PERMIT FACT SHEET

MONTANA GROUND WATER POLLUTION CONTROL SYSTEM (MGWPCS)

Permittee:	Grass Valley Gardens LLC
Permit Number:	MTX000331
Permit Type:	Domestic Wastewater
Application Type:	Major Modification
Facility Name:	Grass Valley Gardens Residential Subdivision
Facility Location:	14N 20W 20SW Missoula County Latitude: 46.955904° Longitude: -114.162644°
Facility Address:	8700 US Hwy 10, Missoula MT 59808
Facility Contact:	Hunter Morriscal – WGM Group
Treatment Type:	Proposed: Advanced, Membrane Bioreactor Facility (MBR)
Receiving Water:	Class I Ground Water
Number of Outfalls:	1
Proposed Outfall, Type:	001, Rapid infiltration cells (RIC)
Effluent Type:	Domestic strength wastewater
Mixing Zone:	Standard
Effluent Limit Type:	WQBEL
Effluent Limits:	Total nitrogen: 7.90 lbs/day Total phosphorus: NA
Flow Rate:	Design maximum: 180,000 gpd Design average: 120,000 gpd
Effluent sampling:	Monthly sampling for influent and effluent
Ground water sampling:	Quarterly, MW-1, MW-2 and MW-3
Fact Sheet Date:	May 2026
Prepared By:	M. Peziol

1.0 PERMIT INFORMATION

The following fact sheet provides the principal facts considered in preparing a major modification to Montana Ground Water Pollution Control System (MGWPCS) permit No. MTX000331 issued to Grass Valley Gardens LLC (Permittee) for the Grass Valley Gardens Residential Subdivision (Facility). As part of this permitting action, only those permit conditions subject to modification are reopened.

Following issuance of the permit, DEQ identified an error in the calculation used to establish the nitrogen effluent limitation. DEQ reevaluated the calculation and revised the effluent limitation accordingly. The revised limitation is more stringent and is necessary to ensure consistency with applicable ground water quality standards and the technical basis supporting the permit.

The major modification also includes revisions to compliance dates associated with installation of required monitoring wells.

The revised limitation and compliance schedule do not change the nature, location, or design capacity of the discharge and does not increase the potential for impacts to ground water quality. Therefore, the modification does not constitute a new discharge and does not require submittal of a new MGWPCS application.

1.1 APPLICATION

DEQ received an application for a new discharge permit on August 15, 2024. Permit fees accompanied the application. DEQ identified deficiencies in the permit application during completeness review and notified the permittee in a letter dated September 17, 2024. The permittee provided supplemental application information on September 23, 2024, October 17, 2024, and November 14, 2024, allowing DEQ to determine the application complete on December 2, 2024.

1.2 CHANGES TO THIS PERMIT

This major modification includes revisions to effluent limitations following DEQ's identification of an error in the original effluent limitation calculations after permit issuance. The revised calculations result in more stringent effluent limitations.

The modification also includes revisions to the compliance schedule associated with installation of required monitoring wells. The revised schedule allows additional time for monitoring well installation following permit issuance.

The modification does not alter the authorized discharge location, treatment system, design flow, monitoring requirements, reporting requirements, or disposal system configuration.

2.0 FACILITY INFORMATION

2.1 LOCATION

The Grass Valley Gardens Residential Subdivision is located northwest of Missoula, along U.S. Highway 10 West, in the "Wye" area. It is situated in the southern half of Section 20, Township 14 North, Range 20 West, with an approximate address of 8700 U.S. Highway 10 W (**Figure 1**).

The subdivision collection system will serve a population of 1,000 of 436 households, seven commercial lots, and 16 common areas. The subdivision is divided into four sub-phases. Most of the commercial development is planned for Phases 1 and 2. Each phase is estimated to take one year, resulting in the build out being completed in the first five years of construction. All wastewater components will be located on-site (**Figure 2**).

Figure 1. Vicinity Map

Table 1: Operations Summary	
Collection	
Facility: Grass Valley Gardens Residential Subdivision SIC Codes: 1623: Water, Sewer, and Utility Lines and 1522: Residential Construction Treatment: Proposed Membrane Bioreactor (MBR) Location: 46.955904° -114.162644°	
Wastewater Sampling/Monitoring	
INF-001: The influent wastewater sample to be collected from a sample port on equalization tank. EFF-001: The effluent wastewater sample to be collected from a sample port on dose tank. FM-001: The effluent flow meter sample to be collected. Sampling plan: The permittee is required to develop and implement a Wastewater Sampling, Analysis, and Reporting Plan for their community system (Section 7).	
Disposal Operation	
Method: Proposed subsurface disposal using rapid infiltration cells (RIC) Location: Outfall 001 Outfall 001: 46.951529° -114.160508° 14N 20W 20SW Missoula County Capacity: Average design flow 120, 000 GPD Maximum design flow 180, 000 GPD	

