2023 through 2024

Trends in Fund Revenue and Expenditure Activities

Revenue

A fitted line indicates that revenue from fuels sold in the state increased by approximately \$71,000 each year over the last 30 years; 1995-2024*. This average increase, estimated from a linear regression of the fuel revenues from 1995 through 2024*, is holding steady with the last biennium's estimate of \$70,000, and the coefficient of determination 93%.

The COVID-19 pandemic precipitated a contraction of economic activity resulting from people staying at home and businesses shut. Although people were not as mobile, there was a surge in trucking of goods, which translated into a strong revenue base in Montana despite the pandemic. The revenue from gasoline, diesel, and aviation fuels trended upward over the past five-year period, from 2020 through 2024. A fitted line indicates that revenue from fuels sold in the state increased by approximately \$198,480 each year of that five-year period.

The fuel revenue comes from fees levied on gasoline, diesel, and aviation fuels, each of which exhibits a different trend. The data indicates that when comparing the three fuels, diesel fuel revenue still has the steepest incline from 1995 through 2024*. This incline is evident in the least-squares analysis used to calculate a straight line that best fits the revenue data for the thirty-year period, for each of the fuel categories. The slopes of the lines predicted from a linear regression are \$22,773; \$43,279; and \$4,452 per year for gasoline, diesel, and aviation fuels, respectively. The slope provides an estimate of the annual increase in revenue for each category. Even though the slopes of the three trend lines are all positive, gasoline and aviation fuel revenues do not exhibit as significant a trend as diesel fuel. The addition of the numbers from the recent biennium to the linear regression line resulted in an increase in the slope for aviation fuel and gasoline with a decrease in slope for diesel fuel.

The linear trends for fuel revenues indicate that the Petroleum Tank Release Cleanup Fund (Fund) could expect combined fuel revenues to increase by approximately \$71,000 each year, with diesel contributing \$43,000 to the expected annual revenue increase, gasoline accounting for \$23,000, and aviation fuel accounting for nearly \$5,000. The revenue estimate predicts that fuel use will increase by about 1% per year. Although this indicates an increase in revenue, it probably is not significant enough to consider in a future estimate.

The slope of the linear regression line appears to still be the best predictor of future revenues. The slope of a least-squares regression would predict revenues at \$7.89, \$7.96, \$8.03, and \$8.10 million for 2025, 2026, 2027, and 2028 respectively. If revenues for the four years were predicted to remain nearly the same as they have for this biennium, the revenue predictions for 2025 through 2028 would be \$7.8 million annually. The difference in the two prediction methods for the coming biennium averages less than 3%.

The Montana Department of Transportation's projected tax revenue was not available at the writing of this report*.

The U.S. Energy Information Administration's, (EIA), Short-Term Energy Outlook on Diesel consumption and energy growth indicated that from mid-2020, during the most restrictive pandemic-related measures, through late 2022, U.S. GDP grew at an average annualized rate of 6.1% per quarter. From mid-2020 to 1Q21, growth was partially driven by increases in consumer spending, particularly on goods. During this period, spending on services, such as retail trade or accommodation and food services, was lessened due to behaviors and policies aimed at reducing the spread of COVID-19. As a result, the share of consumer spending on manufactured goods increased, which supported trucking activity and diesel consumption.

Although EIA expects U.S. GDP to grow over the next 18 months, downward trends in transportation and manufacturing indicators contribute to EIA's lower U.S. diesel consumption forecast relative to 2022. EIA is uncertain about several factors in EIA's forecast including future GDP growth and employment. EIA's forecast assumes that the Federal Reserve's interest rate increases will slow inflation without causing major disruptions to U.S. employment or economic activity. If GDP growth does decline, EIA could see a further slowdown in U.S. diesel consumption. On the other hand, if the outlook for the manufacturing sector improves, EIA's diesel consumption forecast could be adjusted upward, even in the event of a deteriorating GDP forecast.

Expenditures

The administrative expenses incurred by the Fund consist of expenses by the Petroleum Tank Release Compensation Board (Board) for fund administration and expenses by the Department of Environmental Quality (Department) for regulatory activities. There appears to be a shift in the operating expenses in fiscal year 2011. The change is attributed to the loan repayment and reduction of legal cases. A linear regression of operating expenses of the years of 1995 through 2011 indicates an annual increase of approximately \$18,000 as contrasted to the period of 2012 to the present that exhibits an annual increase of approximately \$12,727.

