vast flocks of migrating birds, and ...	Consolidated Response OIL-4 addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils. Identification of sensitive environments crossed by the proposed Project is discussed in Consolidated Response ENV-1 and ENV-3. The proposed Project does not cross any rivers within designated scenic river reaches and would cross both the Niobrara and Platte rivers using the horizontal directional drilling method as described in Section 2.3.3.5 of the EIS.
1130	4	Heckman	Terri		[the Platte River] which provides water for agriculture and municipal drinking water for many towns, including Lincoln and Omaha, the two largest cities in Nebraska... Nebraska has one of the highest ground water levels because of the vast Ogallala Aquifer which underlies most of the state and all the way down to Texas. Nebraska has more streams and lakes	Section 3.13 of the EIS addresses reliability and safety issues, including calculations of the probability of a spill from the proposed Project and the potential environmental impacts associated with spills. Issues related to the High Plains Aquifer System are addressed in Consolidated Response AQF-1 through AQF-4. Consolidated Response AQF-3

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					than Minnesota. An oil spill would be devastating not only to the ecosystem, but for the agricultural economy of Nebraska. . . The livelihoods of Nebraska farmers could be irreversibly damaged just as the fishing and shrimping industries of the Gulf may not come back within one's lifetime.	provides information on hypothetical spills from the Project over two areas of the Northern High Plains Aquifer System. As noted in those responses, a spill over the Northern High Plains Aquifer system would not devastate the economy of Nebraska.
1130	5	Heckman	Terri		Just last week I read in the local paper about an oil pipeline spill in Utah that threatened waterways near suburbs that would lead to the Great Salt Lake. Nebraska has one of the highest ground water levels because of the vast Ogallala Aquifer which underlies most of the state and all the way down to Texas. Nebraska has more streams and lakes than Minnesota...What about the wildlife and hundreds of communities whose life-saving drinking water would be detrimentally affected by an oil spill?	Issues related to the Northern High Plains Aquifer System are addressed in Consolidated Responses AQF-1 through AQF-4. Consolidated Response AQF-3 provides information on hypothetical spills from the Project over two areas of the Northern High Plains Aquifer System.
1393	1	Heil	Nelson	Carroll County Commission	As county officials from the State of Missouri, we strongly encourage the U.S. Department of State to approve an energy infrastructure project that not only will strengthen long-term energy security in the United States, ... We support the Keystone XL Pipeline Project look forward to the issuance of a Final Environmental Impact Statement followed by a Presidential Permit that allows the construction of Keystone XL.	Comment acknowledged.
1393	3	Heil	Nelson	Carroll County Commission	As county officials from the State of Missouri, we strongly encourage the U.S. Department of State to approve an energy infrastructure project that not only will strengthen long-term energy security in the United States, but also will provide a powerful private sector economic stimulus to the communities along the pipeline route during its construction at a time when our economy continues to struggle. As we understand it, Keystone XL will directly create more than 13,000 high wage construction and manufacturing jobs during the project's 2011-2012 construction schedule. In Missouri, TransCanada has just finished up a pipeline stretching across the northern tier of our state which provided a huge economic boost as well as strengthened the regions long term energy security. Below are just some of the benefits communities across the state received during the construction of Keystone here in Missouri: -\$18 million spent on food and lodging throughout Missouri - Keystone locally purchased construction consumables and other supplies which boosted Use Tax revenue for Carroll County nearly 40% in fiscal years 2009 and 2010. -15% of total construction workforce was from Missouri - The total capital expenditure in Missouri is estimated at \$770 million - First year property tax revenues in Missouri are estimated to be \$13.8 million with Carroll Counties portion of locally assessed utilities being \$80,000.00 Like construction in Missouri, Keystone XL will generate substantial economic benefits for the United States and in states and communities along the proposed route. In many cases these are areas where economic performance has stagnated or is shrinking. It is our understanding that TransCanada commissioned a study to measure the project's economic stimulus to the U.S. and the states along the route. The study found that in the U.S., Keystone XL would generate \$20.9 billion in total	Consolidated Response ECO-1 addresses potential socioeconomic impacts, and Consolidated Response TAX-1 addresses concerns regarding taxes.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					expenditures, \$9.6 billion in output (gross product), personal income of \$6.5 billion and 118,935 person years of employment Gobs). In addition, the report concluded that during construction, Keystone XL would generate \$486.36 million in tax revenue for state governments along the route and \$99.1 million for local taxing entities where the pipeline is located. Moreover, in addition to the construction and manufacturing jobs Keystone XL will create during construction, the economic stimulus provided by the pipeline's construction and development will lead to the creation of more than 100,000 additional jobs in the economy.	
1393	6	Heil	Nelson	Carroll County Commission	Oil sands account for more than 97 percent of that vast reserve: 170 billion barrels of oil with the potential for more than 100 years of production.	Comment acknowledged.
352	2	Heintz	Stephen	Rockefeller Brothers Fund	We are gravely concerned that if the use of tar sands fuel is expanded through the permitting of the Keystone XL pipeline, this would lock us into dependence on this extremely dirty fuel in direct conflict with the Administration's stated goals of building a clean energy economy and combating climate change.	Consolidated Response OIL-4 addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils. As described in Section 1.4 of the EIS, and in Consolidated Response P&N-1, much of the oil transported by the proposed Project would replace the heavy crude oil traditionally processed due to the continuing decrease in the supply of heavy crude oil from Mexico, Venezuela, and other sources.
352	4	Heintz	Stephen	Rockefeller Brothers Fund	Although the use of tar sands oil may produce some short term economic benefits from pipeline and refinery construction jobs, in the long term, we will sacrifice employment growth as other economies move more aggressively to develop the clean energy technologies for the future.	Consolidated Response ALT-2 addresses the use of alternative technologies, alternative energy sources, and conservation of energy.
352	5	Heintz	Stephen	Rockefeller Brothers Fund	In addition to the climate security and competitiveness concerns that tar sands pose, the refineries of tar sands oil in our country already show potential to inflict much higher pollution and degradation to surrounding communities and human health than refineries processing other fuels.	Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries. Consolidated Response OIL-4 also addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils.
352	6	Heintz	Stephen	Rockefeller Brothers Fund	The State Department should suspend the permitting process for the Keystone XL pipeline until an Environmental Protection Agency (EPA) greenhouse gas life-cycle assessment for tar sands and emissions increase in the U.S. transportation sector is completed and can be integrated into the DEIS.	Consolidated Response GHG-1 addresses the greenhouse gas life-cycle analyses presented in the revised EIS. As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries. Consolidated Response OIL-4 also addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils.
209	1	Heisinger	James	SD Sierra Club	The South Dakota Chapter of the Sierra Club warns that this proposed pipeline facilitates ongoing, severe and large-scale ecological destruction in Canada, poses worrisome threats to land, water, wildlife and people along its route, adds to atmospheric degradation by increasing public use of tar sands	Consolidated Response P&N-1 addresses the need that the Project has been proposed to meet.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					oil, and damages efforts advancing clean, renewable energy sources...We believe that any endorsement of this pipeline by our government and our elected officials translates into a step backwards for our nation's energy policy. Reasonable, informed people now understand the true costs of oil, and the irrefutable, inherent threats by oil to the environment and to public health extend to all sources of oil, irrespective of whether they are foreign, domestic, offshore or onshore sources of oil. All oil pollutes, and tar sands oil is quite possibly the dirtiest, most pollution-prone oil on the planet. It is time to begin transitioning away from oil use, and it is not unreasonable to target a 20-year period in which to accomplish this transition. That transition must begin by slowing investment in oil infrastructure. Our addiction to oil will be broken only if we commit to that effort. Allowing and encouraging ongoing, massive investments in tar sands infrastructure creates just the opposite effect of what we need. You can help this important transition away from oil gain momentum by opposing the XL pipeline....With America on the verge of making meaningful advances with clean, renewable energy sources, big oil and tar sands companies want to commit the U.S. to many more decades of dependence on highly polluting oil. South Dakota and the nation as a whole has a considerable stake in developing solar, wind, and geothermal technologies as well as advanced biofuels, and increasing tar sands crude oil availability decreases the impetus to support and pursue these clean, innovative and necessary energy types.	