Figure 3. Proposed RIC System Layout

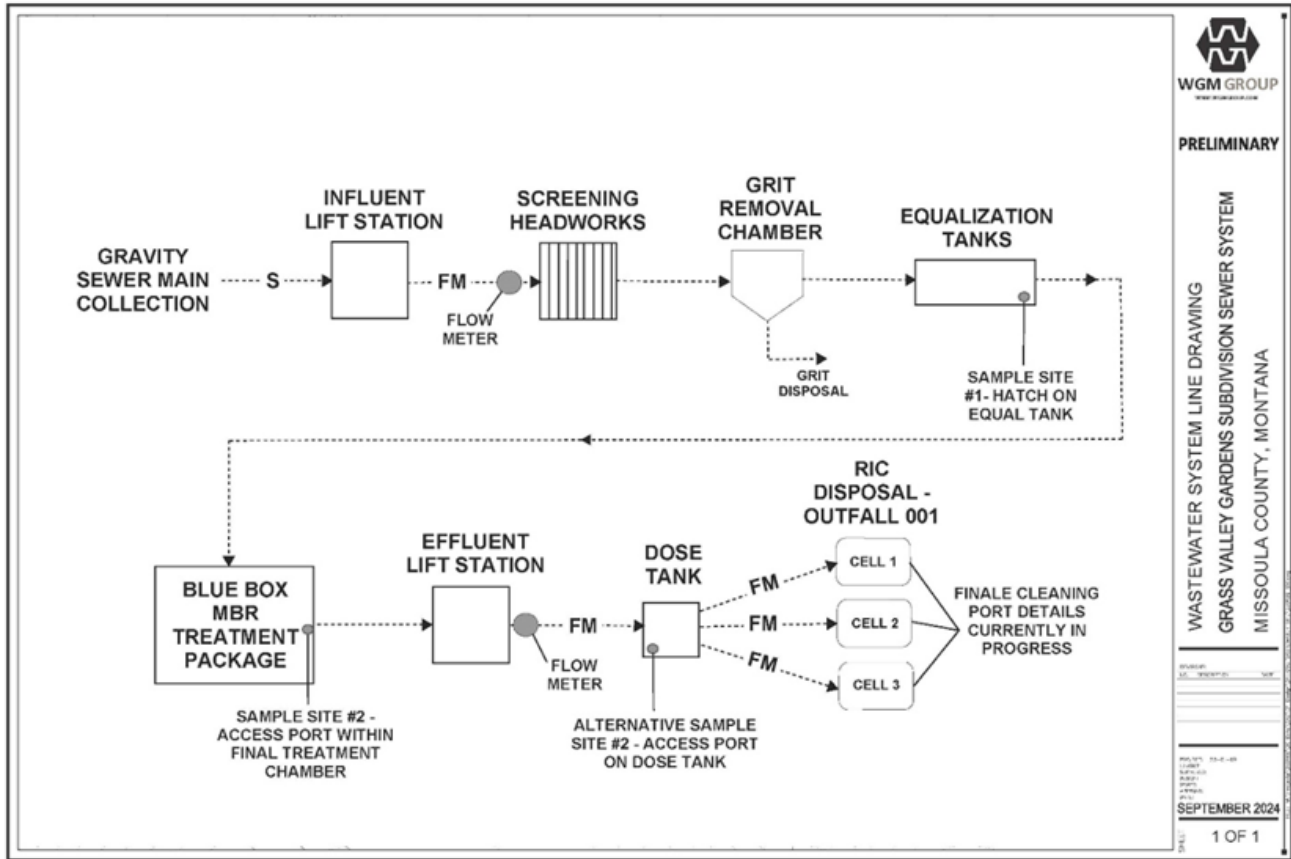

Figure 4. Wastewater Treatment System Line Diagram

2.3 GEOLOGIC CONDITIONS

WGM conducted thirteen test pits across the site, revealing a soil profile of silty clay, silty clay loam, and loamy sand. Clay layers were typically found beneath the topsoil at depths of 18 inches to six feet, with sandy layers extending from below the clay to depths of 10 to 13 feet. No groundwater was detected, and soil borings indicate relatively transmissive subsurface conditions. The disposal area was chosen based on soil properties, prioritizing areas with better infiltration rates while avoiding poorly draining soils. The central site location was found to have more pervious soils than the perimeter (MGWPCS, 2024).

Test pit locations are shown on **Figure 5** and a summary of the wastewater tests is provided in **Appendix A**.

Figure 5. Test Pit Locations

2.4 HYDROGEOLOGIC CONDITIONS

Site specific hydrogeologic data determined ground water flow direction to be $S78^{\circ}W$. The nearest potable water wells are located approximately 1,500 feet downgradient of the proposed wastewater infiltration site. The closest surface water feature downgradient is the Clark Fork River, 11,500 ft, with several irrigation ditches, including the Grass Valley French Ditch (0.7 miles away), situated between the disposal site and the river. Based on regional groundwater levels, the ditch is considered a losing feature in this area (MGWPCS, 2024).

The site lies within a semi-confined, shallow to deep basin-fill aquifer, characterized by layers of sand, gravel, and cobbles interspersed with Glacial Lake Missoula clay and silt. The aquifer is recharged primarily by leakage and underflow from O’Keefe Creek, tributaries, and surrounding hills. Classified as an “open” aquifer by the DNRC, it serves over 40,000 homes in the Missoula area and is documented as being productive enough to support the proposed subdivision (MGWPCS, 2024).

Two separate mounding analyses were conducted by WGM Group, utilizing the Hantush Method to assess the ability of the water to dissipate in the subsurface. It was determined that the mounding potential of the proposed rapid infiltration cells will not interfere with the infiltration capacity of the cells, and will not cause the groundwater to artificially surface.

Hydrogeologic characteristics are summarized below in **Table 2**.

Table 2: Hydrogeologic Summary	
Shallowest depth to ground water:	61 ft
Ground water flow direction:	$S78^{\circ}W$
Hydraulic conductivity:	50.20 ft/day
Hydraulic gradient:	0.0062 ft/ft

2.5 GROUND WATER MONITORING NETWORK

Five monitoring wells were established as part of the facility's site-specific hydrogeologic investigation. Well information is provided in **Table 3**. A map of the wells is included above as **Figure 6**. Well lithology and construction reports are provided in **Appendix B**.

FACT SHEET: MGWPCS Permit No. MTX000331 – Grass Valley Gardens Residential Subdivision

Table 3: Monitoring Well Summary
GVG#1
MBMG GWIC #: 326745 Use: Data collection for on-site deep aquifer characteristics Permit Status: Active. Constructed on March 23, 2023 Location: T14N, R20W, Section 20 Latitude: 46.95221° Longitude: -114.14864° Total depth 418 feet. Static water level 152 feet. The well represents the deeper aquifer underlying the facility.
GVG#2
MBMG GWIC #: 328213 Use: Well had perforations set at elevations where the shallowest depth of water was discovered for data collection on shallow groundwater characteristics. Permit Status: Active. Constructed on September 7, 2023 Location: T16N, R15W, Section 20 Latitude: 46.952213° Longitude: -114.16453° Total depth 280 feet. Static water level 61 feet. The well was utilized to calculate groundwater direction, gradient and hydraulic conductivity.
GVG#3
MBMG GWIC #: 330384 Use: Data collection for on-site deep aquifer characteristics Permit Status: Active. Constructed on January 23, 2024 Location: T14N, R20W, Section 20 Latitude: 46.953556 Longitude: -114.152306 Total depth 400 feet. Static water level 106 feet. The well represents the deeper aquifer underlying the facility.
GVG#4
MBMG GWIC #: 332088 Use: Data collection for on-site deep aquifer characteristics Permit Status: Active. Constructed on July 12, 2024 Location: T14N, R20W Section 20 Latitude: 46.953306° Longitude: -114.153111° Total depth 340 feet. Static water level 104 feet. The well represents the deeper aquifer underlying the facility.
MW-1
MBMG GWIC #: 333352 Use: Well had perforations set at elevations where the shallowest depth of water was discovered for data collection on shallow groundwater characteristics. Permit Status: Active. Constructed on April 17, 2024 Location: T14N, R20W, Section 20 Latitude: N 46° 57' 6" Longitude: W 114° 9' 36" Representation: Well is side gradient of the RIC disposal, Outfall 001. The well was utilized to calculate groundwater direction, gradient and hydraulic conductivity. Water samples collected will be representative of ambient quality of the shallow aquifer specifically for this permit.
MW-2
MBMG GWIC #: Use: Monitoring of the shallow unconfined ground water bearing zone downgradient of the RIC disposal. Permit Status: Proposed Location: The well must be on or near the downgradient boundary of the proposed mixing zone. Representation: Downgradient of the RIC disposal, Outfall 001. The well as finished represents the shallow ground water underlying the proposed discharge area.
MW-3
MBMG GWIC #: 333352 Use: Monitoring of the shallow unconfined ground water bearing zone upgradient of the RIC disposal. Permit Status: Proposed Location: The well must be within 1,000 ft of the RIC disposal and positioned upgradient of the discharge area. Representation: Upgradient of the RIC disposal, Outfall 001. The well as finished represents ambient quality of the shallow aquifer.