The slope of a linear regression analysis of the total combined expenses for both the Board and the Department from 1995 to 2024*, excluding the special allocations, indicates that the slope of the trend for total expenses exhibits an annual increase of 1.6%. The expenses associated with personnel shows an increase of 2% per year over the last 30 years.

A linear regression equation for the combined total expenses for fiscal years 1995 through 2024* estimates that the total costs will increase approximately \$38,000 per year. This indicates that the total program expenditures for FY2025 and FY2026 can be estimated at approximately \$2.4 million per year.

Claim Expenditures

The annual claim expenditures for FY1995 through FY2024* reflects a decreasing trend. The claim data shows a range of variation in annual claim expenditures from FY1995 through FY2024* from about \$3 million to \$8 million. The claim expenditure data was analyzed using regression techniques from FY1995 through FY 2024*. Performing a least-squares linear regression analysis to calculate a straight line that best fits the claim expenditure data for FY1995 through FY2024* yields a decreasing regression line with a \$27,000 per year rate of decline, about .05%** per year. The regression estimates over the years continue to be erratic. Regression analysis for this data exhibits a low coefficient of determination, 0.05, and is therefore not likely the most reliable predictor of future claim expenditures.

The Consumer Price Index (CPI) has had a steady increase over the past 100 years but during COVID 19, the CPI has hit record highs without a decrease corollary with pre-COVID 19 market increases. Simply put, costs for goods and services have increased in every sector with no return to what was considered the normal yearly increase of approximately 3% found in the Urban Consumer's CPI report. According to Urban Consumer's CPI, the past 5 years CPI were 1.8%, 1.2%, 4.7%, 8%, 4.1% for years 2019, 2020, 2021, 2022 and 2023 accordingly. The CPI for the year 2024* is not available as of the date of this report.

Given that the claim expenditures are declining, rather than keeping pace with CPI, the amount of remediation activity that is being submitted as claims appears to be declining over the past 5 years. This could be a contributing factor to the increase in the Fund balance. The Board would encourage additional cleanup activities to be conducted in the amount of approximately \$650,000 additional claim expenditures

**Correction - 5%

per year, over the next decade, to leverage the available revenues to accomplish a greater number of site closures. The Board is pursuing strategies with the Department to accomplish this goal.

Future Claim Projections

Using the average of claim expenditures for the past 30 years would project the expenditures for the next few years to be at approximately \$4.9 million. The average annual claim expenditure is probably the best available predictor to provide an estimate for future claim expenditure projections. This analysis focused on the data and did not take into consideration any impacts from potential influential outside actions, such as regulatory changes, or any long-term strategic plans. The biennial report for 2022 projected claim expenditures to be at approximately \$4.9 million based on the average calculated from the prior 28 years. The average claim expenditure for FY2023 through FY2024* was \$4.4 million. The claim expenditures are a function of requested cleanup activity, site condition factors and costs of goods and services, and therefore, the best predictor would be an average of the more recent years. Using the average of claim expenditures for the past 10 years would project the expenditures for the next few years to be at approximately \$4.5 million per year.

Cash Balance

As revenue has risen and work plan activity, which results in claimed costs to the fund, has declined, there is a cash balance that has been building. From 2012 through 2024*, the Fund's cash balance has been building on average by \$392,755 each year. A fitted line on the last five years, 2020 – 2024*, shows the cash balance has been building by approximately \$593,115 each year. The balance is increasing because there is less work being required and approved through work plan activity which results in less claim activity and direct expense allocated to the Fund. The Fund was created to aid eligible owners with remediation activities, thus there is a need for a positive fund balance, however it is important to maintain a balance between work expenditures and revenue, helping to keep the Fund in balance. When there is not a balance between work expenditures and revenue it results in an increase in cash in the Fund. The Board would like to see a minimum balance maintained and the available cash in the Fund used for remediation or prevention activities that aid the same citizen base currently served.

Exposure to Long-Term Liabilities

Liabilities to the Fund consist of cleanup costs for current eligible releases, future eligible releases, and releases where ineligibility may be contested. The liabilities associated with the current eligible releases are the total cleanup for each current active release reduced by the amount of current cleanup accomplished; the amount of insurance coverage for the release; and the facility's compliance. The future releases that may be Fund eligible consist of releases from active petroleum storage tanks, releases that are currently being remediated that have not applied for assistance, releases that have been discovered and no corrective action has been performed, and existing contamination yet to be discovered at old petroleum storage facilities (former gas stations). The potential liability for contested eligibilities is assessed as applications for eligibility are received, recommendations of eligibility are made and then ratified or heard by the Board for final determination.