209	2	Heisinger	James	SD Sierra Club	Resolution from the South Dakota Chapter of the Sierra Club Regarding the Keystone XL Pipeline Passed by the Chapter Executive Committee May 27, 2010 [resolution text included in letter] Therefore, the South Dakota Chapter of the Sierra Club asks the U.S. Department of State and the U.S. government to formally reject the Keystone XL pipeline on the grounds that it contributes to severe environmental destruction, atmospheric degradation from carbon dioxide releases, and that the Keystone XL project will directly and indirectly hamper and obstruct the emerging and vitally important clean energy sector in the U.S.	The impacts associated with implementation of the proposed Project are addressed in Section 3.0 of the EIS. As noted in that section, construction and normal operation the proposed Project would not result in significant environmental impacts. Greenhouse gas emissions are addressed in Section 3.14.3.14. Consolidated Response ALT-2 addresses the use of alternative technologies, alternative energy sources, and conservation of energy. Consolidated Response ENR-1 provides information on the Department of State's environmental review process, the National Interest Determination process, and the need to complete those reviews before approving or denying the Presidential permit for the proposed Project.
1106	1	Helwig	Patrick		To whom it may concern, I am writing to express my opposition to the Keystone XL pipeline.	Comment acknowledged.
1106	3	Helwig	Patrick		The Ogallala Aquifer is not only used for drinking water but also supplies water for agricultural products in eight states, including cattle, wheat, and that Nebraska mainstay corn... In some parts of the Sandhills where the pipeline is proposed, the water table is so high that when you dig a hole for fence posts it will fill with water. Imagine how easily the Ogallala Aquifer would become contaminated if such a pipeline were to be buried and spring a leak...	Issues related to the Northern High Plains Aquifer System are addressed in Consolidated Responses AQF-1 through AQF-4. Consolidated Response AQF-3 provides information on hypothetical spills from the Project over two areas of the Northern High Plains Aquifer System.
1106	4	Helwig	Patrick		...The Ogallala Aquifer ... supplies water for agricultural products in eight states, including cattle, wheat, and that Nebraska mainstay corn...	Issues related to the High Plains Aquifer System are addressed in Consolidated Response AQF-1 through AQF-4. Consolidated Response AQF-3 provides information on

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
						hypothetical spills from the Project over two areas of the Northern High Plains Aquifer System.
1106	6	Helwig	Patrick		According to reports, TransCanada plans to use this pipeline to transport oil of such poor quality that it may not even be used in United States; it may be sold to other countries.	Consolidated Response OIL-4 addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils. Consolidated Response P&N-2 provides information on the export of refined product from Gulf Coast refineries as well as exporting WCSB crude oil from the Gulf Coast.
1106	7	Helwig	Patrick		...Its proposed routing over the Ogallala Aquifer is a risky proposition at best and at worst a disaster worse than the current BP leak in the Gulf. [According to reports, TransCanada plans to use this pipeline to transport oil of such poor quality that it may not even be used in United States; it may be sold to other countries.] This being the case, why doesn't TransCanada pipe its crude through the Canadian Rockies and out to sea in British Columbia? But would the citizens of British Columbia allow their beautiful mountains to despoiled for such a project? Not likely. So why such Americans allow our most precious natural resource, water and our landscape to be bargained away. Some things are worth more than money, or crude oil such as clean water used for many purposes in eight states. We can live without oil, but one cannot survive without fresh drinking water.	<p>Consolidated Response ALT-1 and Section 4.3 of the EIS address potential alternative routes, including routes that would avoid much of the Northern High Plains Aquifer System.</p> <p>As described in Consolidated Response GLF-1, the risks associated with the proposed Project are substantially different from those associated with the BP Deepwater Horizon Project.</p> <p>As noted in Consolidated Response OIL-4, the Canadian crude oil that would be transported by the proposed Project would be similar to other heavy crude oil transported by pipeline in the U.S. In addition, the temperature of the oil transported would not be different from that of other heavy crudes transported as noted in the 57 Project-specific Special Conditions that Keystone has agreed to (see Section 3.13.1.1 of the EIS and Appendix B). As discussed in Section 3.13.4.2 of the EIS, if a spill occurs, the behavior of the released oil-sands derived Canadian crude oil would be the same as that of other heavy crude oils. Therefore, the recovery process and the equipment needed would be the same as those applicable to other heavy crude oils.</p> <p>Consolidated Response P&N-1 addresses the need that the Project has been proposed to meet. Transporting the oil to British Columbia and transport by sea would not meet that need.</p>
241	1	Henderson	Sue	Henderson Economic Development Corporation	As General Manager of Henderson Economic Development Corporation from the State of Texas, we strongly encourage the U.S. Department of State to approve an energy infrastructure project that not only will strengthen long-term energy security in the United States, but also will provide a powerful private sector economic stimulus to the communities along the pipeline route during its construction at a time when our economy continues to struggle. As we understand it; Keystone XL will create more than 13,000 high-wage construction and manufacturing jobs during the projects 2011-2012 construction schedules. Many of those jobs will be created in Texas and in our counties, where too many of our residents continue to find it difficult to find good jobs.	Consolidated Response ECO-1 addresses potential socioeconomic impacts, and Consolidated Response TAX-1 addresses concerns regarding taxes.
241	2	Henderson	Sue	Henderson Economic Development Corporation	In addition to the jobs Keystone XL will create, the project will generate substantial economic benefits for the United States and in states and communities along the proposed route. Like our counties, in many cases these are areas where economic performance has stagnated or is shrinking. It is our understanding that TransCanada commissioned a study to	Consolidated Response ECO-1 addresses potential socioeconomic impacts, and Consolidated Response TAX-1 addresses concerns regarding taxes.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					measure the project's economic stimulus to the U.S. and the states along the route. The study found that In the U.S. Keystone XL would generate \$20.9 billion in total expenditures, \$9.6 billion in output (gross product), personal income of \$6.5 billion and 118,935 person years of employment (jobs). In addition, the report concluded that during construction, Keystone XL would generate \$486.36 million in tax revenue for state governments along the route and \$99.1 million for local taxing entities where the pipeline is located. In Texas, the study found Keystone XL expenditures during construction would total \$5.4 billion and generate an economic gross product of nearly \$2.86 million. Keystone XL construction also would generate more than \$64.5 million in tax revenue for local government and \$152 million for state government.	
241	3	Henderson	Sue	Henderson Economic Development Corporation	Furthermore, the delivery of secure and affordable supplies of Canada's energy to American consumers would have minimal impacts on the environment. This is a vital project that will strengthen U.S. energy security and reduce our dependence on unstable foreign sources of oil...Canada has more than 50% of the non-state controlled reserves in the world. Long-term supply is critical in a world where supply risks are growing, whether due to declining production from a once reliable source, an unstable geo-political climate, or uncertainties in key oil producing regions.	Comment acknowledged.
241	4	Henderson	Sue	Henderson Economic Development Corporation	Construction of additional pipeline facilities such as the Keystone XL Project, to transport oil sands production to the vitally important Gulf Coast area is critical. These refineries also have excess capacity as a result of reduced production from Mexico, where heavy oil production is in steep decline, and Venezuela, which is moving to other markets. Turning to Canada for a secure oil supply is a logical step.	Comment acknowledged.
749	1	Henderson	Nancy		I do not believe this is a smart idea...	Comment acknowledged.
452	1	Hendricks	Teresa		I was born and raised in the Sandhills of Nebraska. I didn't realize what a treasure it was when I lived there, but I do now. Why is there any question about risking the possibility of a leak in an area that has the ecosystem of no other in the world? Surely, with the recent disasters occurring in the south, we have to imagine the possibility of a leak happening at some time.	Section 3.13 of the EIS addresses reliability and safety issues, including calculations of the probability of a spill from the Project and the potential environmental impacts associated with spills. Issues related to the Sand Hills area are addressed in Consolidated Response ERO-1. Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
452	2	Hendricks	Teresa		The Ogallala Aquifer has to be considered also, for reasons that need no explanation. Obviously, the oil companies have money to burn. Why not try to avoid a problem, which might involve spending more money to change the route, but would preserve where and how we live. Thank you for your time, please think long and hard before destroying this beautiful resource.	Consolidated Response ALT-1 addresses potential alternative routes, including routes that would avoid much of the Northern High Plains Aquifer system.
1255	1	Hendrix	Daniel	Pipeliners Union 798	We write to express our support for the proposed Keystone XL Pipeline and agree with the Draft Environmental Impact Statement (DEIS) that the delivery of secure and affordable supplies of Canadian energy to America consumers would have minimal impacts on the environment.	Comment acknowledged.
1255	3	Hendrix	Daniel	Pipeliners Union	As we understand it, Keystone XL will create more than	Consolidated Response ECO-1 and Section 3.10.2.2 of the

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
				798	13,000 high-wage construction and manufacturing jobs during the project's 2011-2012 construction schedule. Many of those jobs will be created in rural areas in our districts, where too many of our residents continue to find it difficult to find good jobs. With Keystone XL, they will have an opportunity to work on the project or for businesses that provide supplies, goods, and services for its construction and operation.	EIS address the potential socioeconomic impacts of the proposed Project.