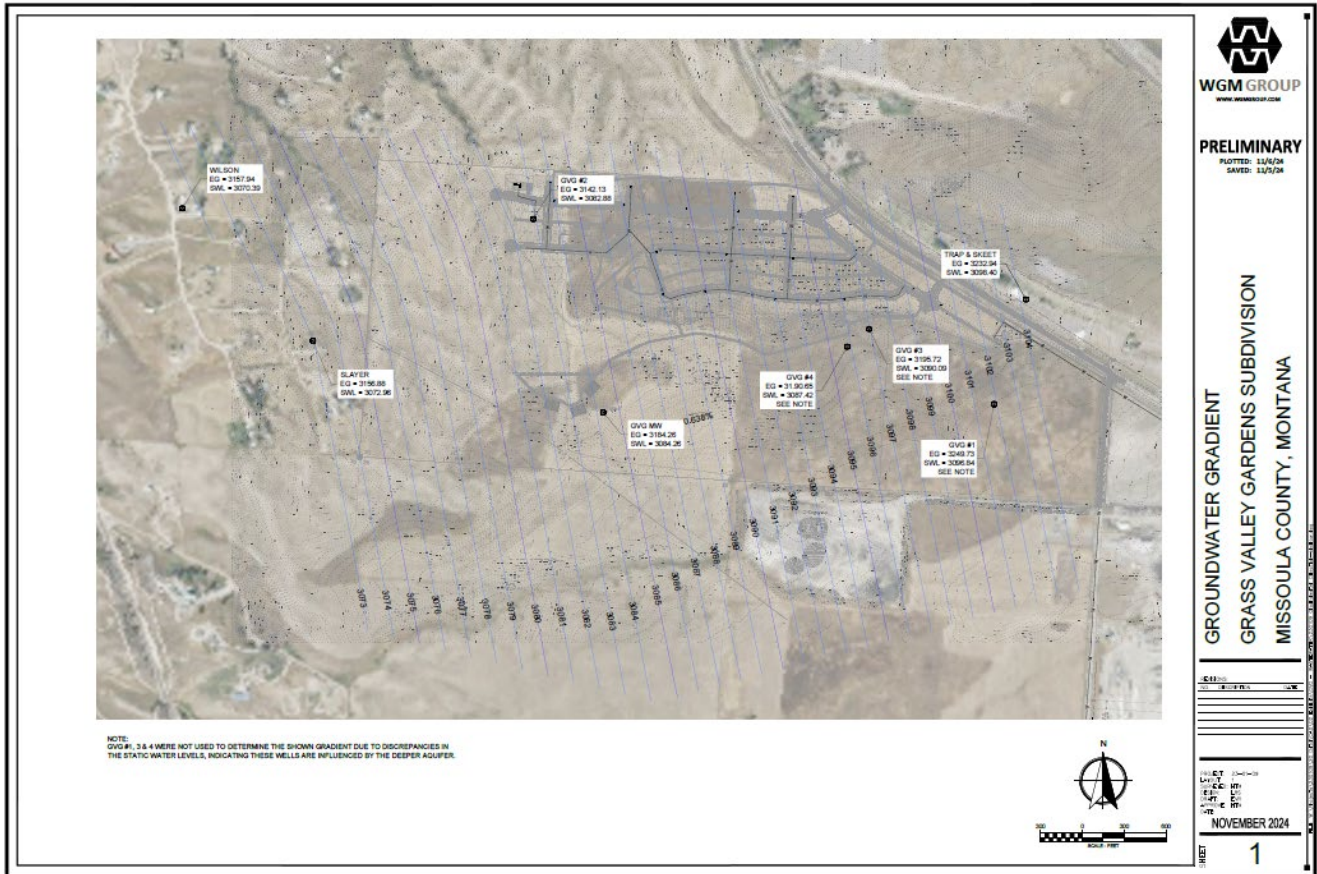

Figure 6. Monitoring Well Map

2.6 WATER QUALITY INFORMATION

The Applicant has proposed an advanced wastewater treatment system that can remove approximately 90% of the raw wastewater nitrogen load. A summary of the estimated influent and effluent characteristics is provided in **Table 4**.

Table 4: Estimated Influent and Effluent Quality – Outfall 001

Parameter ⁽¹⁾	Units	Influent Limits	Effluent Limits	Source of Data
Biochemical Oxygen Demand (BOD ₅)	mg/L	350	<10	APP
TSS	mg/L	350	<10	APP
Nitrogen, Total Kjeldahl (as N)	mg/L	60	<2.5	APP
Nitrogen, Total Ammonia (as N)	mg/L	43.0	<1	APP
Nitrogen, Nitrate + Nitrite (as N)	mg/L		<2.5	APP
Nitrogen, Total [as N]	mg/L	60	<5	APP
Oil & Grease	mg/L	<10	<6	APP
pH Maximum	s.u.		9	APP
pH Minimum	s.u.		6	APP
Phosphorus, Total (as P)	mg/L	<2	<2	APP
Total Dissolved Solids (TDS)	mg/L	29.0	20.0	APP
Max Wastewater Temperature	°C	25		APP

Footnotes:

APP = MGWPCS Application and supplemental materials from applicant

CFU = Colony Forming Unit

s.u. = standard units

(1) Conventional and nonconventional pollutants only, table does not include all possible toxics

Ambient ground water quality characteristics of the shallow aquifer were collected from MW-1 on April 18, 2024, June 12, 2024, and July 9, 2024. A summary of the ground water quality is provided in **Table 5**.

Table 5: Ground Water Monitoring Results

Monitor Source ⁽¹⁾	Parameter	Units	Reported Minimum Value	Reported Maximum Value	Reported Average Value
MW-1	Chloride (Cl)	mg/L	6	7	6
	<i>Escherichia coli</i> Bacteria	CFU/100 ml	0	0	0
	Nitrogen, Nitrate + Nitrite (as N)	mg/L	0.56	3.47	2.38
	Nitrogen, Total Kjeldahl (as N)	mg/L	0.00	0.70	0.23
	pH	s.u.	7.50	8.00	7.73
	Specific Conductivity (@ 25°C)	µS/cm	286	309	300
	Total Organic Carbon (TOC)	mg/L	0.50	1.10	0.77
	Total Dissolved Solids (TDS)	mg/L	161	189	179

Footnotes:

APP = MGWPCS Application and supplemental materials from applicant

bgs = below ground surface

CFU = Colony Forming Units

ND = Not detected at the Reporting Limit of 0.5 mg/L

s.u. = standard units

(1) Refer to Section 2 of the Fact Sheet for the existing or proposed location of the monitoring wells.

(2) Maximum value recorded of all monthly or quarterly reported values.

Based on the 300 microsiemens per centimeter (µS/cm) specific conductance, the receiving water is Class I ground water.

3.0 WATER QUALITY STANDARDS

Part of DEQ's mission is to protect and sustain the quality of state waters. Water quality standards provide the basis for limitations that protect state waters. These include beneficial use maintenance, specific water quality standards, and the Nondegradation policy. DEQ protects all designated uses of state water by basing effluent limitations on the most restrictive water quality standards intended to protect the most sensitive uses.

3.1 BENEFICIAL USES

The receiving state water is Class I ground water which is a high-quality water of the state. The current and future beneficial uses of the aquifer will be protected. The beneficial uses and water quality standards are listed below.