The sites that have active and current cleanup need to proceed through the remediation phases, which requires requests for work to be done, the implementation of that work and time required for implementation. All open releases for which no work has been requested need to become part of the work process; starting with a work plan request, which results in the Board receiving an eligibility application. History has shown that former petroleum storage facilities have varying degrees of contamination yet to be discovered. It is known that there is a limited number of these facilities, and federal petroleum Brownfield's activities are assisting in

finding and investigating these facilities. There will come a time when all historical storage facilities have been investigated and are working toward cleanup and closure. These liabilities can only be assessed based on rates of discovery, followed by application for assistance to the Fund, the estimated cleanup costs, followed by projected closure dates, and finally the resolution of those releases.

Fund liabilities for active tanks are positively impacted by prevention efforts, facility compliance, regulatory changes, and potential insurance coverage. The new regulations have prompted more preventative efforts and owners that stay in compliance, help releases avoid catastrophic levels and reduce the excess costs to the Fund. Over time, there will be new release discoveries because of Brownfields investigative activities, phase II environmental site assessments associated with property transfers, and monitoring of active tank systems.

There is a concern for those release discoveries for which there is no reasonable expectation of insurance coverage. These include discoveries of contamination that are found during a property transaction and usually involve sites that had petroleum tanks in the past, as well as releases that occur from heating oil tanks at residences or businesses. These types of releases currently have coverage provided by the Fund if they meet the criteria of compliance at the time of release discovery. The release from historical contamination will remain a Fund liability because insurance can only be obtained for sites with active tanks. Releases from heating oil tanks at residences or business will remain a liability until the Legislature creates a framework to mandate pollution coverage for homes and businesses. There will continue to be several discoveries in the future for releases that are not able to obtain insurance coverage.

Throughout time, there have been nearly 5,000 discovered releases, and of those less than 1,000 remain open. An analysis of discovered releases from 2019 through 2023 indicates the number of releases being discovered each year averages 34, with no expected change. Further analysis shows an average of 51 release closures per year in that same time frame. As of 2023, the amount of release discoveries and closures appear to be equalized and if this trend continues the number of open releases will be over 1,000 by 2027. There must be more releases being closed than discovered each year to reduce the backlog of historical releases currently open. The totals for 2024* were not included in the analysis as the data set won't be complete until the end of the calendar year.

Of all open releases over time, there remain 211 releases that have never applied for eligibility to the Fund included in that total are 14 releases that were discovered before the inception of the Fund and would therefore be ineligible for assistance. The remaining 197 releases represent an unknown liability to the Fund, the costs of bringing these to closure cannot be assessed until eligibility is applied for and potentially granted. If all known and open releases were in some phase of active remediation, the Fund's liability would be easier to define and other uses for the Fund could be predicted, such as helping to fund prevention of releases.

The best estimate of liability to the fund would be the total remaining costs for each of the open eligible releases plus any expected future liability. Appendix A, which is included with this Biennial Report identifies sites with open releases characterized in the following categories, see table below.

Never Applied for eligibility, discovered after Fund inception	197
Those applied to the Fund and granted eligibility	578
Those applied and determined ineligible	89
Those that have applied and are in process of eligibility determination	20
Those that have applied and are suspended awaiting additional information, or suspended at request of owner	4
Those that have applied and have requested the application withdrawn	4

The Fund cannot currently assess its projected full liability because the information to do so does not exist. To understand full liability, the Fund needs to have an expected time of closure for each of the currently open and eligible releases, per 75-11-521(2), MCA.

“The department shall develop a list of open release sites prioritized by danger to the health and safety of the public and anticipated date of categorizing the sites as resolved.”

The list of open releases with an anticipated date of categorizing the site as resolved is not available. If the maximum allowed coverage is assumed to be necessary for each of the 578 open and eligible releases to reach closure, the total remaining liability to the Fund for these releases would be \$441,776,027.65. However, the Fund has no way of projecting how long a release will remain open, the bulk of Fund eligible open releases are more than 15 years old. This translates into 82% of the currently open and eligible releases falling into the category of being discovered more than 15 years ago.

To aid in calculating the Fund’s long-term liability, the Board will be embarking on a research project to ascertain the work that has been done for each open eligible release and what remains to be done. A list of those open eligible releases that will be used for this project can be found in Appendix A. The project will consider the current remediation phase for each site as documented by the consultant, owner, and Department. With that understanding the Fund can then assess liability using current market costs, which have not normalized since the spikes seen during COVID 19, to project more accurately the liability to the Fund. The goal in gathering this data, and the associated costs, is to have a projected release closure date and expected remaining activity to assist with a prediction. All stakeholders involved in remediation need to be a party to that projected closure date. The Board is looking forward to future communication with the Department, the owner, and their consultants to better understand the closure dates for all open and eligible releases that the Fund holds as liabilities.