1255	5	Hendrix	Daniel	Pipeliners Union 798	Long-term supply is critical in a world where supply risks are growing, whether due to declining production from a once-reliable source, an unstable geo-political climate, or uncertainties in key oil producing regions.	Comment acknowledged.
1255	6	Hendrix	Daniel	Pipeliners Union 798	Construction of additional pipeline facilities such as the Keystone XL Project, to transport oil sands production to the vitally important Gulf Coast area is critical.	Comment acknowledged.
1255	7	Hendrix	Daniel	Pipeliners Union 798	These refineries have excess capacity as a result of reduced production from Mexico, where heavy oil production is in steep decline, and Venezuela, which is moving to other markets. Turning to Canada for a secure oil supply is a logical step.	Comment acknowledged.
1557	12	Hendrix	Danny		TransCanada, Keystone is a good company that cares about the environment and the safety of its workers. Best valued contractors in the United States. Oklahoma people will greatly benefit from this project.	Comment acknowledged.
392	1	Henk	Makenzie		Tar sands are destroying communities and are not sustainable.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project.
743	3	Henry	Deborah		...Tar sands are one of the grossest and most energy intensive energy sources that exist in the world. The United States can do better than this.....Oil that comes from Tar Sands is a temporary and abusive use of the world and nation's labor and natural resources. The United States can do better than this.	Issues related to development of oil sands projects in Canada are addressed in Consolidated Response CAN-1, including information regarding development of oil sands projects with and without the proposed Project.
915	1	Hentges	Harlan	Center for Energy Matters, Inc.	Section I addresses the State Department's process which excluded relevant issues and limited public participation. Section II addresses certain DEIS sections that are inaccurate. These comments are incomplete due to insufficient time and access to data. The research and analyses presented by Plain Justice is crucial to a full and fair discussion of this pipeline's impacts. Briefly stated, due to a faulty process, the DEIS does not fully or fairly discuss Keystone XL's impact. At best, the DEIS is uselessly general. At worst, it is boldly misleading. In any event it does not meet the basic legal requirements of an Environmental Impact Statement. We request an extension of the comment period and expansion of public participation so the State Department can issue a meaningful and legally adequate EIS.	As noted in Consolidated Response ENR-1, the environmental review, including preparation of this EIS, has been conducted consistent with the DOS regulations pertaining to NEPA (22 CFR Part 161) as well as the Council on Environmental Quality (regulations for implementing NEPA (40 CFR Part 1500) and includes the preparation of this EIS. As a result, DOS considers the EIS to be in full compliance with the requirements of a NEPA environmental review. Consolidated Response CMT-1 addresses the issue of extending the comment period for the draft EIS.
915	3	Hentges	Harlan	Center for Energy Matters, Inc.	The DEIS's vague description of impacts is inadequate to explain that the pipeline will make it impossible to live safely on at least 21,000 acres, and that it has the potential to pollute the Ogallala and other aquifers on which the region depends.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
915	5	Hentges	Harlan	Center for Energy Matters,	The State Department's process stifled citizen comment on the DEIS in Oklahoma. The 2,000 page DEIS was released on	The public comment period on the draft EIS extended from April 16 through July 2 to allow the public to submit written

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
				Inc.	April 16. On May 3 and 4, ten business days later, the State Department held public comment meetings in Oklahoma. It was impossible to review the DEIS before the meeting. Hard copies of the DEIS were available only in certain rural libraries, not in Oklahoma City or in Tulsa where they would be accessible to environmental lawyers and governmental officials. Printing the DEIS from the State Department's website or DVD's is unnecessarily expensive and labor intensive. Notice of the public meetings was ineffective and did not reach the citizens who would be most likely to comment. The State Department's process and TransCanada have effectively eliminated input from Oklahoma citizens.	comments on the EIS. Written comments were given the same weight as verbal comments. Public comment meetings were held in the vicinity of the proposed route to provide affected landowners with the opportunity to attend and provide comments.
915	6	Hentges	Harlan	Center for Energy Matters, Inc.	Citizens who attended the meetings wanted to ask questions of the State Department representatives because they had not been able to review the DEIS before the meeting. The State Department representatives, however, announced they would not answer any questions and would only listen to comments. Thus, at the meetings in Oklahoma the State Department received comments on a document that no one had seen and about which the State Department would not answer questions. Moreover, at the public meeting in Stroud, Oklahoma, a State Department representative took the liberty of responding to comments with which he disagreed – specifically the comment that notice to State Government officials was insufficient. Meaningful citizen participation was snuffed out in Oklahoma. The degree to which opposition was beaten down was expressed by a rural land owner in Stroud, Oklahoma on May 4, 2010. He explained he believed the pipeline is coming and no one can change it. The only thing to do is get as much money as possible from TransCanada. This attitude is not uncommon.	The comment meetings were held to provide the public with the opportunity to comment on the draft EIS consistent with the Council on Environmental Quality's regulations for implementing NEPA. The draft EIS was issued on April 16, 2010 and the comment meetings in Oklahoma were held on May 3 through 5 which provided interested parties the opportunity to review the EIS. The public comment period extended through July 2 to allow the public to submit written comments on the EIS. Written comments were given the same weight as verbal comments. Consolidated Response ENR-1 provides information on the Department of State's environmental review process, the National Interest Determination process, and the need to complete those reviews before approving or denying the Presidential permit for the proposed Project.
915	7	Hentges	Harlan	Center for Energy Matters, Inc.	The State Department expressly assumes that TransCanada will comply with all applicable laws, and plans. It also, implicitly assumes that in the event damage occurs, TransCanada will compensate the damaged parties. It appears that the State Department, due to these assumptions, found it unnecessary to fully analyze and discuss catastrophic failures such as breaches of the pipe, failure of shut off mechanisms or long-term leaks. These unrealistic assumptions do not negate the possibility of catastrophic failure and they do not reduce the need to examine, discuss and seek public input regarding the impact of pipeline failures. In addition, the compensation of the property owners for property damage does not eliminate or even reduce the amount of environmental damage. The DEIS should contain a full and fair discussion of the impacts of failures of the pipeline. In order to prepare a legally adequate EIS, we urge the State Department to broaden the scope of the DEIS to include a detailed analysis of the impacts of failure of the pipeline.	Keystone would be required to comply with the terms and conditions of the permits it obtains from federal, state, and local agencies. Violations would likely result in corrective orders, fines, or orders to shut the Project down. If DOS approves the proposed Project, the requirements of the Keystone Construction, Mitigation, and Reclamation Plan (see Appendix B of the EIS), which includes requirements for compensation for damage to private property and for crop loss, would be included in the Record of Decision (ROD) for the Project and Keystone would be required to comply with the ROD. Consolidated Response LIA-1 addresses Keystone's liability if there is a spill of hazardous materials or fuel during construction and from a spill of crude oil from the proposed Project. The liability requirements are mandated by federal law. Responses to a spill would likely include implementation of a federally mandated resource recovery plan as a part of a natural resources damage assessment. Implementation of such a plan would compensate for impacts to environmental resources due to the release. Consolidated Response OIL-2 and Section 3.13.4.2 of the EIS address the maximum volume spill from the proposed Project. That section of the EIS includes calculations of the probability of a spill from the proposed Project and the potential

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
						environmental impacts associated with spills from small, long-term leaks to very large releases, including the maximum release size. Sections 3.13.5.6, including Table 1.13.5-10, and 3.13.6 of the EIS, address potential impacts, including catastrophic impacts, of many spill sizes, including a maximum spill volume.
915	8	Hentges	Harlan	Center for Energy Matters, Inc.	We urge the State Department to obtain citizen input regarding impacts. Specifically, we urge the State Department to devise a process for seeking public comment that does more than meet minimum legal requirements. Instead, the State Department could design and implement a process so that it actually obtains significant and relevant citizen input.	DOS held 20 public scoping meetings, 19 public comment meetings on the draft EIS, and accepted comments on the draft EIS from April 16 through July 2, 2010. As noted in Section 1.7 of the EIS, DOS received substantial public input during scoping and the public comment period on the draft EIS.
915	9	Hentges	Harlan	Center for Energy Matters, Inc.	In light of the events in the Gulf, it is indisputable that there are grave economic and human consequences for not presenting a full and fair discussion of environmental impacts. The plains, sparse rain fall and prolific aquifers are to people on the plains as the beaches, fisheries and wetlands are to the people on the Gulf Coast. Despite the obvious importance of the plains' natural resources, the DEIS fails to fully and fairly discuss the potential damage to these resources.	The EIS has been revised to further address potential impacts to the Northern High Plains Aquifer (NHPAQ) system and the Sand Hills area. The impacts associated with implementation of the proposed Project are addressed in Section 3.0 of the EIS. As noted in that section, construction and normal operation the proposed Project would not result in significant environmental impacts. Section 3.13 of the EIS addresses reliability and safety issues, including calculations of the probability of a spill from the proposed Project and the potential environmental impacts associated with spills. Issues related to the NHPAQ system are addressed in Consolidated Responses AQF-1 through AQF-4. Issues related to the Sand Hills region are addressed in ERO-1.