Beneficial uses:

- Public and private water supplies
- Culinary and food processing purposes
- Irrigation
- Drinking water for livestock and wildlife
- Commercial and industrial purposes

Water quality standards are established to protect these beneficial uses. Standards are as follows:

- Ground water human health
- Harmful, detrimental, or injurious activity
- Nondegradation provisions

DEQ protects all designated uses of state water by basing effluent limitations on the most restrictive water quality standards intended to protect the most sensitive uses. The most restrictive standard will be used in formulating limitations (**Section 5**). The corresponding numeric and narrative standards are listed in **Table 6**.

Parameter ⁽¹⁾	Units	Ground Water Human Health Standards	Pollutant Category ⁽²⁾	Nonsignificance Criteria ⁽³⁾
Bacteria [<i>Escherichia coli</i>]	CFU/100 mL	< 1	-	-
Nitrogen, Nitrate + Nitrite [as N]	mg/L	10.0	T	7.5
Nitrogen, Total (TN) ⁽⁴⁾	mg/L	10.0	-	7.5
Phosphorus, Total Inorganic			H	Surface water breakthrough time greater than 50 years ⁽⁵⁾

Footnotes:

CFU = Colony Forming Unit

These standards establish the allowable changes in ground water quality and are the basis for limiting discharges to ground water.

(1) The list includes identified parameters of interest.

(2) Circular DEQ-7: Carcinogen (C), Harmful (H), and Toxic (T) parameter. Toxic pollutant with a Bioconcentrator (B) factor.

(3) Criteria indicates threshold for a significant activity that may lead to degradation.

(4) DEQ conservatively assumes all forms of nitrogen will convert to nitrates within the aquifer. DEQ recognizes that other nitrogen forms may be harmful to the beneficial uses therefore will use Total Nitrogen for projecting impacts and in formulation of compliance efforts (limitations).

(5) Changes in receiving ground water quality are not significant if water quality protection practices approved by the DEQ have been fully implemented and if the listed nonsignificance criteria is met.

3.2 NONDEGRADATION

Montana’s Nondegradation policy is intended to preserve the existing condition of high-quality state waters. Any water whose existing condition is better than the water quality standards must be maintained in that high quality. Nondegradation policy allows discharges to cause only nonsignificant changes in water quality.

Activities that cause a significant change in water quality require an authorization to degrade. An authorization to degrade is not an authorization to pollute; the water quality standard may not be exceeded outside of a department-authorized mixing zone. This activity is not authorized to degrade. **Figure 7** illustrates the relationship between water quality standards, nondegradation, and nonsignificant changes in water quality.

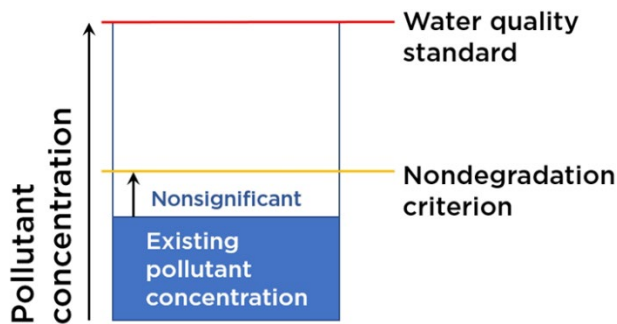

Figure 7. Pollutant Loading Effects on Nondegradation and Nonsignificance

The 2025 Significance Determination Analysis found that the discharge from the proposed facility was not a significant activity (**Appendices C and D**) and is summarized in the following sections.

3.3 SIGNIFICANCE CRITERIA AND DETERMINATION

Changes of nitrate as nitrogen in ground water are nonsignificant if the discharge will not cause degradation of surface water and the predicted concentration of nitrate as nitrogen at the boundary of the ground water mixing zone does not exceed 7.5 mg/L. Using the nonsignificance criterion of 7.5 mg/L, DEQ will establish effluent limitations and long-term monitoring requirements for compliance at the end of the mixing zone (**Section 5.0**).

In addition to WGM, DEQ also performed a significance determination in predicting nitrate values downgradient of the proposed discharge structure. The new wastewater system design along with on-site ground water characteristics (**Section 2**) and dilution estimates (**Section 4**) were used in these projections.

Due to a high volume of ground water and a decrease in the proposed nitrogen loading discharge; it is predicted that nitrates in the receiving aquifer will be 4.81 mg/L after dilution with the underlying mixing zone. This is less than the nitrate nonsignificance criteria of 7.5 mg/L and is therefore nonsignificant.

For phosphorus, a surface water breakthrough time of greater than 50 years is a nonsignificant change in water quality. The phosphorus criterion requires an analysis to determine a breakthrough time based on the adsorption capacity of the soil. Breakthrough occurs when the subsurface soils lose their capability to adsorb any more phosphorus, and it has a potential to reach surface water. DEQ’s phosphorus breakthrough analysis estimates that phosphorus discharged to ground water from Outfall 001 may reach surface water in 197 years. This is assuming a distance to surface water of 11,500 ft, which, as discussed in **Section 2**, is a conservative estimate; the effluent flow path is likely much longer. The predicted phosphorus breakthrough is greater than 50 years, and therefore is not considered to be significant and phosphorus permit limits are not required.

These analyses show that the discharge activity is not significant, and the discharge permit requires that the permittee complies with these established limitations on a long-term basis.

3.4 CUMULATIVE EFFECTS

The proposed project is designed to treat the nitrogen in the wastewater to 5mg/L prior to discharge. DEQ performed a projection of nitrate levels at the end of the mixing zone. Upon dilution, nitrate concentration is reduced to 4.81 mg/L which is less than the nitrate nonsignificance criteria of 7.5 mg/L (**Table 7**). This maintains assimilative capacity for potential future development elsewhere while still protecting the aquifer's beneficial uses. This projection does not take nitrate attenuation into account; while the effluent travels in the subsurface, nitrate naturally decays from biogeochemical processes that occur in the aquifer. These projections are conservative because nitrogen attenuation is likely to take place in the vadose, phreatic, and hyporheic zones.

DEQ considered the direct, secondary, and cumulative environmental impacts of the construction and operation of the facility and found no significant adverse effects on water quality, the human environment, and the physical environment. The DEQ analysis included the cumulative impact from other past and present actions.

All major discharge permitting actions, including the current action and any future actions, will include any substantive information derived from public input relating to potential impacts on the human environment and on water quality. All future actions related to this current action will be addressed by DEQ through additional discharge permitting process procedures. Any actions that are outside the prevue of the discharge permit may not be addressed by DEQ until the next permitting action takes place.

To protect beneficial uses, there shall be no increase of a pollutant to a level that renders the waters harmful, detrimental, or injurious. Therefore, no wastewaters may be discharged such that the wastewater either alone or in combination with other wastes will violate or can reasonably be expected to violate any standard.

The allowable discharge will be derived from a mass-balance equation that determines the assimilative capacity of the receiving aquifer (**Section 5**). This factors into the cumulative impacts of all existing upgradient discharges in the receiving aquifer.

A ground water monitoring network has been established that will provide for long-term monitoring of the aquifer. The ground water data collected will provide continual monitoring of the health of the aquifer including the impacts of any upgradient dischargers. This data is made available to the public for their viewing and will be used by DEQ to update future permit limitations. In addition, any update to limitations, including cumulative effect analyses, will be noticed to the public and will undergo public comment.