The Board remains concerned that the number of AST releases may become most of the long-term liabilities. Many ASTs do not comply with current storage tank requirements established by the State Fire Marshal. A checklist has been established by the Board to aid owners in determining compliance requirements that affect Fund eligibility. The current AST Fund eligibility requirements can be found on the Board’s web site at:

<https://deq.mt.gov/files/DEQAdmin/PET/Documents/Forms/StorageTankChecklist.pdf>

Over the long term, compliance by AST owners with current State standards, specifically the AST check list, will help to reduce the number of releases from ASTs. Since this is a voluntary compliance, there are many AST owners that have tank systems that don’t meet these State standards. The Legislature should consider establishing required inspections to help owners minimize potential releases.

Impacts of changes, in State and Federal Regulations, on Underground and Aboveground Storage Tanks

The Department’s adoption of EPA’s requirements in October of 2018 does not appear to have impacted the number of new releases applying for eligibility. However, the Board does believe that the new regulations have resulted in less spills turning into confirmed releases and has prevented catastrophic releases from happening. The number of new release discoveries still seems to be impacted mostly by property transactions wherein phase II site assessments are conducted and historic contamination is found.

The overall lack of regulation for Aboveground Storage Tanks, (ASTs), is an ongoing concern for the Fund. There has not been any formal inspection or regulatory framework set in place for ongoing compliance for AST’s. As previously discussed, the Board has established a checklist to provide a path to eligibility for AST’s

that may seek Fund coverage because coverage is based on compliance. Without any regulatory oversight, compliance is hard to determine or encourage.

Availability of Petroleum Storage Tank Insurance and Trends

There are many releases still being discovered because of property transactions, most are historic contamination that is found during the site assessment that is conducted as part of the sale of the property. There can be no reasonable expectation of an owner having insurance for historic contamination. Insurance coverage is usually written for a known likely liability, and it generally does not cover pre-existing liabilities. Until the backlog of open releases and newly discovered releases that are tied to historic contamination are closed, it would be very difficult to legislate a mandate for insurance coverage that would responsibly provide for protection of human health and the environment without providing a minimal insurance structure to reach that goal.

Insurance and state petroleum assistance funds are the most common mechanisms used by owners and operators to comply with federal and state financial responsibility requirements. Montana's Petroleum Tank Release Cleanup Fund (Fund) requires that insurance be used for cleanup activities before costs are reimbursed from the Fund. The program does allow the owner to leverage any insurance, or other funding sources, to assist with the owner's copay requirements. This model allows the owner to cost effectively meet the financial responsibility requirements. The program has seen an increase in the use of storage tank insurance over the last decade for active storage tanks.

It is important to recognize that Montana does not require owners to participate in the Fund. Owners can choose several mechanisms to meet the federal Financial Responsibility (FR) requirements. If the owner does not choose the Fund, they can choose coverage of another type to satisfy the Certificate of Financial Responsibility (CFR) requirements, including insurance. Insurance is a valuable part of the owner's portfolio. Having coverage from both insurance and the Fund reduces the owner's liability risk. Assistance from a chosen mechanism, such as the Fund or an insurance company, is based on compliance throughout time.

As found in the Arizonia Underground Storage Tank (UST) report from 2023, the Arizonia Fund will aid owners that have insurance coverage that is used to meet the Financial Requirements imposed in 1989 that require UST owners to provide assurance of Financial Responsibility. The choice of different mechanisms to meet that requirement are very similar to Montana's CFR and insurance coverage is a way to comply with FR, however in Arizonia the only owners receiving aid from the Arizonia Fund are those that have insurance coverage. This means that only insured active underground storage tanks in Arizonia are receiving consideration for aid. In Arizonia, approximately 65 percent of UST owners and operators rely on commercial UST insurance as of September 26, 2023. This indicates that although Arizonia requires insurance for federally regulated tanks, (active USTs), Arizonia still maintains a Fund that provides financial assistance for releases where the insurance denies a submitted claim. This coordination of benefits puts insurance first and the Arizonia fund as a backup for only those owners that are eligible for assistance.

