

### Outfall 001 Gas fired boiler effluent sample collection port

Inside gas boiler room, west wall. Sample port is downstream from the water softener, just before it discharges into the drainfield. There is a valve and line tapped into the softener discharge line, which is used to take the samples.

Flowmeter is located after the water softener, ~50 north (downstream) of the sample port. No other water or other fluid is introduced after the sample port.

### Outfall 002 Hurst boiler effluent sample collection port

Sample port is inside the pH neutralization/mixing tank room, on the west side of the boiler building. The port is inside the door, on the right. This port was installed after the pH mixing tank and water softener discharge, just before the discharge goes into the drainfield. From the port to the discharge point is ~6'.