Long-term monitoring and reporting, continual analysis and updates of permit conditions, and public notice and comment procedures is a benefit to having a system that is covered under a discharge permit.

4.0 MIXING ZONE

A mixing zone is an area of the receiving shallow ground water where the aquifer can assimilate wastewater pollutants. It is a specifically defined area of the receiving aquifer where water quality standards may be exceeded. The availability of dilution is based on the site-specific aquifer characteristics and the drainfield dimensions. The allowable level of dilution is limited by the permit to ensure that water quality standards are met at the end of the mixing zone.

The applicant requested a standard mixing zone for this combined discharge. A standard mixing zone extends 500 feet downgradient from the source. The upgradient boundary is equal to the width of the source (measured perpendicular to the ground water flow direction). The mixing zone widens in the downgradient direction by 5° on either side. The width of the downgradient boundary is calculated by adding the increased width for each side (the tangent of 5° (0.0875) times the mixing zone length) to the width of the upgradient boundary (**Figure 8**). Standard mixing zones extend 15 feet below the top contact of the ground water table. A map of the proposed mixing zone is provided in **Figure 9**.

Figure 8: Mixing Zone Schematic

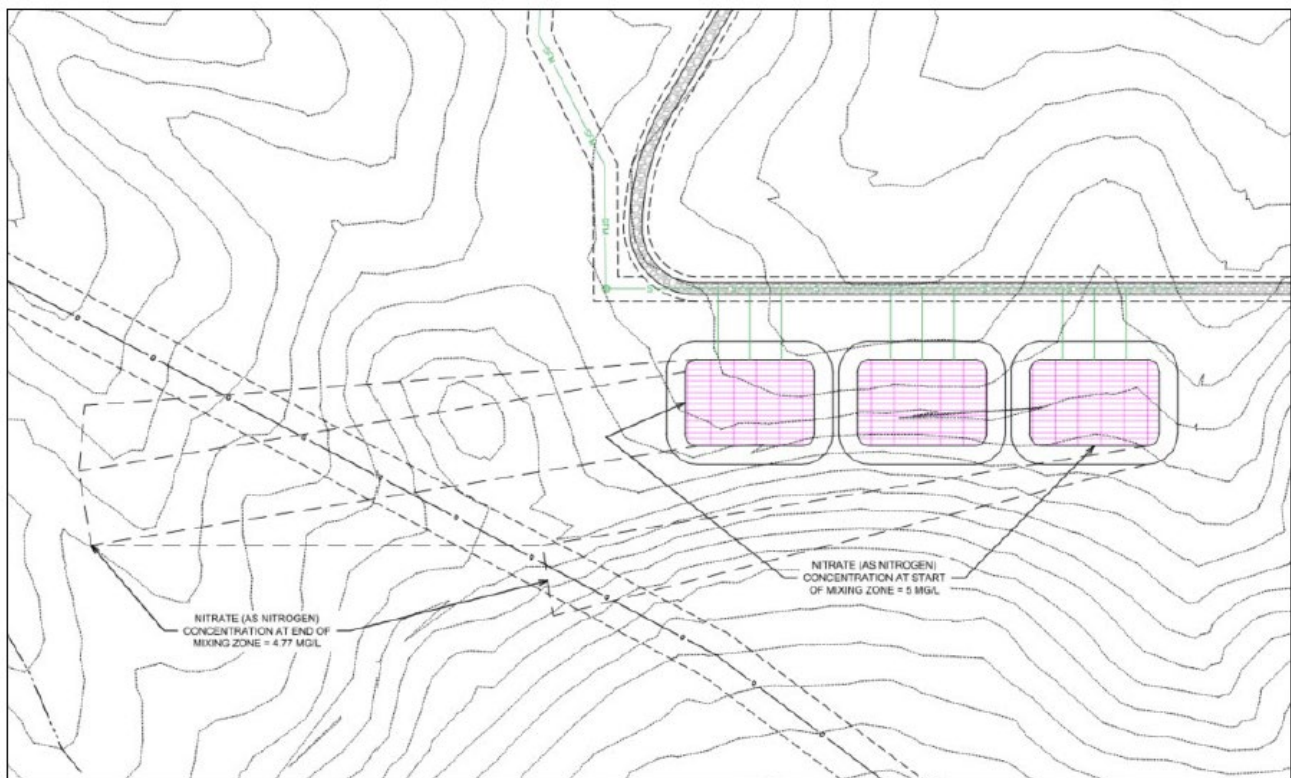

Figure 9. Proposed Mixing Zone

Information below provides details on how DEQ calculates the available dilution of the receiving aquifer. A summary is provided in **Table 7**.

Based on the dimensions of the mixing zone, and the hydrogeologic characteristics (**Section 2.5**), the volume of ground water (Q_{gw}) available to mix with the wastewater is calculated using Darcy's Equation:

$$Q_{gw} = KIA$$

Where Q_{gw} = ground water flow volume (ft³/day)

K = hydraulic conductivity (ft/day)

I = hydraulic gradient (ft/ft)

A = cross-sectional area (ft²) of flow at the downgradient boundary of the mixing zone

Modern drainfield systems are designed to minimize the likelihood of the subsurface transport of pathogenic bacteria. Pathogens are a direct existential threat to public and environmental health. In general, DEQ recognizes that replacement of older drainfields with a newly designed one may have environmental benefits.

Parameter	Units	Value
Mixing Zone Type	-	Standard
Authorized Parameters	-	Total Nitrogen
Ambient Ground Water Concentrations, Nitrate + Nitrite	mg/L	2.38
Ground Water Flow Direction	azimuth/bearing	S 78° W
Length of Mixing Zone	feet	500
Thickness of Mixing Zone	feet	15
Outfall Width, Perpendicular to Ground Water Flow Direction	feet	174
Width of Mixing Zone at Down Gradient Boundary	feet	261.5
Cross Sectional Area of Mixing Zone (A)	ft ²	3922.5
Hydraulic Conductivity (K)	feet/day	50
Hydraulic Gradient (I)	ft/ft	0.0062
Volume of Ground Water Available for Mixing (Q_{gw})	ft ³ /day	1,221

5.0 LIMITATIONS

Discharge permits include conditions that ensure compliance with the Montana Water Quality Act and implementing regulations. These conditions include effluent limits and any additional requirements DEQ determines necessary to protect the quality of the receiving water.

Following issuance of the permit, DEQ identified an error in the effluent calculation used to establish permit limitations. DEQ corrected the calculation to ensure consistency with the technical basis of the permit and applicable regulatory requirements.

Correction of the calculation resulted in revised effluent limitations that are more stringent than those included in the issued permit. The revised limitations reflect the proper application of design flow, treatment assumptions, and mixing zone analysis used to evaluate compliance with applicable groundwater quality standards.

Based on the corrected analysis, the discharge authorized under this permit is expected to comply with applicable ground water quality standards at the downgradient boundary of the mixing zone.