In Arizonia all responsible parties that have historic contamination discovered, own an AST, or are at a residential or business with a heating oil tank not only do not have insurance, they also won't be considered eligible for aid for their remediation expenses. In Montana, the responsible parties that are not being provided aid in Arizonia, make up a large portion of the citizen base which the Montana Fund serves. The Montana Fund is providing aid and keeping properties viable for current and future uses and maintaining those properties on the tax records by aiding the owners in costs that would otherwise financially turn the property upside down in value vs costs to remediate.

The Board is participating in the State Funds and Financial Responsibility Quarterly Calls offered by our federal partners and is conducting research on issues with insurance. These efforts have identified several issues with tank insurance policies.

Insurance companies only cover releases that occurred within the policy period. Which means insurance does not cover releases outside their policy period. So, discovery of contamination in 2023 of contamination that was released in 1993 is not covered by insurance because it did not occur during the policy period. The State does not have knowledge of policy expirations and active tank owners are often unaware that insurance policies require the release to be discovered within the policy period. If insurance expires and the owner does not renew their policy, the release that is discovered may not be covered by insurance.

Many insurance policies do not have retroactive coverage. Policies can limit coverage to the time the release was discovered or when the release occurred. If the policy limits coverage to when the release occurred and has no retroactive coverage, the owner will not have coverage for a release that occurred in an earlier policy period. This problem is common when owners change insurance providers and transition from a release occurrence policy to a release discovery policy.

Certain insurance companies will not pay for cleanup if the release is discovered during a voluntary investigation, such as a Phase II site assessment for the sale of property. There continues to be a number of fueling station property sales occurring within the state of Montana. This policy exclusion makes it difficult for the property owner to sell the property to a potential buyer because the buyer wants an investigation and yet if a release is discovered during the investigation the release would be excluded from coverage due to the policy exclusion clause.

Most insurance policies do not provide coverage for an extended reporting period after the policy period and owners often don't investigate a site that is closing. Therefore, owners who allow the policy to end and discover a release after the business closes will be denied coverage.

Tanks in temporary closure presents a variety of issues regarding insurance. To meet the letter of the financial responsibility regulations, tank owners may be able to purchase insurance for out of service tanks, however typically the policy will include language that makes it clear that the policy is intended only to comply with FR regulations, and since a release cannot occur from an empty, out of service tank there is no actual coverage for cleanup of a release from an inactive tank.

The issues with insurance include occurrence outside of the policy period, no retroactive coverage, no coverage for voluntary investigations, no coverage beyond the policy period and no coverage for out of service tanks. These known issues result in owners relying on the Cleanup Fund for assistance when the insurance denies coverage of the release.

It is important to note that insurance coverage changes from year to year and reimbursement or payment is based on a claim. The life of that claim is very short as insurance companies try to get those closed as quickly as possible. There is no translation of coverage between the Fund providing aid for 36 years on the same release and an insurance company paying out a claim, which would only cover a portion of the life of a release. The continuity of coverage is not even comparable between the Fund and insurance when factoring in the number of years a release can remain unresolved.

Another segment of UST's population for which insurance coverage is a concern is aging UST systems in the nation. Systems that are 30 years old and older continue to make up a larger segment of the UST population. Some owners of aging USTs report having trouble renewing or obtaining insurance, with smaller UST owners struggling the most. Montana, being a rural state, is made up of several struggling smaller UST

owners. It is recognized that uninsured aging USTs expose the state to cleanup costs if owners don't have financial resources. The Fund bridges this financial gap, and the Board is mindful of the challenges and is seeking solutions.

List of Insurance Companies

List of insurance providers from EPA is available online at: [List Of Insurance Providers For UST Financial Responsibility Requirements | US EPA](#) The current list shows a total of 15 insurance companies that write pollution coverage. There is a total of 13 companies listed that offer coverage for UST owners and operators that include Montana in that coverage, there are 2 companies that do not write coverage for Montana. The 2020 Biennial report indicated that a total of 64 insurance companies provided insurance coverage in the United States. Since that time, EPA has assessed the insurance companies that meet federal FR requirements, and the results greatly reduced the list that EPA published for available coverage, to a much smaller list of providers.

Continuing Collection of Petroleum Tank Release Cleanup Fees

Given the expressed concerns with insurance at both the national and state level there is still a prevailing need for the Fund and the coverage it provides to assure a clean and healthful environment for the citizens of Montana. There remains a bulk of known releases that are yet to be resolved. Within the set of open releases there are many sites where no corrective action has been requested or performed. Many of those sites will apply for assistance once a request for cleanup is made. There is still historic contamination yet to be found at former petroleum storage tank facilities most of these will be discovered during property transactions and will apply for assistance. Once these challenges are overcome, other models for funding cleanup, such as insurance, can be considered.