915	10	Hentges	Harlan	Center for Energy Matters, Inc.	The DEIS states that the pipeline will increase surface soil temperatures from 4 – 8 degrees. At a depth of 6 inches, the temperature will increase from 10 to 15 degrees. (DEIS, 3.5-31). We submit that a full and fair discussion of a soil temperature change must include the effect of an artificially warm ecosystem running from Texas to Canada.	Consolidated Response ENV-2 addresses concerns related to pipeline temperature effects.
915	11	Hentges	Harlan	Center for Energy Matters, Inc.	A temperature differential will change the types of plants, insects and other organisms that can grow in the vicinity of the pipeline. It will change the times of the year during which plants and other organisms can grow. Due to this differential, freezing will occur at different times than the areas adjacent to the pipeline. Freezing will be prevented in places it would otherwise occur. As a practical matter, the pipeline will create a new ecosystem that is artificially warmer than the ecosystems adjacent to it. The DEIS contains no discussion of this impact.	Heat dissipation and potential impacts on native vegetation and crops are discussed in Section 3.5.5 of the EIS. The EIS was revised to add discussions of temperature effects on native prairie grasses and crops in Section 3.5.5, and additional discussions of this issue are included in Consolidated Response ENV-2. Appendix L of the EIS illustrates modeled temperature effects of the pipeline from Montana to Texas and reviews effects of increased soil temperature on native prairie grasses and crops.
915	12	Hentges	Harlan	Center for Energy Matters, Inc.	An artificially warm ecosystem within a cultivated field will cause the crop to germinate, grow and mature differently than the crop around it. This will complicate management of cultivated crops, harvesting, weed control, insect control and disease control. Likewise, an artificially warmed ecosystem will impact the adjacent natural ecosystems from Texas to Canada by enabling organism to expand into areas that they otherwise would not. A seemingly obvious relevant example would be the fire ant. The fire ant is an invasive species that is damaging to natural habitats as well as agricultural areas. Its northern expansion is limited by temperature. The artificially warmer ecosystem of the pipeline may facilitate its northern expansion and its adaptation to colder climates.	Heat dissipation and potential impacts on native vegetation and crops are discussed in Section 3.5.5 of the EIS. The EIS was revised to add discussions of temperature effects on native prairie grasses and crops in Section 3.5.5, and additional discussions of this issue are included in Consolidated Response ENV-2. Appendix L of the EIS illustrates modeled temperature effects of the pipeline from Montana to Texas and reviews effects of increased soil temperature on native prairie grasses and crops.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
915	13	Hentges	Harlan	Center for Energy Matters, Inc.	It appears that the statements in the DEIS and Appendix L (Pipeline Temperature Effects Study) are based on a presumption that earlier germination, increased growth of vegetation, and longer growing seasons are positive environmental and agricultural impacts. This simplistic premise is groundless. Certainly, citrus grows better in South Texas than in Oklahoma, but that does not mean it would be good to have a narrow strip of South Texas running through the ecosystems of Oklahoma. The DEIS analysis of the impact of soil temperature increases is entirely unsound. We urge the State Department to investigate and to full and fairly discuss the potential impacts of a soil temperature change throughout the length of the pipeline.	The purpose of the EIS is to disclose environmental effects. Soil temperature warming effects can be both positive and negative for plant growth and soil moisture as discussed in Section 3.2.2.3, 3.4.5, and 3.5.5. The EIS presents the significant results from the modeled thermal effects for the entire pipeline length (see Appendix L) and these effects are analyzed within each resource with the more substantial impacts for certain regions discussed in more detail, such as areas where heat dissipation from the pipeline would delay or prevent soils from freezing. The extent of the soil temperature changes would be limited to the area within the permanent right-of-way (generally less than 7 feet centered over the pipeline). Previous studies of pipeline temperature effects specific to agricultural crops have failed to show significant negative effects, with the exception of potential soil drying and related water availability. Soil temperature effects on agricultural crops and vegetation are discussed in Section 3.5.5.1. Consolidated Response ENV-2 also addresses soil temperature effects from pipeline heat dissipation.
915	17	Hentges	Harlan	Center for Energy Matters, Inc.	The Ogallala is to farmers as the Gulf Coast is to fishermen. Yet, with extraordinary understatement the DEIS states, "the Ogallala aquifer in this area is a major source of water." These twelve words are the DEIS's most substantial discussion of the Ogallala. The DEIS described potential for damage to aquifers as follows, Routine operation and maintenance is not expected to affect groundwater resources; however, if a crude oil release occurred, crude oil could migrate into subsurface aquifers and into areas where these aquifers are used for water supplies. (DEIS, 3.13-42). These general and vague statements are inadequate.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. As described in Consolidated Response GLF-1, the risks associated with the proposed Project are substantially different from those associated with the BP Deepwater Horizon Project.
915	18	Hentges	Harlan	Center for Energy Matters, Inc.	The ongoing oil well blow out in the Gulf of Mexico provides relevant context in which understand the inadequacy of this DEIS. It could be said, routine operation of off-shore drilling is not expected to affect gulf coast resources; however, if a crude oil release occurred, crude oil could migrate into those resources. In light of the very detailed and very specific information that we now have regarding the actual effect of a "release of crude oil" in the Gulf of Mexico, the general statements in the DEIS are not a full or fair discussion of the potential impact to the Ogallala or other aquifers.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4. As described in Consolidated Response GLF-1, the risks associated with the proposed Project are substantially different from those associated with the BP Deepwater Horizon Project.
915	19	Hentges	Harlan	Center for Energy Matters, Inc.	Table 3.10.1-9 purports to show increases in property tax revenue for counties. This table is problematic for two reasons. First, it omits a discussion of the ability and propensity for TransCanada to avoid tax obligations. Second, the effect of the information is to suppress public comment. The DEIS purports to show the taxes that TransCanada might pay. It omits, however, a discussion of the taxes that TransCanada might be able to avoid. In Kansas, TransCanada successfully lobbied for a property tax exemption for the Keystone pipeline. Due to its lobbyists influence, TransCanada avoid a large tax obligation. Yet the DEIS is silent as to means by which TransCanada may reduce the taxes it pays to state, county or local governments. The DEIS discussion of additional tax revenue is incomplete,	Consolidated Response TAX-1 and revisions to Section 3.10.2.4 of the EIS address concerns regarding taxes associated with implementation of the proposed Project.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					biased and misleading.	
915	20	Hentges	Harlan	Center for Energy Matters, Inc.	Due to this misleading information regarding tax revenue, those who scrutinize the pipeline are seen, incorrectly, as jeopardizing tax revenue. Table 3.10.1-9 is particularly troubling, because it has virtually nothing to do with the environmental impact of the pipeline. Its only purpose seems to be to provide a means or justification for cash strapped governments, elected officials, publicly funded schools and others to suppress citizen concerns about the environmental impact of the pipeline. Due to the misleading nature of the information provide in the DEIS, we urge the State Department to examine the issue fully and present a fair discussion of the increased taxes that would actually be expected to be paid as a result of the pipeline.	Consolidated Response TAX-1 and revisions to Section 3.10.2.4 of the EIS address concerns regarding taxes associated with implementation of the proposed Project.
915	21	Hentges	Harlan	Center for Energy Matters, Inc.	The DEIS contains a discussion of jobs created by the pipeline. The most prominent statistic is a total workforce of 5,000 workers. (DEIS, 3.10-47). Obscured is that only about 50 construction labor jobs, lasting about 6 months are expected in Oklahoma. The local job creation potential of the pipeline project is negligible and that should be stated clearly. In this regard, the DEIS is misleading, and as discussed above, it has the effect of stifling expression of environmental concerns about the pipeline. The DEIS does not contain a full and fair discussion of minimal potential of this project to create local jobs.	As shown in Tables 3.10.2-1 and 2.1-1 of the EIS, 4 pump stations and 155 miles of pipeline, representing more than one spread, would be constructed in Oklahoma. As indicated in Section 3.10.2.2, construction of each pump station would require 20 to 30 people and 500 to 600 construction personnel would be allocated to each spread, with an estimated 10 to 15 percent hired locally. Section 2.4 states that 20 permanent operational jobs would be created and would be located along the length of the pipeline. Section 3.10.2.2 has been revised to clearly reflect the jobs that would be created during operation.