5.1 NITROGEN

To protect beneficial uses, there shall be no increase of a pollutant to a level that renders the waters harmful, detrimental, or injurious. Therefore, no wastewaters may be discharged such that the wastewater either alone or in combination with other wastes will violate or can reasonably be expected to violate any standard. DEQ will establish an effluent limitation for nitrogen within this permit. The limit will conservatively be based on the projection that the entire nitrogen load in the wastewater stream may ultimately be converted to nitrate.

The allowable discharge will be derived from a mass-balance equation which is a simple steady-state model that determines the assimilative capacity of the receiving aquifer. The equation factors in cumulative impacts of existing upgradient discharges in the receiving aquifer and any available dilution within the mixing zone. The mass-balance equation derived for ground water is as follows:

$$Q_{gw}C_{gw} + Q_{eff}C_{eff} = Q_{comb}C_{proj}$$

Where Q_{gw} = ground water available for mixing
 C_{gw} = ambient receiving ground water concentration
 Q_{eff} = design capacity of wastewater system
 C_{eff} = effluent pollutant concentration
 Q_{comb} = combined ground water and effluent volume
 C_{proj} = projected pollutant concentration after mixing

The mass-balance equation has been arranged to calculate the maximum amount of nitrogen that can be added to the aquifer without causing or contributing to an exceedance of the water quality standard:

$$C_{limit} = C_{std} + \frac{Q_{gw}}{Q_{eff}}(C_{std} - C_{gw})$$

Where C_{limit} = concentration-based effluent limit
 C_{std} = water quality standard concentration, (7.5 mg/L)
 Q_{gw} = ground water available for mixing (1,221 ft³/day)
 Q_{eff} = Average design capacity of wastewater system (120,000 gpd)
 C_{gw} = ambient receiving ground water concentration (2.38 mg/L)

Numeric effluent limits are often expressed as loads which inherently regulates both volume and strength of the discharge. The load limit ensures compliance with the ground water standard at the end of the mixing zone.

$$L_{limit} = C_{limit}Q_{eff}f_{con}$$

Where L_{limit} = load-based effluent limit (lbs/day)
 C_{limit} = concentration-based effluent limit (mg/L)
 Q_{eff} = design capacity of wastewater system (gpd)
 f_{con} = conversion factor of 8.34×10^{-6}

With the facility's average design capacity of 120,000 gpd, the resulting concentration and load limits are:

Concentration limit= 7.89 mg/L total nitrogen

Load limit= 7.90 lbs/day total nitrogen

DEQ reevaluates effluent limitations during permit renewal using updated monitoring and water quality data to ensure continued protection of the receiving ground water quality.

5.2 PHOSPHORUS

As discussed in **Section 3.3**, the phosphorus breakthrough analysis estimated the phosphorus breakthrough to occur in 197 years. Predicted phosphorus breakthrough within 50 years is considered significant. Therefore, a limit has not been developed.

5.3 FINAL EFFLUENT LIMITS

The effluent limitations for this permit are summarized in **Table 8**.

Table 8: Effluent Limitations – Outfall 001		
Parameter	Units	Monthly
Nitrogen, Total [as N]	lbs/day	7.90
Monthly load calculation: Monthly average load calculations must use the average of all sample concentrations collected during the reporting period and the total monthly flow. Additional calculation requirements are provided in the Wastewater monitoring Tables.		

6.0 MONITORING AND REPORTING

Long-term monitoring and reporting of wastewater and ground water will be established as a condition of the permit. Monitoring of the wastewater characteristics before and after treatment will help ensure operation, maintenance, and compliance with the permit limitations. Wastewater monitoring and reporting requirements are provided in **Table 9**. The permittee must develop and implement a Wastewater Sampling, Analysis, and Reporting Operation Manual. This manual is further discussed in **Section 7**.

Ground water monitoring will provide DEQ with ongoing information on the current and future health of the aquifer. Ground water monitoring and reporting requirements are provided in **Table 10**. The permittee must develop and implement a Ground Water Monitoring, Analysis, and Reporting Operational Manual. This manual is further discussed in **Section 7**.

Reporting must be completed in use of Discharge Monitoring Reports (DMRs). The permittee or operator will file DMRs electronically in use of the online NetDMR program. Information and contacts for this program can be found here: <https://deq.mt.gov/water/assistance>.

Footnotes:
 EFF-001: Description provided in Table 1 of the Fact Sheet document.
 INF-001: Description provided in Table 1 of the Fact Sheet document.
 FM-001: Description provided in Table 1 of the Fact Sheet document.
 If no discharge occurs through out the reporting period, "no discharge" shall be recorded on the wastewater Discharge Monitoring Report (DMR) report forms.
 Parameter analytical methods shall be in accordance with the Code of Federal Regulations, 40 CFR Part 136, unless specified above or within a deviation authorized by DEQ.
 (1) See definitions in Part V of the permit unless defined within this table or by a permit condition.
 (2) Monthly Average: The average of all individual daily concentrations (mg/L) analyzed during the reporting period.
 (3) Requires recording device and/or totalizing meter. Equipment must be capable of recording daily, quarterly, and annual effluent volumes.
 (4) Monthly Average Flows: Determine total flows that occurred during the reporting period. Divide total flow by the number of calendar days in the reporting period to get a unit of daily flow (gal/day).
 (5) Total Nitrogen is the sum of Nitrate + Nitrite and Total Kjeldahl Nitrogen.
 (6) Load Calculation. Determine concentration (mg/L): Use the average of all individual daily concentrations (mg/L) analyzed during the reporting period. Determine totalized flows: Total flow that occurred during the reporting period. Convert to a daily flow average (gal/day): Divide the total monthly flow by the total calendar days (days) of the reporting period. Calculate load (lbs/day): Concentration (mg/L) x Flows (gal/day) x [8.34x10⁻⁶].

Table 10: Ground Water Monitoring and Reporting Requirements

Analyte/Measurement	Monitor Location	Units	Sample Type ⁽¹⁾	Minimum Sampling	Reporting ⁽²⁾ Requirements	Report Frequency
Chloride [as Cl]	MW-1 MW-2 MW-3	mg/L	Grab	1/Quarter	Quarterly Average	Quarterly
Nitrogen, Nitrite+Nitrate [as N]	MW-1 MW-2 MW-3	mg/L	Grab	1/Quarter	Quarterly Average	Quarterly
Nitrogen, Total Ammonia [as N]	MW-1 MW-2 MW-3	mg/L	Grab	1/Quarter	Quarterly Average	Quarterly
Nitrogen, Total Kjeldahl (TKN)[as N]	MW-1 MW-2 MW-3	mg/L	Grab	1/Quarter	Quarterly Average	Quarterly
Nitrogen, Total [as N] ⁽³⁾	MW-1 MW-2 MW-3	mg/L	Calculate	1/Quarter	Quarterly Average	Quarterly
Specific Conductivity @ 25°C	MW-1 MW-2 MW-3	µS/cm	Grab or Instantaneous	1/Quarter	Quarterly Average	Quarterly
Temperature	MW-1 MW-2 MW-3	°C	Instantaneous	1/Quarter	Quarterly Average	Quarterly
Static Water Level (SWL) ⁽⁴⁾	MW-1 MW-2 MW-3	ft-bmp	Instantaneous	1/Quarter	Quarterly Average	Quarterly
Well Depth ⁽⁴⁾	MW-1 MW-2 MW-3	ft-bmp	Instantaneous	1/Quarter	Quarterly Average	Quarterly

Footnotes:

CFU = Colony Forming Units

ft-bmp = feet below measuring point

Monitoring for MW-1 commences upon the permit effective date.