The Fund continues to protect public health and safety and the environment. The Fund allows UST owners to demonstrate financial responsibility as required by federal regulations. The Fund continues to provide financial resources for reimbursement of certain costs, expenses and other obligations incurred because of releases of petroleum products from active, inactive, and historical petroleum storage tank systems. The Board, the Department and the EPA continue to find ways to encourage owners to improve tank facilities in an effort to minimize the likelihood of accidental releases.

Because of the challenges already noted for adequate insurance coverage to meet federal FR, exclusionary language in policies and the amount of historic contamination known and unknown, there will be an ongoing need from the Fund for assistance in petroleum remediation efforts. This need will continue on some level, for the foreseeable future, both due to the need for an insurance model that requires and sets minimal standards along with the portion of the population for which insurance may never be a coverage mechanism, like the farm and ranch owners and homeowners with heating oil tanks.

The Board feels the fee should remain imposed and collected to help owners and operators comply with UST obligations under federal requirements, to fund reimbursement of corrective action related to historical releases and assist certain petroleum storage tank owners with cleanup of petroleum releases to protect public health and safety and improve the condition of the environment. The fund balance has not yet approached the ceiling established by law (§75-11-314 MCA) and continues to collect \$0.0075 on each gallon of fuel sold.

The Fund continues to be a significant part of property transfers for petroleum contaminated sites. Petroleum impacted sites that have been granted eligibility to the Fund pose less risk to the buyer in a property transaction. Because eligibility can easily be transferred to the new owner, and the bulk of the environmental liability is carried by the Fund, property sales are more likely to occur. This results in more Montana business properties remaining a business that can continue to serve its community and contribute to the tax base.

The Board continues to research and seek feedback on ways to incentivize owners to pursue implementation of cleanup strategies that bring their releases to closure in a timely manner. This could help to address the backlog of open historic releases, thus allowing for a different funding model. Although participation in the Fund is voluntary, the fee collected comes from all people who purchase aviation fuel, gasoline, diesel, and heating oil. Thus, any incentives provided from this Fund need to be beneficial to the citizens at large and the state of Montana.

Definitions

Claim – In an actuarial context, a “claim” is typically used to refer to a single event triggering coverage by an insurer. For the Fund, a claim is a request for reimbursement for a single work plan related to the remediation of a site. For the purposes of this report, the term “claim” will have the latter meaning, while “release” will be used to signify individual triggering events, per the terminology used by the Fund.

Coefficient of Determination - Compares the fitted (estimated) curve and actual data, and ranges in value from 0 to 1. If it is 1, there is a perfect correlation between the fitted curve and the data — At the other extreme, if the coefficient of determination is 0, the fitted equation is not helpful in predicting values.

Correlation - Refers to the relationship between two variables during a period of time which indicates whether and how strongly pairs of variables are related.

Fiscal Year - The State of Montana Fiscal Year begins on July 1 of each year and ends on June 30 of the following year.

Frequency – Technically speaking, frequency is the average number of releases per insured exposure. For the Fund, an insured exposure is one tank insured for one year. For example, if 250 releases are reported in a year with 10,000 insured tanks, the frequency (average number of releases per insured exposure) is $250/10,000$ insured tanks = 0.025 releases per tank. In spite of this, the term “frequency” is often used to simply describe the number of releases (rather than releases per exposure), such as in the “Frequency Times Severity Method”. The term is clarified is the meaning is unclear from context, and the distinction is important.

Least-squares - The method of least-squares analysis assumes that the best-fit curve of a given type is the curve that has the minimal sum of the deviations squared (least square error) from a given set of data. The least-squares line method uses a straight line ($y=mX+b$) to approximate the given set of data $(x_1, y_1), (x_2, y_2), \dots, (x_n, y_n)$.

Linear Regression Formula - attempts to model the relationship between two variables by fitting a **linear equation** to observed data. A **linear regression** line has an **equation** of the form $Y = a + bX$, where X is the explanatory variable and Y is the dependent variable.

Severity – Severity is the average cleanup cost of a release for a given collection of release. For instance, if the total cost for three releases is \$45,000, the severity (average size of a release) is $\$45,000 / 3$ releases = \$15,000 severity.

Appendix A

Appendix A is a list of open petroleum release sites with eligibility status, claim activity and the liability assessment on the available data.