915	22	Hentges	Harlan	Center for Energy Matters, Inc.	Refining Tar Sands Oil in Oklahoma and Texas will increase emissions from refineries. Greater emissions will increase the likelihood that Oklahoma City and Tulsa will go "nonattainment" under the Clean Air Act. Non-attainment status entails stricter environmental regulations and limits economic growth in Oklahoma's two main metropolitan areas. While this impact is potentially much greater than the potential for 50 temporary construction labor jobs, the DEIS contains no discussion of this impact.	As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries.
915	25	Hentges	Harlan	Center for Energy Matters, Inc.	According to the DEIS this pipeline is needed to reduce U.S. dependence on foreign oil from unfriendly foreign countries. The DEIS's reasoning is flawed because it does not account for the involvement of China in the Tar Sands. Chinese government owned companies have invested \$7 billion in production facilities in the Canadian Tar Sands. And Enbridge, a Canadian company is seeking approval for a pipeline to carry more than 500,000 barrels per day of Tar Sands Crude from Alberta to the Pacific coast for export to China. U.S. consumers who purchase products made with Tar Sands Crude will be competing with the Chinese Government. If U.S. consumers are dependent upon Tar Sands Crude, the Chinese government will have an effective tool to manipulate the U.S. economy, consumers and government.	Consolidated Response P&N-4 provides information on investments by Chinese companies in Canadian oil sands projects. Chinese investments in oil sands projects do not affect the proposed Project's ability to meet the heavy crude oil needs of Gulf Coast refineries as described in Consolidated Response P&N-1 and Sections 1.2 and 1.4 of the EIS. Consolidated Response CAN-1 addresses production from oil sands projects.
915	26	Hentges	Harlan	Center for Energy Matters, Inc.	Dependence on foreign oil is clearly a problem for U.S. consumers. Moreover, reducing dependence on foreign oil is clearly in the best interest of the U.S. consumer. Becoming dependant upon Tar Sands Crude does not address this problem. The DEIS extols the benefits of dealing with Canada, without even mentioning the involvement of the Chinese	Consolidated Response P&N-4 provides information on investments by Chinese companies in Canadian oil sands projects.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					government in Tar Sands production. This omission is alarming. We would urge the State Department to determine that investment by the Chinese government in the Canadian Tar Sands is an essential factor that must be part of full and fair discussion of this project.	
915	28	Hentges	Harlan	Center for Energy Matters, Inc.	The draft EIS presents a flawed analysis of environmental injustice. Environmental injustice is not a matter of race or poverty; it is a matter of an abuse of political power. Some communities cannot protect themselves from abuse of political power because they are poor, they are of ethnic or racial minorities or because they are small. Environmental injustice along the route this pipeline is not a matter of poverty or race. It is a matter of numbers. The number of citizens whose property is taken for the pipeline is small from a political perspective. It is located on a strip of rural land about 10 miles wide and 1,400 miles long. Thus, it is not like a community. These few people scattered through the plains do not have political power, organization or other resources needed to participate effectively in the draft EIS process. Unless the State Department addresses this environmental injustice, these people - this community - will bear environmental risks and suffer environmental damages that would not be possible if this pipeline were built where the affected citizens had political influence equal to that of any ordinary community.	Consolidated Response JUS-1 and Section 3.10.1.2 of the EIS describe the counties in the project area with higher populations of minority and low-income groups that may be impacted by the project. This analysis is in accordance with Council on Environmental Quality guidance for analysis of potential environmental justice effects. As noted in Section 3.10, the proposed Project and associated mitigation measures are not expected to result in adverse impacts that would fall disproportionately on minority or low-income populations located along the pipeline route. Moreover, project-related spending and tax revenues would result in substantial socioeconomic benefits in the region of influence, which may positively affect low-income and minority populations and Native American tribes through increased employment opportunities, income benefits, and improved public service levels.
915	29	Hentges	Harlan	Center for Energy Matters, Inc.	The abuse of political power occurring during this project is made possible by the pipeline route. The pipeline route does not appear to have any other purpose other than to reduce public participation. The route is not designed to minimize additional environmental damage. By placing it relatively undisturbed rural areas, it seems to maximize the amount of new environmental degradation. The route does, however, insure the least amount of public scrutiny. It insures the smallest number of people will be inclined to examine the potential for environmental impacts and the safety of the pipeline. It insures the fewest large businesses or governmental entities will devote resources to examining the project. It insures that a minimum amount of resources will be devoted to effectively presenting the interest of the people who are most effected by the project. This pipeline, due to its route, will receive the least amount of public scrutiny of its environmental impacts. The draft EIS does not meaningfully discuss this environmental justice. Incredibly it concludes there is no environmental justice concern.	As noted in the resource portions of Section 3.0 of the EIS, to the extent practicable, the proposed route and alternatives were selected to avoid or minimize impacts to developed areas, and sensitive biological, geologic, wetlands, water, cultural , vegetation, wildlife and endangered species, and visual resources. Landowners in the vicinity of the proposed route and other interested parties were informed of the proposed Project in the Notice of Intent to prepare the EIS and the Notice of Availability for the draft EIS. Those stakeholders were given the opportunity for providing input at the scoping meetings and the public comment meetings on the EIS and in written scoping and draft EIS comments. Consolidated Response JUS-1 and Section 3.10.1.2 of the EIS describe the counties in the project area with higher populations of minority and low-income groups that may be impacted by the project. This analysis is in accordance with Council on Environmental Quality guidance for analysis of potential environmental justice effects. As noted in Section 3.10, the proposed Project and associated mitigation measures are not expected to result in adverse impacts that would fall disproportionately on minority or low-income populations located along the pipeline route. Moreover, project-related spending and tax revenues would result in substantial socioeconomic benefits in the region of influence, which may positively affect low-income and minority populations and Native American tribes through increased employment opportunities, income benefits, and improved public service levels.
915	30	Hentges	Harlan	Center for	The Center for Energy Matters and the Association of Rural	As noted in Consolidated Response ENR-1, the environmental

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
				Energy Matters, Inc.	Land Owners believe the Draft Environmental Impact Statement for the Keystone XL Pipeline is seriously flawed. Due to lack of specificity and analysis, the discussion presented by the DEIS is, at best, uselessly general, and at worst, biased and misleading. We believe flaws in the DEIS are the result of a process that discouraged and hindered public participation, particularly by the people who live on, work on and own the pipeline route. The process excluded input from the citizens who have the most direct information concerning the environmental impacts of this pipeline. As a result, the DEIS fails to present a full and fair discussion of many issues.	review, including preparation of this EIS, has been conducted consistent with the DOS regulations pertaining to NEPA (22 CFR Part 161) as well as the Council on Environmental Quality (regulations for implementing NEPA (40 CFR Part 1500) and includes the preparation of this EIS. As a result, DOS considers the EIS to be in full compliance with the requirements of a NEPA environmental review. DOS held 20 public scoping meetings and 19 public comment meetings on the draft EIS. Also see Consolidated Response CMT-2 for issues related to public comment meetings.
915	31	Hentges	Harlan	Center for Energy Matters, Inc.	In light of the foregoing, we urge the Department of State to revise the DEIS incorporating these comments and to extend and continue the period for public participation so that the EIS will fully and fairly discuss the significant environmental impacts of the Keystone XL Pipeline.	The supplemental draft EIS and the final EIS addressed comments received on the draft EIS. Consolidated Response CMT-1 addresses the issue of extending the comment period for the draft EIS.
1259	1	Hentges	Harlan	Center for Energy Matters, Inc.	Briefly stated, due to a faulty process, the DEIS does not fully or fairly discuss Keystone XL's impact.	As noted in Consolidated Response REG-2, DOS takes seriously its responsibilities to thoroughly evaluate the environmental effects of its Presidential Permit decisions consistent with NEPA and other relevant laws and regulations. In conducting the environmental review of the proposed Project, DOS followed NEPA, CEQ regulations and guidance, and all other applicable laws and regulations. In addition, DOS was assisted by a third-party environmental contractor in the environmental review of the proposed Project. That contractor, Cardno ENTRIX, has conducted environmental impact assessments of nearly 30 proposed pipeline projects and has experience in such work throughout the U.S., including in the states along the proposed corridor. DOS also consulted extensively with other relevant federal agencies that have particular technical expertise and authority relevant to the proposed Project. As a result, DOS considers the EIS to be in full compliance with the requirements of a NEPA environmental review.
1259	2	Hentges	Harlan	Center for Energy Matters, Inc.	A general, statistical description of the "environment," is inadequate to describe the place where farmers, ranchers and other rural residents live and work.	Consolidated Response RUR-1 addresses issues related to rural environments.