Monitoring for MW-2 and MW-3 shall commence on the Completion Date listed in the Compliance Table.

A description of MW-1 can be found in Table 2 of the Fact Sheet document. The requirements of MW-2 and MW-3 can be found in the Special Conditions section of the Fact Sheet and Permit.

A description of each monitoring well can be found in Table 3 of the Fact Sheet document.

At no time shall the permittee mark or state “no discharge” on any monitoring well DMR form.

Each monitor well to be individually monitored and sampled for the analyte and measurements respectively listed.

If any monitoring well(s) are abandoned, destroyed or decommissioned, or are no longer able to be sampled due to fluctuations in the ground water table; the permittee shall install a new well to replace the abandoned, destroyed, decommissioned, or non-viable well(s).

Parameter analytical methods shall be in accordance with the Code of Federal Regulations, 40 CFR Part 136, unless specified above.

Samples must not be collected until after the well casing is properly purged as determined by the DEQ approved Ground Water Monitoring Operational Manual.

Submittal of discharge monitoring report forms (DMRs) will be required, regardless of the operational status of the facility or of each individual monitoring well.

(1) See definitions in Part V of the permit unless defined within this table or by a permit condition.

(2) Quarterly Average: The average of all individual daily concentrations (mg/L) analyzed during the quarterly reporting period.

(3) Total Nitrogen is the sum of Nitrate + Nitrite and Total Kjeldahl Nitrogen.

(4) Measuring point (point of reference) for SWL measurements shall be from top of inner casing or as established by the Operational Manual and measured to within 1/100th of one foot.

7.0 SPECIAL CONDITIONS

7.1 MONITORING WELL INSTALLATION PLAN

Submit for approval an installation plan for Monitoring Well MW-2 and MW-3. MW-2 will be built on or near the downgradient boundary of the proposed mixing zone and MW-3 will be constructed within 1,000 ft of the RIC disposal and positioned upgradient of the discharge area to represent ambient groundwater conditions. These wells must be constructed to be representative of ground water occurring in the top twenty (20) feet of the shallow aquifer or as otherwise approved.

The plan needs to be approved prior to installation of the monitoring well(s). All monitoring wells must be secured, maintained, labeled, and monitored for long-term viability. In any permit renewal, DEQ will consider concentrations from the previous permit cycle to determine appropriate sampling requirements and necessary modifications to the monitoring plan. The completion and submittal date of the plan is listed in **Section 8**.

The installation dates for Monitoring Well MW-2 and MW-3 are also provided in **Section 8**. A post construction report documenting lithology, drilling and construction techniques, well construction information and diagram, surveyed spatial location and measuring point is due two months after installation. All new wells must be reported to the Montana Bureau of Mining and Geology's Ground Water Information Center.

Installation and post construction reports are required for all subsequent well installation and modification actions.

DEQ recognizes the challenges faced with well installation efforts in the field. Upon approval, modification to the plan can be made when challenging field conditions occur.

7.2 WASTEWATER SAMPLING, ANALYSIS, AND REPORTING OPERATION MANUAL

The permittee shall use BMPs in developing SOPs for sampling, analyzing, and reporting wastewater characteristics from the wastewater system. The manual needs to be site-specific and result in monitoring and reporting that is representative of the nature of the wastewater streams. The manual must be used as a guide in:

- Equipment calibration.
- Preparing and collecting wastewater influent (INF-001) and effluent (EFF-001) wastewater samples.
- Analyte calculations (**Table 9**).
- Recording and reporting wastewater characteristics.
- Recording and reporting wastewater flows.

The completion and submittal date for the manual is listed in **Section 7**. The manual must be reviewed and approved by DEQ prior to implementation. The permittee shall maintain a copy of the operational manual, sampling, and calibration records at the facility at all times. Wastewater monitoring requirements are discussed in **Section 6**. All subsequent amended manuals must be reported to DEQ within 30 calendar days.

7.3 GROUND WATER MONITORING, ANALYSIS, AND REPORTING OPERATIONAL MANUAL

The permittee shall use Best Management Practices (BMPs) in developing SOPs (Standard Operating Procedures) for sampling, analyzing, and reporting ground water characteristics. The SOP manual must be site-specific and result in monitoring and reporting that is representative of the nature of the shallow ground water bearing zone. The manual must provide for consistent identification, development, monitoring, sampling, calculating, recording, and reporting of the monitoring wells. The manual must provide for guidance on determining and documenting dry-well occurrences; and determining future well viability. DEQ recommends using the Montana

Bureau of Mines and Geology Open-File Report 746 titled Standard Procedures and Guidelines for Field Activities (MBMG, 2022) as a reference in developing a site-specific operational manual.

The completion and submittal date of the manual is listed in **Section 8**. The manual must be reviewed and approved by DEQ prior to implementation. The permittee shall maintain a copy of the manual, monitoring well development records, dry well occurrence records, sampling records, and calibration records at the facility always. Ground water monitoring requirements are discussed in **Section 6**. All subsequent amended manuals must be reported to DEQ within 30 calendar days.

7.4 MONITORING WELL VIABILITY

The permittee shall monitor and collect representative ground water samples from the receiving ground water aquifer. If any of the wells are abandoned, destroyed, decommissioned, or non-viable; or are no longer able to be monitored due to obstructions or fluctuations in the ground water table; the permittee shall rehab the non-viable well or replace with the installation of a new well.

7.5 MONITORING WELL REPLACEMENT, REHABILITATION, AND ABANDONMENT

If for any reason a monitoring well needs to be replaced, rehabilitated, or abandoned, the permittee shall submit a plan to DEQ for approval prior to the action taking place. The plan must document existing site-specifics and the reasoning behind the proposed action. The plan must detail the specific steps to take place during deconstruction, drilling, workover, and/or construction of the respective wells.

Written permission from DEQ is needed prior to the abandonment of any monitoring well. At minimum, monitoring well abandonment activities must be done in accordance with ARM 36.21.810(2-5). If the monitoring well is located in or around any collection, storage, treatment, disposal, land application, and/or mixing zone workings (or similar) additional actions may be required to prevent preferential subsurface flows, cross contamination, and to mitigate against any unauthorized wastewater releases. All new well installations must have detailed drilling, lithology, geospatial, and well construction information. A follow-up report summarizing all actions and details must be submitted to DEQ within 30 calendar days.

8.0 COMPLIANCE SCHEDULE

The actions listed in **Table 11** must be completed on or before the respective scheduled completion date. A report documenting each respective action must be received by DEQ on or before the scheduled reporting date. Unless otherwise stated, completion of all actions or deliverables must be reported to DEQ in accordance with Part II and Part IV.G of the permit.