1259	3	Hentges	Harlan	Center for Energy Matters, Inc.	<p>The DEIS's vague description of impacts is inadequate to explain that the pipeline will make it impossible to live safely on at least 21,000 acres, and that it has the potential to pollute the Ogallala and other aquifers on which the region depends. At best, the DEIS is uselessly general. At worst, it is boldly misleading. In any event it does not meet the basic legal requirements of an Environmental Impact Statement.</p> <p>We request an extension of the comment period and expansion of public participation so the State Department can issue a meaningful and legally adequate EIS.</p>	<p>The only restrictions on land use during operation are associated with the 50-foot-wide permanent right-of-way, which encompasses a total of about 8,600 acres along the 1,384-mile-long proposed route. There would not be restrictions on use of land outside of that right-of-way. It is not reasonable to assume that all landowners along the route would consider the area adjacent to the permanent right-of-way to be unbuildable or dangerous to workers. Much of the route extends through range land and agricultural land and essentially all current land uses could continue during operation of the proposed Project, including within the 50-foot-wide permanent right-of-way. Some landowners may elect to avoid construction near the pipeline, but that would not result in a significant impact.</p> <p>Issues related to the Ogallala aquifer are addressed in</p>

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
						<p>Consolidated Responses AQF-1 and AQF-4.</p> <p>As noted in Consolidated Response ENR-1, the environmental review, including preparation of this EIS, has been conducted consistent with the DOS regulations pertaining to NEPA (22 CFR Part 161) as well as the Council on Environmental Quality (CEQ) regulations for implementing NEPA (40 CFR Part 1500). As a result, DOS considers the EIS to be in full compliance with the requirements of a NEPA environmental review.</p> <p>Consolidated Response CMT-2 addresses issues related to the length of the comment period for the draft EIS.</p>
1259	5	Hentges	Harlan	Center for Energy Matters, Inc.	We request an extension of the comment period and expansion of public participation so the State Department can issue a meaningful and legally adequate EIS.	Consolidated Response CMT-1 addresses issues related to the length of the comment period for the draft EIS and supplemental draft EIS. Consolidated Response CMT-2 addresses issues related to comment meetings on the draft EIS and requests for additional public involvement.
1259	6	Hentges	Harlan	Center for Energy Matters, Inc.	While no process is perfect, the process for this DEIS is unreasonably flawed. This process yielded a voluminous compilation of data, but produced no realistic analysis or meaningful discussion of the potentially devastating impacts of Keystone XL.	The impacts associated with implementation of the proposed Project are addressed in Section 3.0 of the EIS. As noted in that section, construction and normal operation the proposed Project would not result in significant environmental impacts. Section 3.13 of the EIS addresses reliability and safety issues, including calculations of the probability of a spill from the proposed Project and the potential environmental impacts associated with spills.
1259	7	Hentges	Harlan	Center for Energy Matters, Inc.	The State Department's process stifled citizen comment on the DEIS in Oklahoma. The 2,000 page DEIS was released on April 16. On May 3 and 4, ten business days later, the State Department held public comment meetings in Oklahoma. It was impossible to review the DEIS before the meeting.	The public comment period extended through July 2 to allow the public to submit written comments on the EIS. Written comments were given the same weight as verbal comments.
1259	8	Hentges	Harlan	Center for Energy Matters, Inc.	Hard copies of the DEIS were available only in certain rural libraries, not in Oklahoma City or in Tulsa where they would be accessible to environmental lawyers and governmental officials. Printing the DEIS from the State Department's website or DVD's is unnecessarily expensive and labor intensive. Notice of the public meetings was ineffective and did not reach the citizens who would be most likely to comment. Citizens who attended the meetings wanted to ask questions of the State Department representatives because they had not been able to review the DEIS before the meeting. The State Department representatives, however, announced they would not answer any questions and would only listen to comments. Thus, at the meetings in Oklahoma the State Department received comments on a document that no one had seen and about which the State Department would not answer questions.	See Consolidated Response CMT-6. The comment meetings were held to provide the public with the opportunity to comment on the draft EIS consistent with the Council on Environmental Quality's regulations for implementing NEPA. Those meetings were designed to allow time for the public to comment on the draft EIS. They were not intended to be conducted in a question-and-answer format. The public comment period extended through July 2 to allow the public to submit written comments on the EIS. Written comments were given the same weight as verbal comments. Consolidated Response CMT-6 addresses issues related to the availability of paper copies of the draft EIS.
1259	9	Hentges	Harlan	Center for Energy Matters, Inc.	At the public meeting in Stroud, Oklahoma, a State Department representative took the liberty of responding to comments with which he disagreed – specifically the comment that notice to State Government officials was insufficient. Meaningful citizen participation was snuffed out in Oklahoma.	The comment meetings were held to provide the public with the opportunity to comment on the draft EIS consistent with the Council on Environmental Quality's regulations for implementing NEPA. Those meetings were designed to allow time for the public to comment on the draft EIS. They were not intended to be conducted in a question-and-answer format. The public comment period extended through July 2 to allow

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
						the public to submit written comments on the draft EIS. Written comments were given the same weight as verbal comments.
1259	10	Hentges	Harlan	Center for Energy Matters, Inc.	The degree to which opposition was beaten down was expressed by a rural land owner in Stroud, Oklahoma on May 4, 2010. He explained he believed the pipeline is coming and no one can change it. The only thing to do is get as much money as possible from TransCanada. This attitude is not uncommon. The State Department's process and TransCanada have effectively eliminated input from Oklahoma citizens.	Consolidated Response ENR-1 provides information on the Department of State's environmental review process, the National Interest Determination process, and the need to complete those reviews before approving or denying the Presidential permit for the proposed Project. In addition to the public comment meetings on the draft EIS, written comments on the draft EIS were accepted through July 2, 2010. Written comments were given the same weight as verbal comments.
1259	11	Hentges	Harlan	Center for Energy Matters, Inc.	The State Department expressly assumes that TransCanada will comply with all applicable laws, and plans. It also, implicitly assumes that in the event damage occurs, TransCanada will compensate the damaged parties. It appears that the State Department, due to these assumptions, found it unnecessary to fully analyze and discuss catastrophic failures such as breaches of the pipe, failure of shut off mechanisms or long-term leaks. These Unrealistic assumptions do not negate the possibility of catastrophic failure and they do not reduce the need to examine, discuss and seek public input regarding the impact of pipeline failures.	<p>As described in Consolidated Response SAF-1 and in Section 3.13.1.1, Keystone must operate the Project in accordance with the Pipeline and Hazardous Materials Safety Administration (PHMSA) requirements to construct, operate, maintain, inspect, and monitor the proposed Project in a manner that protects the health and safety of the public and the environment. In addition, PHMSA developed 57 Project-specific Special Conditions that Keystone has agreed to implement. Incorporation of those conditions would result in a Project that would have a degree of safety over any other typically constructed domestic oil pipeline system under current code and a degree of safety along the entire length of the pipeline system similar to that which is required in HCAs as defined in 49 CFR 195.450. Consolidated Response SAF-1 and Section 3.13.1.1 also describe the inspections and reviews of the proposed Project that PHMSA would conduct to ensure compliance with those regulatory requirements.</p> <p>Section 3.13 of the EIS addresses reliability and safety issues, including calculations of the probability of a spill from the Project and the potential environmental impacts associated with spills. The probability analysis and impact assessments consider a wide range of spill sizes, from minor leaks to maximum spill volumes, irrespective of the cause of the spill. In essence this section answers the question "what if" and does not rely on specific causes. This information was included in the DEIS and was available for public comment.</p> <p>Consolidated Response LIA-1 addresses Keystone's liability if there is a spill of hazardous materials or fuel during construction or a spill of crude oil from the proposed Project.</p>
1259	12	Hentges	Harlan	Center for Energy Matters, Inc.	The compensation of the property owners for property damage does not eliminate or even reduce the amount of environmental damage.	With the landowner's agreement, Keystone would repair damage that occurs during construction and maintenance activities and return the damaged areas to previous conditions to the extent practicable. If the landowner prefers to be compensated for the damage, the landowner would decide what corrective action would be necessary. Many options would exist for corrective actions that could reduce environmental damage.
1259	13	Hentges	Harlan	Center for Energy Matters, Inc.	The DEIS should contain a full and fair discussion of the impacts of failures of the pipeline.	Section 3.13 of the EIS addresses reliability and safety issues, including calculations of the probability of a spill from the Project and the potential environmental impacts associated with spills. DOS considers this assessment to be complete,

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
						unbiased, and in compliance with NEPA environmental review requirements.
1259	14	Hentges	Harlan	Center for Energy Matters, Inc.	In order to prepare a legally adequate EIS, we urge the State Department to broaden the scope of the DEIS to include a detailed analysis of the impacts of failure of the pipeline.	There is no need to broaden the scope of the EIS since Section 3.13 of the EIS addresses the impacts of accidental releases from the Project.
1259	15	Hentges	Harlan	Center for Energy Matters, Inc.	We urge the State Department to obtain citizen input regarding impacts of failure of the pipeline. Specifically, we urge the State Department to devise a process for seeking public comment that does more than meet minimum legal requirements. Instead, the State Department could design and implement a process so that it actually obtains significant and relevant citizen input.	DOS held 20 public scoping meetings, 19 public comment meetings on the draft EIS, and accepted comments on the draft EIS from April 16 through July 2, 2010. As noted in Section 1.7 of the EIS, DOS received substantial public input during scoping and the public comment period on the draft EIS.
1259	17	Hentges	Harlan	Center for Energy Matters, Inc.	The plains, sparse rain fall and prolific aquifers are to people on the plains as the beaches, fisheries and wetlands are to the people on the Gulf Coast. Despite the obvious importance of the plains' natural resources, the DEIS fails to fully and fairly discuss the potential damage to these resources	The EIS has been revised to further address potential impacts to the Northern High Plains Aquifer (NHPAQ) system and the Sand Hills area. The impacts associated with implementation of the proposed Project are addressed in Section 3.0 of the EIS. As noted in that section, construction and normal operation the proposed Project would not result in significant environmental impacts. Section 3.13 of the EIS addresses reliability and safety issues, including calculations of the probability of a spill from the proposed Project and the potential environmental impacts associated with spills. Issues related to the NHPAQ system are addressed in Consolidated Responses AQF-1 through AQF-4. Issues related to the Sand Hills area are addressed in Consolidated Response ERO-1.
1259	19	Hentges	Harlan	Center for Energy Matters, Inc.	The DEIS states that the pipeline will increase surface soil temperatures from 4 – 8 degrees. At a depth of 6 inches, the temperature will increase from 10 to 15 degrees. (DEIS, 3.5-31). We submit that a full and fair discussion of a soil temperature change must include the effect of an artificially warm ecosystem running from Texas to Canada.	Consolidated Response ENV-2 addresses concerns related to pipeline temperature effects.
1259	20	Hentges	Harlan	Center for Energy Matters, Inc.	A temperature differential will change the types of plants, insects and other organisms that can grow in the vicinity of the pipeline. It will change the times of the year during which plants and other organisms can grow. Due to this differential, freezing will occur at different times than the areas adjacent to the pipeline. Freezing will be prevented in places it would otherwise occur. As a practical matter, the pipeline will create a new ecosystem that is artificially warmer than the ecosystems adjacent to it. The DEIS contains no discussion of this impact.	The effects of temperature increases due to operation of the proposed pipeline are addressed in Consolidated Response ENV-2 and in Sections 3.2.2, 3.5.5, and 3.6.2 of the EIS, including changes in soil temperature and effects on vegetation and wildlife. Additional information and modeled changes in soil temperature profiles is provided in Appendix L of the EIS.
1259	21	Hentges	Harlan	Center for Energy Matters, Inc.	An artificially warm ecosystem within a cultivated field will cause the crop to germinate, grow and mature differently than the crop around it. This will complicate management of cultivated crops, harvesting, weed control, insect control and disease control.	Heat dissipation and potential impacts on native vegetation and crops are discussed in Section 3.5.5 of the EIS. The EIS was revised to add discussions of temperature effects on native prairie grasses and crops in Section 3.5.5, and additional discussions of this issue are included in Consolidated Response ENV-2. Appendix L of the EIS illustrates modeled temperature effects of the pipeline from Montana to Texas and reviews effects of increased soil temperature on native prairie grasses and crops.
1259	22	Hentges	Harlan	Center for Energy Matters, Inc.	Likewise, an artificially warmed ecosystem will impact the adjacent natural ecosystems from Texas to Canada by enabling organisms to expand into areas that they otherwise	Keystone would implement measures to prevent the spread of noxious weeds and invasive aquatic animals as described in Sections 3.5.5.4 and 3.7.3.1 of the EIS. Section 3.7.3.1 of the

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					would not. A seemingly obvious relevant example would be the fire ant. The fire ant is an invasive species that is damaging to natural habitats as well as agricultural areas. Its northern expansion is limited by temperature. The artificially warmer ecosystem of the pipeline may facilitate its northern expansion and its adaptation to colder climates. Other examples would be known throughout the pipeline route.	EIS was revised to include additional measures Keystone would implement to prevent the spread of aquatic invasive species. The measures described were recommended by federal and state management agencies. Disturbed soils would be revegetated as quickly as possible and equipment would be cleaned after use within infected areas; these are the primary deterrents to establishment and expansion of noxious weeds. Small changes in soil temperature would have local, not regional scale impacts and would likely be indistinguishable from exposure to local noxious weed sources.
1259	23	Hentges	Harlan	Center for Energy Matters, Inc.	In evaluating the impact of increased soil temperature the DEIS states, "in general increased soil temperatures ... would cause early germination and emergence and increased productivity in annual crops such as corn and soybeans and in tall grass prairie species. Increased soil temperature may lead to localized soil drying and localized decreases in soil moisture available for evapotranspiration." (DEIS, p. 3.5-31) It appears that this statement and Appendix L (Pipeline Temperature Effects Study) are based on a presumption that earlier germination, increased growth of vegetation, and longer growing seasons are positive environmental and agricultural impacts. This simplistic premise is groundless. Certainly, citrus grows better in South Texas than in Oklahoma, but that does not mean it would be good to have a narrow strip of South Texas running through the ecosystems of Oklahoma.	Heat dissipation and potential impacts on native vegetation and crops are discussed in Section 3.5.5 of the EIS. The EIS was revised to add discussions of temperature effects on native prairie grasses and crops in Section 3.5.5, and additional discussions of this issue are included in Consolidated Response ENV-2. Appendix L of the EIS illustrates modeled temperature effects of the pipeline from Montana to Texas and reviews effects of increased soil temperature on native prairie grasses and crops.
1259	24	Hentges	Harlan	Center for Energy Matters, Inc.	The DEIS analysis of the impact of soil temperature increases is entirely unsound. We urge the State Department to investigate and to full and fairly discuss the potential impacts of a soil temperature change throughout the length of the pipeline.	Consolidated Response ENV-2 addresses concerns related to pipeline temperature effects.
1259	25	Hentges	Harlan	Center for Energy Matters, Inc.	The DEIS contains no specific information about seismic activity or the potential of the pipeline to fail as a result of seismic activity in Oklahoma. In Oklahoma, on February 27, 2010 there was a magnitude 4.1 earthquake the epicenter of which was within ten miles of the pipeline. On April 15, 2010, there were two earthquakes, the epicenters of which were within one mile of the proposed pipeline. One was a magnitude of 3.0 the other 3.2. (http://www.okgeosurvey1.gov/pages/eq-catalogs/2010-2019.php)	Consolidated Response GEO-2 addresses potential seismic hazards.
1259	26	Hentges	Harlan	Center for Energy Matters, Inc.	The data presented in the DEIS regarding seismic activity in Oklahoma are incomplete, and the conclusion is misleading. Accurately assessing the risk of pipeline failure due to seismic activity in Oklahoma would include not only earthquakes between 1.8 and 2.5, but also less frequent earthquakes of greater magnitudes. It would seem especially important to include recent earthquakes that had epicenters on the pipeline route.	Consolidated Response GEO-2 addresses potential seismic hazards.
1259	27	Hentges	Harlan	Center for Energy Matters, Inc.	It would seem vital to have data regarding the anticipated performance of the pipeline during earthquakes of different magnitudes. With these data it would seem possible to assess how many times during the 50 year life of the pipeline, there	Consolidated Response GEO-2 addresses potential seismic hazards.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					would be an earthquake that would be expected to damage the pipeline.	
1259	28	Hentges	Harlan	Center for Energy Matters, Inc.	We urge the State Department to obtain complete data on seismic activity including the largest earthquakes that would be expected during the 50 year life of the project.	Consolidated Response GEO-2 addresses potential seismic hazards.
1259	29	Hentges	Harlan	Center for Energy Matters, Inc.	We would request data regarding the probability that the pipeline would fail during earthquakes of different magnitudes. Then it seems the State Department would be able to present a discussion of how the pipeline would be expected to perform during the largest earthquakes that would be expected during the life of the project. Unless such data are included, the discussion of seismic activity cannot be said to be full or fair, but is instead incomplete and misleading.	Consolidated Response GEO-2 addresses potential seismic hazards.