Table 11: Compliance Schedule			
Action	Frequency	Completion Date of Action	Reporting Due Date
Develop and implement a Wastewater Sampling, Analysis, and Reporting Operation Manual.	Single event	<i>Within 180 days of the effective date of the modified permit.</i>	Due on or before the 28th day of the month following the completion date.
Develop and implement a Ground Water Monitoring, Analysis, and Reporting Operational Manual.	Single event	<i>Within 180 days of the effective date of the modified permit.</i>	Due on or before the 28th day of the month following the completion date.
Complete a Monitoring Well Installation Plan .	Single event	<i>Within 180 days of the effective date of the modified permit.</i>	Due on or before the 28th day of the month following the completion date.
Complete the installation of the monitoring well(s).	Single event	<i>Within one (1) year of the effective date of the modified permit.</i>	Due on or before the 28th day of the month following the completion date.
Commence monitoring and reporting of the newly installed monitoring well(s).	Single event	<i>Within one (1) year of the effective date of the modified permit.</i>	Due on or before the 28th day of the month following the completion date.
Complete a Monitoring Well Installation Report .	Single event	<i>Within one (1) year and two (2) months of the effective date of the modified permit.</i>	Due on or before the 28th day of the month following the completion date.

PUBLIC NOTICE

Legal notice information for water quality discharge permits is listed at the following website:

<http://deq.mt.gov/Public/notices/wqnotices>. Public comments on this proposal are invited any time prior to close of business on **July 9, 2026**. Comments may be directed to:

DEQWPBPublicComments@mt.gov

or to:

Montana Department of Environmental Quality
Water Protection Bureau
PO Box 200901
Helena, MT 59620

All comments received or postmarked prior to the close of the public comment period will be considered in the formulation of the final permit. DEQ will respond to all substantive comments pertinent to this permitting action and may issue a final decision within thirty days of the close of the public comment period.

All persons, including the applicant, who believe any condition of the draft permit is inappropriate, or that DEQ's tentative decision to deny an application, terminate a permit, or prepare a draft permit is inappropriate, shall raise all reasonably ascertainable issues and submit all reasonably available arguments supporting their position by the close of the public comment period (including any public hearing). All public comments received for this draft permit will be included in the administrative record and will be available for public viewing during normal business hours.

Copies of the public notice are mailed to the applicant, state and federal agencies, and interested persons who have expressed interest in being notified of permit actions. A copy of the distribution list is available in the administrative record for this draft permit. Electronic copies of the public notice, draft permit, fact sheet, and draft environmental assessment are available at the following website:

<http://deq.mt.gov/Public/notices/wqnotices>.

Any person interested in being placed on the mailing list for information regarding this permit may contact the DEQ Water Protection Bureau at (406) 444-5546 or email DEQWPBPublicComments@mt.gov. All inquiries will need to reference the permit number (MTX000331), and include the following information: name, address, and phone number.

During the public comment period provided by the notice, DEQ will accept requests for a public hearing. A request for a public hearing must be in writing and must state the nature of the issue proposed to be raised in the hearing.

APPENDIX C – SIGNIFICANCE DETERMINATION AND REASONABLE POTENTIAL ANALYSES

MONTANA DEPARTMENT OF ENVIRONMENTAL QUALITY (DEQ)

Montana Ground Water Pollution Control System

Ground Water Dilution Projection (GWDP) - Nondegradation Significance Analysis

These projections estimate the parameter concentrations in the aquifer downgradient of the subsurface discharge. After dilution with ground water, the projected concentration is compared to the respective significance criteria in determining nonsignificant changes in water quality (ARM 17.30.715).

Site Name: Grass Valley Gardens Residential Subdivision

Location: Missoula County

Permit #: MTX000331

Notes: Design Capacity = 120,000 gpd; Design flow 16,042 ft³/d

These calculations are for the following parameter of interest: Nitrate

These calculations use the most restrictive ground water standard.

These calculations do not credit potential losses due to chemical transformation.

These calculations do not credit potential losses due to attenuation.

Projected Concentration Calculation

$$Cr = \frac{(Qd)(Cd) + (Qs)(Cs)}{Qd + Qs}$$

$$Qd + Qs$$

The Activity is Not Significant if Cr < Significance Criteria

GWDP(a) - Ground Water **Nitrate** Projection at the End of the Mixing Zone.

Qd =	16042	ft ³ /d	Design capacity - effluent flow rate
Cd =	5.0	mg/L	Concentration - effluent (treated wastewater)
	500	ft	Length of ground water dilution zone
	15	ft	Thickness of dilution zone
	174	ft	Outfall width, perpendicular to ground water flow direction
	262	ft	Projected width of downgradient dilution zone
	3923	ft ²	Cross sectional area of dilution zone (A)
	50	ft/d	Hydraulic conductivity (K)
	0.00620	ft/ft	Hydraulic gradient (I)
Qs(Qgw) =	1221	ft ³ /d	Ground water volume (Qgw)
Cs =	2.38	mg/L	Ambient nitrate concentration in ground water
Cr =	4.81	mg/L	Projected concentration - end of the mixing zone
Sign. Criteria =	7.5	mg/L	Nonsignificance Criteria, ARM 17.30.715
Sign. Activity?	<7.5	mg/L	The activity is not significant

APPENDIX D – SIGNIFICANCE DETERMINATION AND REASONABLE POTENTIAL ANALYSES

MONTANA DEPARTMENT OF ENVIRONMENTAL QUALITY (DEQ)

PHOSPHOROUS BREAKTHROUGH ANALYSIS

SITE NAME:	Grass Valley Gardens Residential Subdivision
COUNTY:	Missoula
Permit #:	MTX000331
NOTES:	Variables used are based on conservative measurements
	Design Capacity = 120,000 gpd; Design flow 16,042 ft ³ /d

<u>VARIABLES</u>	<u>DESCRIPTION</u>	<u>VALUE</u>	<u>UNITS</u>
Lg	Length of Primary Drainfield as Measured Perpendicular to Ground Water Flow	174	ft
L	Length of Primary Drainfield's Long Axis	387	ft
W	Width of Primary Drainfield's Short Axis	71	ft
B	Depth to Limiting Layer from Bottom of Drainfield Laterals*	15	ft
D	Distance from Drainfield to Surface Water	11500	ft
T	Phosphorous Mixing Depth in Ground Water (0.5 ft for coarse soils, 1.0 ft for fine soils)**	0.5	ft
Ne			
Sw	Soil Weight (usually constant)	100	lb/ft ³
Pa	Phosphorous Adsorption Capacity of Soil (usually constant)	200	ppm
#l	Design Flow Rate	120000	gpd
<u>CONSTANTS</u>			
PI	Phosphorous Load per proposed wastewater treatment system	730	lbs/yr
X	Conversion Factor for ppm to percentage (constant)	1.0E+06	
<u>EQUATIONS</u>			
Pt	Total Phosphorous Load = (PI)(#l)	732	lbs/yr
W1	Soil Weight under Drainfield = (L)(W)(B)(Sw)	40925250	lbs
W2	Soil Weight from Drainfield to Surface Water = [(Lg)(D) + (0.0875)(D)(D)] (T)(Sw)	678643750	lbs
P1	Total Phosphorous Adsorption by Soils = (W1 + W2)/[(Pa)/(X)]	143914	lbs
<u>SOLUTION</u>			
BT	Breakthrough Time to Surface Water = P / Pt	197	years