1259	30	Hentges	Harlan	Center for Energy Matters, Inc.	The Ogallala is to farmers as the Gulf Coast is to fishermen. Yet, with extraordinary understatement the DEIS states, "the Ogallala aquifer in this area is a major source of water." These twelve words are the DEIS's most substantial discussion of the Ogallala.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
1259	31	Hentges	Harlan	Center for Energy Matters, Inc.	The DEIS described potential for damage to aquifers are general and vague statements and are inadequate.	Issues related to the Northern High Plains Aquifer system are addressed in Consolidated Responses AQF-1 through AQF-4.
1259	32	Hentges	Harlan	Center for Energy Matters, Inc.	The ongoing oil well blow out in the Gulf of Mexico provides relevant context in which understand the inadequacy of this DEIS. It could be said, routine operation of off-shore drilling is not expected to affect gulf coast resources; however, if a crude oil release occurred, crude oil could migrate into those resources. In light of the very detailed and very specific information that we now have regarding the actual effect of a "release of crude oil" in the Gulf of Mexico, the general statements in the DEIS are not a full or fair discussion of the potential impact to the Ogallala or other aquifers.	As described in Consolidated Response GLF-1, the risks associated with the proposed Project are substantially different from those associated with the BP Deepwater Horizon Project, particularly with regard to the volume of released oil, environmental impacts, and control, containment and cleanup of released oil. Section 3.13 of the EIS was revised to update spill incident statistics and projections, provide additional information on composition of the crude oil that would be transported by the proposed Project, additional information on potential impacts to the Northern High Plains Aquifer system, and other key information. This section addresses reliability and safety issues, including calculations of the probability of a spill from the proposed Project and the potential environmental impacts associated with spills. DOS considers this assessment to be in compliance with NEPA environmental review requirements. Issues related to the High Plains Aquifer System are also addressed in Consolidated Responses AQF-1 through AQF-4. Consolidated Response AQF-3 provides information on hypothetical spills from the Project over two areas of the Northern High Plains Aquifer System.
1259	33	Hentges	Harlan	Center for Energy Matters, Inc.	Table 3.10.1-9 purports to show increases in property tax revenue for counties. This table is problematic for two reasons. First, it omits a discussion of the ability and propensity for TransCanada to avoid tax obligations. Second, the effect of the information is to suppress public comment.	Consolidated Response TAX-1 and revisions to Section 3.10.2.4 of the EIS address concerns regarding taxes associated with implementation of the proposed Project.
1259	34	Hentges	Harlan	Center for Energy Matters, Inc.	The DEIS purports to show the taxes that TransCanada might pay. It omits, however, a discussion of the taxes that TransCanada might be able to avoid. In Kansas, TransCanada successfully lobbied for a property tax exemption for the Keystone pipeline. Due to its lobbyists influence, TransCanada avoid a large tax obligation. Yet the DEIS is silent as to means by which TransCanada may reduce	Consolidated Response TAX-1 and revisions to Section 3.10.2.4 of the EIS address concerns regarding taxes associated with implementation of the proposed Project.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					the taxes it pays to state, county or local governments.	
1259	35	Hentges	Harlan	Center for Energy Matters, Inc.	The DEIS discussion of additional tax revenue is incomplete, biased and misleading. Misleading information regarding tax revenue also has a chilling effect on public participation. Due to this misleading information, those who scrutinize the pipeline are seen, incorrectly, as jeopardizing tax revenue.	Consolidated Response TAX-1 and revisions to Section 3.10.2.4 of the EIS address concerns regarding taxes associated with implementation of the proposed Project.
1259	36	Hentges	Harlan	Center for Energy Matters, Inc.	Table 3.10.1-9 is particularly troubling, because it has virtually nothing to do with the environmental impact of the pipeline. Its only purpose seems to be to provide a means or justification for cash strapped governments, elected officials, publicly funded schools and others to suppress citizen concerns about the environmental impact of the pipeline.	As stated in the EIS, "Table 3.10.1-9 displays the 2007 property tax levied by county, the assessed value of property and the implied effective tax rate by county for the Project area of influence." That information was used to estimate the potential tax revenues that would be generated with implementation of the proposed Project. That revenue represents a positive (beneficial) economic impact of the proposed Project consistent with the requirements for implementing NPEA.
1259	37	Hentges	Harlan	Center for Energy Matters, Inc.	Due to the misleading nature of the information provide in the DEIS, we urge the State Department to examine the issue fully and present a fair discussion of the increased taxes that would actually be expected to be paid as a result of the pipeline.	Consolidated Response TAX-1 and revisions to Section 3.10.2.4 of the EIS address concerns regarding taxes associated with implementation of the proposed Project.
1259	38	Hentges	Harlan	Center for Energy Matters, Inc.	The DEIS contains a discussion of jobs created by the pipeline. The most prominent statistic is a total workforce of 5,000 workers. Obscured is that only about 50 construction labor jobs, lasting about 6 months are expected in Oklahoma. The local job creation potential of the pipeline project is negligible and that should be stated clearly. In this regard, the DEIS is misleading, and as discussed above, it has the effect of stifling expression of environmental concerns about the pipeline. The DEIS does not contain a full and fair discussion of minimal potential of this project to create local jobs.	As shown in Tables 3.10.2-1 and 2.1-1 of the EIS, 4 pump stations and 155 miles of pipeline, representing more than one spread, would be constructed in Oklahoma. As indicated in Section 3.10.2.2, construction of each pump station would require 20 to 30 people and 500 to 600 construction personnel would be allocated to each spread, with an estimated 10 to 15 percent hired locally. Section 2.4 states that 20 permanent operational jobs would be created and would be located along the length of the pipeline. Section 3.10.2.2 has been revised to clearly reflect the jobs that would be created during operation.
1259	39	Hentges	Harlan	Center for Energy Matters, Inc.	Refining Tar Sands Oil in Oklahoma and Texas will increase emissions from refineries. Greater emissions will increase the likelihood that Oklahoma City and Tulsa will go "nonattainment" under the Clean Air Act. Non-attainment status entails stricter environmental regulations and limits economic gright-of-wayth in Oklahoma's two main metropolitan areas. While this impact is potentially much greater than the potential for 50 temporary construction labor jobs, the DEIS contains no discussion of this impact.	As described in Consolidated Responses P&N-1, P&N-3, and OIL-4, construction and operation of the proposed Project would be independent of the level of oil refining in PADD III and would not directly result in increased or significantly changed refinery emissions in Gulf Coast refineries. Consolidated Response OIL-4 also addresses the composition of the Canadian crude oil that would be transported by the proposed Project. As noted in that response, that crude oil is similar in composition to other heavy crude oils.
1259	44	Hentges	Harlan	Center for Energy Matters, Inc.	According to the DEIS this pipeline is needed to reduce U.S. dependence on foreign oil from unfriendly foreign countries. The DEIS's reasoning is flawed because it does not account for the involvement of China in the Tar Sands. Chinese government owned companies have invested \$7 billion in production facilities in the Canadian Tar Sands.	The commenter has not correctly identified the primary need. As noted in Consolidated Response P&N-1 and Sections 1.2 and 1.4, the project has been proposed to meet the heavy crude oil demand of Gulf Coast refineries, primarily because of dwindling supplies from Mexico and Venezuela. Our response to Comment Letter 1259, Comment 45 addresses issues related to Chinese investments in oil sands projects.
1259	45	Hentges	Harlan	Center for Energy Matters, Inc.	Enbridge, a Canadian company is seeking approval for a pipeline to carry more than 500,000 barrels per day of Tar Sands Crude from Alberta to the Pacific coast for export to China. U.S. consumers who purchase products made with Tar Sands Crude will be competing with the Chinese Government. If U.S. consumers are dependent upon Tar Sands Crude, the	Consolidated Response P&N-4 provides information on investments by Chinese companies in Canadian oil sands projects. Chinese investments in oil sands projects do not affect the proposed Project's ability to meet the heavy crude oil needs of Gulf Coast refineries as described in Consolidated Response P&N-1 and Sections 1.2 and 1.4 of the EIS.

Ltr ID	Cmt ID	Last Name	First Name	Organization	Comment	Response
					Chinese government will have an effective tool to manipulate the U.S. economy, consumers and government.	Consolidated Response CAN-1 addresses production from oil sands projects.
1259	46	Hentges	Harlan	Center for Energy Matters, Inc.	Dependence on foreign oil is clearly a problem for U.S. consumers. Moreover, reducing dependence on foreign oil is clearly in the best interest of the U.S. consumer. Becoming dependant upon Tar Sands Crude does not address this problem.	Consolidated Response P&N-1 addresses the need that the Project has been proposed to meet.
